

ADSP-2159x/ADSP-SC59x SHARC+ Processor

Hardware Reference

Revision 0.1, September 2020

Part Number
82-100147-01

Contents

Clock Generation Unit (CGU)

CGU Features	1-1
CGU Functional Description.....	1-1
ADSP-2159x CGU Register List	1-2
ADSP-2159x CGU Interrupt List	1-3
ADSP-2159x CGU Trigger List.....	1-3
CGU Definitions.....	1-3
CGU PLL Block Diagram	1-4
CLKOUT Selections	1-5
CGU Operating Modes	1-6
CGU Power-up Sequence	1-6
CGU Event Control	1-6
Oscillator Watchdog	1-7
CGU Programming Model	1-8
Configuring CGU Modes	1-9
Changing the Clock Frequencies	1-9
Changing the PLL Clock Frequency.....	1-9
Changing the CCLKn or SYSCLK Frequency Without Modifying the PLLCLK Frequency	1-10
Changing the OCLK Frequency.....	1-11
Selecting SCLK1_0 Source.....	1-11
Changing SCLK1_0 Frequencies.....	1-11
Aligning All Clocks	1-12
Shutting Off CCLKn from Another Master	1-12
Valid Clock Multiplier Settings	1-13
PLL Bypass and PLL Disable	1-13
ADSP-2159x Specific Information	1-14
ADSP-2159x CGU Register Descriptions	1-14
Core Clock Buffer Disable Register	1-15

Core Clock Buffer Status Register	1-16
CLKOUT Select Register	1-17
Control Register	1-19
Clocks Divisor Register	1-21
DIV Register Extension	1-24
Oscillator Watchdog Register	1-25
PLL Control Register	1-27
Revision ID Register	1-29
System Clock Buffer Disable Register	1-30
System Clock Buffer Status Register	1-32
Status Register	1-34
Time Stamp Counter 32 LSB Register	1-37
Time Stamp Counter 32 MSB Register	1-38
Time Stamp Control Register	1-39
Time Stamp Counter Initial 32 LSB Value Register	1-40
Time Stamp Counter Initial MSB Value Register	1-41

Clock Distribution Unit (CDU)

CDU Features.....	2-1
CDU Functional Description.....	2-1
CDU Block Diagram.....	2-1
CDU Definitions.....	2-3
CDU Clock Configuration Options	2-3
CDU Programming Model.....	2-4
Changing the PLL and Clock Frequency	2-4
Changing the Clock Frequency.....	2-5
ADSP-2159x CDU Register Descriptions	2-5
CDU Configuration	2-7
CLKIN Select	2-8
CDU Revision ID	2-9

CDU Status	2–10
Dynamic Power Management (DPM)	
DPM Features.....	3–1
DPM Functional Description	3–1
ADSP-2159x DPM Register List.....	3–1
DPM Definitions	3–1
DPM Operating Modes	3–2
Reset State	3–2
Full-on Mode.....	3–2
DPM Event Control	3–3
DPM Programming Model.....	3–3
ADSP-2159x DPM Register Descriptions	3–4
Control Register	3–5
Peripherals Disable Register 0	3–6
Peripherals Disable Register 1	3–8
Revision ID	3–10
Status Register	3–11
Reset Control Unit (RCU)	
RCU Features	4–1
RCU Functional Description	4–2
ADSP-2159x RCU Register List.....	4–2
ADSP-2159x RCU Trigger List	4–3
RCU Definitions	4–3
RCU Architectural Concepts	4–4
RCU Status and Error Signals.....	4–5
ADSP-2159x RCU Register Descriptions	4–5
Boot Code Register	4–6
Core Reset Outputs Control Register	4–9
Core Reset Outputs Status Register	4–10

Control Register	4-11
Message Register	4-13
Message Clear Bits Register	4-17
Message Set Bits Register	4-18
System Interface Disable Register	4-19
System Interface Status Register	4-20
System Reset Request Status Register	4-21
Status Register	4-22
Software Vector Register 0	4-24
Software Vector Register 1	4-25
Software Vector Register 2	4-26
SVECT Lock Register	4-27

System Event Controller (SEC) and Generic Interrupt Controller (GIC)

SEC Features.....	5-1
SEC Functional Description	5-2
ADSP-2159x SEC Register List.....	5-2
ADSP-2159x SEC Interrupt List	5-3
ADSP-2159x SEC Trigger List	5-3
Combined SEC and GIC Interrupt List	5-4
SEC Definitions	5-16
SEC System Event Aggregator (SEA)	5-17
SEC Block Diagram.....	5-17
SEC Fault Interface (SFI)	5-18
SEC Core Interface (SCI)	5-19
SEC Source Interface (SSI)	5-20
SEC Architectural Concepts	5-20
System Interrupt Acknowledge.....	5-20
System Interrupt Groups.....	5-21
System Interrupt Flow.....	5-21
System Interrupt Priorities	5-22

SEC Error.....	5-22
SEC Programming Model.....	5-22
Programming Concepts.....	5-23
Programming Examples.....	5-23
Fault Management Interface Programming Model	5-23
Configuring a System Source to Interrupt a Core.....	5-24
Core/SEC Handshake Requirements to Ensure Proper Interrupt Handling	5-25
Configuring a System Source as a Fault	5-26
Configuring the WDOG Expiry Event to Issue a System Reset.....	5-26
SEC Programming Restrictions	5-26
ADSP-2159x SEC Register Descriptions	5-27
SCI Active Register n	5-29
SCI Control Register n	5-30
SCI Group Mask Register n	5-32
SCI Priority Level Register n	5-34
SCI Priority Mask Register n	5-36
Core Pending Register n	5-37
SCI Source ID Register n	5-38
SCI Status Register n	5-39
Global End Register	5-41
Fault COP Period Register	5-42
Fault COP Period Current Register	5-43
Fault Control Register	5-44
Fault Delay Register	5-47
Fault Delay Current Register	5-48
Fault End Register	5-49
Fault Source ID Register	5-50
Fault System Reset Delay Register	5-51
Fault System Reset Delay Current Register	5-52
Fault Status Register	5-53

Global Control Register	5-55
Global Status Register	5-56
Global Raise Register	5-58
Source Control Register n	5-59
Source Status Register n	5-62
GIC Overview	5-63
GIC Functional Description	5-64
GIC Block Diagram	5-65
ADSP-2159x GICDST Register Descriptions	5-65
GIC Port 0 Enable	5-66
Software Generated Interrupt Priority Register	5-67
Shared Peripheral Interrupt Priority Register	5-68
Software Generated Interrupt Active Register	5-69
Software Generated Interrupt Control Register	5-70
Software Generated Interrupt Clear-Pending Register	5-72
Software Generated Interrupt Pending Set Register	5-73
Software Generated Interrupt Security Register	5-74
Shared Peripheral Interrupt Register	5-75
Shared Peripheral Interrupt Active Register	5-76
Shared Peripheral Interrupt Configuration Register	5-77
Shared Peripheral Interrupt Enable Clear Register	5-78
Shared Peripheral Interrupt Enable Set Register	5-79
Shared Peripheral Interrupt Pending Clear Register	5-80
Shared Peripheral Interrupt Pending Set Register	5-81
Shared Peripheral Interrupt Security Register	5-82
Shared Peripheral Interrupt Processor Targets Register	5-83
ADSP-2159x GICCPU Register Descriptions	5-83
Aliased Binary Point Register (ICCABPR)	5-84
Binary Point Register (ICCBPR)	5-85
CPU Interface Control Register (ICCICR)	5-86

End of Interrupt Register (ICCEOIR)	5–87
Highest Pending Interrupt Register (ICCHPIR)	5–88
Interrupt Acknowledge Register (ICCIAR)	5–89
Priority Mask Register (ICCIPMR)	5–90
Running Priority Register (ICCRPR)	5–91

Trigger Routing Unit (TRU)

TRU Features	6–1
TRU Functional Description	6–1
ADSP-2159x TRU Register List.....	6–2
ADSP-2159x TRU Interrupt List	6–2
ADSP-2159x TRU Trigger List	6–3
TRU Definitions	6–3
TRU Block Diagram	6–4
TRU Architectural Concepts	6–4
TRU Programming Model.....	6–4
Programming Concepts.....	6–5
Programming Examples.....	6–5
Configuring a Simple Trigger Sequence.....	6–5
TRU Event Control	6–5
TRU Status and Error Signals.....	6–5
ADSP-2159x TRU Register Descriptions	6–5
Error Address Register	6–7
Global Control Register	6–8
Master Trigger Register	6–10
Slave Select Register	6–11
Status Information Register	6–12

L2 System Memory

L2 System Memory Features	7–1
L2 System Memory Functional Description.....	7–1

ADSP-2159x L2CTL Register List	7-1
ADSP-2159x L2CTL Interrupt List	7-3
ADSP-2159x L2CTL Trigger List	7-3
L2 System Memory Block Diagram	7-3
L2 System Memory Architectural Concepts.....	7-4
Access Characteristics	7-4
Read/Write Latency and Throughput	7-4
L2 Memory Controller Block Diagram (Instance)	7-5
Arbitration and Priority.....	7-5
Data Integrity.....	7-7
ECC Algorithm.....	7-7
ECC Hardware Control	7-9
ECC Error Management	7-9
Memory Refresh.....	7-10
Power Modes.....	7-10
L2 System Memory Event Control.....	7-10
ECC Error Interrupt.....	7-10
ADSP-2159x L2CTL Register Descriptions	7-11
Control Register	7-13
Error Type 0 Address Register	7-16
Error Type 1 Address Register	7-17
Error Type 2 Address Register	7-18
Error Type 3 Address Register	7-19
Error Type 4 Address Register	7-20
ECC Error Address 0 Register	7-21
ECC Error Address 1 Register	7-22
ECC Error Address 2 Register	7-23
ECC Error Address 3 Register	7-24
ECC Error Address 4 Register	7-25
ECC Error Address 5 Register	7-26

ECC Error Address 6 Register	7-27
ECC Error Address 7 Register	7-28
ECC Error Address 8 Register	7-29
Error Type 0 Register	7-30
Error Type 1 Register	7-31
Error Type 2 Register	7-32
Error Type 3 Register	7-33
Error Type 4 Register	7-34
Initialization Register	7-35
Initialization Status Register	7-37
Power Control Register	7-39
Revision ID Register	7-41
Read Priority Count Register	7-42
Read Priority Count Register	7-43
Scrub Start Address Register	7-44
Scrub Count Register	7-45
Scrub Control Register	7-46
Status Register	7-48
L2 Port Error Status Register	7-51
Write Priority Count Register	7-52
Write Priority Count Register	7-53

Dynamic Memory Controller (DMC)

DMC Features	8-1
Feature Exclusions	8-2
DMC Functional Description	8-2
ADSP-2159x DMC Register List	8-3
ADSP-2159x DMC Register List	8-3
Protocol Controller.....	8-4
Efficiency Controller	8-4

Page-Based Scheduling	8-4
Same Master Transaction Scheduling	8-5
DMC Read Data Buffer	8-5
Closed Page Per Bank.....	8-5
SCB ID-Based Priority	8-5
Delaying up to Eight Auto-Refresh Commands.....	8-6
Page and Bank Interleaving	8-6
System Crossbar Slave Interface.....	8-6
Read/Write Command and Data Buffers.....	8-7
Peripheral Bus Slave Interface	8-7
Architectural Concepts	8-7
Controller On Die Termination (ODT).....	8-8
Mode Register Set and Extended Mode Register Set Command.....	8-8
DDR3 Reset Functionality.....	8-8
DDR3 SDRAM Organization.....	8-8
DMC Clocking	8-9
DMC DMA	8-9
DMC Operating Modes	8-10
Self-Refresh Mode	8-10
DMC Event Control.....	8-10
DMC Programming Model	8-10
PHY DLL Calibration	8-11
DDR3 ZQ Calibration Short CMD	8-11
DDR3 ZQ Calibration Long CMD.....	8-11
On Die Termination (DDR3).....	8-12
Leveling Techniques	8-12
Initializing the DMC	8-13
Resetting the DMC Lane	8-13
Performing ZQ Calibration	8-13
Programming the DMC Controller	8-14
ADSP-2159x DMC Register Descriptions	8-15

Configuration Register	8-17
Control Register	8-19
DLL Control Register	8-23
Data Calibration Address Register	8-24
Data Calibration Data 0 Register	8-25
Data Calibration Data 1 Register	8-26
Efficiency Control Register	8-27
Shadow EMR3 Register	8-31
Shadow MR0 Register (DDR3)	8-32
Shadow MR1 Register (DDR3)	8-34
Shadow MR2 Register (DDR3)	8-37
Mask (Mode Register Shadow) Register	8-39
Priority ID Register 1	8-41
Priority ID Register 2	8-42
Priority ID Mask Register 1	8-43
Priority ID Mask Register 2	8-44
DMC Read Data Buffer ID Register 1	8-45
DMC Read Data Buffer ID Register 2	8-46
DMC Read Data Buffer Mask Register 1	8-47
DMC Read Data Buffer Mask Register 2	8-48
Status Register	8-49
Timing 0 Register	8-52
Timing 1 Register	8-54
Timing 2 Register	8-55
ADSP-2159x DMC Register Descriptions	8-56
DDR CA Lane Control Register	8-57
Data Lane 0 Control Register 0	8-59
Data Lane 0 Control Register 1	8-61
Data Lane 1 Control Register 0	8-62
Data Lane 1 Control Register 1	8-64

DDR ROOT Module Control Register	8–65
DDR Calibration Control Register 0	8–67
DDR Calibration Control Register 1	8–68
DDR Calibration Control Register 2	8–69

One-Time Programmable Memory Controller (OTPC)

OTPC Features	9–1
OTPC Functional Description	9–1
ADSP-2159x OTPC Register List	9–1
ADSP-2159x OTPC Interrupt List	9–2
Error Correction	9–2
OTPC Event Control	9–2
OTPC Interrupt Signals	9–2
OTPC Status and Error Signals	9–2
OTP API Overview	9–2
OTP Programming	9–3
OTP Program	9–3
OTP Reading	9–4
OTP Get Field	9–4
OTP Counters	9–5
Lock API	9–5
ADSP-2159x OTPC Register Descriptions	9–6
OTP Security State Register	9–7
OTP Status Register	9–8

System Memory Protection Unit (SMPU)

SMPU Features	10–1
SMPU Functional Description	10–2
ADSP-2159x SMPU Register List	10–3
SMPU Interrupts	10–4
Memory Writes	10–4

Memory Reads	10-4
ID Comparison	10-4
Memory Region.....	10-8
SMPU Definitions	10-9
SMPU Block Diagram.....	10-10
SMPU Architectural Concepts	10-10
SMPU Operating Modes	10-11
SMPU Interrupt Signals	10-11
SMPU Status and Error Signals	10-12
ADSP-2159x SMPU Register Descriptions	10-12
Bus Error Address Register	10-14
Bus Error Details Register	10-15
SMPU Control Register	10-16
Exclusive Access IDn Address	10-18
Exclusive Access Status	10-19
Interrupt Address Register	10-20
Interrupt Details Register	10-21
Region n Address Register	10-22
Region n Control Register	10-23
SMPU Revision ID Register	10-26
Region n ID A Register	10-27
Region n ID B Register	10-28
Region n ID Mask A Register	10-29
Region n ID Mask B Register	10-30
SMPU Control Secure Accesses Register	10-31
Region n Control Secure Accesses Register	10-33
SMPU Status Register	10-34

General-Purpose Ports (PORT)

PORT Features	11-2
---------------------	------

PORT Functional Description.....	11-2
ADSP-2159x PORT Register List	11-3
ADSP-2159x PORT Trigger List.....	11-3
ADSP-2159x PINT Register List	11-4
ADSP-2159x PINT Interrupt List	11-4
ADSP-2159x PINT Trigger List.....	11-5
ADSP-2159x PADS Register List	11-5
PORT Architectural Concepts.....	11-7
Internal Interfaces	11-7
External Interfaces.....	11-7
GPIO Pin Function.....	11-7
Input Mode.....	11-7
Output Mode	11-7
Trigger Toggle Mode.....	11-8
Open-Drain Mode	11-8
Port Multiplexing Control.....	11-8
PORT Event Control.....	11-9
PORT Interrupt Signals	11-9
PORT Programming Model	11-11
ADSP-2159x PORT Register Descriptions	11-14
Port x GPIO Data Register	11-16
Port x GPIO Data Clear Register	11-20
Port x GPIO Data Set Register	11-24
Port x GPIO Output Toggle Register	11-27
Port x GPIO Direction Register	11-30
Port x GPIO Direction Clear Register	11-34
Port x GPIO Direction Set Register	11-38
Port x Function Enable Register	11-41
Port x Function Enable Clear Register	11-44
Port x Function Enable Set Register	11-47

Port x GPIO Input Enable Register	11-50
Port x GPIO Input Enable Clear Register	11-53
Port x GPIO Input Enable Set Register	11-56
Port x GPIO Lock Register	11-59
Port x Multiplexer Control Register	11-61
Port x GPIO Polarity Invert Register	11-63
Port x GPIO Polarity Invert Clear Register	11-67
Port x GPIO Polarity Invert Set Register	11-70
Port x GPIO Trigger Toggle Register	11-73
ADSP-2159x PINT Register Descriptions	11-74
PINT Assign Register	11-76
PINT Edge Clear Register	11-78
PINT Edge Set Register	11-81
PINT Invert Clear Register	11-84
PINT Invert Set Register	11-87
PINT Latch Register	11-90
PINT Mask Clear Register	11-94
PINT Mask Set Register	11-97
PINT Pin State Register	11-100
PINT Request Register	11-104
ADSP-2159x PADS Register Descriptions	11-108
DAI0 1 to 10 pins DS control	11-110
DAI0 11 to 20 pins DS control	11-113
DAI0 Port Input Enable Control Register	11-116
DAI1 1 to 10 pins DS control	11-117
DAI1 11 to 20 pins DS control	11-120
DAI1 Port Input Enable Control Register	11-123
DAIx Pull-Down Enable	11-124
DAIx Pull-Up Enable	11-125
Non-GPIO Drive Strength Register	11-126

Peripheral PAD Configuration0 Register	11-128
Peripheral Configuration1 Register	11-130
PORTA 0 to 7 pins DS control	11-131
PORTA 8 - 15 pins DS control	11-134
PORTB 0 to 7 pins DS control	11-137
PORTB 8 - 15 pins DS control	11-140
PORTC 0 to 7 pins DS control	11-143
PORTC 8 - 15 pins DS control	11-146
PORTD 0 to 7 pins DS control	11-147
PORTD 8 to 15 pins DS control	11-148
PORTE 0 to 7 pins DS control	11-149
PORTE 8 to 15 pins DS control	11-150
PORTF 0 to 7 pins DS control	11-151
PORTF 8 to 15 pins DS control	11-152
PORTG 0 to 7 pins DS control	11-153
PORTG 8 to 15 pins DS control	11-154
PORTH 0 to 7 pins DS control	11-155
PORTH 8 to 15 pins DS control	11-156
PORTI 0 to 7 pins DS control	11-157
PORTx Pull-Down Enable	11-158
PORTx Pull-Up Enable	11-159

Thermal Monitoring Unit (TMU)

TMU Features	12-1
TMU Functional Description	12-1
ADSP-2159x TMU Register List.....	12-1
ADSP-2159x TMU Interrupt List	12-2
ADSP-2159x TMU Trigger List	12-2
TMU Definitions	12-2
TMU Block Diagram	12-3

TMU Architectural Concepts	12-3
TMU and HADC	12-4
TMU Event Control	12-5
Status and Error Signals.....	12-5
TMU Programming Guidelines	12-5
ADSP-2159x TMU Register Descriptions	12-6
Alert High Limit Register	12-7
Alert Low Limit Register	12-8
Averaging Register	12-9
Temperature conversion blank register	12-10
TMU Control Register	12-11
Fault High Limit Register	12-12
Fault Low Limit Register	12-13
Gain Value Register	12-14
Interrupt Mask Register	12-15
Offset Register	12-16
Temperature Refresh Counter	12-17
Status Register	12-18
Temperature Value Register	12-19
 Housekeeping ADC (HADC)	
HADC Features	13-1
HADC Functional Description.....	13-2
ADSP-2159x HADC Register List	13-2
ADSP-2159x HADC Interrupt List	13-2
ADSP-2159x HADC Trigger List.....	13-3
HADC Definitions.....	13-3
HADC Block Diagram	13-4
HADC Signal Descriptions	13-5
HADC Architectural Concepts.....	13-5

Converter Operation	13-5
Auto-Scan.....	13-6
Channel Sequence Programming.....	13-6
ADC Transfer Function.....	13-7
Results.....	13-7
HADC Operating Modes	13-7
HADC Event Control.....	13-8
HADC Programming Model	13-8
ADSP-2159x HADC Register Descriptions	13-8
Channel Mask Register	13-10
Control Register	13-11
Channel Data Registers	13-13
Interrupt Mask Register	13-14
Status Register	13-15
 Watchdog Timer (WDOG)	
WDOG Features.....	14-1
WDOG Functional Description	14-2
ADSP-2159x WDOG Register List.....	14-3
ADSP-2159x WDOG Interrupt List	14-3
WDOG Block Diagram.....	14-3
Internal Interface	14-4
External Interface	14-4
ADSP-2159x WDOG Register Descriptions	14-4
Count Register	14-5
Control Register	14-6
Watchdog Timer Status Register	14-7
Watchdog Timer Window Register	14-9
 Link Port (LP)	
LP Features	15-1

LP Functional Description.....	15-1
ADSP-2159x LP Register List	15-2
ADSP-2159x LP Interrupt List	15-2
ADSP-2159x LP Trigger List.....	15-2
ADSP-2159x LP DMA Channel List.....	15-3
Block Diagram.....	15-3
External Connections	15-4
Internal Blocks	15-4
Architectural Concepts	15-4
Link Port Protocol.....	15-4
FIFO Buffers	15-7
Handshake for Link Port Enable Process	15-9
Clocking	15-10
Multi-Processor Connectivity	15-10
LP Operating Modes	15-12
LP Data Transfer Modes.....	15-12
Core Data Transfers	15-12
DMA Data Transfers.....	15-12
LP Event Control.....	15-13
Interrupt Signals	15-13
Enabling Link Port Interrupts	15-13
Status and Error Signals.....	15-14
LP Programming Model	15-14
Setting Up a DMA Transmit Operation	15-14
Setting Up a DMA Receive Operation.....	15-15
Setting Up a Core Transmit Operation	15-16
Setting Up a Core Receive Operation	15-16
ADSP-2159x LP Register Descriptions	15-17
Control Register	15-18
Clock Divider Value Register	15-20

Receive Buffer Register	15–21
Status Register	15–22
Transmit Buffer Register	15–24
Shadow Input Transmit Buffer Register	15–25
Shadow Output Transmit Buffer Register	15–26

Serial Peripheral Interface (SPI)

SPI Features.....	16–1
SPI Functional Description.....	16–2
ADSP-2159x SPI Register List	16–2
ADSP-2159x SPI Interrupt List	16–3
ADSP-2159x SPI Trigger List.....	16–4
ADSP-2159x SPI DMA Channel List	16–5
SPI Block Diagram	16–5
Transfer Protocol	16–5
Clock Considerations	16–7
Controlling Delay Between Frames	16–7
Flow Control	16–9
Slave Select Operation	16–10
Beginning and Ending a Non-DMA SPI Transfer	16–11
Transmit Operation in Non-DMA Mode	16–12
Receive Operation in Non-DMA Mode	16–12
Dual I/O Mode	16–12
Quad I/O Mode (SPI2 only)	16–13
Fast Mode	16–14
Memory-Mapped Mode (SPI2 only).....	16–15
Memory-Mapped Description of Operation.....	16–16
Memory-Mapped Architectural Concepts.....	16–17
Memory-Mapped Read Accesses.....	16–19
Memory-Mapped High-Performance Features.....	16–22
Merged Read Accesses	16–22

Wrap Around Accesses	16–22
Execute-In-Place (XIP, SPI2 only)	16–23
Memory-Mapped Mode Error Status Bits	16–24
Memory-Mapped Programming Guidelines	16–25
SPI Interrupt Signals	16–27
Data Interrupts.....	16–27
Status Interrupts.....	16–28
Error Conditions	16–28
SPI Programming Concepts.....	16–29
Master Operation in Non-DMA Modes	16–30
Slave Operation in Non-DMA Modes	16–30
Configuring DMA Master Mode.....	16–31
Configuring DMA Slave Mode Operation.....	16–32
ADSP-2159x SPI Register Descriptions	16–33
Clock Rate Register	16–35
Control Register	16–36
Delay Register	16–42
Masked Interrupt Condition Register	16–43
Masked Interrupt Clear Register	16–45
Interrupt Mask Register	16–48
Interrupt Mask Clear Register	16–50
Interrupt Mask Set Register	16–53
Memory Mapped Read Header	16–56
SPI Memory Top Address	16–60
Receive FIFO Data Register	16–61
Received Word Count Register	16–62
Received Word Count Reload Register	16–63
Receive Control Register	16–64
Slave Select Register	16–67
Status Register	16–70

Transmit FIFO Data Register	16-75
Transmitted Word Count Register	16-76
Transmitted Word Count Reload Register	16-77
Transmit Control Register	16-78

Octal Serial Peripheral Interface (OSPI)

OSPI Features.....	17-1
OSPI Functional Description	17-2
ADSP-2159x OSPI Register List	17-2
ADSP-2159x OSPI Interrupt List	17-3
OSPI Block Diagram.....	17-3
Architectural Concepts	17-4
Direct Access Controller (DAC)	17-5
Software Triggered Instruction Generator (STIG)	17-6
Servicing STIG Request	17-7
Arbitration Between DAC and STIG Access	17-7
Auto Polling for DAC Write Access	17-7
SPI Command Translation.....	17-8
Hold and Reset Control	17-9
Flash Instruction Type Support	17-9
Dual Data Rate (DDR) Operations	17-10
Data Sampling	17-13
PHY Module Architecture.....	17-14
PHY Pipeline Mode	17-17
Programming Concepts	17-17
Configuring OSPI after Reset.....	17-17
Programming Dummy Cycles.....	17-18
Configuring OSPI for Optimal Use.....	17-18
Configuring OSPI for DAC Read Operation.....	17-19
Configuring OSPI for DAC Write Operation.....	17-19
Issuing STIG Command	17-20

Entering XIP mode.....	17–22
Using PHY mode	17–23
ADSP-2159x OSPI Register Descriptions	17–26
Octal SPI Control Register	17–28
Device Delay Register	17–33
Device Read Instruction Control Register	17–34
Device Write Instruction Control Register	17–36
Device Size Control Register	17–38
DLL Observable Register (Lower)	17–39
DLL Observable Register (Upper)	17–40
Flash Command Address Register	17–41
Flash Command Control Register	17–42
Flash Command Control Memory Register	17–44
Flash Command Read Data Register (Lower)	17–45
Flash Command Read Data Register (Upper)	17–46
Flash Command Write Data Register (Lower)	17–47
Flash Command Write Data Register (Upper)	17–48
Interrupt Mask Register	17–49
Interrupt Status Register	17–50
Lower Write Protection Register	17–51
Mode Bit Control Register	17–52
Module ID Register	17–53
Polling Expiration Register	17–54
Opcode Extension Register (Lower)	17–55
Opcode Extension Register (Upper)	17–56
PHY Control Register	17–57
PHY DLL Master Control Register	17–58
Polling Flash Status Register	17–59
Read Data Capture Register	17–60
Remap Address Register	17–61

Upper Write Protection Register	17–62
Write Protection Control Register	17–63
Write Completion Control Register	17–64

Universal Asynchronous Receiver/Transmitter (UART)

UART Features	18–1
UART Functional Description	18–2
ADSP-2159x UART Register List	18–3
ADSP-2159x UART Interrupt List	18–3
ADSP-2159x UART Trigger List	18–4
ADSP-2159x UART DMA Channel List	18–5
UART Block Diagram	18–5
UART Architectural Concepts	18–6
Internal Interface	18–6
External Interface	18–6
Hardware Flow Control	18–7
Bit Rate Generation	18–7
Autobaud Detection	18–8
UART Debug Features	18–10
UART Operating Modes	18–10
UART Mode	18–10
IrDA SIR Mode	18–11
Multi-Drop Bus Mode	18–11
UART Data Transfer Modes	18–13
UART Mode Transmit Operation (Core)	18–13
UART Mode LIN Break Command	18–13
UART Mode Receive Operation (Core)	18–14
IrDA Transmit Operation	18–15
IrDA Receive Operation	18–15
MDB Transmit Operation	18–16
MDB Receive Operation	18–17

DMA Mode.....	18–17
Mixing DMA and Core Modes.....	18–18
Setting Up Hardware Flow Control.....	18–18
UART Event Control.....	18–18
Interrupt Masks.....	18–19
Interrupt Servicing	18–19
Transmit Interrupts	18–20
Receive Interrupts.....	18–21
Status Interrupts.....	18–22
Multi-Drop Bus Events.....	18–23
UART Programming Model	18–23
Detecting Autobaud	18–23
Using Common Initialization Steps.....	18–24
Using Core Transfers	18–24
Using DMA Transfers.....	18–24
Using Interrupts	18–24
Setting Up Hardware Flow Control.....	18–24
ADSP-2159x UART Register Descriptions	18–25
Clock Rate Register	18–26
Control Register	18–27
Interrupt Mask Register	18–33
Interrupt Mask Clear Register	18–37
Interrupt Mask Set Register	18–39
Receive Buffer Register	18–41
Receive Shift Register	18–42
Receive Counter Register	18–43
Scratch Register	18–44
Status Register	18–45
Transmit Address/Insert Pulse Register	18–50
Transmit Hold Register	18–51

Transmit Shift Register	18–52
Transmit Counter Register	18–53

Enhanced Parallel Peripheral Interface (EPPI)

EPPI Features	19–1
EPPI Functional Description	19–2
ADSP-2159x EPPI Register List.....	19–3
ADSP-2159x EPPI Interrupt List	19–3
ADSP-2159x EPPI Trigger List.....	19–4
RGB Data Formats	19–4
Data Clipping.....	19–4
Data Mirroring.....	19–5
Windowing.....	19–6
Preamble, Blanking and Stripping Support.....	19–6
EPPI Definitions	19–7
EPPI Block Diagram	19–8
EPPI Architectural Concepts	19–8
Reset Operation	19–8
Frame Sync Polarity and Sampling Edge.....	19–9
Direct Memory Access (DMA)	19–9
EPPI Clock	19–10
EPPI Operating Modes.....	19–11
ITU-R 656 Modes.....	19–11
ITU-R 656 Background	19–11
ITU-R 656 Input Modes.....	19–15
Entire Field	19–15
Active Video.....	19–15
Vertical Blanking Interval (VBI).....	19–15
ITU-R 656 Output in General-Purpose Transmit Modes.....	19–16
Frame Synchronization in ITU-R 656 Modes.....	19–17
General-Purpose EPPI Modes	19–18

General-Purpose 0 Frame Sync Mode.....	19–18
General-Purpose 1 Frame Sync Mode.....	19–18
General-Purpose 2 Frame Sync Mode.....	19–19
Data Enable in General-Purpose 2 Frame Sync Transmit Mode	19–19
General-Purpose 3 Frame Sync Mode.....	19–19
Supported Data Formats	19–20
Receive Data Formats	19–20
Transmit Data Formats	19–22
Data Transfer Modes	19–23
Data Packing for Receive Modes	19–23
Data Packing for Transmit Modes	19–24
Sign-Extended and Zero-Filled Data	19–24
Split Receive Modes	19–24
Split Transmit Modes	19–25
Clock Gating.....	19–25
Support for Delayed Start of EPPI Frame Syncs	19–25
Ignoring Premature External Frame Syncs for Data Consistency	19–26
EPPI Event Control	19–26
EPPI Status, Error, and Interrupt Signals	19–27
Frame and Line Track Errors	19–27
Line Track Errors	19–27
Frame Track Errors.....	19–27
Preamble Error Not Corrected Error	19–28
EPPI Programming Model	19–28
Receiving ITU-R 656 Frames	19–28
Transmitting ITU-R 656 Frames in GP Transmit Modes	19–28
Configuring Transfers in GP 0 FS Mode	19–29
Configuring Transfers in GP 1 FS Mode	19–29
Configuring Transfers in GP 2 FS Mode	19–30
Configuring Transfers in GP 3 FS Mode	19–31
Configuring the EPPI to Use the Windowing Feature	19–31

EPPI Mode Configuration.....	19-32
Configuring 8-Bit Receive Mode	19-32
Configuring 10/12/14-Bit Receive Modes	19-33
Configuring 16-Bit Receive Mode	19-35
Configuring 18-Bit Receive Mode	19-36
Configuring 8-Bit Split Receive Mode.....	19-37
Configuring 10/12/14/16-Bit Split Receive Mode with SPLTWDR=0	19-40
Configuring 16-Bit Split Receive Mode with SPLTWDR=1.....	19-41
Configuring 8-Bit Transmit Mode.....	19-42
Configuring 10/12/14-Bit Transmit Modes	19-43
Configuring 16-Bit Transmit Mode.....	19-43
Configuring 18-Bit Transmit Mode.....	19-44
Configuring 8-Bit Split Transmit Mode	19-44
Configuring 10/12/14/16-Bit Transmit Mode with SPLTWDR=0	19-47
Configuring 16-Bit Split Transmit Mode with SPLTWDR=1	19-49
EPPI Programming Concepts.....	19-50
ADSP-2159x EPPI Register Descriptions	19-50
Clock Divide Register	19-52
Control Register	19-53
Control Register 2 Register	19-61
Clipping Register for EVEN (Luma) Data Register	19-62
Lines Per Frame Register	19-63
Frame Sync 1 Delay Value Register	19-64
FS1 Period Register / EPPI Active Samples Per Line Register	19-65
FS1 Width Register / EPPI Horizontal Blanking Samples Per Line Register	19-66
Frame Sync 2 Delay Value Register	19-67
FS2 Period Register / EPPI Active Lines Per Field Register	19-68
FS2 Width Register / EPPI Lines Of Vertical Blanking Register	19-69
Horizontal Transfer Count Register	19-70
Horizontal Delay Count Register	19-71
Interrupt Mask Register	19-72

Samples Per Line Register	19-74
Clipping Register for ODD (Chroma) Data Register	19-75
Status Register	19-76
Vertical Transfer Count Register	19-79
Vertical Delay Count Register	19-80

General-Purpose Timer (TIMER)

GP Timer Features.....	20-1
ADSP-2159x TIMER Register List	20-2
ADSP-2159x TIMER Interrupt List	20-2
ADSP-2159x TIMER Trigger List.....	20-3
Timer Block Diagram.....	20-5
Internal Interface	20-5
Internal Timer Connections	20-6
External Interface	20-6
GP Timer Operating Modes	20-6
General Operation.....	20-7
Period, Width and Delay Register Interaction	20-7
Single-Pulse PWMOUT Mode	20-8
Continuous PWMOUT Mode	20-9
Width Capture (WIDCAP) Mode	20-10
Width Capture Mode Overflow.....	20-13
Windowed Watchdog (WATCHDOG) Modes	20-15
Windowed Watchdog Width Mode	20-15
Windowed Watchdog Period Mode.....	20-17
Pin Interrupt (PININT) Mode.....	20-19
External Clock (EXTCLK) Mode	20-19
GP Timer Programming Concepts	20-20
Setting Up Constantly Changing Timer Conditions	20-20
Configuring, Enabling, and Disabling One or More Timers.....	20-21
Configuring Timer Data and Status Interrupts	20-21

Configuring the Timer as a Trigger Slave.....	20–21
Ordered Trigger Toggle Mode	20–22
Using the Timer Broadcast Feature.....	20–22
Timer Illegal States	20–23
Continuous PWMOUT Mode	20–23
Single Pulse PWMOUT Mode.....	20–24
WIDCAP Mode	20–25
EXTCLK Mode	20–25
WATCHDOG Events.....	20–26
ADSP-2159x TIMER Register Descriptions	20–27
Broadcast Delay Register	20–28
Broadcast Period Register	20–29
Broadcast Width Register	20–30
Data Interrupt Latch Register	20–31
Data Interrupt Mask Register	20–32
Error Type Status Register	20–33
Run Register	20–37
Run Clear Register	20–38
Run Set Register	20–39
Status Interrupt Latch Register	20–40
Status Interrupt Mask Register	20–41
Stop Configuration Register	20–42
Stop Configuration Clear Register	20–43
Stop Configuration Set Register	20–44
Timer n Configuration Register	20–45
Timer n Counter Register	20–50
Timer n Delay Register	20–51
Timer n Period Register	20–52
Timer n Width Register	20–53
Trigger Slave Enable Register	20–54

Trigger Master Mask Register	20–55
General-Purpose Counter (CNT)	
GP Counter Features	21–1
GP Counter Functional Description	21–1
ADSP-2159x CNT Register List	21–2
ADSP-2159x CNT Interrupt List	21–2
ADSP-2159x CNT Trigger List.....	21–3
GP Counter Operating Modes.....	21–3
Quadrature Encoder Mode	21–3
Binary Encoder Mode.....	21–4
Up/Down Counter Mode	21–4
Direction Counter Mode	21–5
Timed Direction Mode.....	21–5
GP Counter Programming Model	21–5
GP Counter General Programming Flow	21–5
GP Counter Mode Configuration.....	21–5
Configuring GP Counter Push-Button Operation	21–6
Configuring Zero-Marker-Zeros-Counter Mode	21–6
Configuring Zero-Marker-Error Mode	21–6
Configuring Zero-Once Mode.....	21–6
Configuring Boundary Auto-Extend Mode	21–7
Configuring Boundary Capture Mode.....	21–7
Configuring Boundary Compare and Boundary Zero Modes	21–7
Configuring GP Counter Push-Button Operation	21–8
GP Counter Programming Concepts.....	21–8
CNT Input Noise Filtering	21–8
Capturing Counter Interval and CNT_CNTR Read Timing	21–9
Capturing Time Interval Between Successive Counter Events	21–10
GP Counter Event Control	21–11
Illegal Gray and Binary Code Events	21–11

Up/Down Count Events	21-11
Zero-Count Events	21-12
Overflow Events	21-12
Boundary Match Events	21-12
Zero Marker Events	21-12
ADSP-2159x CNT Register Descriptions	21-12
Configuration Register	21-14
Command Register	21-17
Counter Register	21-20
Debounce Register	21-21
Interrupt Mask Register	21-23
Maximum Count Register	21-26
Minimum Count Register	21-27
Status Register	21-28
 Media Local Bus (MLB)	
Features.....	22-1
MLB Definitions	22-2
Clocking	22-3
Functional Description	22-3
ADSP-2159x MLB Register List.....	22-4
ADSP-2159x MLB Interrupt List	22-5
MediaLB Protocol	22-5
MLB Architectural Concepts	22-6
MediaLB Block Diagram	22-6
MediaLB Interface	22-7
Routing Fabric.....	22-8
Data Buffer RAM.....	22-8
Channel Table RAM	22-8
Address Mapping	22-8
Channel Allocation Table.....	22-9

Channel Set Up.....	22–10
Channel Descriptor Tables.....	22–11
AHB Descriptor Table (ADT).....	22–15
Interrupt Interface Block.....	22–19
Operating Modes.....	22–20
Isochronous Data Exchange.....	22–20
Asynchronous and Control Data Exchange.....	22–21
Synchronous Data Exchange.....	22–22
Data Transfer.....	22–22
DMA.....	22–23
Programming Model.....	22–23
Channel Initialization.....	22–23
Configure the Hardware.....	22–23
Program the CAT and the CDT.....	22–23
Program the ADT.....	22–24
Service.....	22–25
Servicing the DMA Channel Interrupts.....	22–26
Servicing the MediaLB Status Interrupts.....	22–26
Polling for MediaLB System Commands.....	22–27
ADSP-2159x MLB Register Descriptions	22–27
Peripheral Channel Mask 0 Register	22–29
Peripheral Channel Mask 1 Register	22–30
Peripheral Channel Status 0 Register	22–31
Peripheral Channel Status 1 Register	22–32
Bus Control Register	22–33
MediaLB Control 0 Register	22–35
Control 1 Register	22–37
MLB Global Control Register	22–38
HBI Channel Busy 0 Register	22–39
HBI Channel Busy 1 Register	22–40

HBi Channel Error 0 Register	22-41
HBi Channel Error 1 Register	22-42
HBi Channel Mask 0 Register	22-43
HBi Channel Mask 1 Register	22-44
HBi Control Register	22-45
Memory Interface Address Register	22-46
Memory Interface Control Register	22-47
Memory Interface Control Data 0 Register	22-48
Memory Interface Control Data 1 Register	22-49
Memory Interface Control Data 2 Register	22-50
Memory Interface Control Data 3 Register	22-51
Memory Interface Control Data Write Enable 0 Register	22-52
Memory Interface Control Data Write Enable 1 Register	22-53
Memory Interface Control Data Write Enable 2 Register	22-54
Memory Interface Control Data Write Enable 3 Register	22-55
Interrupt Enable Register	22-56
Channel Status 0 Register	22-59
Channel Status 1 Register	22-60
System Data Register	22-61
System Status Register	22-62
MediaLB 6-pin Control 0 Register	22-64

Two-Wire Interface (TWI)

TWI Features.....	23-1
TWI Functional Description	23-2
ADSP-2159x TWI Register List.....	23-2
ADSP-2159x TWI Interrupt List	23-3
TWI Block Diagram.....	23-3
External Interface	23-3
Serial Clock Signal (SCL)	23-4
Serial Data Signal (SDA).....	23-4

Internal Interface.....	23-5
TWI Architectural Concepts	23-5
TWI Protocol.....	23-5
Clock Generation and Synchronization	23-6
Bus Arbitration	23-6
Start and Stop Conditions	23-7
General Call Support.....	23-7
Fast Mode	23-8
TWI Operating Modes	23-8
Repeated Start	23-8
Transmit Receive Repeated Start.....	23-8
Receive Transmit Repeated Start.....	23-9
Clock Stretching	23-10
Clock Stretching During FIFO Underflow	23-10
Clock Stretching During FIFO Overflow	23-11
Clock Stretching During Repeated Start.....	23-11
TWI Programming Model.....	23-12
General Setup	23-12
Slave Mode	23-13
Master Mode Program Flow	23-14
Master Mode Clock Setup	23-15
Master Mode Transmit	23-15
Master Mode Receive.....	23-16
ADSP-2159x TWI Register Descriptions	23-17
SCL Clock Divider Register	23-18
Control Register	23-19
FIFO Control Register	23-21
FIFO Status Register	23-23
Interrupt Mask Register	23-24
Interrupt Status Register	23-26

Master Mode Address Register	23–29
Master Mode Control Registers	23–30
Master Mode Status Register	23–33
Rx Data Double-Byte Register	23–36
Rx Data Single-Byte Register	23–37
Slave Mode Address Register	23–38
Slave Mode Control Register	23–39
Slave Mode Status Register	23–41
Tx Data Double-Byte Register	23–42
Tx Data Single-Byte Register	23–43

Ethernet Media Access Controller (EMAC)

EMAC Features.....	24–1
EMAC Functional Description	24–3
ADSP-2159x EMAC Register List.....	24–4
ADSP-2159x EMAC Interrupt List	24–10
ADSP-2159x EMAC Trigger List	24–11
EMAC Definitions	24–11
EMAC Block Diagram and Interfaces.....	24–12
EMAC CORE Subblocks	24–14
EMAC PHY Interface	24–16
RGMII Board Design Recommendations.....	24–18
Clock Sources	24–20
EMAC Architectural Concepts	24–21
EMAC Feature Summary	24–21
EMAC System Crossbar Interface (EMAC SCB).....	24–22
Priority of SCB Requests	24–23
SCB Interface Programming Options	24–23
DMA Bursts Using the SCB Interface	24–25
SCB Bus Transaction Status	24–26
Fatal Bus Error	24–26

DMA Controller (EMAC DMA)	24-26
DMA Related Registers	24-27
DMA Descriptors	24-28
OWN Bit (Ownership) Semaphore	24-45
Application Data Buffer Alignment.....	24-46
Buffer Size Calculations	24-46
EMAC FIFO Layer (EMAC MFL)	24-46
FIFO Layer Transmit Path	24-47
FIFO Layer Receive Path.....	24-48
EMAC CORE	24-49
EMAC CORE Transmission Engine	24-51
Source Address, VLAN, and CRC Insertion, Replacement, or Deletion	24-55
EMAC CORE Reception Engine	24-57
EMAC Station Management Interface (SMI)	24-67
MDC Clock Frequency	24-68
SMI Write Operation	24-69
SMI Read Operation.....	24-70
EMAC Management Counters (MMC)	24-70
MMC Receive Interrupt Register	24-72
MMC Transmit Interrupt Register	24-72
MMC Receive Checksum Offload Interrupt Register	24-72
EMAC Precision Time Protocol (PTP) Engine	24-72
IEEE1588 and the PTP Engine	24-72
Block Diagram	24-76
PTP Module Clock.....	24-77
Time Stamp Module	24-79
System Time	24-86
Target Time Trigger (Alarm)	24-89
Pulse-Per-Second (PPS).....	24-89
PTP Interrupts.....	24-92
Audio Video Data Transmission	24-92
Transmit Path Functions	24-93

Receive Path Functions	24-94
DMA Arbiter	24-95
Slot Number Function	24-96
Interrupts.....	24-96
Credit-Based Shaper Algorithm Functions	24-96
Energy-Efficient Ethernet.....	24-98
Transmit Path Functions.....	24-98
LPI Timers.....	24-99
EMAC Event Control	24-100
EMAC Interrupt Signals.....	24-101
PHYINT Interrupt Signal	24-102
EMAC Programming Model.....	24-102
EMAC Programming Steps	24-102
DMA Initialization.....	24-102
EMAC CORE Initialization	24-104
Performing Normal Transmit and Receive Operations	24-104
Stopping and Starting Transfers	24-105
Interrupts and Interrupt Service Routines	24-105
Enabling Checksum for Transmit and Receive	24-106
Programming the System Time Module.....	24-107
Programming the PTP for Frame Detection and Time Stamping.....	24-108
Programming for Auxiliary Time Stamps	24-108
Programming Fixed Pulse-Per-Second Output	24-109
Programming Flexible Pulse-Per-Second Output.....	24-109
EMAC Programming Concepts	24-110
IEEE 802.3 Ethernet Packet Structure.....	24-110
Frame Size Statistics for Application Software.....	24-111
Software Visualization of Programmable Packet Size	24-111
Ethernet Packet Structure in C	24-111
DMA Descriptor Implementation in C	24-112
PTP Header Structure in C	24-112

ADSP-2159x EMAC Register Descriptions	24-113
MAC Address 0 High Register	24-120
MAC Address 0 Low Register	24-121
MAC Address 1 High Register	24-122
MAC Address 1 Low Register	24-123
Debug Register	24-124
DMA SCB Bus Mode Register	24-127
DMA SCB Status Register	24-129
DMA Bus Mode Register	24-130
DMA Interrupt Enable Register	24-133
DMA Missed Frame Register	24-136
DMA Operation Mode Register	24-137
DMA Rx Buffer Current Register	24-141
DMA Rx Descriptor List Address Register	24-142
DMA Rx Descriptor Current Register	24-143
DMA Rx Interrupt Watch Dog Register	24-144
DMA Rx Poll Demand register	24-145
DMA Status Register	24-146
DMA Tx Buffer Current Register	24-151
DMA Tx Descriptor List Address Register	24-152
DMA Tx Descriptor Current Register	24-153
DMA Tx Poll Demand Register	24-154
DMA Bus Mode Register	24-155
Channel 1 Credit Shaping Control Register	24-158
Channel 1 Average Traffic Transmitted Register	24-159
Channel 1 High Credit Value Register	24-160
Channel 1 Idle Slope Credit Value Register	24-161
Channel 1 Low Credit Value Register	24-162
Channel 1 Control Bits for Slot Function Register	24-163
Channel 1 Send Slope Credit Value Register	24-164

DMA Interrupt Enable Register	24–165
DMA Missed Frame Register	24–168
DMA Operation Mode Register	24–169
DMA Rx Buffer Current Register	24–173
DMA Rx Descriptor List Address Register	24–174
DMA Rx Descriptor Current Register	24–175
DMA Rx Interrupt Watch Dog Register	24–176
DMA Rx Poll Demand Register	24–177
DMA Status Register	24–178
DMA Tx Buffer Current Register	24–183
DMA Tx Descriptor List Address Register	24–184
DMA Tx Descriptor Current Register	24–185
DMA Tx Poll Demand Register	24–186
DMA Bus Mode Register	24–187
Channel 2 Credit Shaping Control Register	24–190
Channel 2 Avg Traffic Transmitted Status Register	24–191
Channel 2 High Credit Value Register	24–192
Channel 2 Idle Slope Credit Value Register	24–193
Channel 2 Low Credit Value Register	24–194
Channel 2 Control Bits for Slot Function Register	24–195
Channel 2 Send Slope Credit Value Register	24–196
DMA Interrupt Enable Register	24–197
DMA Missed Frame Register	24–200
DMA Operation Mode Register	24–201
DMA Rx Buffer Current Register	24–205
DMA Rx Descriptor List Address Register	24–206
DMA Rx Descriptor Current Register	24–207
DMA Rx Interrupt Watch Dog Register	24–208
DMA Rx Poll Demand register	24–209
DMA Status Register	24–210

DMA Tx Buffer Current Register	24–215
DMA Tx Descriptor List Address Register	24–216
DMA Tx Descriptor Current Register	24–217
DMA Tx Poll Demand Register	24–218
Flow Control Register	24–219
RGMII Control and Status Register	24–221
Hash Table High Register	24–222
Hash Table Low Register	24–223
Interrupt Mask Register	24–224
MMC IPC Rx Interrupt Mask Register	24–225
MMC IPC Rx Interrupt Register	24–231
Interrupt Status Register	24–236
Layer3 and Layer4 Control Register	24–238
Layer 3 Address0 Register	24–240
Layer 3 Address1 Register	24–241
Layer 3 Address2 Register	24–242
Layer 3 Address3 Register	24–243
Layer 4 Address Register	24–244
Low Power Idle Control and Status Register	24–245
Low Power Idle Timeout Register	24–247
MAC Configuration Register	24–248
MAC Rx Frame Filter Register	24–253
AV MAC Control Register	24–256
MMC Control Register	24–258
MMC Rx Interrupt Mask Register	24–260
MMC Rx Interrupt Register	24–264
MMC TX Interrupt Mask Register	24–268
MMC Tx Interrupt Register	24–272
Rx 1024- to Max-Byte Frames (Good/Bad) Register	24–276
Rx 128- to 255-Byte Frames (Good/Bad) Register	24–277

Rx 256- to 511-Byte Frames (Good/Bad) Register	24–278
Rx 512- to 1023-Byte Frames (Good/Bad) Register	24–279
Rx 64-Byte Frames (Good/Bad) Register	24–280
Rx 65- to 127-Byte Frames (Good/Bad) Register	24–281
Rx alignment Error Register	24–282
Rx Broadcast Frames (Good) Register	24–283
Rx CRC Error Register	24–284
Rx Good Control Frames Register	24–285
Rx FIFO Overflow Register	24–286
Rx Frame Count (Good/Bad) Register	24–287
Rx ICMP Error Frames Register	24–288
Rx ICMP Error Octets Register	24–289
Rx ICMP Good Frames Register	24–290
Rx ICMP Good Octets Register	24–291
Rx IPv4 Datagrams Fragmented Frames Register	24–292
Rx IPv4 Datagrams Fragmented Octets Register	24–293
Rx IPv4 Datagrams (Good) Register	24–294
Rx IPv4 Datagrams Good Octets Register	24–295
Rx IPv4 Datagrams Header Errors Register	24–296
Rx IPv4 Datagrams Header Errors Register	24–297
Rx IPv4 Datagrams No Payload Frame Register	24–298
Rx IPv4 Datagrams No Payload Octets Register	24–299
Rx IPv4 UDP Disabled Frames Register	24–300
Rx IPv4 UDP Disabled Octets Register	24–301
Rx IPv6 Datagrams Good Frames Register	24–302
Rx IPv6 Good Octets Register	24–303
Rx IPv6 Datagrams Header Error Frames Register	24–304
Rx IPv6 Header Errors Register	24–305
Rx IPv6 Datagrams No Payload Frames Register	24–306
Rx IPv6 No Payload Octets Register	24–307

Rx Jab Error Register	24–308
Rx Length Error Register	24–309
Rx Multicast Frames (Good) Register	24–310
Rx Octet Count (Good) Register	24–311
Rx Octet Count (Good/Bad) Register	24–312
Rx Out Of Range Type Register	24–313
Rx Oversize (Good) Register	24–314
Rx Pause Frames Register	24–315
Rx Error Frames Received Register	24–316
Rx Runt Error Register	24–317
Rx TCP Error Frames Register	24–318
Rx TCP Error Octets Register	24–319
Rx TCP Good Frames Register	24–320
Rx TCP Good Octets Register	24–321
Rx Unicast Frames (Good) Register	24–322
Rx UDP Error Frames Register	24–323
Rx UDP Error Octets Register	24–324
Rx UDP Good Frames Register	24–325
Rx UDP Good Octets Register	24–326
Rx Undersize (Good) Register	24–327
Rx VLAN Frames (Good/Bad) Register	24–328
Rx Watch Dog Error Register	24–329
SMI Address Register	24–330
SMI Data Register	24–332
Time Stamp Addend Register	24–333
Time Stamp Auxiliary TS Nano Seconds Register	24–334
Time Stamp Auxiliary TM Seconds Register	24–335
Time Stamp Control Register	24–336
Time Stamp High Second Register	24–342
Time Stamp Nanoseconds Register	24–343

Time Stamp Nanoseconds Update Register	24–344
Time Stamp PPS Interval Register	24–345
Time Stamp Target Time Nanoseconds Register	24–346
Time Stamp Target Time Seconds Register	24–347
PPS Width Register	24–348
PPS 1 Interval Register	24–349
PPS 1 Target Time Nanoseconds Register	24–350
PPS 1 Target Time Seconds Register	24–351
PPS 1 Width Register	24–352
PPS 2 Interval Register	24–353
PPS 2 Target Time Nanoseconds Register	24–354
PPS 2 Target Time Seconds Register	24–355
PPS 2 Width Register	24–356
PPS 3 Interval Register	24–357
PPS 3 Target Time Nanoseconds Register	24–358
PPS 3 Target Time Seconds Register	24–359
PPS 3 Width Register	24–360
PPS Control Register	24–361
Time Stamp Low Seconds Register	24–364
Time Stamp Seconds Update Register	24–365
Time Stamp Status Register	24–366
Time Stamp Sub Second Increment Register	24–369
Tx 1024- to Max-Byte Frames (Good/Bad) Register	24–370
Tx 128- to 255-Byte Frames (Good/Bad) Register	24–371
Tx 256- to 511-Byte Frames (Good/Bad) Register	24–372
Tx 512- to 1023-Byte Frames (Good/Bad) Register	24–373
Tx 64-Byte Frames (Good/Bad) Register	24–374
Tx 65- to 127-Byte Frames (Good/Bad) Register	24–375
Tx Broadcast Frames (Good) Register	24–376
Tx Broadcast Frames (Good/Bad) Register	24–377

Tx Carrier Error Register	24–378
Tx Deferred Register	24–379
Tx Excess Collision Register	24–380
Tx Excess Deferral Register	24–381
Tx Frame Count (Good) Register	24–382
Tx Frame Count (Good/Bad) Register	24–383
Tx Late Collision Register	24–384
Tx Multicast Frames (Good) Register	24–385
Tx Multicast Frames (Good/Bad) Register	24–386
Tx Multiple Collision (Good) Register	24–387
Tx Octet Count (Good) Register	24–388
Tx OCT Count (Good/Bad) Register	24–389
Number of Tx Frames (Good) greater than maxsize	24–390
Tx Pause Frame Register	24–391
Tx Single Collision (Good) Register	24–392
Tx Unicast Frames (Good/Bad) Register	24–393
Tx Underflow Error Register	24–394
Tx VLAN Frames (Good) Register	24–395
VLAN Tag Register	24–396
VLAN Hash Table Register	24–398
VLAN Tag Inclusion or Replacement Register	24–399
Watchdog Timeout Register	24–400

Digital Audio Interface (DAI)

SRU Features	25–1
Functional Description	25–2

Half SPORT 'A' Multichannel Status Register	26–90
Half SPORT 'B' Multichannel Status Register	26–91
Half SPORT 'A' Rx Buffer (Primary) Register	26–92
Half SPORT 'B' Rx Buffer (Primary) Register	26–93
Half SPORT 'A' Rx Buffer (Secondary) Register	26–94
Half SPORT 'B' Rx Buffer (Secondary) Register	26–95
Half SPORT 'A' Tx Buffer (Primary) Register	26–96
Half SPORT 'B' Tx Buffer (Primary) Register	26–97
Half SPORT 'A' Tx Buffer (Secondary) Register	26–98
Half SPORT 'B' Tx Buffer (Secondary) Register	26–99

Precision Clock Generators (PCG)

Features.....	27–1
Functional Description	27–2
ADSP-2159x PCG Register List.....	27–2
Internal Interface	27–3
Serial Clock	27–3
Frame Sync	27–4
Frame Sync Output	27–4
Divider Mode Selection	27–4
Phase Shift	27–4
Pulse Width	27–5
Default Pulse Width.....	27–5
Input Clock Source Considerations	27–6
Timing Example for I ² S Mode	27–6
Cross Mode Connections	27–6
Operating Modes	27–6
Normal Mode.....	27–6

Bypass Mode	27-7
One-Shot Mode.....	27-7
Audio System Example	27-8
Hardware Trigger Control	27-10
Clock Configuration Examples	27-10
Global PCG Enable	27-11
PCG Event Control	27-11
External Event Trigger	27-11
External Event Trigger Delay	27-11
Programming Model.....	27-12
Frame Sync Phase Setting	27-12
External Event Trigger	27-12
Debug Features	27-13
ADSP-2159x PCG Register Descriptions	27-13
Precision Clock A Control 0 Register	27-15
Precision Clock A Control 1 Register	27-16
Precision Clock B Control 0 Register	27-17
Precision Clock B Control 1 Register	27-18
Precision Clock C Control 0 Register	27-19
Precision Clock C Control 1 Register	27-20
Precision Clock D Control 0 Register	27-21
Precision Clock D Control 1 Register	27-22
Precision Clock E Control 0 Register	27-23
Precision Clock E Control 1 Register	27-24
Precision Clock F Control 0 Register	27-25
Precision Clock F Control 1 Register	27-26
Precision Clock G Control 0 Register	27-27
Precision Clock G Control 1 Register	27-28
Precision Clock H Control 0 Register	27-29
Precision Clock H Control 1 Register	27-30

Precision Clock Pulse Width Control 1 Register	27–31
Precision Clock Pulse Width Control 2 Register	27–33
Precision Clock Pulse Width Control 3 Register	27–35
Precision Clock Pulse Width Control 4 Register	27–37
Precision Clock Frame Sync Synchronization 1 Register	27–39
Precision Clock Frame Sync Synchronization 2 Register	27–42
Precision Clock Frame Sync Synchronization 3 Register	27–45
Precision Clock Frame Sync Synchronization 4 Register	27–48

Asynchronous Sample Rate Converter (ASRC)

Features.....	28–1
Functional Description	28–2
ADSP-2159x ASRC Register List	28–2
ASRC Interrupt List	28–2
ASRC Block Diagram	28–2
SRU Programming	28–3
Clocking.....	28–3
I/O Ports	28–3
De-Emphasis Filter	28–4
Mute Control	28–4
SRC Core	28–4
RAM FIFO	28–4
Digital Servo Loop	28–5
FIR Filter	28–5
Sample Rate Sensing	28–5
Digital Filter Group Delay	28–5
Data Format	28–6
Operating Modes.....	28–6
TDM Input Mode.....	28–6
TDM Output Mode.....	28–7
Matched-Phase Mode	28–7

Bypass Mode	28–8
De-Emphasis Mode	28–8
Dithering Mode.....	28–8
Muting Modes.....	28–9
Soft Mute	28–9
Hard Mute	28–9
Auto Mute.....	28–9
Interrupts.....	28–10
Sources	28–10
SRC Mute Out.....	28–10
Masking.....	28–10
Service	28–10
Programming Model.....	28–10
Debug Features	28–10
ADSP-2159x ASRC Register Descriptions	28–11
Control Register for ASRC 0 and 1	28–12
Control Register for ASRC 2 and 3	28–17
Mute Register	28–22
Ratio Register for ASRC 0 and 1	28–23
Ratio Register for ASRC 2 and 3	28–25

Sony/Philips Digital Interface (S/PDIF)

Features.....	29–1
ADSP-2159x SPDIF Register List	29–1
SRU Programming	29–3
S/PDIF Interrupt List.....	29–3
Clocking	29–3
S/PDIF Transmitter.....	29–3
Functional Description	29–4
Input Data Formats.....	29–5
Operating Modes.....	29–6

Full Serial Mode	29–6
Standalone Mode.....	29–6
Data Output Mode	29–7
S/PDIF Receiver	29–7
Functional Description	29–8
Clock Recovery.....	29–8
TDM Clock Output.....	29–9
Output Data Format	29–9
Channel Status	29–9
Operating Modes.....	29–10
Compressed or Non-linear Audio Data	29–10
Emphasized Audio Data.....	29–10
Single-Channel Double-Frequency Mode.....	29–10

ADSP-2159x Register List

Preface

Thank you for purchasing and developing systems using an ADSP-2159x SHARC+[®] processor from Analog Devices, Inc.

Purpose of This Manual

The *ADSP-2159x SHARC+ Processor Hardware Reference* provides architectural information about the ADSP-2159x processors. This hardware reference provides the main architectural information about these processors. The architectural descriptions cover functional blocks, buses, and ports, including all features and processes that they support.

For timing, electrical, and package specifications, refer to the *SHARC+ Dual-Core DSP with Arm Cortex-A5 ADSP-21591/593/594/ADSP-SC592/594 Data Sheet*.

Intended Audience

Technical or Customer Support

You can reach customer and technical support for processors from Analog Devices in the following ways:

- Post your questions in the processors and DSP support community at *EngineerZone*[®]:

<http://ez.analog.com/community/dsp>

- Submit your questions to technical support at *Connect with ADI Specialists*:

<http://www.analog.com/support>

- E-mail your questions about software/hardware development tools to:

processor.tools.support@analog.com

- E-mail your questions about processors and DSPs to:

processor.support@analog.com (world wide support)

processor.china@analog.com (China support)

- Contact your Analog Devices sales office or authorized distributor. Locate one at:

<http://www.analog.com/adi-sales>

- Send questions by mail to:

Analog Devices, Inc.

Three Technology Way

P.O. Box 9106

Norwood, MA 02062-9106 USA

Product Information

Product information can be obtained from the Analog Devices Web site.

Analog Devices Web Site

The Analog Devices Web site, <http://www.analog.com>, provides information about a broad range of products—analog integrated circuits, amplifiers, converters, and digital signal processors.

To access a complete technical library for each processor family, go to: http://www.analog.com/processors/technical_library The manuals selection opens a list of current manuals related to the product as well as a link to the previous revisions of the manuals. When locating your manual title, note a possible errata check mark next to the title that leads to the current correction report against the manual.

Also note, [MyAnalog.com](http://www.analog.com) is a free feature of the Analog Devices Web site that allows customization of a Web page to display only the latest information about products you are interested in. You can choose to receive weekly e-mail notifications containing updates to the Web pages that meet your interests, including documentation errata against all manuals. [MyAnalog.com](http://www.analog.com) provides access to books, application notes, data sheets, code examples, and more.

Visit [MyAnalog.com](http://www.analog.com) to sign up. If you are a registered user, just log on. Your user name is your e-mail address.

EngineerZone

[EngineerZone](http://www.analog.com) is a technical support forum from Analog Devices. It allows you direct access to ADI technical support engineers. You can search FAQs and technical information to get quick answers to your embedded processing and DSP design questions.

Use EngineerZone to connect with other DSP developers who face similar design challenges. You can also use this open forum to share knowledge and collaborate with the ADI support team and your peers. Visit <http://ez.analog.com> to sign up.

Supported Processors

The following is the list of Analog Devices, Inc. processors.

Blackfin+[®] (ADSP-BF7xx) Processors

The name *Blackfin+* refers to the enhanced fixed-point Blackfin core architecture featured by the ADSP-BF70x processor product line, which is a family of 16-bit embedded processors.

Blackfin® (ADSP-BF6xx/BF5xx) Processors

The name *Blackfin* refers to the fixed-point core architecture featured on the following processors: ADSP-BF5xx and ADSP-BF6xx.

SHARC® (ADSP-21xxx) Processors

The name *SHARC* refers to the high-performance, 32-bit, floating-point core architecture featured on the following processors: ADSP-2116x, ADSP-2126x, ADSP-213xx, and ADSP-214xx. These processors can be used in speech, sound, graphics, and imaging applications.

SHARC+® (ADSP-SC5xx, ADSP-215xx) Processors

The name *SHARC+* refers to the enhanced high-performance, 32-bit, floating-point core architecture featured on the following processors: ADSP-215xx/ADSP-SC5xx. The connected SHARC+ ADSP-SC5xx processors also contain an Arm® Cortex®-A5 core. These products can be used in speech, sound, graphics, and imaging applications.

The following is the list of Analog Devices, Inc. processors supported by the IAR Embedded WorkBench® development tools. For information about the IAR Embedded WorkBench product and software download, go to <http://www.iar.com/en/Products/IAR-Embedded-Workbench>.

Notation Conventions

Text conventions used in this manual are identified and described as follows. Additional conventions, which apply only to specific chapters, may appear throughout this document.

Example	Description
<i>File > Close</i>	Titles in reference sections indicate the location of an item within the CrossCore Embedded Studio IDE's menu system (for example, the <i>Close</i> command appears on the <i>File</i> menu).
{this that}	Alternative required items in syntax descriptions appear within curly brackets and separated by vertical bars; read the example as <i>this</i> or <i>that</i> . One or the other is required.
[this that]	Optional items in syntax descriptions appear within brackets and separated by vertical bars; read the example as an optional <i>this</i> or <i>that</i> .
[this, ...]	Optional item lists in syntax descriptions appear within brackets delimited by commas and terminated with an ellipse; read the example as an optional comma-separated list of <i>this</i> .
.SECTION	Commands, directives, keywords, and feature names are in text with Letter Gothic font.
<i>filename</i>	Non-keyword placeholders appear in text with italic style format.

Example	Description
NOTE:	<i>NOTE:</i> For correct operation, ... A note provides supplementary information on a related topic. In the online version of this book, the word <i>NOTE:</i> appears instead of this symbol.
CAUTION:	<i>CAUTION:</i> Incorrect device operation may result if ... <i>CAUTION:</i> Device damage may result if ... A caution identifies conditions or inappropriate usage of the product that could lead to undesirable results or product damage. In the online version of this book, the word <i>CAUTION:</i> appears instead of this symbol.
ATTENTION:	<i>ATTENTION:</i> Injury to device users may result if ... A warning identifies conditions or inappropriate usage of the product that could lead to conditions that are potentially hazardous for devices users. In the online version of this book, the word <i>ATTENTION:</i> appears instead of this symbol.
Registers/Bits	All registers and bits in this manual are linked (clickable) to their respective descriptions in the "Register Descriptions" of each chapter.
Miscellaneous Conventions	Interrupt and internal signals are shown in all caps with no other formatting. For example the SPDIFn_RX or SCLK signal or the PKTE0_IRQ interrupt. An overbar denotes an active-low signal as in $\overline{\text{SYS_FAULT}}$.

Register Documentation Conventions

Register diagrams use the following conventions:

- The descriptive name of the register appears at the top with the short form of the name.
- If a bit has a short name, the short name appears first in the bit description, followed by the long name.
- The reset value appears in binary in the individual bits and in hexadecimal to the left of the register.
- Bits marked *X* have an unknown reset value. Consequently, the reset value of registers that contain such bits is undefined or dependent on pin values at reset.
- Shaded bits are reserved

NOTE: To ensure upward compatibility with future implementations, write back the value that is read for reserved bits in a register, unless otherwise specified.

Register description tables use the following conventions:

- Each bit's or bit field's access type appears beneath the bit number in the table in the form (read-access/write-access). The access types include:
 - R = read, RC = read clear, RS = read set, R0 = read zero, R1 = read one, Rx = read undefined
 - W = write, NW = no write, W1C = write one to clear, W1S = write one to set, W0C = write zero to clear, W0S = write zero to set, WS = write to set, WC = write to clear, W1A = write one action

- Many bit and bit field descriptions include enumerations, identifying bit values and related functionality. Unless otherwise indicated (with a prefix), these enumerations are decimal values.

1 Clock Generation Unit (CGU)

The Clock Generation Unit (CGU) includes the phase locked loop (PLL) and the PLL control unit (PCU). The PLL generates a master clock that runs at a frequency that is a multiple of the CLKIN input clock frequency. The PCU divides down the master clock to generate various system clocks and synchronization signals.

CGU Features

The CGU module supports the following features:

- Provides smooth transitions from the current clock condition to a new condition with PLL logic and executes the changes to clocks due to register programming.
- Provides PLL and clock domain status reporting for event management.
- Supports the capability to bypass the PLL for power savings.
- Software controlled dynamic power management allows control of the core clock frequency (f_{CLK}).
- Controls clock gating of the core and system clocks.

NOTE: For more information about processor-specific CGU features, see the processor data sheet.

CGU Functional Description

The CGU generates all on-chip clocks and synchronization signals based on the programmed PLL multiplication factor and dividers. The CGU provides the following functionality.

Change the PLL Clock Frequency

The CGU allows programs to change the PLL clock frequency by writing new values to bits in the control register. Any time the PLL rellocks, the CGU aligns all core and system clocks.

Change Other Clock Frequencies

The CGU allows programs to change the CCLKn, SYSCLK, SCLKn, DCLK, and OCLK frequencies by writing values to the [CGU_DIV](#) register. Any time the clock frequency is changed, the OCLK, CCLKn, SYSCLK, DCLK, and SCLKn clocks exit the frequency change sequence aligned.

Perform Clock Alignment

The CGU can align all clocks by writing to the [CGU_DIV](#) register. This function aligns all PLL-based clocks.

For more information on these functions, see the [CGU Programming Model](#) section.

ADSP-2159x CGU Register List

The clock generation unit (CGU) includes the phase locked loop (PLL) and the PLL control unit (PCU). The PLL generates a clock, running at a frequency that is a multiple of the CLKIN input clock's frequency. The CGU also generates all on-chip clocks and synchronization signals. The PCU permits application software control of the PLL's operation. A set of registers govern CGU operations. For more information on CGU functionality, see the CGU register descriptions.

Table 1-1: ADSP-2159x CGU Register List

Name	Description
CGU_CCBF_DIS	Core Clock Buffer Disable Register
CGU_CCBF_STAT	Core Clock Buffer Status Register

Table 1-4: ADSP-2159x CGU Trigger List Slaves

Trigger ID	Name	Description	Sensitivity
None			

CGU Definitions

DPM

The Dynamic Power Management module (DPM) works with the CGU to provide flexible power dissipation modes for the processor.

PCU

The PLL control unit (PCU) in the CGU controls PLL operations. The MMR registers of the CGU are implemented in the PCU.

PLL

The phase-locked loop (PLL) operates within the CGU.

RCU

The reset control unit (RCU) provides input to the CGU to manage clocks during processor reset.

CDU

The clock distribution unit distributes the clocks from the CGU to different clock domains

CGU

The clock generation unit (CGU) is comprised of the PLL and PCU. The CGU generates the clocks listed in the *Clock Descriptions* table.

Table 1-5: Clock Descriptions

Clock	Description
CCLK0_0	CCLK0 derived from CGU0
CCLK1_0	CCLK1 derived from CGU0
SYSCLK_0	SYSCLK derived from CGU0
SCLK0_0	SCLK0 derived from CGU0
SCLK1_0	SCLK1 derived from CGU0
DCLK_0	DCLK derived from CGU0
OCLK_0	OCLK derived from CGU0
CCLK0_1	CCLK0 derived from CGU1
SYSCLK_1	SYSCLK derived from CGU1
SCLK0_1	SCLK0 derived from CGU1
SCLK1_1	SCLK1 derived from CGU1
DCLK_1	DCLK derived from CGU1
OCLK_1	OCLK derived from CGU`

CGU PLL Block Diagram

The *CGU PLL Block Diagram* provides a top-level block diagram of the phase locked loop (PLL). The main blocks of the PLL are the phase/frequency detector (PFD), the charge pump, the loop filter and the voltage controlled oscillator (VCO). The VCO multiplies the SYS_CLKIN0 input to a higher frequency.

Additional configuration options are configured using the Clock Distribution Unit.

Figure 1-1: CGU PLL Block Diagram

CLKOUT Selections

The *SYS_CLKOUT Generation* figure is a conceptual representation of the CLKOUT module. Different clocks that originate from the CGU blocks are available on the SYS_CLKOUT output pin. The selection of the clock output on the SYS_CLKOUT pin is controlled by the CGU_CLKOUTSEL.CLKOUTSEL bit field. Most of the clock frequencies are divided with a fixed divider value, for example CGU0_SYSCLK0 has a fixed divider of 8 for the CLKOUT pin.

Figure 1-2: SYS_CLKOUT Generation

The BMODE pin affects the CLKOUT pins after a hardware reset is deasserted.

BMODE= 0 — When a hardware reset is deasserted, CGU0_OCLK/PLLCLK0 is selected to come out of the CLKOUT pin. The default value of OSEL and MSEL is the same. This functionality enables the user to verify PLL functionality by checking that the CLKOUT period is identical to CLKIN period.. While programming all values of the CGU_CLKOUTSEL.CLKOUTSEL bit field is possible, changing it to 0 (SYS_CLKIN) is not possible until and unless a non-zero value is first programmed to the the CGU_CLKOUTSEL.CLKOUTSEL bit field.

BMODE = (non zero) — When a hardware reset is deasserted, SYS_CLKIN is selected by default.

CGU Operating Modes

The CGU does not have configurable operating modes, but CGU operations affect the operating modes of other modules. Some CGU operation issues that affect operation of other modules include the following:

- The PLL of the CGU operates in either normal mode (CGU clock divisors applied) or bypass mode (CGU PLL is bypassed and clock divisors ignored).
- The SCB uses the CGU for clock synchronization across clock domains. For more information, see [System Crossbars \(SCB\)](#).
- The DPM uses the CGU for clock management as power state transitions occur. For more information, see the Dynamic Power Management (DPM) chapter.
- The CGU uses clock gating control to obtain flexible low-power modes.

CGU Power-up Sequence

See the product data sheet for exact power-up requirements. The processor is configured to come up in clock bypass mode. The programs is required to configure full speed clocks and safety monitors. CLKIN0 and all supplies should be stable before the SYS_HWRST signal is deasserted.

CGU Event Control

The CGU generates an event or error for several different reasons. Events and errors are described in the following sections.

Events

After a frequency change, a CGU event indicates that the PLL has locked and clocks are synchronized. If a core was idled while changing frequencies, the CGU can use an event interrupt to break the core idle. While in active mode, a CGU event indicates that the PLL has locked.

CGU Errors

A CGU error occurs under following conditions:

- A write access to the [CGU_DIV/CGU_DIVEX](#) registers trigger an alignment sequence while the PLL is locked and is still aligning the clocks.

The `CGU_STAT.WDIVERR` bit state indicates this error. If this error occurs, clear the `CGU_STAT.WDIVERR` bit and rewrite the desired values to the `CGU_DIV/CGU_DIVEX` registers.

- A change to the `CGU_DIV/CGU_DIVEX` registers occur while the PLL is locked and is still aligning the clocks.

The `CGU_STAT.WDIVERR` bit state indicates this error. If this error occurs, clear the `CGU_STAT.WDIVERR` bit and rewrite the desired values to the `CGU_DIV/CGU_DIVEX` registers.

- A write access to the `CGU_CTL.DF` bit field occurs or a write access to the `CGU_CTL.MSEL` bit field occurs while the PLL is locking.

The `CGU_STAT.WDFMSERR` bit state indicates this error. If this error occurs, wait until the PLL has finished locking, clear the error, and rewrite the desired value change.

The CGU monitors changes to the following fields:

- SYSCLK Divisor – `CGU_DIV.SYSSEL`

CGU Generated Bus Errors

The CGU generates a bus error when a read or write transaction to an unused address within the CGU address range is attempted. It also generates a bus error when a misaligned access is made to a CGU register. In addition to the bus error, the `CGU_STAT.ADDRERR` bit is set. If a write to a write-protected CGU register is attempted, the CGU generates a bus error. In addition, the `CGU_STAT.LWERR` bit is set.

Oscillator Watchdog

The oscillator watchdog detects the absence of input clock transitions and provides a fault warning through the `SYS_FAULT` pin. To detect harmonic or subharmonic crystal oscillator behavior, the watchdog (under programmable control) also detects and reports input oscillator frequencies above and below the specified limits. Use an internal asynchronous, local 1 MHz oscillator combined with a series of programmable counters for this detection. Set the `CGU_OSCWDCTL.MONDIS` bit and clear the `CGU_OSCWDCTL.FAULTEN` bit to optionally disable all the input clock monitor and fault detection functions.

Set the `CGU_OSCWDCTL.HODEN` bit to enable harmonic oscillation detection. The CGU uses the `CGU_OSCWDCTL.HODF` bit field to indicate the desired lower fail limit (in MHz) for the harmonic oscillation detection. The upper limit is always twice the lower limit.

The *HODF Settings for Different Input Clock Frequencies* table shows an example of the `CGU_OSCWDCTL.HODF` bit settings for different input clock frequencies.

Table 1-6: HODF Settings for Different Input Clock Frequencies

<code>CGU_OSCWDCTL.HODF[5:0]</code>	Subharmonic Frequency (MHz)	Nom. Lower Fail Limit (MHz)	Input Clock Frequency (MHz)	Nom. Upper Fail Limit (MHz)	Second Harmonic Frequency (MHz)
14	10	14	20	28	40

Table 1-6: HODF Settings for Different Input Clock Frequencies (Continued)

CGU_OSCWDCTL.HODF[5:0]	Subharmonic Frequency (MHz)	Nom. Lower Fail Limit (MHz)	Input Clock Frequency (MHz)	Nom. Upper Fail Limit (MHz)	Second Harmonic Frequency (MHz)
21	15	21	30	42	60

The CGU uses the CGU_OSCWDCTL.BOUF (Bad Oscillator Upper Frequency limit) asynchronous control bit field to indicate the desired upper fail limit for the bad oscillation detection. Set the CGU_OSCWDCTL.BOUEN bit to enable upper-limit bad oscillation detection. A bad oscillation detection condition signals a fault before any processor operations occur. This detection occurs (even in bypass mode) whenever a clock frequency exceeds the specifications.

The CGU_OSCWDCTL.BOUF = 0 operation starts with a target of 32 MHz and each additional LSB increases the frequency test limit by 2 MHz. For example:

Target Upper Frequency Limit = CGU_OSCWDCTL.BOUF × 2 MHz + 32 MHz

The CGU_STAT.OSCWDSTATFC status bits indicate the nature of the fault.

The *Fault Map* table shows the fault values.

Table 1-7: Fault Map

CGU_STAT.OSCWDSTATFC Bitfield Values	Fault Type
0	No Fault
1	No Input Clock
2	Subharmonic CLKIN
3	Harmonic CLKIN
4	No AUX_CLK
5	CLKIN > Upper Freq Limit (BOUF)
6	Reserved
7	Multiple Limit Faults

There is a priority to the faults given in the case of multiple fault errors. The highest priority is given to No Input clock followed by No AUX_CLK. The other three fault cases share the lowest priority. Multiple limit faults are asserted if more than one type of subharmonic CLKIN, harmonic CLKIN, or BOUF faults are observed.

NOTE: All the CGU_STAT.OSCWDSTATFC faults other than the absence of AUX_CLK (for example, CGU_STAT.OSCWDSTATFC = 4) are not reliable and used for debug only.

Program and enable the OSCWDOG to match the actual crystal, before bringing the PLL out of bypass.

CGU Programming Model

The programming model for the CGU involves the various mode configuration techniques.

Configuring CGU Modes

Use the following procedures to configure the clocks and PLL.

NOTE: The program needs to clear the `CGU_STAT.CLKSALGN` bit before changing clocks. The following sequence is executed once, inside the application, after coming out of reset.

```
*pREG_CGU0_PLLCTL |= BITM_CGU_PLLCTL_PLLBPCL; // come out of bypass and enter
Full ON
while( (pADI_CGU0 ->STAT & 0xF) != 0x5 ) { } // poll
// now clocks are running with hardware default divisors.
// now program can change frequencies If desired the program can put the PLL
again into bypass.
```

Changing the Clock Frequencies

Applications change clock frequencies in two ways. The first way is modifying the PLL multiplication value by writing to the `CGU_CTL` register and the second is modifying the clock dividers by writing to the `CGU_DIV` register. Both actions have different implications even if the frequencies of the final clock are the same. Write accesses to change the `CGU_CTL.DF` or `CGU_CTL.MSEL` bit fields while the PLL is locking set the `CGU_STAT.WDFMSERR` error bit. The `CGU_STAT.WDIVERR` error bit is set when one of following accesses is attempted while the PLL is locked, but still aligning the clocks:

- A write access to the `CGU_DIV/CGU_DIVEX` to trigger an alignment sequence.
- A write access to the `CGU_DIV/CGU_DIVEX` to change the `CGU_DIV.CSEL/`, `CGU_DIV.SYSSEL`, `CGU_DIV.S0SEL`, `CGU_DIV.S1SEL`, or `CGU_DIV.DSEL/CGU_DIVEX.S1SELEX` bits.

Read-after-write accesses to these registers return the new value, even if the frequency of the clock change is still in-progress.

Modifying the PLL multiplier requires the PLL to relock. Once the PLL locks, the CGU synchronizes the clocks. Changes to the `CGU_CTL.DF` or `CGU_CTL.MSEL` bit field result in bypassing the PLL. By setting the `CGU_CTL.WFI` bit, programs force the PLL to wait for the core to return to the idle or reset state before the frequency changes. If necessary, clear the `CGU_DIV.UPDT` bit to avoid multiple clock alignment sequences. If the `CGU_DIV` register is not updated, the CGU uses the current values to determine the frequencies of the clock. It is the programs responsibility to guarantee that the new `CGU_CTL.DF` or `CGU_CTL.MSEL` and `CGU_DIV/CGU_DIVEX` combinations are legal.

Changing the PLL Clock Frequency

To change the phase-locked loop clock (*PLLCLK*) frequency, write new values to the `CGU_CTL.MSEL` field or `CGU_CTL.DF` field. Any time the PLL relocks, all core and system clocks are aligned.

1. Read `CGU_STAT` register and verify that:
 - a. The `CGU_STAT.PLEN` bit =1 (PLL enabled)
 - b. The `CGU_STAT.PLOCK` bit =1 (PLL is not locking)

- c. The `CGU_STAT.CLKSALGN` bit =0 (clocks aligned)
2. Write the desired values to the clock divisor select fields of the `CGU_DIV/CGU_DIVEX` register with the `CGU_DIV.UPDT` bit =0.
3. Write the desired values to the `CGU_CTL.DF` and `CGU_CTL.MSEL` fields.
 - a. To change the PLL frequency while the core is idle, write to the `CGU_CTL` register with the `CGU_CTL.WFI` bit =1.
 - b. To change the PLL frequency while the core is active, write to the `CGU_CTL` register with the `CGU_CTL.WFI` bit =0.

This sequence performs these actions:

1. Updates the corresponding CGU registers.
2. Bypasses the PLL.
3. Makes the PLL lock to the new values in the `CGU_CTL.MSEL` or `CGU_CTL.DF` fields.
4. Changes the clock frequencies.
5. Exits the PLL bypass with all clocks aligned.

When exiting the PLL bypass state, a CGU event occurs.

The `CGU_STAT` register exits this sequence with the `CGU_STAT.PLEN` bit =1, the `CGU_STAT.PLOCK` bit =1, the `CGU_STAT.PLLBP` bit =0, and the `CGU_STAT.CLKSALGN` bit =0. Poll the `CGU_STAT.PLOCK` bit, `CGU_STAT.PLLBP` bit, and `CGU_STAT.CLKSALGN` bit to discover when the PLL is locked and the clocks are aligned.

Changing the frequency of the PLL is allowed while the PLL is bypassed. In this case the new PLLCLK frequency is not used until the PLL is no longer bypassed.

Changing the CCLKn or SYSCLK Frequency Without Modifying the PLLCLK Frequency

To change the clock frequencies, write new values to `CGU_DIV.CSEL` or `CGU_DIV.SYSSEL` bits. The frequency change occurs only when the PLL is not bypassed. Any time the CCLKn or SYSCLK clock frequencies are changed, they exit the frequency change sequence aligned.

1. Read the `CGU_STAT` register to verify that the `CGU_STAT.CLKSALGN` bit =0 (clocks aligned).
2. Write the desired `CGU_DIV.CSEL`, `CGU_DIV.SYSSEL`, and `CGU_DIV.OSEL` bitfield values with the `CGU_DIV.UPDT` bit = 1 and/or, write to the `CGU_DIVEX.S1SELEX` field. This write updates the `CGU_DIV` register, changes the SCLKn and SYSCLK frequencies, and aligns the clocks. When the clocks are aligned, a CGU event occurs.

The `CGU_STAT` register exits this sequence with the `CGU_STAT.CLKSALGN` bit =0. Poll the `CGU_STAT.CLKSALGN` bit to discover when the clocks are aligned. Any write attempt to change the

CGU_DIV.S0SEL or CGU_DIV.S1SEL bit fields while CGU_STAT.CLKSALGN bit =1 (clocks alignment in progress) triggers an MMR access bus error and the CGU_DIV register is not modified.

Also, any write attempt to change the CGU_DIVEX.S1SELEX field while the CGU_STAT.CLKSALGN bit =1 (clocks alignment in progress) triggers an MMR access bus error and the CGU_DIVEX register is not modified.

Programming the SYSCLK frequency to a higher value than CCLKn also triggers an MMR access bus error and the CGU_DIV/CGU_DIVEX register is not modified.

Writing to the CGU_DIV/CGU_DIVEX register is allowed while the processor is in active (PLL bypassed) mode. In this case the effect of the write is visible only after the transition to full-on (PLL not bypassed) mode.

Accessing the DDR memory while changing the SYSCLK frequency is not supported and can have unpredictable results.

Changing the OCLK Frequency

To change the OCLK clock frequency, write a new CGU_DIV.OSEL bit value. Any time the OCLK clock frequency is changed, the OCLK, CCLKn, SYSCLK, and SCLKn clocks exit the frequency change sequence aligned.

1. Read the CGU_STAT register to verify that the CGU_STAT.CLKSALGN bit =0 (clocks aligned).
2. Write the desired CGU_DIV.OSEL value with the CGU_DIV.UPDT bit =1. This write updates the CGU_DIV register, changes the OCLK frequency, and aligns all clocks except OCLK.

The CGU_STAT register exits this sequence with the CGU_STAT.CLKSALGN bit =0. Poll the CGU_STAT.CLKSALGN bit to discover when the clocks are aligned. Any write attempt to change the CGU_DIV.DSEL field while the CGU_STAT.CLKSALGN bit =1 (clock alignment in progress) triggers an MMR access bus error and the CGU_DIV/CGU_DIVEX is not modified. When the clocks are aligned, a CGU event occurs.

Writing to the CGU_DIV.OSEL bit field is allowed while the processor is in active (PLL bypassed) mode. In this case the effect of the write is visible only after the transition to full-on (PLL not bypassed) mode.

Selecting SCLK1_0 Source

SCLK1_0 sources the SPDIF receiver clock. This can be sourced from PLL clock or SYSCLK0_0. Programming the CGU_DIVEX enables PLL clock as source (bypassing SYSCLK0_0 that continues to source other peripherals).

When CGU_DIVEX is enabled, the PLL clock is divided from CGU_DIVEX register value.

Changing SCLK1_0 Frequencies

Complete the following steps to change the SCLK0 or SCLK1 frequency.

1. Read the CGU_STAT register. Verify that CGU_STAT.CLKSALGN = 0 (Clocks aligned).

2. Read the [CGU_CTL](#) register. Verify that the `CGU_CTL.S1SELEXEN` bit is set as needed. (These bits can only be modified when the PLL is bypassed).
3. Read the [CGU_STAT](#) register. Verify that the PLL is not bypassed. (If it is bypassed, see [PLL Bypass and PLL Disable](#) topic.)
4. Read the [CGU_DIV](#) register. Verify that the `CGU_DIV.UPDT` bit is set.
5. Write the desired `CGU_DIVEX.S1SELEX` value to the [CGU_DIVEX](#) registers .

Aligning All Clocks

To align the clocks, write 1 to the `CGU_DIV.ALGN` bit. The frequency can also be changed, if necessary. The clocks aligned include:

- CCLK_n
- SYSCLK
- SCLK_n
- DCLK
- OCLK

1. Read the [CGU_STAT](#) register to verify that `CGU_STAT.CLKSALGN` bit =0 (clocks aligned).
2. Write 1 to the `CGU_DIV.ALGN` bit. All other fields can change.

ADDITIONAL INFORMATION: This write does not alter the [CGU_DIV/CGU_DIVEX](#) register unless one of the clock-select fields is modified. When the clocks are aligned, a CGU event occurs.

The [CGU_STAT](#) register exits this sequence with the `CGU_STAT.CLKSALGN` bit =0. Poll the `CGU_STAT.CLKSALGN` bit to discover when the clocks are aligned. Any write to the [CGU_DIV/CGU_DIVEX](#) register intended to align clocks or to change a clock select field while the `CGU_STAT.CLKSALGN` bit =1 (clocks alignment in progress) triggers an MMR access bus error. In this case, the [CGU_DIV/CGU_DIVEX](#) register is not modified.

Writing 1 to the `CGU_DIV.ALGN` bit has no effect while the processor is in active (PLL bypassed) mode.

Shutting Off CCLK_n from Another Master

CCLK_n can be shut off to save power when it is not in use. In the ADSP-2156x processor, this master is a memory DMA.

1. Disable interrupts to core n.
2. Set the `RCU_SIDIS.SI[n]` bit to disable the interfaces of core n in order to:
 - a. Stop DMA accesses to its L1.

- b. Stop memory accesses to core 0.
 - c. Stop accesses to MMRs.
 3. Test the `RCU_SISTAT.SI[n]` bit to detect when accesses to core n have been disabled and all the pending transactions have completed.
 4. Set the `CGU_CCBF_DIS.CCBF0` bit to disable the CCLKn buffer.
 5. Check the `CGU_CCBF_STAT.CCBF0` bit.
- If the `CGU_CCBF_STAT.CCBF0` bit is set, continue.

Reenable CCLKn From Another Master

1. Clear the `CGU_CCBF_DIS.CCBF0` to enable CCLKn.
2. Check the `CGU_CCBF_STAT.CCBF0` bit.
 - a. If the `CGU_CCBF_DIS.CCBF0` bit is cleared, continue.
3. Clear the `RCU_SIDIS.SI[n]` bit. The core deasserts its acknowledge signal in response to the `RCU_SYSRST0` signal. This operation clears the `RCU_SISTAT.SI[n]` bit.

Valid Clock Multiplier Settings

Processor operations depend on valid settings in the `CGU_CTL` and `CGU_DIV` registers. These registers control the clock multiplier and divisor values. Set these registers such that the minimum and maximum clocks specified in the data sheet are not violated. All other clock specifications in the data sheet must also be adhered to for correct operation of the processor.

PLL Bypass and PLL Disable

Writing 1 to the `CGU_PLLCTL.PLLBPST` bit tells the PLL to apply `OSC_CLKIN` clock to CCLK, SYCLK, SCLK0, SCLK1, DCLK (PLL Bypass), and OCLK outputs. Writing 1 to the `CGU_PLLCTL.PLLBPCL` bit tells the PLL to exit its PLL Bypass state and make all output clocks align and transition to their programmed frequencies.

The PLL can be disabled by clearing the `CGU_PLLCTL.PLLEN` bit while in the bypass state. If necessary, clock buffers can be disabled.

CCLK0 clock can be disabled or enabled by writing 1 or 0 to the corresponding bit in the `CGU_CCBF_DIS` register.

To determine which core clock buffers were disabled since the last read, software reads the `CGU_CCBF_STAT` register. The SCLK0, SCLK1, DCLK and OCLK clocks can be disabled or enabled by writing 1 or 0 to the corresponding bit in the `CGU_SCBF_DIS` register. Software cannot disable SYCLK.

ADSP-2159x Specific Information

The processor has two system crystal oscillators and two system CGU units to provide the clocks to the system. However, the ADSP-21593 and ADSP-21591 processors have one system crystal oscillator. Both of the CGUs come up in bypass mode out of reset.

CGU0 is the main CGU which provides most of the clocks including CCLK0, SYSCLK (SYSCLK_0), SCLK0 (SCLK0_0), and SCLK1 (SCLK1_0) to the system buses, infrastructure, and most of the peripherals. The rest of the clock outputs from the two CGUs can be routed to a specific peripheral in the system. For details, refer to the [Clock Distribution Unit \(CDU\)](#).

NOTE: The frequency ratio of the core clock to SYSCLK is 2:1.

The frequency ratios of SYSCLK to SCLK0 are 6:1, 4:1 or 2:1.

The processor does not support any other frequency ratio.

ADSP-2159x CGU Register Descriptions

Clock Generation Unit (CGU) contains the following registers.

Table 1-8: ADSP-2159x CGU Register List

Name	Description
CGU_CCBF_DIS	Core Clock Buffer Disable Register
CGU_CCBF_STAT	Core Clock Buffer Status Register
CGU_CLKOUTSEL	CLKOUT Select Register
CGU_CTL	Control Register
CGU_DIV	Clocks Divisor Register
CGU_DIVEX	DIV Register Extension
CGU_OSCWDCTL	Oscillator Watchdog Register
CGU_PLLCTL	PLL Control Register
CGU_REVID	Revision ID Register
CGU_SCBF_DIS	System Clock Buffer Disable Register
CGU_SCBF_STAT	System Clock Buffer Status Register
CGU_STAT	Status Register
CGU_TSCOUNT0	Time Stamp Counter 32 LSB Register
CGU_TSCOUNT1	Time Stamp Counter 32 MSB Register
CGU_TSCTL	Time Stamp Control Register
CGU_TSVALUE0	Time Stamp Counter Initial 32 LSB Value Register
CGU_TSVALUE1	Time Stamp Counter Initial MSB Value Register

Core Clock Buffer Disable Register

The `CGU_CCBF_DIS` register controls each core's clock buffer to determine if the CCLK is enabled.

Figure 1-3: `CGU_CCBF_DIS` Register Diagram

Table 1-9: `CGU_CCBF_DIS` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W)	LOCK	Lock. If set (=1) the <code>CGU_CCBF_DIS</code> .LOCK bit locks the <code>CGU_CCBF_DIS</code> register.
		0 Unlock register
		1 Lock register
0 (R/W)	CCBF0	Core Clock Buffer 0. The <code>CGU_CCBF_DIS</code> .CCBF0 bit enables (=0) or disables (=1) CCLK0s buffer.
		0 Enable buffer
		1 Disable buffer

Core Clock Buffer Status Register

The `CGU_CCBF_STAT` register shows which core clock buffer(s) are disabled. For example clearing the `CGU_CCBF_DIS.CCBF0` bit clears the `CGU_CCBF_STAT.CCBF0` bit after a number of cycles. To guarantee that the correct value is read, this register should be read twice and the second result used.

Figure 1-4: `CGU_CCBF_STAT` Register Diagram

Table 1-10: `CGU_CCBF_STAT` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
0 (R/NW)	CCBF0	Core Clock Buffer 0.
		The <code>CGU_CCBF_STAT.CCBF0</code> bit reports the status of the <code>CGU_CCBF_DIS.CCBF0</code> bit where 0 = enabled and 1 = disabled.
		0 Enabled
		1 Disabled

CLKOUT Select Register

The `CGU_CLKOUTSEL` selects the signal that the CGU drives through the CLKOUT multiplexer. Also, this register selects the divisor for the USBCLK output.

Figure 1-5: CGU_CLKOUTSEL Register Diagram

Table 1-11: CGU_CLKOUTSEL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W)	LOCK	Lock. If the global lock bit is set (<code>SPU_CTL.GLCK</code> bit =1) and the <code>CGU_CLKOUTSEL.LOCK</code> bit is set, the <code>CGU_CLKOUTSEL</code> register is read only (locked).
		0 Unlock
		1 Lock
4:0 (R/W)	CLKOUTSEL	CLKOUT Select. The <code>CGU_CLKOUTSEL.CLKOUTSEL</code> selects the signal that the CGU drives through the CLKOUT pin multiplexer.
		0 CLKIN0
		1 CLKIN1
		2 PLLTOP0.SYSCLKO
		3 PLLTOP0.CCLK0
		4 CDU.CLKO3 for DDR
		5 CDU.CLKO4 for CAN
		6 CDU.CLKO7 for EMAC
		7 CDU.CLKO8 for LP
		8 PLLTOP1.SYSCLKO
		9 PLLTOP1.OCLK

Table 1-11: CGU_CLKOUTSEL Register Fields (Continued)

		15	Reserved
		16	PLLTOP0.SCLK0
		17	Reserved
		18	Reserved
		19	GND

Control Register

The `CGU_CTL` controls the clock generation divisors for `SYS_CLKIN` and the PLL. Read after write accesses to the `CGU_CTL` register returns the new value even if the clock's frequency change is still in progress.

Figure 1-6: CGU_CTL Register Diagram

Table 1-12: CGU_CTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W)	LOCK	Lock.
		If the global lock bit is set (<code>SPU_CTL.GLCK</code> bit =1) and the <code>CGU_CTL.LOCK</code> bit is set, the <code>CGU_CTL</code> register is read only (locked).
		0 Unlock 1 Lock
30 (R/W)	WFI	Wait For Idle.
		Modifying the PLL multiplier requires the PLL to re-lock and once the PLL locks, clocks have to be synchronized. Changes to the <code>CGU_CTL.MSEL</code> and the <code>CGU_CTL.DF</code> bit values results in bypassing the PLL.
		The <code>CGU_CTL.WFI</code> bit forces the PLL to wait for all processor cores to be in an idle or reset state before changing frequencies as a result of changes to the <code>CGU_CTL.MSEL</code> or <code>CGU_CTL.DF</code> bits. Write accesses to the <code>CGU_CTL</code> to change the <code>CGU_CTL.DF</code> or <code>CGU_CTL.MSEL</code> bit values while the PLL is locking sets the <code>CGU_STAT.WDFMSERR</code> bit.
		0 Update Immediately 1 Wait for Idle

Table 1-12: CGU_CTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
17 (R/W)	S1SELEXEN	SCLK1 Extension Divider Enable. The <code>CGU_CTL.S1SELEXEN</code> directs the CGU to select S1SELEX instead of S1SEL. This bit can only be updated when the PLL is bypassed.
		0 Selects SYSCLK to SCLK1 Divider
		1 Selects PLLCLK to SCLK1 Divider
14:8 (R/W)	MSEL	Multiplier Select. The <code>CGU_CTL.MSEL</code> bit field selects the multiplier in the PLLCLK equation: $\text{PLLCLK frequency} = (\text{SYS_CLKIN frequency} / (\text{DF} + 1)) * \text{MSEL}$ Where the value of MSEL is between 1 and 127.
		0 MSEL = 128
		1-127 MSEL = 1 to 127
0 (R/W)	DF	Divide Frequency. The <code>CGU_CTL.DF</code> bit selects whether or not the CLKIN input is divided by two before being passed to the PLL.
		0 Pass OSC_CLKIN to PLL
		1 Pass OSC_CLKIN/2 to PLL

Clocks Divisor Register

The `CGU_DIV` register controls clock divisors for core clocks, system clocks, external (off core) memory clocks, and output clock. Read after write accesses to the `CGU_DIV` register returns the new value even if the clock's frequency change is still in progress.

Figure 1-7: CGU_DIV Register Diagram

Table 1-13: CGU_DIV Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W)	LOCK	Lock.
		If the global lock bit is set (<code>SPU_CTL.GLCK</code> bit =1) and the <code>CGU_DIV.LOCK</code> bit is set, the <code>CGU0_DIV</code> and <code>CGU0_DIVEX</code> registers are read only (locked).
		0 Unlock
		1 Lock
30 (R/W)	UPDT	Update Clock Divisors.
		The <code>CGU_DIV.UPDT</code> controls whether the CGU drives new <code>CGU_DIV.CSEL</code> , <code>CGU_DIV.SYSEL</code> , <code>CGU_DIV.S0SEL</code> , <code>CGU_DIV.S1SEL</code> , <code>CGU_DIV.DSEL</code> , and <code>CGU_DIV.OSEL</code> values to PLL after <code>CGU_DIV</code> register update.
		0 No PLL Update
		1 Drive Updated SEL Values to PLL

Table 1-13: CGU_DIV Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
29 (R0/W)	ALGN	Align. The CGU_DIV.ALGN directs the CGU to align the PLL-based clocks. The divisor selections (CGU_DIV.CSEL, CGU_DIV.SYSSEL, CGU_DIV.S0SEL, CGU_DIV.S1SEL, CGU_DIV.DSEL, and/or CGU_DIV.OSEL) do not have to change.
		0 No Action
		1 Align PLL Clocks
28:22 (R/W)	OSEL	OCLK Divisor. The CGU_DIV.OSEL selects the divisor in the OCLK equation: $\text{OCLK frequency} = (\text{SYS_CLKIN frequency} / (\text{DF}+1)) * \text{MSEL} / \text{CGU_DIV.OSEL}$ Where the value of CGU_DIV.OSEL is between 1 and 127.
		0 OSEL = 128
		1-127 OSEL = 1 to 127
20:16 (R/W)	DSEL	DCLK Divisor. The CGU_DIV.DSEL selects the divisor in the DCLK equation: $\text{DCLK frequency} = (\text{SYS_CLKIN frequency} / (\text{DF}+1)) \text{MSEL} / \text{CGU_DIV.DSEL}$ Where the value of CGU_DIV.DSEL is between 1 and 31.
		0 DSEL = 32
		1-31 DSEL = 1 to 31
15:13 (R/W)	S1SEL	SCLK 1 Divisor. The CGU_DIV.S1SEL selects the divisor in the SCLK1 equation: $\text{SCLK1 frequency} = (\text{SYSCLK frequency}) / \text{CGU_DIV.S1SEL}$ Where the value of CGU_DIV.S1SEL is between 1 and 7.
		0 S1SEL = 8
		1-7 S1SEL = 1 to 7
12:8 (R/W)	SYSSEL	SYSCLK Divisor. The CGU_DIV.SYSSEL selects the divisor in the SYSCLK equation: $\text{SYSCLK frequency} = (\text{SYS_CLKIN frequency} / (\text{DF}+1)) \text{MSEL} / \text{CGU_DIV.SYSSEL}$ Where the value of CGU_DIV.SYSSEL is between 1 and 31.
		0 SYSSEL = 32
		1-31 SYSSEL = 1 to 31

Table 1-13: CGU_DIV Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
7:5 (R/W)	S0SEL	SCLK 0 Divisor. The <code>CGU_DIV.S0SEL</code> selects the divisor in the SCLK0 equation: $\text{SCLK0 frequency} = (\text{SYSCLK frequency}) / \text{CGU_DIV.S0SEL}$ Where the value of <code>CGU_DIV.S0SEL</code> is between 1 and 7.
		0 S0SEL = 8
		1-7 S0SEL = 1 to 7
4:0 (R/W)	CSEL	CCLK Divisor. The <code>CGU_DIV.CSEL</code> bit field selects the divisor in the CCLK equation: $\text{CCLK frequency} = (\text{SYS_CLKIN frequency} / (\text{DF}+1)) * \text{MSEL} / \text{CGU_DIV.CSEL}$ Where the value of <code>CGU_DIV.CSEL</code> is between 1 and 31.
		0 CSEL = 32
		1-31 CSEL= 1 to 31

DIV Register Extension

Figure 1-8: CGU_DIVEX Register Diagram

Table 1-14: CGU_DIVEX Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
23:16 (R/W)	S1SELEX	SCLK 1 Extension Divisor. The CGU_DIVEX.S1SELEX selects the divisor in the SCLK1EX equation: SCLK1EX frequency = (PLLCLK frequency) / CGU_DIVEX.S1SELEX Where the value of CGU_DIVEX.S1SELEX is between 1 and 255.
		0 S1SELEX = 256
		1-255 S1SELEX = 1 to 255

Oscillator Watchdog Register

The `CGU_OSCWDCTL` register configures the CGU to allow the detection of the absence of input clock transitions and provides a fault warning via the `SYS_FAULT` pin. The `CGU_OSCWDCTL` register also detects and reports input oscillator frequencies above and below specified limits, in order to specifically detect harmonic or sub-harmonic crystal oscillator behavior. This detection is achieved by using an internal asynchronous, local 1 MHz oscillator combined with a series of programmable counters.

Figure 1-9: `CGU_OSCWDCTL` Register Diagram

Table 1-15: `CGU_OSCWDCTL` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W)	LOCK	Lock.
23 (R/W)	FAULTPINDIS	Fault Pin disabled. The <code>CGU_OSCWDCTL.FAULTPINDIS</code> bit disables pin fault detection.
15 (R/W)	MONDIS	Oscillator Watchdog Monitor functions disabled. The <code>CGU_OSCWDCTL.MONDIS</code> bit disables all the input clock monitor and fault detection functions.
14 (R/W)	FAULTEN	Fault enabled. The <code>CGU_OSCWDCTL.FAULTEN</code> bit enables fault detection.
13 (R/W)	BOUEN	Bad Oscillator Upper Frequency limit detection enabled. The <code>CGU_OSCWDCTL.BOUEN</code> bit enables upper limit bad oscillation detection.

Table 1-15: CGU_OSCWDCTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
12:8 (R/W)	BOUF	Bad Oscillator Upper Frequency limit. The CGU_OSCWDCTL.BOUF bits indicate the desired upper fail limit for the bad oscillation detection.
7 (R/W)	CNGEN	Clock not Good enabled. The CGU_OSCWDCTL.CNGEN bit enables the detection of an oscillator watchdog clock fault.
6 (R/W)	HODEN	Harmonic Oscillation Detection enabled. The CGU_OSCWDCTL.HODEN bit enables harmonic oscillation detection.
5:0 (R/W)	HODF	Watchdog lower frequency limit. The CGU_OSCWDCTL.HODF bit field is used to indicate the desired lower fail limit for the harmonic oscillation detection in MHz.

PLL Control Register

The `CGU_PLLCTL` register contains bits that enable and disable the PLL as well as control its function.

Figure 1-10: `CGU_PLLCTL` Register Diagram

Table 1-16: `CGU_PLLCTL` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W)	LOCK	Lock. Setting (=1) the <code>CGU_PLLCTL . LOCK</code> bit locks access to the <code>CGU_PLLCTL</code> register.
		0 Unlock register
		1 Lock register
3 (R/W)	PLLEN	PLL Enable. Setting (=1) the <code>CGU_PLLCTL . PLLEN</code> bit enables the PLL. Check the <code>CGU_STAT . PLLEN</code> bit to verify that the action is complete.
		0 No action
		1 Enable PLL
2 (R/W)	PLLDIS	PLL Disable. Setting (=1) the <code>CGU_PLLCTL . PLLDIS</code> bit disables the PLL. Check the <code>CGU_STAT . PLLEN</code> bit to verify that the action is complete.
		0 No action
		1 Disable PLL
1 (R/W)	PLLBPCL	PLL Bypass Clear. Setting (=1) the <code>CGU_PLLCTL . PLLBPCL</code> bit takes the PLL out of bypass mode. Check the <code>CGU_STAT . PLLBP</code> bit to verify that the action is complete.
		0 No action
		1 Exit bypass mode

Table 1-16: CGU_PLLCTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
0 (R/W)	PLLBPST	PLL Bypass Set. Setting (=1) the CGU_PLLCTL.PLLBPST bit bypasses the PLL and all the clocks run on CLKIN. Check the CGU_STAT.PLLBP bit to verify that the action is complete.
		0 Use PLL
		1 Bypass PLL

Revision ID Register

The `CGU_REVID` register reports the version of the CGU.

Figure 1-11: CGU_REVID Register Diagram

Table 1-17: CGU_REVID Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
7:4 (R/NW)	MAJOR	Major Version.
3:0 (R/NW)	REV	Incremental Version ID.

System Clock Buffer Disable Register

The `CGU_SCBF_DIS` register controls each system's clock buffer to determine if the SCLKn buffer is enabled.

Figure 1-12: `CGU_SCBF_DIS` Register Diagram

Table 1-18: `CGU_SCBF_DIS` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W)	LOCK	Lock. The <code>CGU_SCBF_DIS</code> . <code>LOCK</code> bit allows writes to the <code>CGU_SCBF_DIS</code> register when cleared (=0) or blocks writes if set (=1) and the <code>SPU_CTL</code> . <code>GLCK</code> bit is set.
		0 Unlock register
		1 Lock register
3 (R/W)	OUTCLKBF	OCLK Buffer. The <code>CGU_SCBF_DIS</code> . <code>OUTCLKBF</code> bit enables (=0, default) or disables (=1) OCLKs buffer.
		0 Enable buffer
		1 Disable buffer
2 (R/W)	DCLKBF	DCLK Buffer. The <code>CGU_SCBF_DIS</code> . <code>DCLKBF</code> bit enables (=0, default) or disables (=1) DCLKs buffer.
		0 Enable buffer
		1 Disable buffer

Table 1-18: CGU_SCBF_DIS Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration	
1 (R/W)	SCLK1BF	SCLK1 Buffer. The CGU_SCBF_DIS.SCLK1BF bit enables (=0, default) or disables (=1) SCLK1s buffer.	
		0	Enable buffer
		1	Disable buffer
0 (R/W)	SCLK0BF	SCLK0 Buffer. The CGU_SCBF_DIS.SCLK0BF bit enables (=0, default) or disables (=1) SCLK0s buffer.	
		0	Enable buffer
		1	Disable buffer

System Clock Buffer Status Register

The `CGU_SCBF_STAT` register shows which system clock buffer(s) are disabled. For example clearing the `CGU_CCBF_DIS.CCBF0` bit clears the `CGU_SCBF_STAT.SCLK0BF` bit after a number of cycles. To guarantee that the correct value is read, this register should be read twice and the second result used.

Figure 1-13: `CGU_SCBF_STAT` Register Diagram

Table 1-19: `CGU_SCBF_STAT` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
3 (R/NW)	OCLKBF	OCLK Buffer. The <code>CGU_SCBF_STAT.OCLKBF</code> bit reports the status of the <code>CGU_SCBF_DIS.OUTCLKBF</code> bit where 0 = enabled and 1 = disabled.
		0 Enabled
		1 Disabled
2 (R/NW)	DCLKBF	DCLK1 Buffer. The <code>CGU_SCBF_STAT.DCLKBF</code> bit reports the status of the <code>CGU_SCBF_DIS.DCLKBF</code> bit where 0 = enabled and 1 = disabled.
		0 Enabled
		1 Disabled
1 (R/NW)	SCLK1BF	SCLK1 Buffer. The <code>CGU_SCBF_STAT.SCLK1BF</code> bit reports the status of the <code>CGU_SCBF_DIS.SCLK1BF</code> bit where 0 = enabled and 1 = disabled.
		0 Enabled
		1 Disabled

Table 1-19: CGU_SCBF_STAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
0 (R/NW)	SCLK0BF	SCLK0 Buffer. The <code>CGU_SCBF_STAT.SCLK0BF</code> bit reports the status of the <code>CGU_SCBF_DIS.SCLK0BF</code> bit where 0 = enabled and 1 = disabled.
		0 Enabled
		1 Disabled

Status Register

The `CGU_STAT` register reflects the PLL status and errors detected during the PLL configuration. This register may be cleared asynchronously by a reset signal from the RCU module. All bits---except those defined as W1C (write-1-to-clear)---are read only.

Figure 1-14: CGU_STAT Register Diagram

Table 1-20: CGU_STAT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
21 (R/W1C)	PCFGERR	PLL Configuration Error. If the <code>CGU_PLLCTL.PLLBPST</code> and the <code>CGU_PLLCTL.PLLBPCL</code> bits are set (=1) simultaneously or the <code>CGU_PLLCTL.PLLDIS</code> bit was set (=1) in full-on mode or while trying to enter full-on mode (<code>CGU_PLLCTL.PLLBPCL</code> =1), the <code>CGU_STAT.PCFGERR</code> bit triggers the bus error.
		0 No Error
		1 Configuration Error

Table 1-20: CGU_STAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
20 (R/W1C)	WDIVERR	Write to DIV Error. The CGU_STAT.WDIVERR bit indicates a write access to the CGU_DIV register (to trigger an alignment sequence or to change the CGU_DIV.CSEL, CGU_DIV.SYSSEL, CGU_DIV.S0SEL, CGU_DIV.S1SEL, or CGU_DIV.DSEL bit values) while the PLL is locked, but still aligning the clocks. Read after write accesses to the CGU_STAT and CGU_DIV registers return the new value even if the clock frequency change is still in progress.
		0 No Error
		1 Write DIV Error
19 (R/W1C)	WDFMSERR	Write to DF or MSEL Error. The CGU_STAT.WDFMSERR bit indicates a write access to the CGU_CTL register to change the CGU_CTL.DF or CGU_CTL.MSEL bit values while the PLL is locking.
		0 No Error
		1 Write DF/MSEL Error
17 (R/W1C)	LWERR	Lock Write Error. The CGU_STAT.LWERR bit indicates an attempt to write to write-protected (locked) CGU registers. The CGU issues a bus error for this condition.
		0 No Error
		1 Lock Write Error
16 (R/W1C)	ADDRERR	Address Error. The CGU_STAT.ADDRERR bit indicates an attempt to make a read or write access to unimplemented addresses or accesses are non-aligned. The CGU issues a bus error for this condition.
		0 No Error
		1 Address Error
15 (R/NW)	OSCWDSTATF	Oscillator Watchdog Status Fault. The CGU_STAT.OSCWDSTATF bit indicates a fault in the oscillator watchdog (CGU's OSC_WDSTAT[1:0]) input pins.
		0 No Fault
		1 Fault
14:12 (R/NW)	OSCWDSTATFC	Oscillator Watchdog Status Fault Code. The CGU_STAT.OSCWDSTATFC bit field indicates the nature of the fault in the oscillator watchdog (CGU's OSC_WDSTAT[1:0]) input pins.
		0 No Fault
		1 No Input Clock

Table 1-20: CGU_STAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration	
		2	Subharmonic CLKIN
		3	Harmonic CLKIN
		4	No AUX_CLK
		5	CLKIN > Upper Frequency Limit (BOUF)
		6	Reserved
		7	Multiple Limit Faults
3 (R/NW)	CLKSALGN	Clock Alignment. The CGU_STAT.CLKSALGN bit indicates whether a clock alignment sequence is in progress. This bit is set when clocks alignment is required by changes to CGU_DIV.CSEL, CGU_DIV.S0SEL, CGU_DIV.S1SEL, CGU_DIV.DSEL, or CGU_DIV.OSEL. The CGU_STAT.CLKSALGN bit is cleared when clocks are aligned. Note that (after a PLL frequency change in active state) the CGU_STAT.CLKSALGN bit may indicate that clocks are not aligned even though the clocks are aligned (all clocks are aligned and running at CLKIN frequency).	
		0	Clocks are Aligned
		1	Clocks not Aligned (alignment in progress)
2 (R/NW)	PLOCK	PLL Lock. The CGU_STAT.PLOCK bit indicates whether the PLL is locked. This bit is set when the PLL locks (PLL lock counter end-of-count). The CGU_STAT.PLOCK bit is cleared when requested PLL frequency change (for PLL reset, PLL disable-to-enable transition, or a change to the CGU_CTL.MSEL or CGU_CTL.DF values) is in progress.	
		0	PLL not Locked (PLL frequency change in progress)
		1	PLL Locked
1 (R/NW)	PLLBP	PLL Bypass. The CGU_STAT.PLLBP bit indicates whether the PLL is bypassed. The default value for the CGU_STAT.PLLBP bit is determined by the bypass strap pin.	
		0	PLL not Bypassed
		1	PLL Bypassed
0 (R/NW)	PLLEN	PLL Enable. The CGU_STAT.PLLEN bit indicates whether the PLL is enabled.	
		0	Disabled
		1	Enabled

Time Stamp Counter 32 LSB Register

The `CGU_TSCOUNT0` register address is used to read the CoreSight time stamp counter LSB 32-bit (bits [31:0]) value.

Figure 1-15: CGU_TSCOUNT0 Register Diagram

Table 1-21: CGU_TSCOUNT0 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	VALUE	TSCOUNT0 Value. The <code>CGU_TSCOUNT0.VALUE</code> bit field holds the time stamp counter 32 LSBs.

Time Stamp Counter 32 MSB Register

The `CGU_TSCOUNT1` register address is used to read the CoreSight time stamp counter MSB 32-bit (bits [63:32]) value.

Figure 1-16: CGU_TSCOUNT1 Register Diagram

Table 1-22: CGU_TSCOUNT1 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	VALUE	Timestamp Counter 32 MSB. The <code>CGU_TSCOUNT1.VALUE</code> bit field holds the time stamp counter 32 MSBs.

Time Stamp Control Register

The `CGU_TSCTL` register controls the operation of the CoreSight time stamp counter.

Figure 1-17: `CGU_TSCTL` Register Diagram

Table 1-23: `CGU_TSCTL` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W)	LOCK	Lock. Setting the <code>CGU_TSCTL.LOCK</code> bit locks this register.
		0 Unlock
		1 Lock
7:4 (R/W)	TSDIV	Counter's Clock Divider. The <code>CGU_TSCTL.TSDIV</code> bit field divides <code>SYSCCLK</code> by 2^{TSDIV} .
		0-15 Divides <code>SYSCCLK</code> by 2^{TSDIV}
1 (R/W)	LOAD	Load Counter. Writing one to the <code>CGU_TSCTL.LOAD</code> bit causes CoreSight time stamp counter to be loaded from the <code>CGU_TSVALUE0</code> and <code>CGU_TSVALUE1</code> registers.
		0 Always read as "0"
0 (R/W)	EN	Counter Enable. The <code>CGU_TSCTL.EN</code> bit enables or disables the CoreSight time stamp counter.
		0 Counter Disabled
		1 Counter Enabled

Time Stamp Counter Initial 32 LSB Value Register

The `CGU_TSVALUE0` register holds the least significant bits (bits [31:0]) value that is initially loaded to the CoreSight time stamp counter.

Figure 1-18: CGU_TSVALUE0 Register Diagram

Table 1-24: CGU_TSVALUE0 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	Counter's 32 LSB Initial Value. The <code>CGU_TSVALUE0.VALUE</code> bit field holds the LSBs value that is initially loaded to the CoreSight time stamp counter.

Time Stamp Counter Initial MSB Value Register

The `CGU_TSVALUE1` register holds the most significant bits (bits [63:32]) value that is initially loaded to the CoreSight time stamp counter.

Figure 1-19: CGU_TSVALUE1 Register Diagram

Table 1-25: CGU_TSVALUE1 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	Counter's Initial 32 MSB Value. The <code>CGU_TSVALUE1.VALUE</code> bit field holds the MSBs value that is initially loaded to the CoreSight time stamp counter.

2 Clock Distribution Unit (CDU)

The Clock Distribution Unit (CDU) consists of an array of multiplexors that select clocks originated from up to four different clock sources. These sources are different clocks that are generated from the CGUs. The multiplexors are configured by software. All clocks multiplexors have up to four different sources. Unused input clocks are grounded internally and never selected. The output clock signal for each multiplexor is assigned to one or more destinations within the processor.

CDU Features

The CDU modules supports the following features:

- Generation of up to 13 output clocks
- Output clock buffers that can be disabled by software
- Each multiplexor has four input clocks
- Multiplexors that are configured by writing to configuration registers ([CDU_CFG\[n\]](#))
- Clocks originated in CGU0 that are selected by default
- A CDU status register ([CDU_STAT](#)) that indicates a configuration change is in-progress

CDU Functional Description

The CDU functions as a set of software-configurable multiplexors that select clocks from different sources.

CDU Block Diagram

The *CDU Block Diagram* figure shows the functional blocks within the CDU. As shown in the figure, the CDU takes different clocks generated by the CGU blocks and provides flexibility to route any clock from possible options to the output CDU clocks. The output clocks from the CDU are connected to specific targets such as the DDR module. All of the targets are clocked through the CDU output clocks rather than being directly clocked by CGU clocks.

This configuration provides the flexibility to meet the specific clock requirements of the different modules in the system (such as the core, DDR, or SPI module) without compromising the clocking of other modules. Such a flexibility is not possible with a single CGU in the system. With two CGUs:

- Each CGU has its own set of clock multipliers and dividers, providing a greater number of orthogonal clocks than possible with a single CGU.
- The `CDU_CLKINSEL.CGU1` bit determines the input for CGU1.

Figure 2-1: CGU/CDU Block Diagram

The DDR is clocked from the DCLK (DCLK_0 and DCLK_1) from CGU0 or CGU1. This configuration provides the flexibility to program the DDR with frequencies orthogonal to the core clock frequencies.

CDU Definitions

The *Clock Descriptions* table provides a brief description of the clocks supported by the processor.

Table 2-1: Clock Descriptions

Clock	Description
CCLK0_0	CCLK0 derived from CGU0
CCLK1_0	CCLK1 derived from CGU0
SYSCLK_0	SYSCLK derived from CGU0
SCLK0_0	SCLK0 derived from CGU0
SCLK1_0	SCLK1 derived from CGU0
DCLK_0	DCLK derived from CGU0
OCLK_0	OCLK derived from CGU0
CCLK0_1	CCLK0 derived from CGU1
SYSCLK_1	SYSCLK derived from CGU1
SCLK0_1	SCLK0 derived from CGU1
SCLK1_1	SCLK1 derived from CGU1
DCLK_1	DCLK derived from CGU1
OCLK_1	OCLK derived from CGU1
CDU_CLKOn	Clocks that come out of the CDU module and go to different blocks

CDU Clock Configuration Options

The *CDU Targets* table provides information about clock source and destination options.

Table 2-2: CDU Targets

CDU0 Input				CDU0 Output	Target
IN0_CLKOn	IN1_CLKOn	IN2_CLKOn	IN3_CLKOn		
CCLK0_0	N/A	N/A	N/A	CLKO0	SHARC0 and corresponding accerators
CCLK0_0	N/A	N/A	N/A	CLKO1	SHARC1 and corresponding accerators
CCLK1_0	N/A	N/A	N/A	CLKO2	ARM
DCLK_0	DCLK_1	N/A	N/A	CLKO3	DDR

Table 2-2: CDU Targets (Continued)

CDU0 Input				CDU0 Output	Target
IN0_CLKOn	IN1_CLKOn	IN2_CLKOn	IN3_CLKOn		
OCLK_0	OCLK_1	N/A	N/A	CLKO4**1	CAN
SCLK1_0	N/A	N/A	N/A	CLKO5	SPDIF
SCLK0_0	OCLK_0	N/A	N/A	CLKO6	SPI
SCLK0_0	SCLK0_1	N/A	N/A	CLKO7*	GIGE
OCLK_0	SCLK0_0	CCLK0_1	N/A	CLKO8	LP
OCLK_0	DCLK_0	SYCLK_1	N/A	CLKO9	LP_DDR
SYCLK_0	SCLK0_0	SCLK1_1	N/A	CLKO10	OSPI_REFCLK
SCLK0_0	SCLK1_1	N/A	N/A	CLKO12	TRACE

*1 Clock is not present in the ADSP-21591 and ADSP-21593 processors

CDU Programming Model

The `CDU_CFG[n]` registers are a system configuration resource. These registers are accessed by a system configuration routine that also handles the configuration of other system modules. Writes to a `CDU_CFG[n]` register must occur when there is not a `CDU_CLKOn` configuration change in progress. If a CGUn inputs are selected, that CGUn configuration must be completed first.

Changing the PLL and Clock Frequency

- Read the `CGU_STAT` register. Verify that:
 - `CGU_STAT.PLLEN = 1` (enabled)
 - `CGU_STAT.PLOCK = 1` (PLL is not locking)
 - `CGU_STAT.CLKSALGN = 0` (clocks aligned)
- Write the desired values into the `CGU_DIV.CSEL`, `CGU_DIV.S0SEL`, `CGU_DIV.SYSEL`, `CGU_DIV.S1SEL`, `CGU_DIV.DSEL` and `CGU_DIV.OSEL` bits with the `CGU_DIV.UPDT` bit cleared (= 0).
- Write the desired values to the `CGU_CTL.DF` and `CGU_CTL.MSEL` bits.
 - To change the PLL frequency while all cores are idle, set the `CGU_CTL.WFI` bit (=1).
 - To change the PLL frequency while the cores are active, clear the `CGU_CTL.WFI` bit (=0).
- Read the `CGU_STAT` register. Verify that:
 - `CGU_STAT.PLLEN = 1` (enabled)

- `CGU_STAT.PLOCK = 1` (not locking)
 - `CGU_STAT.CLKSALGN = 0` (clocks aligned)
5. If clocks switch from CGUm clocks to CGUn input clocks, read the `CGU_SCBF_STAT` and `CGU_CCBF_STAT` registers. The `CGU_CCBF_STAT[1:0]` bit field corresponds to the CCLK1 and CCLK0 clock buffers, respectively. The `CGU_SCBF_STAT[3:0]` bit field corresponds to the OUTCLK, DCLK, SCLK1, and SCLK0 clock buffers, respectively.
 6. Read the `CDU_STAT` register. Verify that the `CDU_STAT.CLK00` (no CLKOn configuration change in progress).
 7. Write to the `CDU_CLKINSEL` register to select the CGU's CLKIN input clock.
 8. Write to the `CDU_CFG[n].SEL` bit to select the clock source (the `CDU_CFG[n].EN` bit should =1.)
 9. Read the `CDU_CFG[n]` register. Verify that the `CDU_CLKINSEL` has the programmed value.

CLKOn is reconfigured.

Changing the Clock Frequency

Use the following procedure to change a clock frequency.

1. Read the `CGU_STAT` register to verify that the `CGU_STAT.CLKSALGN` bit =0 (clocks aligned).
2. Write the desired values into the `CGU_DIV.CSEL`, `CGU_DIV.S0SEL`, `CGU_DIV.SYSSEL`, `CGU_DIV.S1SEL`, `CGU_DIV.DSEL` and `CGU_DIV.OSEL` bits with the `CGU_DIV.UPDT` bit = 1.
3. Read the `CGU_DIV` registers to verify that the `CGU_DIV.CSEL`, `CGU_DIV.S0SEL`, `CGU_DIV.SYSSEL`, `CGU_DIV.S1SEL`, `CGU_DIV.DSEL` and `CGU_DIV.OSEL` bit values are correct.
4. Read the `CGU_STAT` register to verify that the `CGU_STAT.CLKSALGN = 0` (clocks aligned).
5. If clocks switch from CGUm clocks to CGUn input clocks, read the `CGU_SCBF_STAT` and `CGU_CCBF_STAT` registers. The `CGU_CCBF_STAT[1:0]` bit field corresponds to the CCLK1 and CCLK0 clock buffers, respectively. The `CGU_SCBF_STAT[3:0]` bit field corresponds to the OUTCLK, DCLK, SCLK1, and SCLK0 clock buffers, respectively.
6. Read the `CDU_STAT` register.
7. Write to the `CDU_CFG[n].SEL` bit to select the clock source (`CDU_CFG[n].EN = 1`).
8. Read the `CDU_CFG[n]` register. Verify that the `CDU_CLKINSEL` has the programmed value.
9. Verify that the `CDU_STAT.CLK00 = 0`.

ADSP-2159x CDU Register Descriptions

Clock Distribution Unit (CDU) contains the following registers.

Table 2-3: ADSP-2159x CDU Register List

Name	Description
CDU_CFG[n]	CDU Configuration
CDU_CLKINSEL	CLKIN Select
CDU_REVID	CDU Revision ID
CDU_STAT	CDU Status

CDU Configuration

The `CDU_CFG[n]` registers control the configuration of the clock multiplexors. `CDU0_CFG[n]` corresponds to output clock `CDU_CLKO[n]`.

Figure 2-2: `CDU_CFG[n]` Register Diagram

Table 2-4: `CDU_CFG[n]` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W)	LOCK	Lock Bit.
2:1 (R/W)	SEL	Select Clock Input.
		0 IN0_CLKOn Selected
		1 IN1_CLKOn Selected
		2 IN2_CLKOn Selected
		3 IN3_CLKOn Selected
0 (R/W)	EN	Clock Output Enabled. The <code>CDU_CFG[n]</code> .EN bit enables clock output.

CLKIN Select

The `CDU_CLKINSEL` register controls the configuration of the CLKIN multiplexors. One bit is assigned to each CGU in the system. This bit selects either CLKIN0 or CLKINn CGUn inputs.

Figure 2-3: CDU_CLKINSEL Register Diagram

Table 2-5: CDU_CLKINSEL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W)	LOCK	Lock Bit.
0 (R/W)	CGU1	CGU1 CLKINn Select. The <code>CDU_CLKINSEL.CGU1</code> bit drives <code>CDU_CLKIN_SEL[0]</code> to CGU1.
		0 Selects CLKIN0
		1 Selects CLKIN1

CDU Revision ID

Figure 2-4: CDU_REVID Register Diagram

Table 2-6: CDU_REVID Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
7:4 (R/NW)	MAJOR	Major Version ID.
3:0 (R/NW)	REV	Incremental Version ID.

CDU Status

The `CDU_STAT` register reflects the status a change in the configuration of the clock muxes.

Figure 2-5: CDU_STAT Register Diagram

Table 2-7: CDU_STAT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
17 (R/W1C)	LWERR	Lock Write Error. The <code>CDU_STAT.LWERR</code> bit indicates a lock error where write transactions try to access write protected registers.
		0 No Lock Write Error
		1 Lock Write Error
16 (R/W1C)	ADDRERR	Address Error. The <code>CDU_STAT.ADDRERR</code> bit indicates an address error where read or write transactions try to access unimplemented addresses or accesses are non-aligned.
		0 No Address Error
		1 Address Error

3 Dynamic Power Management (DPM)

The dynamic power management (DPM) unit of the processor controls transitions between different power-saving modes.

DPM Features

The DPM allows programs to control the power mode of the processor as follows.

- Permits operation of multiple, external wake-up sources

DPM Functional Description

The DPM can be programmed to transition between power modes.

ADSP-2159x DPM Register List

A set of registers govern DPM operations. For more information on DPM functionality, see the DPM register descriptions.

Table 3-1: ADSP-2159x DPM Register List

Name	Description
DPM_CTL	Control Register
DPM_PER_DIS0	Peripherals Disable Register 0
DPM_PER_DIS1	Peripherals Disable Register 1
DPM_REVID	Revision ID
DPM_STAT	Status Register

DPM Definitions

To make the best use of the DPM, it is useful to understand the following terms.

CGU

Acronym for the clock generation unit (CGU), which is comprised of the PLL and PCU

DPM

Acronym for the dynamic power management (DPM) controller.

Full-on mode

The normal operating mode in which all clock domains are derived from the PLL.

PCU

Acronym for the PLL control unit (PCU).

PLL

Acronym for the phase-locked loop (PLL).

RCU

Acronym for the reset control unit (RCU).

DPM Operating Modes

The DPM includes several operating modes. The modes are:

- Reset
- Full-on

Reset State

Reset is the initial state of the processor and is the result of a hardware or software triggered event. The DPM itself does not trigger entering reset. The external `SYS_HWRST` pin or the RCU triggers entering reset. The DPM responds to reset by transitioning to its default state.

From Reset, the DPM always transitions to PLL Bypassed state.

Full-on Mode

Full-on mode is the default state of the DPM after Reset.

In full-on mode, the processor can reach its maximum clock rate and power dissipation can be at its highest.

DPM Event Control

The DPM event is triggered when an enabled wake-up is asserted. The DPM generates bus errors when a misaligned access to a register occurs. It also generates errors when an attempt is made to access unused DPM address space or a write-protected register.

DPM Events

The DPM event interrupt is triggered when any bit in the [DPM_STAT](#) register is set, indicating that an enabled wake-up was asserted. The DPM event interrupt stays active until the user clears any bits that are set in the [DPM_STAT](#) register.

DPM Errors

The DPM generates a bus error when a read or write transaction is attempted to an unused address within the DPM address range. It also generates a bus error when a misaligned access is made to a DPM register. In addition to the bus error, the DPM sets the `DPM_STAT.ADDRERR` bit.

If a write to a write-protected DPM register is attempted, the DPM generates a bus error. In addition, the DPM sets the `DPM_STAT.LWERR` bit.

DPM Programming Model

The *DPM_PER_DIS0 Register Mapping* and *DPM_PER_DIS01 Register Mapping* tables show the module clocks and the corresponding peripheral. The [DPM_PER_DIS0](#) and [DPM_PER_DIS0](#) registers are used to shut off the clock to each peripheral if it is not required by the application.

Table 3-2: DPM0_PER_DIS0 Register Mapping

Peripheral Name	Gated Module Clocks	Type of sync on PER-DIS bit	Effect latency (In cycles of module clocks)	DPM0_PER_DISn bit
FIR0/FFT	cclk	Not Required	1	0
IIR0	cclk	Not Required	1	1
DAI0	sclk0	Single Flop	2	5
	sclk1	Single Flop	2	
	sysclk	Not Required	1	
DAI1	sclk0	Single Flop	2	6
	sclk1	Single Flop	2

SMPU-L2CTL-DL2-0	sysclk	Not Required	1	21
SMPU-DMC0	sysclk	Not Required	1	27

Table 3-3: DPM0_PER_DIS1 Register Mapping

Peripheral Name	Gated Module Clocks	Type of sync on PER-DIS bit	Effect latency (In cycles of module clocks)	DPM0_PER_DISn bit
TWI0	sclk0	Single Flop	2	0
TWI1	sclk0	Single Flop	2	1
TWI2	sclk0	Single Flop	2	2
TWI3	sclk0	Single Flop	2	3
TWI4	sclk0	Single Flop	2	4
TWI5	sclk0	Single Flop	2	5
OSPI	sysclk	Not Required	1	27

ADSP-2159x DPM Register Descriptions

Dynamic Power Management (DPM) contains the following registers.

Table 3-4: ADSP-2159x DPM Register List

Name	Description
DPM_CTL	Control Register
DPM_PER_DIS0	Peripherals Disable Register 0
DPM_PER_DIS1	Peripherals Disable Register 1
DPM_REVID	Revision ID
DPM_STAT	Status Register

Control Register

The [DPM_CTL](#) register controls sleep modes selections and PLL operations of the DPM. A write protect feature permits locking out changes to this register.

Figure 3-1: DPM_CTL Register Diagram

Table 3-5: DPM_CTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W)	LOCK	Lock. If the global lock bit is set (SPU_CTL.GLCK bit =1) and the DPM_CTL.LOCK bit is set, the DPM_CTL register is read only (locked).
		0 Unlock
		1 Lock

Peripherals Disable Register 0

The `DPM_PER_DIS0` register is used to shut off the clocks to peripherals that are not used in an application in order to save clock switching power.

Figure 3-2: DPM_PER_DIS0 Register Diagram

Table 3-6: DPM_PER_DIS0 Register Fields

4 Reset Control Unit (RCU)

Reset is the initial state of the processor at power-on or the run-time state of any core, as controlled by another core in the device via the RCU or as a result of a hardware or software triggered event. In this state, all control registers are set to their default values and functional units are idle. Exiting a full system hardware reset results with only the host core being released from reset and ready to boot (Core 0 on the ADSP-SC57x devices, Core 1 on the ADSP-215xx devices).

The following table shows the cores that are released from reset. Exiting a Core n only reset starts with this Core n being ready to execute the code from the software vector registers ([RCU_SVECT0](#) , [RCU_SVECT2](#)).

Additional information on reset and booting can be found in the *Boot ROM and Booting the Processor* chapter.

Product	Core Released from Reset by RCU
ADSP-SC57x	Core 0
ADSP-2157x	Core 1

The Reset Control Unit (RCU) controls how all the functional units enter and exit reset. Differences in functional requirements and clocking constraints define how reset signals are generated. Programs must guarantee that none of the reset functions puts the system into an undefined state or causes resources to stall. This functionality is important when only one of the cores is reset (programs must ensure that there is no pending system activity involving the core that is being reset). While core resets and software system resets are controlled directly in the RCU, hardware resets can come from the TRU, SEC, or CGU Oscillator Watchdog.

RCU Features

The RCU module supports the following features:

- Hardware reset through the [SYS_HWRST](#) pin
- Software system reset through the RCU control ([RCU_CTL](#)) register
- Hardware system reset through:
 - TRU module
 - SEC module (System Fault Unit)

- A clock not good reset state (safe state of chip under reset) from the Oscillator Watchdog.
- Core reset through RCU Core Reset Output ([RCU_CRCTL](#)) register

RCU Functional Description

This section provides information on the function of RCU module.

Hardware reset using SYS_HWRST pin

Asserting the [SYS_HWRST](#) pin resets all functional units, except the real time clock (RTC) (if present).

Hardware reset through RCU

The RCU can perform a full system reset which can be initiated through hardware blocks like the SEC, the TRU, and the oscillator watchdog.

Software reset using RCU registers

Setting the [RCU_STAT](#).[SWRST](#) bit issues a software reset for all system units except the RTC module and [RCU_BCODE](#), [RCU_CRCTL](#) and [RCU_STAT](#) registers.

Core reset RCU registers

A core can be individually reset by software, or by setting the [RCU_CRCTL](#).[CR\[n\]](#) bit.

ADSP-2159x RCU Register List

The Reset Control Unit (RCU) controls how all the functional units in the processor enter and exit Reset. Differences in functional requirements and clocking constraints exist (units in different clock domains have to enter reset asynchronously, but units exit reset in a deterministic way), and these differences define how reset signals are generated. Reset signals propagate through all functional units asynchronously. For more information on RCU functionality, see the RCU register descriptions.

Table 4-1: ADSP-2159x RCU Register List

Name	Description
RCU_BCODE	Boot Code Register
RCU_CRCTL	Core Reset Outputs Control Register
RCU_CRSTAT	Core Reset Outputs Status Register
RCU_CTL	Control Register
RCU_MSG	Message Register
RCU_MSG_CLR	Message Clear Bits Register

RCU_SRRQSTAT	System Reset Request Status Register
RCU_STAT	Status Register
RCU_SVECT0	Software Vector Register 0
RCU_SVECT1	Software Vector Register 1
RCU_SVECT2	Software Vector Register 2
RCU_SVECT_LCK	SVECT Lock Register

ADSP-2159x RCU Trigger List

Table 4-2: ADSP-2159x RCU Trigger List Masters

Trigger ID	Name	Description	Sensitivity
None			

Table 4-3: ADSP-2159x RCU Trigger List Slaves

Trigger ID	Name	Description	Sensitivity
50	RCU0_SYSRST0	RCU0 System Reset Slave 0	Pulse
51	RCU0_SYSRST1	RCU0 System Reset Slave 1	Pulse

RCU Definitions

To make the best use of the RCU, it is useful to understand the terms in this section.

The target or source defines the following are types of resets.

Hardware Reset (by target)

All functional units except a small subsection of debug interfaces are set to their default states. State is lost in all non-volatile storage.

System Reset (by target)

All functional units except the RCU, flash interface, and debug are set to their default states.

Core n Only Reset (by target)

Affects Core n only. The system software must guarantee that a bus master cannot access the core in reset state.

Hardware Reset (by source)

The `SYS_HWRST` input signal is asserted active (pulled low).

System Reset (by source)

Software can trigger the reset by writing to the `RCU_CTL` register or by another functional unit such as the TRU or any of the generic reset inputs.

RCU Architectural Concepts

To understand the architecture of the RCU, it is important to consider the reset sources and how differing resets affect the functional units of the processor.

The RCU provides the hardware that controls how all the functional units enter and exit reset. Differences in functional requirements and clocking constraints define how reset signals are generated. For example, units in different clock domains must enter reset asynchronously but exit reset in a deterministic way.

The program must guarantee that none of the reset functions put the system in an undefined state or cause resources to stall. This functionality is important when only one of the cores is reset. The program must guarantee that there is no pending system activity involving Core n before it is reset. For example, there must be no pending transactions to core 0 when the core 0 is reset and vice-versa.

The *RCU Reset Sources* table defines how reset sources affect the different functional units.

Table 4-4: RCU Reset Sources

Reset Source	Reset Type	Affected Functional Units
<code>SYS_HWRST</code> pin assertion	Hardware Reset	All functional units, except RTC (if present)
<code>SYSCLK</code> clock domain system reset by the Fault Unit (FMU) or TRU slave	System Reset	All functional units, except: • RTC (if present) • <code>RCU_STAT</code> • <code>RCU_BCODE</code> • the units on the <code>VDDEXT</code> power domain
<code>RCU_CTL.SYSRST</code> bit set (software triggered reset)	System Reset	All functional units, except: • RTC (if present) • <code>RCU_STAT</code> • <code>RCU_BCODE</code> • the units on the <code>VDDEXT</code> power domain

Table 4-4: RCU Reset Sources (Continued)

Reset Source	Reset Type	Affected Functional Units
RCU_CRCTL.CR[n] bit set (software triggered reset)	Core Only Reset	Core n only , for ($2 \geq n \geq 0$)

RCU Status and Error Signals

The `RCU_STAT` register reflects status and error information. There are three kinds of errors that can occur in the RCU. The reset out error is triggered when `RSTOUT` is both asserted and deasserted at the same time. The lock write error occurs if an attempt is made to write a lock RCU register. The address error occurs if a read-only register is written to or if an attempt is made to a reserved address within the RCU MMR address range.

ADSP-2159x RCU Register Descriptions

Reset Control Unit (RCU) contains the following registers.

Table 4-5: ADSP-2159x RCU Register List

Name	Description
<code>RCU_BCODE</code>	Boot Code Register
<code>RCU_CRCTL</code>	Core Reset Outputs Control Register
<code>RCU_CRSTAT</code>	Core Reset Outputs Status Register
<code>RCU_CTL</code>	Control Register
<code>RCU_MSG</code>	Message Register
<code>RCU_MSG_CLR</code>	Message Clear Bits Register
<code>RCU_MSG_SET</code>	Message Set Bits Register
<code>RCU_SIDIS</code>	System Interface Disable Register
<code>RCU_SISTAT</code>	System Interface Status Register
<code>RCU_SRRQSTAT</code>	System Reset Request Status Register
<code>RCU_STAT</code>	Status Register
<code>RCU_SVECT0</code>	Software Vector Register 0
<code>RCU_SVECT1</code>	Software Vector Register 1
<code>RCU_SVECT2</code>	Software Vector Register 2
<code>RCU_SVECT_LCK</code>	SVECT Lock Register

Boot Code Register

The `RCU_BCODE` register can be used to determine if and how core boots. This register is set to its default values by RESET.

Figure 4-1: RCU_BCODE Register Diagram

Table 4-6: RCU_BCODE Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W)	LOCK	Lock. If the global lock bit is set (<code>SPU_CTL.GLCK</code> bit =1) and the <code>RCU_BCODE.LOCK</code> bit is set, the <code>RCU_BCODE</code> register is read only (locked).
		0 Unlock
		1 Lock
13 (R/W)	IDLEONENTRY	Idle On Entry. The <code>RCU_BCODE.IDLEONENTRY</code> bit configures the RCU to enter the idle state at startup.
		0 Do not enter idle state
		1 Enter idle state

Table 4-6: RCU_BCODE Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
12 (R/W)	NOL2CONFIG	No L2 Configuration. The RCU_BCODE.NOL2CONFIG bit configures the RCU to not perform the L2 memory configuration.
		0 Configure L2 memory
		1 Do not configure L2 memory
10 (R/W)	NOHOOK	No Hook. The RCU_BCODE.NOHOOK bit configures the RCU to not perform the hook routine.
		0 Perform hook routine
		1 Do not perform hook routine
9 (R/W)	NOPREBOOT	No Preboot. The RCU_BCODE.NOPREBOOT bit configures the RCU to not perform the customer preboot routine.
		0 Perform preboot
		1 Do not perform preboot
6 (R/W)	NOFAULTS	No Faults. The RCU_BCODE.NOFAULTS bit configures the RCU to not perform fault initialization.
		0 Perform fault initialization
		1 Do not perform fault initialization
5 (R/W)	NOCACHE	No Cache. The RCU_BCODE.NOCACHE bit configures the RCU to not perform a cache initialization and to not enable the cache.
		0 Enable and initialize cache
		1 Do not initialize or enable cache
4 (R/W)	NOMEMINIT	No Memory Initialization. The RCU_BCODE.NOMEMINIT bit configures the RCU to not perform a memory initialization.
		0 Perform memory initialization
		1 Do not perform memory initialization

Table 4-6: RCU_BCODE Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
3 (R/W)	HBTOWV	Execute Wakeup. The RCU_BCODE.HBTOWV bit configures the RCU to execute a wakeup.
		0 Do not wakeup
		1 Execute wakeup
2 (R/W)	HALT	Halt. The RCU_BCODE.HALT bit configures the RCU to execute the no boot routine.
		0 Do not execute routine
		1 Execute routine
1 (R/W)	NOVECTINIT	No Vector Initialize. The RCU_BCODE.NOVECTINIT bit configures the RCU to not vector to the application.
		0 Vector
		1 Do not vector
0 (R/W)	NOKERNEL	No Boot Kernel. The RCU_BCODE.NOKERNEL bit configures the RCU to not execute the boot kernel.
		0 Execute boot kernel
		1 Do not execute boot kernel

Core Reset Outputs Control Register

The RCU core reset control n registers (`RCU_CRCTL`) include a lock bit (`RCU_CRCTL.LOCK`) and a core reset bit (`RCU_CRCTL.CR[n]`) for each core reset signal on the product.

Figure 4-2: RCU_CRCTL Register Diagram

Table 4-7: RCU_CRCTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W)	LOCK	Lock.
		If the global lock bit is set (<code>SPU_CTL.GLCK</code> bit =1) and the <code>RCU_CRCTL.LOCK</code> bit is set, the <code>RCU_CRCTL</code> register is read only (locked).
		0 Unlock
		1 Lock
3:0 (R/W)	CR[n]	Core Reset Outputs.
		The <code>RCU_CRCTL.CR[n]</code> bits control <code>CRES[1:0]</code> core reset signals. The <code>RCU_CRES[n]</code> signals can be individually controlled. They are reset to their default value by a hard reset or a system reset. For each <code>RCU_CRES[n]</code> , the selected <code>RCU0_CRMSKi[n]</code> bit is cleared.
		0 RCU_CRES[3:0] Deasserted
		1 RCU_CRES[0] ARM A5 reset control bit asserted
		2 RCU_CRES[1] SHARC0 reset control bit asserted
		4 RCU_CRES[2] SHARC1 reset control bit asserted
		8 RCU_CRES[3] DEBUG reset control bit asserted
		15 RCU_CRES[3:0] Asserted

Core Reset Outputs Status Register

The RCU core reset status register ([RCU_CRSTAT](#)) contains status bits, indicating which core reset signals have been asserted.

Figure 4-3: RCU_CRSTAT Register Diagram

Table 4-8: RCU_CRSTAT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
3:0 (R/W1C)	CR[n]	Core Reset Outputs. The RCU_CRSTAT.CR[n] bits indicate which cores have been reset since the last time the bit was cleared. Bits masked by CORE_DISABLE_MASK[15:0] are permanently disabled and the corresponding CR bits set. CR bits are sticky, they need to be cleared by software.
		0 RCU_CRES[1:0] deasserted. CR[n] corresponds to RCU_CRES[n].
		1 RCU_CRES[0] ARM A5 reset control bit asserted
		2 RCU_CRES[1] SHARC0 reset control bit asserted
		4 RCU_CRES[2] SHARC1 reset control bit asserted
		8 RCU_CRES[3] DEBUG reset control bit asserted
		15 RCU_CRES[3:0] were asserted since the last time bits were cleared. CR[n] corresponds to RCU_CRES[n].

Control Register

The RCU control register (`RCU_CTL`) provides a register lock, enables for the core and system reset requests inputs and control for the Reset Output pin.

Figure 4-4: RCU_CTL Register Diagram

Table 4-9: RCU_CTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W)	LOCK	Lock.
		If the global lock bit is set (<code>SPU_CTL.GLCK</code> bit =1) and the <code>RCU_CTL.LOCK</code> bit is set, the <code>RCU_CTL</code> register is read only (locked). This bit is cleared by a hard reset or any system reset event.
		0 Unlock 1 Lock
10 (R/W)	CRSTMSKSEL	Core Reset System Reset Mask Select. The <code>RCU_CTL.CRSTMSKSEL</code> bit selects the core reset system reset mask. This bit is cleared by a hard reset.
9 (R/W)	CRSTREQEN	Core Reset Request Enabled.
		The <code>RCU_CTL.CRSTREQEN</code> bit controls whether the <code>SYSCLK</code> domain source(s) of reset is/are enabled to reset the core(s) when asserted. This bit is cleared by hard reset or any system reset event.
		0 Disabled 1 Enabled

Table 4-9: RCU_CTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
8 (R/W)	SRSTREQEN	System Reset Request Enabled. The RCU_CTL.SRSTREQEN bit controls whether the SYSCLK domain sources of reset are enabled to do a system reset when asserted. This bit is cleared by a hard reset.
		0 Disabled
		1 Enabled
2 (R0/W)	RSTOUTDSRT	Reset Out Deassert. The RCU_CTL.RSTOUTDSRT bit controls the deassertion of the system reset pin.
		0 No Action
		1 Deassert RSTOUT
1 (R0/W)	RSTOUTASRT	Reset Out Assert. The RCU_CTL.RSTOUTASRT bit controls assertion of the system reset pin.
		0 No Action
		1 Assert RSTOUT
0 (R0/W)	SYSRST	System Reset. The RCU_CTL.SYSRST bit provides reset for all system units.
		0 No Action
		1 System Reset

Message Register

The `RCU_MSG` is a general-purpose register. It is intended to provide flexibility for Boot ROM code and to pass predefined variables to the debugger. Please see the Booting chapter for product-specific details.

Figure 4-5: RCU_MSG Register Diagram

Table 4-10: RCU_MSG Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W)	CALLERR	Call Error Flag. The <code>RCU_MSG.CALLERR</code> bit indicates that a flag has been set by the boot code prior to an error call.
		0 Flag not set
		1 Flag set

Table 4-10: RCU_MSG Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
30 (R/W)	CALLBACK	Callback Call Flag. The RCU_MSG.CALLBACK bit indicates that a flag has been set by the boot code prior to a callback call.
		0 Flag not set
		1 Flag set
29 (R/W)	CALLINIT	Call Initcode Flag. The RCU_MSG.CALLINIT bit indicates that a flag has been set by the boot code prior to an initcode call.
		0 Flag not set
		1 Flag set
28 (R/W)	CALLAPP	Call Application Flag. The RCU_MSG.CALLAPP bit indicates that a flag has been set by the boot code prior to an application call.
		0 Flag not set
		1 Flag set
27 (R/W)	HALTONERR	Halt on Error Call. The RCU_MSG.HALTONERR bit generates an emulation exception prior to an error call.
		0 Do not generate exception
		1 Generate exception
26 (R/W)	HALTONCALL	Halt on Callback Call. The RCU_MSG.HALTONCALL bit generates an emulation exception prior to a callback call.
		0 Do not generate exception
		1 Generate exception
25 (R/W)	HALTONINIT	Halt on Initcode Call. The RCU_MSG.HALTONINIT bit generates an emulation exception prior to an initcode call.
		0 Do not generate exception
		1 Generate exception

Table 4-10: RCU_MSG Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
24 (R/W)	HALTONAPP	Halt on Application Call. The RCU_MSG.HALTONAPP bit generates an emulation exception prior to an application call.
		0 Do not generate exception
		1 Generate exception
23 (R/W)	L3INIT	L3 Initialized. The RCU_MSG.L3INIT bit indicates that the L3 resource is initialized.
		0 Resource not initialized
		1 Resource initialized
22 (R/W)	L2INIT	L2 Initialized. The RCU_MSG.L2INIT bit indicates that the L2 resource is initialized.
		0 Resource not initialized
		1 Resource initialized
21 (R/W)	SECINIT	SEC Initialized. The RCU_MSG.SECINIT bit is used by tools for initialization of the SEC.
20 (R/W)	C2ACTIVATE	Core 2 Activated. The RCU_MSG.C2ACTIVATE bit is used by tools for activation of Core 2.
19 (R/W)	C1ACTIVATE	Core 1 Activated. The RCU_MSG.C1ACTIVATE bit is used by tools for activation of Core 1.
18 (R/W)	C2L1INIT	Core 2 L1 Initialized. The RCU_MSG.C2L1INIT bit indicates that the core 2 L1 resource is initialized.
17 (R/W)	C1L1INIT	Core 1 L1 Initialized. The RCU_MSG.C1L1INIT bit indicates that the core 1 L1 resource is initialized.
		0 Resource not initialized
		1 Resource initialized
16 (R/W)	C0L1INIT	Core 0 L1 Initialized. The RCU_MSG.C0L1INIT bit indicates that the core 0 L1 resource is initialized.
		0 Resource not initialized
		1 Resource initialized
10 (R/W)	C2IDLE	Core 2 Idle. The RCU_MSG.C2IDLE bit indicates that core 2 is in a safe idle state in ROM.

Table 4-10: RCU_MSG Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
9 (R/W)	C1IDLE	Core 1 Idle. The <code>RCU_MSG.C1IDLE</code> bit indicates that core 1 is in a safe idle state in ROM.
8 (R/W)	C0IDLE	Core 0 Idle. The <code>RCU_MSG.C0IDLE</code> bit indicates that core 0 is in a safe idle state in ROM.
7:0 (R/W)	ERRCODE	ROM Error Code. The <code>RCU_MSG.ERRCODE</code> bit indicates the error code of the ROM. It is valid only when in the error handler.

Message Clear Bits Register

The `RCU_MSG_CLR` register is used to clear bits in `RCU_MSG` register. Reading this register returns 0x00000000.

Figure 4-6: RCU_MSG_CLR Register Diagram

Table 4-11: RCU_MSG_CLR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R0/W1C)	CLR	Clear MSG Register Bits. The <code>RCU_MSG_CLR</code> .CLR bit resets MSG bit n.

Message Set Bits Register

The `RCU_MSG_SET` register is used to set bits in `RCU_MSG` register. Reading this register returns 0x00000000.

Figure 4-7: RCU_MSG_SET Register Diagram

Table 4-12: RCU_MSG_SET Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R0/W1S)	SET	Set Message Bits. The <code>RCU_MSG_SET.SET</code> bit sets MSG bit n.

System Interface Disable Register

The RCU system interface disable register ([RCU_SIDIS](#)) lets the RCU assert a system interface disable request to functional units in the processor. This register is set to its default values by a hard reset or any system reset event. For information on mapping between [RCU_SIDIS](#) bits and functional units, see the RCU functional description.

Figure 4-8: RCU_SIDIS Register Diagram

Table 4-13: RCU_SIDIS Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W)	LOCK	Lock.
		If the global lock bit is set (<code>SPU_CTL.GLCK</code> bit =1) and the <code>RCU_SIDIS.LOCK</code> bit is set, the RCU_SIDIS register is read only (locked).
		0 Unlock 1 Lock
2:0 (R/W)	SI[n]	System Interface Disable Request [2:0].
		Each <code>RCU_SIDIS.SI[n]</code> bit corresponds to a functional unit in the processor that supports the system interface disable request-acknowledge protocol.
		0 <code>RCU_SI_DISABLE_REQ[2:0]</code> deasserted
		1 <code>RCU_SI_DISABLE_REQ[0]</code> system interface disable request to SHARC0 asserted
		2 <code>RCU_SI_DISABLE_REQ[1]</code> system interface disable request to SHARC1 asserted
		4 Reserved 7 <code>RCU_SI_DISABLE_REQ[2:0]</code> asserted

System Interface Status Register

The RCU system interface status register ([RCU_SISTAT](#)) indicates whether a functional unit has or has not acknowledged an RCU unit disable request.

Figure 4-9: RCU_SISTAT Register Diagram

Table 4-14: RCU_SISTAT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
2:0 (R/NW)	SI[n]	System Interface Disable Acknowledge [2:0]. The <code>RCU_SISTAT.SI[n]</code> bit indicates whether a functional unit has or has not acknowledged an RCU unit disable request.
		0 No Acknowledge
		1 <code>RCU_SI_DISABLE_ACK[0]</code> system interface disable acknowledge from SHARC0 asserted
		2 <code>RCU_SI_DISABLE_ACK[1]</code> system interface disable acknowledge from SHARC1 asserted
		4 Reserved
		7 <code>SI_DISABLE_ACK[2:0]</code> asserted

System Reset Request Status Register

The RCU system reset request status register ([RCU_SRRQSTAT](#)) contains status bits, indicating which system reset request input triggered a system reset. This register is set to its default values by a hard reset.

Figure 4-10: RCU_SRRQSTAT Register Diagram

Table 4-15: RCU_SRRQSTAT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
7:0 (R/W1C)	SRRQ	System Reset Triggered by System Reset Request [n]. The RCU_SRRQSTAT . SRRQ bits are set by the assertion of the corresponding system reset request input and deasserted by writing "1" to the bit. The RCU_SRRQSTAT register is cleared by a hard reset.
		1 RCU_SRRQ[0], System Reset Request from SEC asserted
		2 RCU_SRRQ[1], System Reset Request from TRGS_RCU0_SYSRST0 asserted
		4 RCU_SRRQ[2], System Reset Request from TRGS_RCU0_SYSRST1 asserted
		8 RCU_SRRQ[3], System Reset Request from CTI3 asserted

Status Register

The RCU status register (`RCU_STAT`) contains status bits for all RCU reset sources, reset status, and boot mode inputs. Status bits for reset sources are sticky and can cleared by software. Error status bits are cleared by any reset event.

Figure 4-11: RCU_STAT Register Diagram

Table 4-16: RCU_STAT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
18 (R/W1C)	RSTOUTERR	Reset Out Error. The <code>RCU_STAT.RSTOUTERR</code> bit indicates (if set) that a write attempted to set the <code>RCU_CTL.RSTOUTASRT</code> and <code>RCU_CTL.RSTOUTDSRT</code> simultaneously. This condition triggers a bus error.
		0 No Error
		1 Error Occurred
17 (R/W1C)	LWERR	Lock Write Error. The <code>RCU_STAT.LWERR</code> bit indicates (when set) there was an attempted write to an RCU register while the <code>RCU_CTL.LOCK</code> bit was set and the global lock bit is enabled (<code>SPU_CTL.GLCK</code> bit =1). This status bit is sticky; write-1-to-clear
		0 No Error
		1 Error Occurred

Table 4-16: RCU_STAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
16 (R/W1C)	ADDRERR	Address Error. The RCU_STAT.ADDRERR bit indicates that the RCU generated an address error. This status bit is sticky; write-1-to-clear it.
		0 No Error
		1 Error Occurred
11:8 (R/NW)	BMODE	Boot Mode. The RCU_STAT.BMODE bits indicate the input on the boot mode pins.
5 (R/NW)	RSTOUT	Reset Out Status. The RCU_STAT.RSTOUT bit indicates the assertion status of the system reset pin.
		0 RSTOUT Deasserted
		1 RSTOUT Asserted
3 (R/W1C)	SWRST	Software Reset. The RCU_STAT.SWRST bit indicates that a system reset (which was triggered by software) has occurred since the last time a hardware reset occurred or since the RCU_STAT.SWRST bit was cleared by software.
		0 Inactive
		1 Reset Occurred
2 (R/W1C)	SSRST	System Source Reset. The RCU_STAT.SSRST bit indicates that a system reset triggered by hardware in the system clock domain, clock A domain, or clock B domain has occurred since the last time a hardware reset occurred or since the RCU_STAT.SSRST bit was cleared by software.
		0 Inactive
		1 Reset Occurred
0 (R/W1C)	HWRST	Hardware Reset. The RCU_STAT.HWRST bit indicates that a hardware reset has occurred.
		0 Inactive
		1 Reset Occurred

Software Vector Register 0

The `RCU_SVECT0` register contains the default location of the first instruction to execute after a reset.

Figure 4-12: RCU_SVECT0 Register Diagram

Table 4-17: RCU_SVECT0 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	Core 0 Reset Vector. The <code>RCU_SVECT0.VALUE</code> bit field contains the default location of the first instruction to execute after a reset.

Software Vector Register 1

Figure 4-13: RCU_SVECT1 Register Diagram

Table 4-18: RCU_SVECT1 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	Reset Vector.

Software Vector Register 2

Figure 4-14: RCU_SVECT2 Register Diagram

Table 4-19: RCU_SVECT2 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	Reset Vector.

SVECT Lock Register

The RCU software vector lock register ([RCU_SVECT_LCK](#)) provides a register lock and software vector n enable bits for each processor core on the product. This register is set to its default values by a hard reset or any system reset event.

Figure 4-15: RCU_SVECT_LCK Register Diagram

Table 4-20: RCU_SVECT_LCK Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W)	LOCK	Lock. If the global lock bit is set (<code>SPU_CTL.GLCK</code> bit =1) and the <code>RCU_SVECT_LCK.LOCK</code> bit is set, the RCU_SVECT_LCK register is read only (locked).
		0 Unlock
		1 Lock
2:0 (R/W)	SVECT[n]	Lock SVECTn Registers. If the global lock bit is set (<code>SPU_CTL.GLCK</code> bit =1) and the <code>RCU_SVECT_LCK.SVECT[n]</code> bit is set, the SVECT registers are read only (locked).

5 System Event Controller (SEC) and Generic Interrupt Controller (GIC)

There are two interrupt controllers—a generic interrupt controller (GIC) for the Arm core and the system event controller (SEC) for the SHARC cores.

System event management is the responsibility of the system event controller (SEC). The SEC manages the configuration of all system event sources. The SEC also manages the propagation of system events to all connected cores and the system fault interface.

All of the peripheral interrupts are routed using a single SEC interrupt to the desired core. The SEC allows programmability of the peripheral interrupt's priority, supporting up to 256 priority levels that are arbitrated within the SEC itself. The SEC also allows these interrupts to be grouped and masked by priority level and provides the flexibility to choose which core(s) the interrupt is routed to.

The SEC also supports self-nesting of interrupts, which is required when sharing a single interrupt request to an individual core, as this allows for a higher-priority peripheral interrupt to be passed to the core while it is currently servicing a lower-priority peripheral interrupt. For more information, refer to “Self-Nesting Mode for System Event Controller Interrupt (SECI)” in the *SHARC+ Core Programming Reference*.

For more information about the Arm GIC, visit the Arm Information Center.

SEC Features

The following list describes the system event controller features.

- Comprehensive system event source management including interrupt enable, fault enable, priority, core mapping, and source grouping.
- Fault management including fault action configuration, timeout, external indication, and system reset.
- Determinism where all system events have the same propagation delay and provide unique identification of a specific system event source.
- Distributed programming model where each system event source control and all status fields are independent of all others.

- Slave control port which provides access to all SEC registers for configuration, status, and interrupt or fault service model.
- Global locking supports a register level protection model to prevent writes to “locked” registers.

SEC Functional Description

The following sections provide a functional description of the SEC.

The *SEC/GIC Interrupt Signal Flow* figure shows an overview of the interrupt systems.

Figure 5-1: SEC/GIC Interrupt Signal Flow

ADSP-2159x SEC Register List

The System Event Controller (SEC) manages the system fault sources, including control features such as enable/disable, priority, and active/pending source status. For more information on SEC functionality, see the SEC register descriptions.

Table 5-1: ADSP-2159x SEC Register List

Name	Description
SEC_CACT[n]	SCI Active Register n

SEC Definitions

The event controller uses the following definitions.

System Events

System source indications including interrupts and faults.

System Source

Point of origin of system event.

SID (Identification, unique)

Source numeric identifier for each system source connected to the SEC.

SSI

SEC source interface, system event source control, and status subblock of the SEC.

SCI

SEC core interface, core interface subblock of the SEC

SPR

SEC prioritizer determines the highest priority pending interrupt and the highest priority active interrupt. The SPR provides these interrupts in the appropriate registers of the SCI for the priority and nesting model of the SCI.

SFI

SEC Fault Interface, fault management subblock of the SEC.

SEA

SEC system event aggregator generates an aggregate request to the SEC based on the active events at a given time.

SEC System Event Aggregator (SEA)

System event sources request event service from the SEC. In order to reduce the number of required SSI channels in the SEC, the System Event Aggregator (SEA) acts as an intermediate aggregator between the source and the SEC. All unique system events have dedicated inputs to the SEA. The SEA generates an aggregate request to the SEC based on which events are active at a given time.

To determine the active event for a given SEC ID, read the `SEC_SSTAT[n].CHID` bit field. The *Combined SEC and GIC Interrupt List* table shows five SEAs connected to SEC ID 251-255. All the sources grouped over the SEA are error events for a set of peripherals like the FIR-IIR, SPI-UART-LP-EPPI, MDMA, SPORT, and SWU. An error event from a peripheral is only expected when that peripheral is enabled. To mask SEA events from sources, disable the source peripheral conditions. There are no registers to mask events from the SEA, but there is a provision to mask the complete group output at the SEC.

Events are handled with a fixed priority order, on a first-come, first-served basis. If multiple events corresponding to the same SEC ID are active at the same time, the priority level is order dependent with the lower SEA IDs having the higher priority. The SEA events are level-based, so they remain high until the events are cleared at the source ensuring no event is missed. There is no support for nesting in a group since they all have same the SEC ID. An SEA event must be handled completely before addressing the next event.

SEC Block Diagram

The *SEC Block Diagram* shows the event management architecture.

System sources connect to the SEC through the SSI. Each core has a dedicated SCI. The SFI provides fault action connections to the rest of the system.

Figure 5-2: SEC Block Diagram

As shown in the figure, the SEC has three blocks for event management. The SFI monitors and manages any fault event triggered from various fault input sources. System interrupt sources are routed to the SFI through SEC source interface (SSI).

SEC Fault Interface (SFI)

The SFI manages fault events and associated actions. The fault management support provided in the SEC helps satisfy the safety requirements of various applications. The SSI provides the highest priority pending source that is enabled as a fault. The SFI captures this value and enables a countdown, and once the countdown expires, takes the prescribed action.

Fault actions which can be configured, as shown in *SFI Block Diagram*, include

- Trigger Output
- System Reset
- Fault Output
 - Computer Operating Properly (COP) mode
 - Fault Mode

Figure 5-3: SFI Block Diagram

Fault Management

System sources can be enabled as fault sources in the `SEC_SCTL[n]` register. When a source enabled as a fault moves to pending, it is forwarded to the SFI as a fault indication. The pending bit (`SEC_FSTAT.PND`) indicates a source has signaled a fault assertion but it has not yet triggered the event actions (if delay is enabled). The SEC fault interface sets the `SEC_FSTAT.PND` bit when the fault source ID register (`SEC_FSID`) is updated on assertion of a fault source input. The system source pending triggers a fault pending and after a programmable delay the fault moves to active. Event actions then execute if appropriate action is not taken by the core. The `SEC_FSTAT.ACT` bit indicates that the SEC has received a fault source input, the delay has expired, and the fault actions are enabled.

The `SEC_FSTAT.NPND` bit indicates if one or more sources have signaled a fault assertion, but the input has not yet triggered the fault pending detection in the SEC fault interface. The SEC sets the `SEC_FSTAT.NPND` bit when the fault interface detects assertion of any enabled fault source input, while either the `SEC_FSTAT.PND` or `SEC_FSTAT.ACT` bits are set. The SEC clears the `SEC_FSTAT.NPND` bit when there are no fault sources waiting.

A fault indication from an external device can also be detected on sampling the fault signals. When a fault is detected the `SEC_FSTAT.ACT` and `SEC_FSID.FEXT` bits are set. The assertion of either signal results in a fault input detection.

The `SEC_FEND` register receives a fault end indication from the core. The core writes the SID of the fault to the `SEC_FEND` register. If the SID matches the value in the `SEC_FSID` register, the `SEC_FSTAT.PND` and `SEC_FSTAT.ACT` bits are cleared.

SEC Core Interface (SCI)

The SCI manages communication between the corresponding core and the SEC. The SEC prioritizer (SPR) of the SCI receives pending, active, and priority information from the SSI for each system event source assigned to this SCI. The SPR determines the highest-priority pending system event and the SCI determines whether it propagates to the core. The SCI maintains the coherency for the system event service model implemented on the connected core.

Figure 5-4: SCI Overview Block Diagram

SEC Source Interface (SSI)

The SSI manages all of the system event sources. It maintains the status of each source in the corresponding `SEC_SSTAT[n]` register. The corresponding `SEC_SCTL[n]` register manages the control of each source. A pending and enabled event passes its indication and priority to the SCI to which it is assigned for further processing.

Figure 5-5: SSI Overview Block Diagram

SEC Architectural Concepts

The following sections describe SEC architectural features.

System Interrupt Acknowledge

A system interrupt acknowledge occurs when the core provides an indication that it has acquired the SID of the interrupt last issued by the SEC. The SEC core interface option allows generation by:

- A slave port write to the `SEC_CSID[n]` register.
- The assertion of an input acknowledge signal (the connected core generates the signal).

System Interrupt Groups

System sources can be assigned to groups using the `SEC_SCTL[n].GRP` bit field. Source groups allow fast context switching for system interrupts at each SCI. The `SEC_CGMSK[n]` register allows quick masking of interrupt groups of unlimited size with a single write operation.

System Interrupt Flow

An enabled and asserted system interrupt source is latched at the SSI and routed to the appropriate SCI based on the core target select (`SEC_SCTL[n].CTG`) bit field setting. The SEC priority ordering determines the highest priority pending system interrupt and the SCI updates the `SEC_CPND[n].SID` and `SEC_CACT[n].PRIO` bit field values. The SCI compares the `SEC_CPND[n]` register value against the highest priority active source in the `SEC_CACT[n]` register).

The priority level register (`SEC_CPLVL[n]`) determines how many of the MSBs the SEC uses in the comparison. The priority mask register (`SEC_CPMSK[n]`) and the group mask register (`SEC_CGMSK[n]`) determines which pending interrupt sources participate. If the `SEC_CPND[n]` register value is a higher priority (lower value) than the priority of the `SEC_CACT[n]` register from the comparison based on the `SEC_CPLVL[n]` register, the system interrupt output is asserted. The source ID register (`SEC_CSID[n]`) is updated with the `SEC_CPND[n].SID` bit field value and forwarded to the connected core.

After the core provides an interrupt acknowledgment, the interrupt source is active, until the SEC completes interrupt service with a write to the `SEC_END.SID` bit field with the same value. Note the following:

- Interrupt acknowledgement occurs with an MMR write of the `SEC_CSID[n]` register or the core version of the `SEC_CSID[n]` register.
- Interrupt active status indication is `SEC_SSTAT[n].ACT==1`.

The following sequence shows the example flow for a single interrupt.

1. The SEC compares the `SEC_CPND[n]` register value to the `SEC_CACT[n]` register value. If the interrupt in the `SEC_CPND[n]` register is higher priority, continue.
2. The SEC copies the `SEC_CPND[n]` register value to the `SEC_CSID[n]` register and asserts the interrupt signal.
3. The core reads the `SEC_CSID[n]` register (or core version).
4. The core writes to the `SEC_CSID[n]` register (or core version, asserts the acknowledge signal).
5. The SEC deasserts the interrupt signal and clears the `SEC_SSTAT[n].PND` bit and sets the `SEC_SSTAT[n].ACT` bit of the source going active.
6. The core writes the `SEC_CSID[n]` of the active interrupt to the `SEC_END` register.
7. The SEC clears the `SEC_SSTAT[n].ACT` bit of the source being ended.

The following sequence shows the example flow for interrupt nesting where interrupt A is a lower priority and occurs earlier than interrupt B.

1. The SEC compares the `SEC_CPND[n]` (A) register value to the `SEC_CACT[n]` register and if the interrupt in the `SEC_CPND[n]` register is a higher priority, continue.
2. The SEC copies `SEC_CPND[n]` (A) register to the `SEC_CSID[n]` register and asserts the interrupt signal.
3. The core reads the `SEC_CSID[n]` (A) register (or core version).
4. The core writes to the `SEC_CSID[n]` register (or core version, asserts the acknowledge signal).
5. The SEC deasserts the INT signal and clears the `SEC_SSTAT[n].PND` bit and sets the `SEC_SSTAT[n].ACT` bit of the source (A) going active.
6. The SEC compares the `SEC_CPND[n]` (B) register value to the `SEC_CACT[n]` (A) register value. If the `SEC_CACT[n]` (B) register value is a higher priority, continue.
7. The SEC copies the `SEC_CPND[n]` (B) register value to `SEC_CSID[n]` register and asserts the interrupt signal.
8. The core reads the `SEC_CSID[n]` (B) register (or core version).
9. The core writes to the `SEC_CSID[n]` register (or core version, asserts the acknowledge signal).
10. The SEC deasserts the INT signal and clears the `SEC_SSTAT[n].PND` bit and sets the `SEC_SSTAT[n].ACT` bit of the source (B) going active.
11. The core writes the `SEC_CSID[n]` of the active interrupt (B) to the `SEC_END` register.
12. The SEC clears the `SEC_SSTAT[n].ACT` bit of the source (B) being ended.
13. The core writes the `SEC_CSID[n]` of the active interrupt (A) to the `SEC_END` register.
14. The SEC clears the `SEC_SSTAT[n].ACT` bit of the source (A) being ended.

System Interrupt Priorities

Each system interrupt source has its own programmable priority level which is configured using the `SEC_SCTL[n].PRIO` bit field. The SCI evaluates the priority of all pending sources to determine the source of the highest-priority pending system interrupt for forwarding to the attached core. If more than one source of the pending system interrupt has the same priority setting, the SCI chooses the one with the lowest SID. For example, if SID 0, SID 1, and SID 2 are all pending and have the same priority setting, the SCI chooses SID 0 as the highest-priority source.

SEC Error

The processor includes an SEC error (`SEC_GSTAT.ERR`) as a source input to the SEC to allow for handling the error as an interrupt or fault.

SEC Programming Model

Implementing a system interrupt service model using the SEC requires, at a minimum:

- Proper configuration of a system interrupt source (for example a peripheral or DMA)
- A core interrupt or event service model

The core must be configured for response to system interrupts from the SEC. The SEC must be configured to enable and map the system interrupt source to the correct SCI and to forward interrupts to the connected core.

The system interrupt source must be configured to generate interrupt assertions. Alternatively, the processor can use software triggering for interrupt assertion. Software driven interrupts are generated by writing the source ID of the interrupt to be triggered to the `SEC_RAISE` register.

Programming Concepts

The following list provides the basic programming concepts necessary for configuring the SEC.

- Configuring an SSI as a system interrupt for a specific core.
- Configuring an SCI to provide system interrupts to the connected core (See [Configuring a System Source to Interrupt a Core](#)).
- Configuring an SSI as a system fault (See [Configuring a System Source as a Fault](#)).
- Configuring the SFI to manage system faults.

Programming Examples

This section provides example programming tasks that are typical for SEC usage.

Fault Management Interface Programming Model

The SFI interface can be programmed to manage fault events from system sources and associated actions such as issuing a system reset when watchdog expiration event occurs.

1. Set the `SEC_GCTL.EN` bit to enable the SEC.
2. Write to the `SEC_FCTL` register to configure specific fault actions.
 - Trigger Output. Set the `SEC_FCTL.TOEN` bit for the SEC to produce trigger outputs when a fault becomes active. The `SEC_FCTL.TES` bit can be programmed to select the event that directs the SEC to assert trigger output when a fault is pending or active. Configure slaves for SEC fault trigger master output.

NOTE: If the `SEC_FCTL.TOEN` and or the `SEC_FCTL.TES` bits =1 (Trigger Output Enabled and Trigger on Fault Pending), an external fault (if enabled by the `SEC_FCTL.FIEN` bit) will not issue a trigger since Fault Pending is bypassed for external faults.

- System Reset. The Reset Control Unit (RCU) controls how the functional units enter and exit reset. Configure the `RCU_CTL.SRSTREQEN` bit. This bit controls whether the sources of reset are enabled to perform a system reset. To issue a system reset request when a fault becomes active, set the `SEC_FCTL.SREN` bit. The SEC fault system reset delay register (`SEC_FSRDLY`) can be programmed for the delay, if required, from a fault becoming active to system reset request assertion.

- Fault Output. This configuration allows the SEC to indicate the fault status based on the `SEC_FCTL.CMS` bit configuration.
 - Computer Operating Normally (COP) mode. To configure fault output for COP mode, set the `SEC_FCTL.FOEN` bit to enable fault output. Set the `SEC_FCTL.CMS` bit to select COP mode to toggle the fault pin when no fault is active. Program the `SEC_FCOPP` period register with a desired width value for the COP toggled output pin.
 - Fault mode. Set the `SEC_FCTL.FOEN` bit to enable fault output. The `SEC_FCTL.CMS` bit should be set to Fault mode to toggle the fault pin when a fault is active.
- 3. If required, program the Fault Input to sample fault inputs from external devices on fault pins. Configure the `SEC_FCTL.FIEN` bit to enable the SEC to sample a fault input from an external device.

ADDITIONAL INFORMATION: The `SEC_FCTL.FIEN` bit should be set only while the `SEC_FCTL.EN` bit is low. If the `SEC_FCTL.EN` bit is already high and the `SEC_FCTL.FIEN` bit needs to be set, the `SEC_FCTL.EN` bit should be cleared first. Fault input can only be enabled when Fault mode is selected by the `SEC_FCTL.CMS` bit.
- 4. Program the required fault delay to the `SEC_FDLY.COUNT` bit field if a delay between fault source assertion and the fault response is required.
- 5. Configure the `SEC_FCTL` register to enable the SEC.

ADDITIONAL INFORMATION: The `SEC_FCTL.EN` bit should be set only while the `SEC_FSTAT.ACT` bit is low.
- 6. Write to the control register of a specific source register using the `SEC_SCTL[n]` register to enable the source as a fault.

Configuring a System Source to Interrupt a Core

To configure a system source to interrupt a core, the SEC itself must be enabled with the source interface (SSI) and core interface (SCI) properly initialized. Specifically, the SCI must be set up to accept interrupt signaling from the SEC and pass them to the specified core, and the SSI must properly enable each of the peripheral interrupt sources to generate interrupt signals and optionally define a priority scheme that overrides the default priority settings. In summary:

1. Write to the `SEC_GCTL` register to enable the SEC.
2. Write to the appropriate SCI `SEC_CCTL[n]` register to enable SEC interrupts to be sent to that core.
3. Write to the appropriate SSI `SEC_SCTL[n]` register to enable that peripheral as an interrupt source and to set the core target field to map the source to the desired SCI.
4. (Optional) By default, all the SEC interrupts are grouped as a single priority level, so passing of peripheral interrupt requests from the SEC is based solely on the default enumerated source ID. By programming the `SEC_CPLVL[n].PLVL` register, interrupt sources can be grouped into priority levels within the SEC such that arbitration is first performed by source ID within a grouped priority level before proceeding to the next

priority level, thus providing the flexibility to have lower-priority interrupt sources considered before higher-priority sources.

ADDITIONAL INFORMATION: The `SEC_CPMSK[n]` and `SEC_CGMSK[n]` registers must also can be programmed to mask the interrupts based on the customized levels and grouping.

Core/SEC Handshake Requirements to Ensure Proper Interrupt Handling

A specific handshake with the SEC is required to handle interrupts associated with an individual core. The handshake ensures that nested interrupts are properly tracked and that new peripheral interrupts being raised within the SEC are either passed immediately to the core or held off and queued within the SEC for later servicing.

Use the following procedure to write a custom dispatcher inside the Interrupt Service Routine. Note that the core needs to read and acknowledge the `SEC_CSID[n]` register by writing the same value. The core must also write to the `SEC_END` register after the ISR execution completes.

1. Read the `SEC_CSID[n]` register to obtain the source ID of the peripheral interrupt request.
2. Write the read value back to the `SEC_CSID[n]` register to send the acknowledge signal to the SEC that the core has accepted and begun processing the interrupt request.
3. Execute the actual ISR (typically a call to a specific handler function from a look-up table based on the peripheral source ID). Write to the `SEC_GCTL` register to enable the SEC.
4. Write the value of the `SEC_CSID[n]` register of the active interrupt (read in step 1 above) to the `SEC_END` register to signal to the SEC that the interrupt has now been serviced.
5. Return from interrupt.

This procedure allows a higher-priority interrupt raised by the SEC to be serviced by the core after step 2. The SEC knows what it passed to the core because of the write to the `SEC_CSID[n]` register. After the core acknowledges that write, the SEC knows whether or not newly raised peripheral interrupts are a higher priority than the highest-priority interrupt currently being processed by the core.

- If higher priority, the SEC pushes the current `SEC_CSID[n]` value to an internal stack, writes the new `SEC_CSID[n]` value, and asserts a new SEC interrupt request.
- If lower priority, the SEC queues the interrupt until the core writes to the `SEC_END` register with the source ID of the higher-priority interrupt, confirming that it was fully processed.

At this point the `SEC_CSID[n]` value is popped from the internal stack and any pending peripheral interrupt requests are arbitrated before the SEC writes the new `SEC_CSID[n]` value and asserts a new interrupt request. At the same time the core self-nests the latched SEC interrupt requests as needed. When a higher-priority interrupt is presented to the core the write to the `SEC_END` register in the SEC handler epilog code guarantees that each nested level has the required handshake to signal to the SEC block that each individual source ID interrupt request is fully serviced. See the *SHARC+ Core Programming Reference* for more details about SEC handler code.

Configuring a System Source as a Fault

Use the following procedure configure a system source as a fault.

1. Write to the `SEC_GCTL` register to enable the SEC.
2. Write to the `SEC_FCTL` register to configure specific fault actions.
3. Write to the `SEC_FDLY` bit field to specify fault delay.
4. Write to the control register of a specific source to enable the source as a fault.

Configuring the WDOG Expiry Event to Issue a System Reset

Use the following procedure to configure the WDOG timer to issue a system reset.

1. Configure the `SEC_GCTL` register to enable the SEC.

ADDITIONAL INFORMATION:

```
*pREG_SEC0_GCTL = BITM_SEC_GCTL_EN;
```

2. Configure the `SEC_FCTL` register to choose the Fault response mode. In the following code example, the system reset is issued.

ADDITIONAL INFORMATION:

```
*pREG_RCU0_CTL |= BITM_RCU_CTL_SRSTREQEN;
*pREG_SEC0_FCTL |= BITM_SEC_FCTL_SREN;
```

3. Configure the `SEC_SCTL[n].SEN` and `SEC_SCTL[n].FEN` bits in the registers to determine how the fault source is handled. To configure the WDOG as the fault source, program the register. The program can configure any interrupt as the fault source by programming the corresponding register.

ADDITIONAL INFORMATION:

```
*pREG_SEC0_SCTL3 = BITM_SEC_SCTL_FEN|BITM_SEC_SCTL_SEN;
```

ADDITIONAL INFORMATION: The SEC ID corresponding to WDOG0 is 3, as indicated in the [Combined SEC and GIC Interrupt List](#).

4. Write to the enable bit.

ADDITIONAL INFORMATION:

```
*pREG_SEC0_FCTL |= BITM_SEC_FCTL_EN;
```

SEC Programming Restrictions

Setting the `SEC_FCTL.EN` bit while the `SEC_FSTAT.ACT` bit is high can result in unpredictable behavior. To avoid this issue, set the `SEC_FCTL.EN` bit while the `SEC_FSTAT.ACT` bit is low. The `SEC_FSTAT.ACT` bit is only set when the `SEC_FCTL.EN` bit is high. Therefore, the problem can only occur if the `SEC_FCTL.EN` bit transitions from 1 to 0 and then to 1 again.

Writing to `SEC_FEND` to end a fault with both the `SEC_FCTL.FOEN` bit and the `SEC_FCTL.FIEN` bit set can result in erroneous external fault detection. If this operation (ending a fault) and configuration (fault input and fault output enabled) are required by the application, clear the `SEC_FCTL.FOEN` bit prior to writing to `SEC_FEND`. The recommended sequence for ending a fault with the `SEC_FCTL.FIEN` or `SEC_FCTL.FOEN==1` is as follows:

1. Clear the `SEC_FCTL.FOEN` bit.
2. Write to the `SEC_FEND` register.
3. Set the `SEC_FCTL.FOEN` bit.

ADSP-2159x SEC Register Descriptions

System Event Controller (SEC) contains the following registers.

Table 5-6: ADSP-2159x SEC Register List

Name	Description
<code>SEC_CACT[n]</code>	SCI Active Register n
<code>SEC_CCTL[n]</code>	SCI Control Register n
<code>SEC_CGMSK[n]</code>	SCI Group Mask Register n
<code>SEC_CPLVL[n]</code>	SCI Priority Level Register n
<code>SEC_CPMSK[n]</code>	SCI Priority Mask Register n
<code>SEC_CPND[n]</code>	Core Pending Register n
<code>SEC_CSID[n]</code>	SCI Source ID Register n
<code>SEC_CSTAT[n]</code>	SCI Status Register n
<code>SEC_END</code>	Global End Register
<code>SEC_FCOPP</code>	Fault COP Period Register
<code>SEC_FCOPP_CUR</code>	Fault COP Period Current Register
<code>SEC_FCTL</code>	Fault Control Register
<code>SEC_FDLY</code>	Fault Delay Register
<code>SEC_FDLY_CUR</code>	Fault Delay Current Register
<code>SEC_FEND</code>	Fault End Register
<code>SEC_FSID</code>	Fault Source ID Register
<code>SEC_FSRDLY</code>	Fault System Reset Delay Register
<code>SEC_FSRDLY_CUR</code>	Fault System Reset Delay Current Register
<code>SEC_FSTAT</code>	Fault Status Register
<code>SEC_GCTL</code>	Global Control Register

Table 5-6: ADSP-2159x SEC Register List (Continued)

Name	Description
SEC_GSTAT	Global Status Register
SEC_RAISE	Global Raise Register
SEC_SCTL[n]	Source Control Register n
SEC_SSTAT[n]	Source Status Register n

SCI Active Register n

The SEC SCI active interrupt register (`SEC_CACT[n]`) contains the source ID and priority of the highest priority active interrupt detected by the SEC prioritizer.

Figure 5-6: SEC_CACT[n] Register Diagram

Table 5-7: SEC_CACT[n] Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15:8 (R/NW)	PRIO	Highest Active IRQ Priority. The <code>SEC_CACT[n].PRIO</code> indicates the priority value of the highest priority active interrupt for core n.
7:0 (R/NW)	SID	Highest Active IRQ Source ID. The <code>SEC_CACT[n].SID</code> identifies the source ID value of the highest priority active interrupt for core n.

SCI Control Register n

The SEC control register (`SEC_CCTL[n]`) contains SCI control bits for all system sources.

Figure 5-7: SEC_CCTL[n] Register Diagram

Table 5-8: SEC_CCTL[n] Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W)	LOCK	Lock.
		If the global lock is enabled (<code>SPU_CTL.GLCK</code> bit =1) and the <code>SEC_CCTL[n].LOCK</code> bit is enabled, the <code>SEC_CCTL[n]</code> register is read only.
		0 Unlock
		1 Lock
16 (R/W)	NMIEN	NMI Enable.
		The <code>SEC_CCTL[n].NMIEN</code> bit controls NMI propagation to the core. When the <code>SEC_CCTL[n].NMIEN</code> bit is enabled, the SCI allows NMIs to propagate to the core for servicing.
		0 Disable
		1 Enable
12 (R0/W)	WFI	Wait For Idle.
		When set, the <code>SEC_CCTL[n].WFI</code> bit forces the SCI to wait for indication of core idle before the SCI resumes activity.
		0 No Action
		1 Wait for Idle

Table 5-8: SEC_CCTL[n] Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
1 (R0/W)	RESET	Reset. When set, the SEC_CCTL[n].RESET bit resets all SCI registers to their default values.
		0 No Action
		1 Reset
0 (R/W)	EN	Enable. The SEC_CCTL[n].EN bit controls operation of the SCI. Clearing the SEC_CCTL[n].EN bit halts the execution of the SCI without resetting status registers. (The INT signal to a core is not affected.) Setting the SEC_CCTL[n].EN bit enables the SCI to begin or resume operation with the current configuration and status.
		0 Disable
		1 Enable

SCI Group Mask Register n

The SEC SCI group mask register ([SEC_CGMSK\[n\]](#)) contains selections for a group mask, an ungroup mask, and a register lock. This register contains the system interrupt group masks for the connected core. The core uses the [SEC_CGMSK\[n\].UGRP](#) and [SEC_CGMSK\[n\].GRP](#) fields to mask (disable) interrupts from the specified groups.

Figure 5-8: SEC_CGMSK[n] Register Diagram

Table 5-9: SEC_CGMSK[n] Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W)	LOCK	Lock. If the global lock is enabled (SPU_CTL.GLCK bit =1) and the SEC_CGMSK[n].LOCK bit is enabled, the SEC_CGMSK[n] register is read only.
		0 Unlock
		1 Lock
8 (R/W)	UGRP	Ungrouped Mask. The SEC_CGMSK[n].UGRP bit masks interrupts (if set) for the ungrouped interrupt sources for core n.
		0 Unmask Ungrouped Sources
		1 Mask Ungrouped Sources
3:0 (R/W)	GRP	Grouped Mask. The SEC_CGMSK[n].GRP field selects a group of interrupt sources to mask for core n. (For more information about interrupt source groups, see the SEC_SCTL[n] register description.)
		0 No groups masked
		1 Mask group 0
		2 Mask group 1
		3 Mask groups 0, 1

Table 5-9: SEC_CGMSK[n] Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
		4 Mask group 2
		5 Mask groups 0, 2
		6 Mask groups 1, 2
		7 Mask groups 0, 1, 2
		8 Mask group 3
		9 Mask groups 0, 3
		10 Mask groups 1, 3
		11 Mask groups 0, 1, 3
		12 Mask groups 2, 3
		13 Mask groups 0, 2, 3
		14 Mask groups 1, 2, 3
		15 Mask groups 0, 1, 2, 3

SCI Priority Level Register n

The SEC SCI priority level register ([SEC_CPLVL\[n\]](#)) contains selections for priority levels and a register lock. This register is used to divide the total number of priority levels into sub-levels. The sub-level priority resolution provides the tie breaker for simultaneously pending interrupts assigned to the same level.

Figure 5-9: SEC_CPLVL[n] Register Diagram

Table 5-10: SEC_CPLVL[n] Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W)	LOCK	Lock.
		If the global lock is enabled (<code>SPU_CTL . GLCK</code> bit =1) and the <code>SEC_CPLVL[n] . LOCK</code> bit is enabled, the SEC_CPLVL[n] register is read only.
		0 Unlock 1 Lock
2:0 (R/W)	PLVL	Priority Levels.
		The <code>SEC_CPLVL[n] . PLVL</code> field serves to divide the total number of interrupt priority levels into sub-levels. The sub-level priority resolution provides the tie breaker for simultaneously pending interrupts assigned to the same interrupt level. The sub-level priority value specifies the number of MSBs (minus 1) designated to interrupt levels, while the remaining LSBs are designated for sub-level specification.
		For example, if the <code>SEC_CPLVL[n] . PLVL</code> field is set to two, the result is four priority levels are specified, because only the two MSBs are used for preemption evaluation. The remaining bits of the priority setting are used for sub-level prioritization.
		0 1 MSBs (2 priority levels)
		1 2 MSBs (4 priority levels)
		2 3 MSBs (8 priority levels)
		3 4 MSBs (16 priority levels)
		4 5 MSBs (32 priority levels)
		5 6 MSBs (64 priority levels)

Table 5-10: SEC_CPLVL[n] Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration	
		6	7 MSBs (128 priority levels)
		7	8 MSBs (256 priority levels)

SCI Priority Mask Register n

The SEC SCI priority mask register (`SEC_CPMSK[n]`) contains the SCI priority mask for core n and includes a register lock.

Figure 5-10: SEC_CPMSK[n] Register Diagram

Table 5-11: SEC_CPMSK[n] Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W)	LOCK	Lock. If the global lock is enabled (<code>SPU_CTL.GLCK</code> bit =1) and the <code>SEC_CPMSK[n].LOCK</code> bit is enabled, the <code>SEC_CPMSK[n]</code> register is read only.
		0 Unlock
		1 Lock
7:0 (R/W)	PRIO	IRQ Priority Mask. The <code>SEC_CPMSK[n].PRIO</code> contains the system interrupt priority mask for core n. The core uses the <code>SEC_CPMSK[n].PRIO</code> field to mask (block) interrupts below the specified level.
		0 Priority level 0 (highest)
		1-254
		255 Priority level 255 (lowest)

Core Pending Register n

The SCI pending interrupt register (`SEC_CPND[n]`) contains the source ID and priority of the highest priority pending interrupt detected by the SEC prioritizer.

Figure 5-11: SEC_CPND[n] Register Diagram

Table 5-12: SEC_CPND[n] Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15:8 (R/NW)	PRIO	Highest Pending IRQ Priority. The <code>SEC_CPND[n] . PRIO</code> indicates the priority value of the highest priority pending interrupt for core n.
7:0 (R/NW)	SID	Highest Pending IRQ Source ID. The <code>SEC_CPND[n] . SID</code> identifies the source ID value of the highest priority pending interrupt for core n.

SCI Source ID Register n

The SCI source ID register (`SEC_CSID[n]`) contains the source ID of the interrupt last issued to core n. The `SEC_CSID[n]` register value is loaded by the SCI when a system interrupt indication is sent to core n. The SCI does not change the `SEC_CSID[n]` until after the interface receives an interrupt acknowledge from core n. Writing to the `SEC_CSID[n]` register generates an interrupt acknowledge, but does not update the value in the register.

Figure 5-12: SEC_CSID[n] Register Diagram

Table 5-13: SEC_CSID[n] Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
7:0 (R/NW)	SID	Source ID. The <code>SEC_CSID[n] . SID</code> bit is the source ID of the interrupt last issued to core n.

SCI Status Register n

The SCI status register ([SEC_CSTAT\[n\]](#)) contains status bits, indicating the operational status of the SCI.

Figure 5-13: SEC_CSTAT[n] Register Diagram

Table 5-14: SEC_CSTAT[n] Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
16 (R/W1C)	NMI	Non-Maskable Interrupt. The SEC_CSTAT[n].NMI bit indicates whether an NMI has occurred since the bit was last cleared.
		0 No NMI Occurred
		1 NMI Occurred
12 (R/W1C)	WFI	Wait For Idle. The SEC_CSTAT[n].WFI bit indicates (if set) that the SCI is temporarily disabled, pending a core idle indication. This bit is set when SEC_CCTL[n].WFI is set.
		0 Not Waiting
		1 Waiting
10 (R/NW)	SIDV	SID Valid. The SEC_CSTAT[n].SIDV bit indicates (if set) that the current value in the SEC_CSID[n] register is valid. The SCI sets the SEC_CSTAT[n].SIDV bit when the updating the SEC_CSID[n] register with a new value. The SEC_CSTAT[n].SIDV bit is cleared when the SEC_CSID[n] register is written. This status indication may be used to extract all pending interrupts in a single interrupt service routine.
		0 Invalid
		1 Valid

Table 5-14: SEC_CSTAT[n] Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
9 (R/NW)	ACTV	ACT Valid. The SEC_CSTAT[n].ACTV bit indicates (if set) that the current value in the SEC_CACT[n] register is valid. The SCI sets the SEC_CSTAT[n].ACTV bit when updating the SEC_CACT[n] registers with a new value. The SEC_CSTAT[n].ACTV bit is cleared when the SEC_CSID[n] register is written.
		0 Invalid
		1 Valid
8 (R/NW)	PNDV	PND Valid. The SEC_CSTAT[n].PNDV bit indicates (if set) that the current value in the SEC_CPND[n] register is valid. The SCI sets the SEC_CSTAT[n].PNDV bit when updating the SEC_CPND[n] register with a new value. The SEC_CSTAT[n].PNDV bit is cleared when the SEC_CSID[n] register is written.
		0 Invalid
		1 Valid
5:4 (R/NW)	ERRC	Error Cause. The SEC_CSTAT[n].ERRC bits are updated on assertion of the SEC_CSTAT[n].ERR bit to indicate the SCI error type. SEC_CSTAT[n].ERRC is only updated on the assertion of SEC_CSTAT[n].ERR. Subsequent errors while SEC_CSTAT[n].ERR is asserted do not update SEC_CSTAT[n].ERRC.
		0 Reserved
		1 Acknowledge Error. SCI has received an acknowledge without a pending, unacknowledged interrupt present.
		2 Reserved
		3 Reserved
1 (R/W1C)	ERR	Error. The SEC_CSTAT[n].ERR bit indicates that an error has occurred in the SCI. When SEC_CSTAT[n].ERR is set, the SCI updates the SEC_CSTAT[n].ERRC field to the value of the corresponding error cause.
		0 No Error
		1 Error Occurred

Global End Register

The SEC global end register (`SEC_END`) contains a source ID interrupt service end field (`SEC_END.SID`). When a core has finished servicing an interrupt, the core writes the `SEC_END.SID` field in the `SEC_END` register. This write causes the SEC to clear the `SEC_SSTAT[n].ACT` bit in the `SEC_SSTAT[n]` register of the corresponding interrupt.

Figure 5-14: SEC_END Register Diagram

Table 5-15: SEC_END Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
7:0 (R/W)	SID	Source ID IRQ to End. The SEC_END.SID bit field contains the source ID interrupt service end value.

Fault COP Period Register

The SEC fault COP period register ([SEC_FCOPP](#)) contains the width value (count in (SEC) clock cycles) for the high and low phase of the computer operating properly (COP) toggled output on the COP pin. Note that the actual high/low phase value is the `SEC_FCOPP.COUNT` programmed value plus 1.

Figure 5-15: SEC_FCOPP Register Diagram

Table 5-16: SEC_FCOPP Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	COUNT	Fault COP Period. The <code>SEC_FCOPP.COUNT</code> bit field is the width value for the high and low phase of the computer operating properly (COP) toggled output on the COP pin.

Fault COP Period Current Register

The SEC fault COP period current register (`SEC_FCOPP_CUR`) contains the active count (in (SEC) clock periods) for the current phase (high or low) of the computer operating properly (COP) toggled output on the COP pin. The SEC loads the `SEC_FCOPP_CUR` register from the `SEC_FCOPP` register when the `SEC_FCOPP_CUR.COUNT` field is cleared and the SEC is in COP mode (`SEC_FCTL.CMS` bit =1). The SEC decrements the `SEC_FCOPP_CUR` count each (SEC) clock cycle while `SEC_FCTL.CMS` is set and the `SEC_FSTAT.ACT` bit is not set.

Figure 5-16: SEC_FCOPP_CUR Register Diagram

Table 5-17: SEC_FCOPP_CUR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	COUNT	Fault COP Period. The <code>SEC_FCOPP_CUR.COUNT</code> bit field is the active count for the current phase (high or low) of the computer operating properly (COP) toggled output on the COP pin.

Fault Control Register

The SEC fault control register ([SEC_FCTL](#)) contains fault control bits for all SEC channels. This register controls the operation of the System Fault Management Interface (SFI).

Figure 5-17: SEC_FCTL Register Diagram

Table 5-18: SEC_FCTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W)	LOCK	Lock. If the global lock is enabled (SPU_CTL.GLCK bit =1) and the SEC_FCTL.LOCK bit is enabled, the SEC_FCTL register is read only.
		0 UnLock
		1 Lock
13 (R/W)	TES	Trigger Event Select. The SEC_FCTL.TES bit selects the event that directs the SEC to assert trigger output. In fault pending mode, the SEC asserts trigger output when a fault is pending. In fault active mode, the SEC asserts trigger output when a fault is active.
		0 Fault Active Mode
		1 Fault Pending Mode

Table 5-18: SEC_FCTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
12 (R/W)	CMS	COP Mode Select. The SEC_FCTL.CMS selects the SEC mode for handling fault input. In COP mode, the SEC toggles the COP pin to indicate that no fault is active and ceases toggling the pin to indicate that a fault is active. In fault mode, the SEC deasserts the fault pin (=0) and fault_b pin (=1) when no fault is active and asserts the fault pin (=1) and fault_b pin (=0) when a fault is active. Not all processors feature both the fault and fault_b pins. Refer to the product data sheet for details.
		0 Fault Mode
		1 COP Mode
7 (R/W)	FIEN	Fault Input Enable. The SEC_FCTL.FIEN bit enables the SEC to sample fault input. If SEC_FCTL.FIEN is set (=1), a fault indication from an external device sets the SEC_FSTAT.ACT bit and SEC_FSID.FEXT bit.
		0 Disable
		1 Enable
6 (R/W)	SREN	System Reset Enable. The SEC_FCTL.SREN bit enables the SEC to issue a system reset request when a fault becomes active.
		0 Disable
		1 Enable
5 (R/W)	TOEN	Trigger Output Enable. The SEC_FCTL.TOEN bit enables the SEC to produce trigger output when a fault becomes active.
		0 Disable
		1 Enable
4 (R/W)	FOEN	Fault Output Enable. The SEC_FCTL.FOEN bit enables the SEC to indicate fault status, according to the SEC_FCTL.CMS bit configuration.
		0 Disable
		1 Enable
1 (R0/W)	RESET	Reset. Setting the SEC_FCTL.RESET bit resets ALL SEC registers to their default values.
		0 No Action
		1 Reset

Table 5-18: SEC_FCTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
0 (R/W)	EN	Enable. The SEC_FCTL.EN bit controls the operational state of the SEC. Clearing the SEC_FCTL.EN bit halts the execution of the SEC without resetting status registers. Setting the SEC_FCTL.EN bit enables the SEC to begin or resume operation with the current configuration and status.
		0 Disable
		1 Enable

Fault Delay Register

The SEC fault delay register ([SEC_FDLY](#)) contains the number (`SEC_FDLY.COUNT` field) of (SEC) clock periods to delay from fault pending to fault active, when actions are enabled.

Figure 5-18: SEC_FDLY Register Diagram

Table 5-19: SEC_FDLY Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	COUNT	Fault Delay. The SEC_FDLY.COUNT bit field is the number of (SEC) clock periods to delay from fault pending to fault active, when actions are enabled.

Fault Delay Current Register

The SEC fault delay current register (`SEC_FDLY_CUR`) contains the active count (`SEC_FDLY_CUR.COUNT` field) in (SEC) clock periods for the delay from fault pending to fault active, when actions are enabled. The count is loaded from the `SEC_FDLY` register when a fault becomes pending (`SEC_FSTAT.PND` bit is set). The SEC decrements the value in `SEC_FDLY_CUR` each (SEC) clock cycle while the `SEC_FSTAT.PND` bit is set.

Figure 5-19: SEC_FDLY_CUR Register Diagram

Table 5-20: SEC_FDLY_CUR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	COUNT	Fault Delay. The <code>SEC_FDLY_CUR.COUNT</code> bit field is the active count in (SEC) clock periods for the delay from fault pending to fault active, when actions are enabled.

Fault End Register

The SEC fault end register (**SEC_FEND**) contains fault source ID and internal/external fields. This register receives fault end indication from a core.

Figure 5-20: SEC_FEND Register Diagram

Table 5-21: SEC_FEND Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
16 (R/W)	FEXT	Fault External. Setting the SEC_FEND.FEXT bit, when the SEC_FEND.SID field is cleared, clears an active fault from an external source.
		0 Fault Internal
		1 Fault External
7:0 (R/W)	SID	Source ID. The SEC_FEND.SID identifies a fault to be ended as indicated to the SEC by the core. The core loads the SEC_FEND.SID field value. If the SEC_FEND.SID value matches the SEC_FSID.SID value, the SEC_FSTAT.PND bit and SEC_FSTAT.ACT bit are cleared.

Fault Source ID Register

The SEC fault source ID register ([SEC_FSID](#)) contains a fault source ID and internal/external fields.

NOTE:These bits are not reset by system reset so that a fault that automatically triggers a system reset to avoid a fault may be analyzed after the reset occurs.

Figure 5-21: SEC_FSID Register Diagram

Table 5-22: SEC_FSID Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
16 (R/NW)	FEXT	Fault External. The SEC_FSID.FEXT bit indicates that the last active fault was asserted by an external device. The SEC sets the SEC_FSID.FEXT bit when the SEC_FSTAT.ACT bit is set by the fault input pins. The SEC_FSID.FEXT bit is cleared when the SEC_FSTAT.ACT bit is set by an internal fault or when the external fault is ended. When the SEC_FSID.FEXT bit is set, the SEC_FSID.SID is cleared.
		0 Fault Internal
		1 Fault External
7:0 (R/NW)	SID	Source ID. The SEC_FSID.SID identifies the fault assertion detected by the SEC fault interface. The SEC loads the SEC_FSID.SID field value when a system fault indication is asserted. The SEC fault interface does not change the SEC_FSID.SID value until the fault is no longer pending or active, as indicated by the SEC_FSTAT.PND bit and SEC_FSTAT.ACT bit being cleared in the SEC_FSTAT register.

Fault System Reset Delay Register

The SEC fault system reset delay register ([SEC_FSRDLY](#)) contains the number (`SEC_FSRDLY.COUNT` field) of (SEC) clock periods for the delay from a fault becoming active to system reset request assertion, if enabled.

Figure 5-22: SEC_FSRDLY Register Diagram

Table 5-23: SEC_FSRDLY Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	COUNT	Fault System Reset Delay. The <code>SEC_FSRDLY.COUNT</code> bit field is the number of (SEC) clock periods for the delay from a fault becoming active to system reset request assertion.

Fault System Reset Delay Current Register

The SEC fault system reset delay current register (`SEC_FSRDLY_CUR`) contains the active count (`SEC_FSRDLY_CUR.COUNT` field) in (SEC) clock periods for the delay from fault active to system reset assertion, if enabled. The count is loaded from the `SEC_FSRDLY` register when a fault becomes active (`SEC_FSTAT.ACT` bit is set). The SEC decrements the value in `SEC_FSRDLY_CUR` each (SEC) clock cycle while the `SEC_FSTAT.ACT` bit is set.

Figure 5-23: SEC_FSRDLY_CUR Register Diagram

Table 5-24: SEC_FSRDLY_CUR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	COUNT	Fault System Reset Delay. The <code>SEC_FSRDLY_CUR.COUNT</code> bit field is the active count in (SEC) clock periods for the delay from fault active to system reset assertion.

Fault Status Register

The SEC fault status register ([SEC_FSTAT](#)) indicates the operational status of the SFI.

Figure 5-24: SEC_FSTAT Register Diagram

Table 5-25: SEC_FSTAT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
10 (R/NW)	NPND	Next Pending Fault. The SEC_FSTAT.NPND bit indicates that one or more sources have signaled fault assertion, but the input has not yet triggered the fault pending detection in the SEC fault interface. The SEC sets the SEC_FSTAT.NPND bit when the fault interface detects assertion of any enabled fault source input, while either the SEC_FSTAT.PND or SEC_FSTAT.ACT bits are set. The SEC clears the SEC_FSTAT.NPND bit when there are no fault sources waiting.
		0 Not Pending
		1 Pending
9 (R/NW)	ACT	Fault Active. The SEC_FSTAT.ACT bit indicates that the SEC has received a fault source input, the current fault delay count (in the SEC_FDLY_CUR register) has expired, and the fault actions are enabled. The SEC also sets the SEC_FSTAT.ACT bit on fault input detection if the SEC_FCTL.FIEN bit is set. The SEC_FSTAT.ACT bit is cleared by writing the ID value of the asserted fault from SEC_FSID register to the SEC_FEND register.
		0 No Fault
		1 Active Fault

Table 5-25: SEC_FSTAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
8 (R/NW)	PND	Pending Fault. The SEC_FSTAT.PND bit indicates a fault source has signaled a fault assertion to the SEC, but the SEC has not yet triggered the event actions due to the delay selected with the SEC_FDLY register. The SEC fault interface sets the SEC_FSTAT.PND bit when the SEC_FSID is updated on assertion of a fault source input. The SEC_FSTAT.PND bit is only set when the SEC_FSTAT.ACT bit is cleared. The SEC updates the SEC_FSID register with the SID value when the SEC_FSTAT.PND bit is set. The SEC_FSTAT.PND bit is cleared <i>either</i> by the SEC fault interface when the current delay count in the SEC_FDLY_CUR register expires <i>or</i> by writing the SEC_FSID.SID field value (which indicates the ID of the asserted fault) to the SEC_FEND register.
		0 Not Pending
		1 Pending
5:4 (R/NW)	ERRC	Error Cause. When the SEC_FSTAT.ERR bit is asserted, the SEC updates SEC_FSTAT.ERRC field to convey the interrupt source error type. When the error type is source overflow, the status indicates that a source signal assertion occurred or an SEC raise operation was attempted while pending was already set. The source overflow is detected when the source is set for edge only. When the error type is end error, the status indicates that an end was received for a source while the SEC_FSTAT.ACT bit was not set.
		0 Source Overflow Error
		1 Reserved
		2 End Error
		3 Reserved
1 (R/W1C)	ERR	Error. The SEC_FSTAT.ERR bit indicates an SEC fault interface error. When SEC_FSTAT.ERR is set, the SEC updates the SEC_FSTAT.ERRC field to indicate the corresponding error cause. When multiple errors occur, the SEC_FSTAT register captures the status for the first error and does not capture subsequent errors until the status is cleared.
		0 No Error
		1 Error Occurred

Global Control Register

The SEC global control register ([SEC_GCTL](#)) provides register locking, reset, and enable for the SEC module.

Figure 5-25: SEC_GCTL Register Diagram

Table 5-26: SEC_GCTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W)	LOCK	Lock. If the global lock is enabled (SPU_CTL.GLCK bit =1) and the SEC_GCTL.LOCK bit is enabled, the SEC_GCTL register is read only.
		0 Unlock
		1 Lock
1 (R0/W)	RESET	Reset. The SEC_GCTL.RESET bit is write-1-action and triggers a soft reset to all SEC registers.
		0 No Action
		1 Reset
0 (R/W)	EN	Enable. The SEC_GCTL.EN bit is read/write and must be set for the SEC to begin/resume SEC operation with the current configuration and status. Clearing the SEC_GCTL.EN bit halts the execution of the SFI and all SCIs. All SSIs remain active, along with all error detection, without resetting status registers.
		0 Disable
		1 Enable

Global Status Register

The SEC global status register ([SEC_GSTAT](#)) contains global status bits for the SEC.

Figure 5-26: SEC_GSTAT Register Diagram

Table 5-27: SEC_GSTAT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W1C)	LWERR	Lock Write Error. The SEC_GSTAT.LWERR bit indicates (when set) there was an attempted write to an SEC register while the SEC_GCTL.LOCK bit was set and while the global lock bit was enabled (SPU_CTL.GLCK bit =1). This status bit is sticky; write-1-to-clear it.
		0 No Error
		1 Error Occurred
30 (R/W1C)	ADREERR	Address Error. The SEC_GSTAT.ADREERR bit indicates that the SEC generated and address error. This status bit is sticky; write-1-to-clear it.
		0 No Error
		1 Error Occurred
23:16 (R/NW)	SID	Source ID for SSI Error. The SEC_GSTAT.SID bits indicate the source ID that generated the last SSI error conveyed in the SEC_GSTAT.ERRC field.
11:8 (R/NW)	SCI	SCI ID for SCI Error. The SEC_GSTAT.SCI bits indicate the number for the specific SCI that generated the last SCI error conveyed in the SEC_GSTAT.ERRC field.

Table 5-27: SEC_GSTAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
5:4 (R/NW)	ERRC	Error Cause. When the SEC updates the SEC_GSTAT.ERR bit, the SEC updates the SEC_GSTAT.ERRC bits to indicate the error type. Note that for SCI errors, the error status represents an OR of all the errors from each SCI. Note that for SSI errors, the error status indicates an error is active for any SSI input. This error is an OR of all the interrupt source errors.
		0 SFI Error
		1 SCI Error
		2 SSI Error
		3 Reserved
1 (R/W1C)	ERR	Error. The SEC_GSTAT.ERR bit indicates an error has occurred in the SEC. When the SEC asserts this bit (=1), the SEC updates the SEC_GSTAT.ERRC field to indicate the corresponding error cause. Even if multiple errors occur, only the first error is captured on assertion of this bit. This status bit is sticky; write-1-to-clear it.
		0 No Error
		1 Error Occurred

Global Raise Register

The SEC global raise register ([SEC_RAISE](#)) contains a source ID event set-to-pending field (`SEC_RAISE.SID`). When a source ID value is written to this field, the SEC raises the source's event status to pending.

Figure 5-27: SEC_RAISE Register Diagram

Table 5-28: SEC_RAISE Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
7:0 (R/W)	SID	Source ID. The <code>SEC_RAISE.SID</code> bit field is the source ID of event that is set to pending status.

Source Control Register n

The SEC source control register (`SEC_SCTL[n]`) contains control bits to configure the SEC event sources. This register controls the configuration of the corresponding SEC event source.

Figure 5-28: SEC_SCTL[n] Register Diagram

Table 5-29: SEC_SCTL[n] Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W)	LOCK	Lock. If the global lock is enabled (<code>SPU_CTL.GLCK</code> bit =1) and the <code>SEC_SCTL[n].LOCK</code> bit is enabled, the <code>SEC_SCTL[n]</code> register is read only.
		0 Unlock
		1 Lock
27:24 (R/W)	CTG	Core Target Select. The <code>SEC_SCTL[n].CTG</code> bits selects the specific SEC core interface to which the interrupt is mapped. Each system interrupt is mapped uniquely to one specific SEC core interface and (as a result) to a specific core.

Table 5-29: SEC_SCTL[n] Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration				
19:16 (R/W)	GRP	Group Select. The SEC_SCTL[n] .GRP bits each select a specific group for the interrupt. Each system interrupt can be assigned to any combination of groups supported by the SEC_SCTL[n] .GRP field. For example, consider the situation where SEC_SCTL[n] .GRP0 represents interrupt group 0, SEC_SCTL[n] .GRP1 represents interrupt group 1, and so on. One group might be used for all enabled interrupts (for example, group 0) and an additional group might be used for all wakeup interrupts (for example, group 1). This approach supports a model of all interrupts and just the wakeup subset. Before going to idle or sleep, all non-wakeup interrupts can be masked off to allow only wakeup interrupts to be enabled for service. Selecting no group (all SEC_SCTL[n] .GRP bits = 0) places the interrupt source in the category of "un-grouped".				
15:8 (R/W)	PRI0	Priority Level Select. The SEC_SCTL[n] .PRI0 bits sets the relative priority for an interrupt request. A pending interrupt request forwards its SEC_SCTL[n] .PRI0 value to the SEC core interface.				
4 (R/W)	ERREN	Error Enable. The SEC_SCTL[n] .ERREN bit permits the SEC_SSTAT[n] .ERR status bit to be set on error detection. If SEC_SCTL[n] .ERREN is cleared, no errors are detected. <table><tr><td>0</td><td>Disable</td></tr><tr><td>1</td><td>Enable</td></tr></table>	0	Disable	1	Enable
0	Disable					
1	Enable					
3 (R/W)	ES	Edge Select. The SEC_SCTL[n] .ES bit selects the operational and sensitivity mode of the SEC source interface input. <table><tr><td>0</td><td>Level Sensitive</td></tr><tr><td>1</td><td>Edge Sensitive</td></tr></table>	0	Level Sensitive	1	Edge Sensitive
0	Level Sensitive					
1	Edge Sensitive					
2 (R/W)	SEN	Source (signal) Enable. The SEC_SCTL[n] .SEN bit controls whether the system event source input signal may affect the pending status of the source. Clearing the SEC_SCTL[n] .SEN bit disables the source input signal from affecting the pending status. Setting SEC_SCTL[n] .SEN enables the source input signal to affect the pending status. <table><tr><td>0</td><td>Disable</td></tr><tr><td>1</td><td>Enable</td></tr></table>	0	Disable	1	Enable
0	Disable					
1	Enable					

Table 5-29: SEC_SCTL[n] Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
1 (R/W)	FEN	Fault Enable. The SEC_SCTL[n] . FEN bit controls whether the SEC may forward an interrupt request to the SEC fault interface as a fault source. This bit does not affect the ability of an interrupt source to set an interrupt as pending. The SEC_SCTL[n] . FEN bit only affects whether the pending request may be forwarded to the SEC fault interface.
		0 Disable
		1 Enable
0 (R/W)	IEN	Interrupt Enable. The SEC_SCTL[n] . IEN bit controls whether the SEC may forward an interrupt request to a core for servicing. This bit does not affect the ability of an interrupt source to set an interrupt as pending.
		0 Disable
		1 Enable

Source Status Register n

The SEC event source status register (`SEC_SSTAT[n]`) contains bits indicating the status of the corresponding event source n. An event source may be: pending, active, active and pending, or neither pending nor active.

Figure 5-29: SEC_SSTAT[n] Register Diagram

Table 5-30: SEC_SSTAT[n] Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
23:16 (R/NW)	CHID	Channel ID. The <code>SEC_SSTAT[n].CHID</code> bits indicate the ID of the specific source (from a set of sources sharing one SEC source interface input) that asserted the SEC source interface input. An SEC source interface input may support multiple system sources, in which case the assertion must be qualified by an identifier to determine the channel that generated the assertion. The <code>SEC_SSTAT[n].CHID</code> field provides this value in the form of a numeric reference that is mapped to a specific interrupt source. The prioritization for simultaneously asserted sources is according to ID, with 0 being the highest priority. The <code>SEC_SSTAT[n].CHID</code> is captured when the SEC source interface input is acknowledged.
9 (R/W1C)	ACT	Active Source. The <code>SEC_SSTAT[n].ACT</code> bit indicates the source has been accepted by a core for servicing, but the service is not yet complete. An <code>SEC_SSTAT[n].ACT</code> bit is set by the SEC when the specific system interrupt is acknowledged by the core through the SEC core interface. An <code>SEC_SSTAT[n].ACT</code> bit is cleared by the SEC when the core provides interrupt service end indication for the specific system interrupt through the SEC core interface.
		0 Not Active
		1 Active

Table 5-30: SEC_SSTAT[n] Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
8 (R/W1C)	PND	Pending Source. The SEC_SSTAT[n] . PND bit indicates the source has signaled an event request, but the event request has not been (or is not currently being) serviced. A SEC_SSTAT[n] . PND bit is set by the SEC on detection of an assertion of the corresponding system source input. A SEC_SSTAT[n] . PND bit is cleared by the SEC when the specific system event is acknowledged by the core through the SEC core interface or by a W1C operation.
		0 Not Pending
		1 Pending
5:4 (R/NW)	ERRC	Error Cause. When the SEC_SSTAT[n] . ERR bit is asserted, the SEC updates SEC_SSTAT[n] . ERRC field to convey the interrupt source error type. When the error type is source overflow, the status indicates that a source signal assertion occurred or an SEC raise operation was attempted while pending was already set. The source overflow is detected when the source is set for edge only. When the error type is end error, the status indicates that an end was received for a source while the SEC_SSTAT[n] . ACT bit was not set.
		0 Source Overflow Error
		1 Reserved
		2 End Error
		3 Reserved
1 (R/W1C)	ERR	Error. The SEC_SSTAT[n] . ERR bit indicates an error for a specific system interrupt source. When the SEC_SSTAT[n] . ERR bit is set, the SEC updates the SEC_SSTAT[n] . ERRC field to the value of the corresponding error cause. Even if multiple errors occur, only the first error is captured on assertion of the SEC_SSTAT[n] . ERR bit.
		0 No Error
		1 Error Occurred

GIC Overview

The generic interrupt controller (GIC) provides an interface to the uniprocessor Cortex A5 core in the processor and collects up to 325 interrupt requests from all processor system sources. In addition, the GIC also supports eight software generated interrupts that are internal to the Cortex A5 core and not connected to the SECs. All GIC interrupts are also connected to the SEC in the same order.

Each interrupt can be configured as a normal or a secure interrupt. Software force registers and software priority masking are also supported. The "Register Descriptions" section in this chapter provide brief descriptions of these Arm-based registers. For complete information refer to the *Arm® Generic Interrupt Controller Architecture version 1.0 Architecture Specification*.

GIC Functional Description

The GIC splits logically into a GICPORT0 (distributor block) and one GICPORT1 (CPU interface blocks).

General Interrupt Controller Port0 (GIC Distributer)

The distributor block provides a programming interface to perform the following tasks.

- Globally enable the forwarding of interrupts to the CPU interfaces
- Enable or disable each interrupt
- Set the priority level of each interrupt
- Set the target processor list of each interrupt
- Set each peripheral interrupt to be level-sensitive or edge-triggered
- Set each interrupt as either Group 0 or Group 1
- Forward an SGI to one or more target processors

In addition, the Distributor provides:

- Visibility of the state of each interrupt
- A mechanism for software to set or clear the pending state of a peripheral interrupt.

General Interrupt Controller Port1 (GIC CPU)

GICPORT1 (CPU interface) block performs priority masking and preemption handling for a connected processor in the system. GICPORT1 supports 8 SGIs (software generated interrupts) and 262 SPIs (shared peripheral interrupts).

Each CPU interface provides a programming interface to perform the following tasks.

- Enable signaling of interrupt requests to the processor
- Acknowledge interrupts
- Indicate that interrupt processing is complete
- Set interrupt priority masks for the processor
- Define the preemption policy for the processor
- Determine the highest priority pending interrupt for the processor

GIC Block Diagram

The *GIC Block Diagram* shows the event management architecture.

Figure 5-30: GIC Block Diagram

ADSP-2159x GICDST Register Descriptions

GIC Distributor Port (GICDST) contains the following registers.

Table 5-31: ADSP-2159x GICDST Register List

Name	Description
GICDST_EN	GIC Port 0 Enable
GICDST_SGI_PRIO[n]	Software Generated Interrupt Priority Register
GICDST_SPI_PRIO[n]	Shared Peripheral Interrupt Priority Register
GICDST_SGI_ACTIVE	Software Generated Interrupt Active Register
GICDST_SGI_CTL	Software Generated Interrupt Control Register
GICDST_SGI_PND_CLR	Software Generated Interrupt Clear-Pending Register
GICDST_SGI_PND_SET	Software Generated Interrupt Pending Set Register
GICDST_SGI_SECURITY	Software Generated Interrupt Security Register
GICDST_SPI[n]	Shared Peripheral Interrupt Register
GICDST_SPI_ACTIVE[n]	Shared Peripheral Interrupt Active Register
GICDST_SPI_CFG[n]	Shared Peripheral Interrupt Configuration Register
GICDST_SPI_EN_CLR[n]	Shared Peripheral Interrupt Enable Clear Register
GICDST_SPI_EN_SET[n]	Shared Peripheral Interrupt Enable Set Register
GICDST_SPI_PND_CLR[n]	Shared Peripheral Interrupt Pending Clear Register
GICDST_SPI_PND_SET[n]	Shared Peripheral Interrupt Pending Set Register
GICDST_SPI_SECURITY[n]	Shared Peripheral Interrupt Security Register
GICDST_SPI_TRGT[n]	Shared Peripheral Interrupt Processor Targets Register

GIC Port 0 Enable

The `GICDST_EN` register enables global monitoring of the peripheral interrupt signals and forwarding pending interrupts to the CPU interfaces.

Figure 5-31: GICDST_EN Register Diagram

Table 5-32: GICDST_EN Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
0 (R/W)	VALUE	Global Interrupt Monitor Enable. The <code>GICDST_EN.VALUE</code> bit field enables global monitoring of the peripheral interrupt signals and forwarding pending interrupts to the CPU interfaces.

Software Generated Interrupt Priority Register

The `GICDST_SGI_PRIO[n]` register provides the 8-bit priority field for each interrupt supported by the GIC. This field stores the priority of the corresponding interrupt.

Figure 5-32: GICDST_SGI_PRIO[n] Register Diagram

Table 5-33: GICDST_SGI_PRIO[n] Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
7:0 (R/W)	VALUE	Software Generated Interrupt Priority. The <code>GICDST_SGI_PRIO[n].VALUE</code> bit field contains the 8-bit priority field for each interrupt supported by the GIC. This field stores the priority of the corresponding interrupt.

Shared Peripheral Interrupt Priority Register

The `GICDST_SPI_PRIO[n]` registers provide an 8-bit priority field for each interrupt supported by the GIC. This field stores the priority of the corresponding interrupt.

Figure 5-33: GICDST_SPI_PRIO[n] Register Diagram

Table 5-34: GICDST_SPI_PRIO[n] Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
0 (R/W)	VALUE	Priority. The <code>GICDST_SPI_PRIO[n].VALUE</code> bit field stores the priority of the corresponding interrupt (byte offset 3 to Byte offset 0).

Software Generated Interrupt Active Register

The `GICDST_SGI_ACTIVE` registers provide a Set-active bit for each interrupt that the GIC supports. Writing to a Set-active bit Activates the corresponding interrupt. These registers are used when preserving and restoring GIC state.

Figure 5-34: GICDST_SGI_ACTIVE Register Diagram

Table 5-35: GICDST_SGI_ACTIVE Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15:0 (R/NW)	VALUE	SGI Active If N. The <code>GICDST_SGI_ACTIVE.VALUE</code> bit field provides a Set-active bit for each interrupt that the GIC supports.

Software Generated Interrupt Control Register

The `GICDST_SGI_CTL` register controls the generation of SGIs. It is implementation defined whether this register has any effect when the forwarding of interrupts by Distributor is disabled by the `GICD_CTLR` settings.

Figure 5-35: GICDST_SGI_CTL Register Diagram

Table 5-36: GICDST_SGI_CTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
25:24 (R/W)	TRGLSTFILT	Target List Filter. The <code>GICDST_SGI_CTL.TRGLSTFILT</code> bit field determines how the distributor must process the requested SGI.
		0 Forward the interrupt to the CPU interfaces specified in the <code>CPUTargetList</code> field
		1 Forward the interrupt to all CPU interfaces except that of the processor that requested the interrupt
		2 Forward the interrupt only to the CPU interface of the processor that requested the interrupt
		3 Reserved
23:16 (R/W)	CPUTRGTLST	CPU Target list. When the <code>GICDST_SGI_CTL.CPUTRGTLST</code> bit field TargetList Filter = 0b00, defines the CPU interfaces to which the Distributor must forward the interrupt. Each bit of the <code>GICDST_SGI_CTL.CPUTRGTLST</code> bit field refers to the corresponding CPU interface, for example <code>CPUTargetList[0]</code> corresponds to CPU interface 0. Setting a bit to 1 indicates that the interrupt must be forwarded to the corresponding interface. If this field is 0x00 when TargetListFilter is 0b00, the Distributor does not forward the interrupt to any CPU interface.

Table 5-36: GICDST_SGI_CTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
15 (R/W)	SATT	Security Value of the SGI. The GICDST_SGI_CTL.SATT bit is implemented only if the GIC includes the Security Extensions. This field is writable only by a Secure access. Any Non-secure write to the GICD_SGIR generates an SGI only if the specified SGI is programmed as Group 1, regardless of the value of bit[15] of the write.
		0 Forward the SGI specified in the SGIINTID field to a specified CPU interface only if the SGI is configured as Group 0 on that interface.
		1 Forward the SGI specified in the SGIINTID field to a specified CPU interfaces only if the SGI is configured as Group 1 on that interface.
3:0 (R/W)	SGIINTID	The Interrupt ID of the SGI.

Software Generated Interrupt Clear-Pending Register

The `GICDST_SGI_PND_CLR` register provides a clear pending bit for each interrupt supported by the GIC. Writing 1 to a clear-pending bit clears the pending status of the corresponding peripheral interrupt. Reading a bit identifies whether the interrupt is pending.

Figure 5-36: GICDST_SGI_PND_CLR Register Diagram

Table 5-37: GICDST_SGI_PND_CLR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15:0 (R/NW)	VALUE	Software Generated Interrupt Clear-Pending. Writing 1 to a clear-pending bit in the <code>GICDST_SGI_PND_CLR.VALUE</code> bit field clears the pending status of the corresponding peripheral interrupt. Reading a bit identifies whether the interrupt is pending.

Software Generated Interrupt Pending Set Register

The `GICDST_SGI_PND_SET` register provides a set-pending bit for each interrupt supported by the GIC.

Figure 5-37: GICDST_SGI_PND_SET Register Diagram

Table 5-38: GICDST_SGI_PND_SET Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15:0 (R/NW)	VALUE	Software Generated Interrupt Set-Pending. Writing 1 to a Set-pending bit in the <code>GICDST_SGI_PND_SET.VALUE</code> bit field sets the status of the corresponding peripheral interrupt to pending. Reading a bit identifies whether the interrupt is pending.

Software Generated Interrupt Security Register

The `GICDST_SGI_SECURITY` registers provide a status bit for each interrupt supported by the GIC. Each bit controls whether the corresponding interrupt is in Group 0 or Group 1. Typically, when used with a processor that implements the ARM Security Extensions, Group 0 interrupts are Secure interrupts, and Group 1 interrupts are Non-secure interrupts,

Figure 5-38: GICDST_SGI_SECURITY Register Diagram

Table 5-39: GICDST_SGI_SECURITY Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15:0 (R/W)	VALUE	Software Generated Interrupt Security. Each bit in the <code>GICDST_SGI_SECURITY.VALUE</code> bit field controls whether the corresponding interrupt is in Group 0 or Group 1.

Shared Peripheral Interrupt Register

The `GICDST_SPI[n]` register contains bits that provide the status of the SPI[987:0] inputs.

Figure 5-39: GICDST_SPI[n] Register Diagram

Table 5-40: GICDST_SPI[n] Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	STAT	Shared Peripheral Interrupt Status. The <code>GICDST_SPI[n].STAT</code> bit field returns the status of the SPI[987:0] inputs on the distributor where bit [x] = 0 SPI[x] is low and bit [x] = 1 SPI[x] is high.

Shared Peripheral Interrupt Active Register

The `GICDST_SPI_ACTIVE[n]` register provides an active bit for each interrupt supported by the GIC.

Figure 5-40: `GICDST_SPI_ACTIVE[n]` Register Diagram

Table 5-41: `GICDST_SPI_ACTIVE[n]` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	Active Bits. The <code>GICDST_SPI_ACTIVE[n].VALUE</code> bit field contains an Active bit for each interrupt supported by the GIC. Reading an active bit identifies whether the corresponding interrupt is active (=1) or not active (=0).

Shared Peripheral Interrupt Configuration Register

The `GICDST_SPI_CFG[n]` register provides a 2-bit `Int_config` field for each interrupt supported by the GIC.

Figure 5-41: GICDST_SPI_CFG[n] Register Diagram

Table 5-42: GICDST_SPI_CFG[n] Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	Shared Peripheral Interrupt Configuration. The <code>GICDST_SPI_CFG[n].VALUE</code> bit field identifies whether the corresponding interrupt is: edge-triggered or level-sensitive handled using the 1-N model or using the N-N model

Shared Peripheral Interrupt Enable Clear Register

The `GICDST_SPI_EN_CLR[n]` register provides a clear-enable bit for each interrupt supported by the GIC.

Figure 5-42: `GICDST_SPI_EN_CLR[n]` Register Diagram

Table 5-43: `GICDST_SPI_EN_CLR[n]` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	Shared Peripheral Interrupt Enable Clear Enable. Writing 1 to a <code>GICDST_SPI_EN_CLR[n].VALUE</code> bit disables forwarding of the corresponding interrupt to the CPU interfaces. Reading a bit identifies whether the interrupt is enabled.

Shared Peripheral Interrupt Enable Set Register

The `GICDST_SPI_EN_SET[n]` register provides a set-enable bit for each interrupt supported by the GIC.

Figure 5-43: `GICDST_SPI_EN_SET[n]` Register Diagram

Table 5-44: `GICDST_SPI_EN_SET[n]` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	Shared Peripheral Interrupt Enable. Writing 1 to a <code>GICDST_SPI_EN_SET[n].VALUE</code> bit enables forwarding of the corresponding interrupt to the CPU interfaces. Reading a bit identifies whether the interrupt is enabled.

Shared Peripheral Interrupt Pending Clear Register

The `GICDST_SPI_PND_CLR[n]` register provides a clear-pending bit for each interrupt supported by the GIC.

Figure 5-44: GICDST_SPI_PND_CLR[n] Register Diagram

Table 5-45: GICDST_SPI_PND_CLR[n] Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	Clear Pending Interrupt. Writing 1 to a <code>GICDST_SPI_PND_CLR[n].VALUE</code> bit clears the pending status of the corresponding peripheral interrupt. Reading a bit identifies whether the interrupt is pending.

Shared Peripheral Interrupt Pending Set Register

The `GICDST_SPI_PND_SET[n]` register provides a set-pending bit for each interrupt supported by the GIC.

Figure 5-45: `GICDST_SPI_PND_SET[n]` Register Diagram

Table 5-46: `GICDST_SPI_PND_SET[n]` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	Set Pending Interrupt. Writing 1 to a <code>GICDST_SPI_PND_SET[n].VALUE</code> bit sets the status of the corresponding peripheral interrupt to pending. Reading a bit identifies whether the interrupt is pending.

Shared Peripheral Interrupt Security Register

The `GICDST_SPI_SECURITY[n]` register provides a security status bit for each interrupt supported by the GIC.

Figure 5-46: GICDST_SPI_SECURITY[n] Register Diagram

Table 5-47: GICDST_SPI_SECURITY[n] Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	Shared Peripheral Interrupt Security Interrupt Security. The <code>GICDST_SPI_SECURITY[n].VALUE</code> bits control the security status of the corresponding interrupt.

Shared Peripheral Interrupt Processor Targets Register

The `GICDST_SPI_TRGT[n]` register provides an 8-bit CPU targets field for each interrupt supported by the GIC.

Figure 5-47: GICDST_SPI_TRGT[n] Register Diagram

Table 5-48: GICDST_SPI_TRGT[n] Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
7:0 (R/W)	VALUE	Shared Peripheral Interrupt Processor Targets. The <code>GICDST_SPI_TRGT[n].VALUE</code> bit field stores the list of processors that the interrupt is sent to if it is asserted.

ADSP-2159x GICCPU Register Descriptions

GIC CPU Port (GICCPU) contains the following registers.

Table 5-49: ADSP-2159x GICCPU Register List

Name	Description
<code>GICCPU_BIN_PT_ALIAS</code>	Aliased Binary Point Register (ICCBPR)
<code>GICCPU_BIN_PT</code>	Binary Point Register (ICCBPR)
<code>GICCPU_CTL</code>	CPU Interface Control Register (ICCICR)
<code>GICCPU_EOI</code>	End of Interrupt Register (ICCEOIR)
<code>GICCPU_PND_HI</code>	Highest Pending Interrupt Register (ICCHPIR)
<code>GICCPU_INT_ACK</code>	Interrupt Acknowledge Register (ICCIAR)
<code>GICCPU_PRIO_MSK</code>	Priority Mask Register (ICCIPMR)
<code>GICCPU_RUN_PRIO</code>	Running Priority Register (ICCRPR)

Aliased Binary Point Register (ICCABPR)

The `GICCPU_BIN_PT_ALIAS` register Provides an alias for the non secure `GICCPU_BIN_PT` register.

Figure 5-48: GICCPU_BIN_PT_ALIAS Register Diagram

Table 5-50: GICCPU_BIN_PT_ALIAS Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	Aliased Priority Value.

Binary Point Register (ICCBPR)

The `GICCPU_BIN_PT` register defines the point at which the priority value fields split into two parts, the group priority field and the sub-priority field. The group priority field is used to determine interrupt preemption.

Figure 5-49: GICCPU_BIN_PT Register Diagram

Table 5-51: GICCPU_BIN_PT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	Binary Point Value. The <code>GICCPU_BIN_PT.VALUE</code> bit field defines the point at which the priority value fields split into two parts.

CPU Interface Control Register (ICCICR)

The `GICCPU_CTL` register enables the signaling of interrupts to the target processors. In a GIC that implements the Security Extensions, provides additional global controls for handling Secure interrupts.

Figure 5-50: GICCPU_CTL Register Diagram

Table 5-52: GICCPU_CTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	Control N.

End of Interrupt Register (ICCEOIR)

A processor writes to the `GICCPU_EOI` register to inform the CPU interface that it has completed its interrupt service routine for the specified interrupt.

Figure 5-51: GICCPU_EOI Register Diagram

Table 5-53: GICCPU_EOI Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	End of Interrupt. The <code>GICCPU_EOI.VALUE</code> bit field indicates to the CPU interface that it has completed its interrupt service routine for the specified interrupt.

Highest Pending Interrupt Register (ICCHPIR)

The `GICCPU_PND_HI` register indicates the Interrupt ID, and processor ID if appropriate, of the pending interrupt with the highest priority on the CPU interface.

Figure 5-52: GICCPU_PND_HI Register Diagram

Table 5-54: GICCPU_PND_HI Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	VALUE	Hi Pend N. Highest Pending Interrupt Register (ICCHPIR)

Interrupt Acknowledge Register (ICCIAR)

The processor reads the `GICCPU_INT_ACK` register to obtain the interrupt ID of the signaled interrupt. This read acts as an acknowledge for the interrupt.

Figure 5-53: GICCPU_INT_ACK Register Diagram

Table 5-55: GICCPU_INT_ACK Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (RC/NW)	VALUE	Interrupt Acknowledge ID. The <code>GICCPU_INT_ACK.VALUE</code> bit field contains the interrupt ID of the signaled interrupt.

Priority Mask Register (ICCIPMR)

The `GICCPU_PRIO_MSK` register provides an interrupt priority filter. Only interrupts with higher priority than the value in this register can be signaled to the processor.

Figure 5-54: GICCPU_PRIO_MSK Register Diagram

Table 5-56: GICCPU_PRIO_MSK Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	Interrupt Priority Filter Value. The <code>GICCPU_PRIO_MSK.VALUE</code> bit field contains the interrupt priority filter value.

Running Priority Register (ICCRPR)

The `GICCPU_RUN_PRIO` register indicates the priority of the highest priority interrupt that is active on the CPU interface.

Figure 5-55: GICCPU_RUN_PRIO Register Diagram

Table 5-57: GICCPU_RUN_PRIO Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	VALUE	Run Priority N. The <code>GICCPU_RUN_PRIO.VALUE</code> bit field contains the priority value of the highest priority interrupt that is active on the CPU interface. If there is no active interrupt on the CPU interface, and the GIC implements 8-bit priority fields, a read of this register returns the value 0xFF, corresponding to the lowest possible interrupt priority. If the GIC implements priority fields of less than 8 bits, the read might return the register reset value of 0xFF, or might return a value corresponding to the lowest possible interrupt priority. Software cannot determine the number of implemented priority bits from a read of this register.

6 Trigger Routing Unit (TRU)

The TRU provides system-level sequence control without core intervention. The TRU maps trigger masters (generators of triggers) to trigger slaves (receivers of triggers). Slave endpoints can be configured to respond to triggers in various ways. Multiple TRUs may be provided in a multiprocessor system to create a trigger network. Common applications enabled by the TRU include:

- Automatically triggering the start of a DMA sequence after a sequence from another DMA channel completes
- Software triggering
- Synchronization of concurrent activities

TRU Features

The TRU supports the following features:

- Automatically triggering the start of a DMA sequence after a sequence from another DMA channel completes. Once a DMA channel completes data transfer, it can act as a Trigger Master and signal an internal trigger pulse to the programmed Trigger Slave which can also be another DMA channel. The Slave Trigger connected to the DMA channel kicks off the DMA transfer automatically. None of this requires core intervention once the initialization is done.
- Software triggers. The best use of triggers is to minimize core intervention. It is also possible to initiate a trigger pulse to a Trigger Slave, in the software.
- Synchronization of concurrent activities. A single Trigger Master can initiate a trigger pulse to multiple Trigger Slaves so that several system level activities can be synchronized on an internally or externally generated event.
- Configuration protection through register-level lock bits and global lock indication

TRU Functional Description

The following sections provide a description of the TRU.

ADSP-2159x TRU Register List

The Trigger Routing Unit (TRU) provides simple sequence control of distributed modules without the penalties associated with core intervention (for example, interrupt overhead). The TRU receives trigger inputs from all master trigger inputs (MTI) and the TRU master trigger register ([TRU_MTR](#)). Based on these inputs, the TRU logic generates trigger outputs that initiate slave operations in the processor core and peripherals. A set of registers governs TRU operations. For more information on TRU functionality, see the TRU register descriptions.

Table 6-1: ADSP-2159x TRU Register List

Name	Description
TRU_ERRADDR	Error Address Register
TRU_GCTL	Global Control Register
TRU_MTR	Master Trigger Register
TRU_SSR[n]	Slave Select Register
TRU_STAT	Status Information Register

ADSP-2159x TRU Interrupt List

Table 6-2: ADSP-2159x TRU Interrupt List

Interrupt ID	Name	Description	Sensitivity	DMA Channel
162	TRU0_SLV0	TRU0 Interrupt 0 - Core 0	Edge	
163	TRU0_SLV1	TRU0 Interrupt 1 - Core 0	Edge	
164	TRU0_SLV2	TRU0 Interrupt 2 - Core 0	Edge	
165	TRU0_SLV3	TRU0 Interrupt 3 - Core 0	Edge

166	TRU0_SLV9	TRU0 Interrupt Request 9	Pulse
167	TRU0_SLV10	TRU0 Interrupt Request 10	Pulse
168	TRU0_SLV11	TRU0 Interrupt Request 11	Pulse

TRU Definitions

The following definitions are helpful when using the TRU module.

Trigger Master

A trigger master is any system module that provides trigger event indication to the TRU. Trigger master modules define trigger events and conditions for assertion.

Trigger Master ID

Trigger masters are assigned a unique numeric ID according to their physical connection to the TRU. Trigger master ID 0 is reserved and defined as null.

Trigger Slave

A trigger slave is any system module that receives a trigger event indication from the TRU. Trigger slave modules define a trigger event response.

NOTE: For peripherals configured as a slave receiver: if the corresponding peripheral DMA is kept waiting for trigger from a master, it can receive stale or garbage data. The peripheral receiver begins shifting in data as soon as it is enabled and it does not wait for the trigger master. Upon receiving the trigger, this data is moved into the DMA FIFO. Therefore, this sequence can result in the slave receiver getting unusable data.

TRU Block Diagram

Trigger masters and the Master Trigger Register (MTR) generate trigger assertions. Each trigger slave has a dedicated Slave Select Register (SSR) that specifies the unique trigger master from which it receives the trigger indication.

Figure 6-1: TRU Block Diagram

TRU Architectural Concepts

The TRU supports a simple trigger-in/trigger-out model for modules that comply with the triggering functional model. The TRU is the controller of the trigger system. Trigger outputs from trigger masters are mapped to trigger inputs of trigger slaves through a set of programmable registers ([TRU_SSR\[n\]](#)).

System modules are trigger master only, trigger slave only, or trigger master and trigger slave.

All of the trigger input and output signals are connected to a trigger routing unit (TRU) which manages the connections of triggers between modules.

In multi-processor systems, multiple TRU units are provided. These TRUs are networked together. Generic Trigger Ports (GTPs) are provided to forward trigger events from one TRU unit to another, forming a pathway from trigger masters to trigger slaves wherever they might lie in the system.

TRU Programming Model

Implementing sequence control using the TRU requires, at a minimum, proper configuration of a trigger slave, a trigger master, and the TRU module itself. The only requirement for the configuration procedure is that the trigger master is configured and enabled as the last step.

Complete the following other steps:

- Configure the trigger slave for response to triggers.
- Configure the TRU to map the trigger master to the trigger slave through the [TRU_SSR\[n\]](#) registers.
- Configure the trigger master to generate trigger assertions.

- Alternatively, use software triggering for trigger assertion. Writing the trigger master ID to the MTR register generates software triggers.

Programming Concepts

The following concepts aid in programming the TRU.

- *Trigger Sequence Configuration.* A simple sequence consists of one trigger master and one trigger slave. More complex trigger sequences consist of several trigger slaves functioning as trigger slave and trigger master. Additionally, trigger sequences can loopback to the original master forming a perpetual sequence.
- *Software Triggering.* Writing a trigger master ID to the MTR generates a trigger within the TRU from the trigger master ID specified.
- *Synchronization.* The TRU can be used to coarsely synchronize events by mapping multiple trigger slaves to the same trigger master or by generating multiple trigger master assertions simultaneously through the MTR.
- *Configuration Protection.* The `TRU_SSR[n].LOCK` bit and the `TRU_GCTL.LOCK` bit enable register level write-protection when the global lock is asserted in the SPU.

Programming Examples

The following examples shows the steps to create a single trigger.

Configuring a Simple Trigger Sequence

The following example shows the steps to create a simple trigger.

1. Write to the `TRU_GCTL` register to enable the TRU.
2. Write to the `TRU_SSR[n]` register of a specific trigger slave to assign it to a specific trigger master.
3. Enable the trigger slave to wait for and accept a trigger.
4. Enable the trigger master to generate a trigger.

TRU Event Control

The TRU is a major part of event control solutions. It is the center of the trigger functional model and can extend to support the interrupt and fault management models as well.

TRU Status and Error Signals

The TRU does not have dedicated status and error output signals other than the MMR interface. Slave errors are reported to the master over the standard peripheral bus protocol.

ADSP-2159x TRU Register Descriptions

Trigger Routing Unit (TRU) contains the following registers.

Table 6-5: ADSP-2159x TRU Register List

Name	Description
TRU_ERRADDR	Error Address Register
TRU_GCTL	Global Control Register
TRU_MTR	Master Trigger Register
TRU_SSR[n]	Slave Select Register
TRU_STAT	Status Information Register

Error Address Register

The TRU error address register ([TRU_ERRADDR](#)) holds the address from the memory-mapped register access generating an access error of TRU registers.

Figure 6-2: TRU_ERRADDR Register Diagram

Table 6-6: TRU_ERRADDR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
11:0 (R/W)	ADDR	Error Address. The <code>TRU_ERRADDR.ADDR</code> holds the address from the memory-mapped register access generating an access error of TRU registers. These errors occur on access to the TRU_SSR[n] or TRU_MTR registers when these registers are locked or on access to an invalid address. See the TRU_SSR[n] and TRU_MTR register descriptions for more information about locking. The TRU_ERRADDR register holds the address of the first error to occur. In the event of multiple errors occurring, the TRU_ERRADDR register contains the address of the first error. To re-enable the TRU_ERRADDR register for update, both status bits (<code>TRU_STAT.LWERR</code> and <code>TRU_STAT.ADDRERR</code>) in the TRU_STAT register must be cleared.

Global Control Register

The TRU global control register ([TRU_GCTL](#)) provides register locking, TRU reset, and TRU enable.

Figure 6-3: TRU_GCTL Register Diagram

Table 6-7: TRU_GCTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W)	LOCK	GCTL Lock Bit. If the global lock is enabled (SPU_CTL.GLCK bit =1) and the TRU_GCTL.LOCK bit is enabled, the TRU_GCTL register is read only.
		0 Read write
		1 Read only
2 (R/W)	MTRL	MTR Lock Bit. If the global lock is enabled (SPU_CTL.GLCK bit =1) and the TRU_GCTL.MTRL bit is enabled, the TRU_MTR register is read only.
		0 Read write
		1 Read only
1 (R/W)	RESET	Soft Reset. The TRU_GCTL.RESET bit is write-1-action and triggers a soft reset to all TRU registers.
		0 No action
		1 Soft reset

Table 6-7: TRU_GCTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
0 (R/W)	EN	Non-MMR Enable. The TRU_GCTL.EN bit is read/write and must be set for the TRU to propagate trigger events. All TRU register read/write operations continue to operate independent of the TRU_GCTL.EN bit.
		0 No trigger events
		1 Propagate trigger events

Master Trigger Register

The TRU master trigger register (**TRU_MTR**) permits trigger generation through software by writing a trigger master ID value to one of the four fields in the **TRU_MTR** register. If the global lock is enabled (**SPU_CTL.GLCK** bit =1) and the **TRU_GCTL.LOCK** bit is set, the **TRU_MTR** register is read only. Note this register is primarily used for debug to trigger a TRU output

Figure 6-4: TRU_MTR Register Diagram

Table 6-8: TRU_MTR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:24 (R/W)	MTR3	Master Trigger Register 3. The TRU_MTR.MTR3 bit field is the trigger master ID value for master 3.
		0 No master specified
		1-182 Range of valid masters
23:16 (R/W)	MTR2	Master Trigger Register 2. The TRU_MTR.MTR2 bit field is the trigger master ID value for master 2.
		0 No master specified
		1-182 Range of valid masters
15:8 (R/W)	MTR1	Master Trigger Register 1. The TRU_MTR.MTR1 bit field is the trigger master ID value for master 1.
		0 No master specified
		1-182 Range of valid masters
7:0 (R/W)	MTR0	Master Trigger Register 0. The TRU_MTR.MTR0 bit field is the trigger master ID value for master 0.
		0 No master specified
		1-182 Range of valid masters

Slave Select Register

The TRU slave select registers ([TRU_SSR\[n\]](#)) each provide slave selection and register locking.

Figure 6-5: TRU_SSR[n] Register Diagram

Table 6-9: TRU_SSR[n] Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W)	LOCK	SSRn Lock. If the global lock is enabled (<code>SPU_CTL.GLCK</code> bit =1) and the <code>TRU_SSR[n].LOCK</code> bit is enabled, the <code>TRU_SSR[n]</code> register is read only.
		0 Unlock register
		1 Lock register
7:0 (R/W)	SSR	SSRn Slave Select. The <code>TRU_SSR[n]</code> register selects the trigger master ID to which the trigger slave responds. For example, when a <code>TRU_SSR[n]</code> register is set to respond to trigger master ID n, a trigger that is generated by trigger master ID n results in a trigger out to the slave.
		0 No master specified
		1-182 Range of valid masters

Status Information Register

The TRU status register (`TRU_STAT`) contains the status of `TRU_MTR` and `TRU_SSR[n]` register writes and status of bus read/write errors.

Figure 6-6: TRU_STAT Register Diagram

Table 6-10: TRU_STAT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
1 (R/W1C)	ADDRERR	Address Error Status. The <code>TRU_STAT.ADDRERR</code> bit is set when an invalid address is provided for an MMR access while the TRU is selected. Writing a one to this bit clears the error indication. The <code>TRU_ERRADDR</code> register also is updated when an address error occurs during an MMR access while the TRU is selected.
		0 No error
		1 Error occurred
0 (R/W1C)	LWERR	Lock Write Error Status. If <code>TRU_STAT.LWERR</code> is set, a lock write error has occurred. Writing a one to this bit clears the error indication.
		0 No error
		1 Error occurred

7 L2 System Memory

L2 system memories have significant bandwidth for core accesses, but it is important to note that L2 responds slower to core accesses than L1 memories. L2 SRAM is the ideal storage for multiple processor cores to share data and instruction resources, such as semaphores, shared buffers, and code libraries. Due to sophisticated data integrity protection and write protection, L2 SRAM is also ideal for data and instructions critical for safe operation of the application.

L2 System Memory Features

The L2 system memory features include:

- Operation at SYSCLK frequency
- ECC protection of SRAM area
- ECC memory refresh

There is one instance of L2 system memory: L2CTL0.

- L2CTL0 contains 2M byte of RAM grouped into eight banks, 256K bytes each and 192K bytes of boot ROM.
- SHARC core data ports can access L2 memory through direct path as well as through Arm L2 cache.

L2 System Memory Functional Description

The L2 system memory manages all of the L2 SRAM and ROM memory banks. The system memory interface arbitrates competing accesses, write protection, and ensures SRAM data integrity. The L2 system memory domain is a unified instruction and data memory. It can hold any mixture of code and data required by the system design.

The following sections provide a functional description of the L2 system memory.

L2 System Memory Block Diagram

The *ADSP-SC59x Complete L2 System Memory Block Diagram* shows the complete L2 system memory, including the memory block instance L2CTL0. The L2CTL0 block contains boot ROM code for Arm and eight banks of L2 RAM containing 256 Kbytes each. The Arm reset ISR (location 0x00000000) is mapped to this block.

Figure 7-1: ADSP-SC59x Complete L2 System Block Diagram

L2 System Memory Architectural Concepts

The following sections describe architecture features of the L2 system memory.

- [Read/Write Latency and Throughput](#)
- [Arbitration and Priority](#)

Access Characteristics

The L2 system memory interface converts all 8-bit, 16-bit, 32-bit, and 64-bit accesses to 128-bit accesses. Additionally, it converts 8-bit, 16-bit, 32-bit, and 64-bit bursts to an equivalent internal 128-bit access. For example, the L2 system memory interface converts a 128-bit address-aligned burst of 8-bit accesses of burst length 16 to a single 128-bit access.

Read/Write Latency and Throughput

The L2 memory design is optimized for burst accesses at the crossbar interface. The L2 system memory buffers and converts write data of 8/16/32/64-bit to an equivalent 128-bit access. This conversion creates modulo-32-bit writes if the starting addresses are 32-bit aligned. A single 8-bit or 16-bit access, or a non-32-bit address-aligned 8-bit or 16-bit burst access to an ECC-enabled bank creates an extra latency of two SYSCLK cycles. No extra latency is seen if the ECC is disabled.

NOTE: Continuous 8/16-bit core access to an ECC-enabled L2 bank is not recommended from a throughput perspective.

L2 Memory Controller Block Diagram (Instance)

As shown in the *L2 System Memory Block Diagram*, the L2 controller has five ports that interface to system cross-bars. Port 0, port 1, and port 2 are 128-bit interfaces dedicated to core and MDMA3 traffic. Port 3 and port 4 are 128-bit interfaces that connect through DMA. For L2 SRAM, all ports (0/1/2/3/4) have a read channel and a write channel; for L2 ROM, all ports (0/1/2/3/4) have read channels only. The SRAM is organized in multiple banks; each bank has 256K Bytes. The 192KB ROM is divided into three banks of 64KB.

Within each bank, data is organized into 16384 words, with each word comprising 128 bits of data and 28 bits of ECC checksum. ROM memory is not protected by the ECC scheme. When the L2 controller accesses RAM and ROM cells, it always reads and writes whole 128-bit words. Despite this, the L2 controller supports 8-, 16-, 32-, and 64-bit reads and writes from cores and system by applying respective data masks.

Figure 7-2: L2 System Memory Block Diagram

Arbitration and Priority

Each bank of L2 RAM or ROM has an arbiter which receives requests from the five crossbar ports.

Each arbiter follows a fixed priority scheme for giving grants when more than one channel requests the same bank. The arbiter also supports priority elevation through urgent priority requests.

NOTE: Attempting a write access to both L2 ROM spaces returns an error.

The *Fixed Priority* table shows the priority for fixed priority mode (with urgent priority disabled) for each SCB channel.

If two cores (or the 64-bit Max BW DMA) simultaneously try to access L2 for the same instance (both read or both write), even to different banks, software allows only one master access at a time. One access port can support one read and write at the same time. However, if one core issues a write and the other issues a read, then access can proceed simultaneously. There is no extra latency inside L2, as long as the accesses are to different banks (assuming pending DMA traffic is also to a non-conflicting bank).

When a core and DMA both access the same bank via the same port (both read or both writes), the best access rate that DMA can achieve is one 128-bit access in every three SYSCLK cycles during the conflict period. This access rate is achieved by programming the read priority count register (`L2CTL_RPCR0.RPC0`) bit and the write priority count register (`L2CTL_WPCR0.WPC0`) to 0, while programming the `L2CTL_RPCR0.RPC1` and the `L2CTL_WPCR0.WPC1` bits to 1.

The arbiters also support priority elevation for a particular channel that has been starved of grants for many SYSCLK cycles. If a channel does not get a grant for N cycles after its request, then that channel can elevate the priority of its request by issuing an urgent priority request. This request causes that particular channel to become the highest priority master for the next grant cycle (pipelined arbitration for urgent priority). The number of cycles N , after which the priority is elevated, can be programmed for each channel separately using the (`L2CTL_RPCR0`) and (`L2CTL_WPCR0`) registers.

Programming the bits in the (`L2CTL_RPCR0`) and (`L2CTL_WPCR0`) registers appropriately achieves the best grant rate for DMA. This grant rate of one in three SYSCLK cycles during the conflict period is achievable under the following conflict conditions:

- An access conflict between the core and DMA to the same memory bank in the fixed priority arbitration scheme with core activity always prioritized over DMA activity
- An access conflict within the pipelined implementation of urgent priority

To disable urgent priority requests, set the `L2CTL_CTL.DISURP` bit. This bit disables the urgent priority requests for all port channels. Each channel can also be prevented from raising the urgent priority request through the priority count register for the specific channel. However, there is no support for disabling urgent priority for a specific memory bank arbiter.

The *Fixed Priority With Priority Elevation* table provides the various priority levels for the L2 system memory.

Table 7-5: Fixed Priority With Priority Elevation

Channel	Priority Level
L2 Scrub/Initialization Request	21 (highest)
Port 0 Read Channel Urgent Request	20
Port 0 Write Channel Urgent Request	19
Port 1 Read Channel Urgent Request	18

Table 7-5: Fixed Priority With Priority Elevation (Continued)

Channel	Priority Level
Port 1 Write Channel Urgent Request	17
Port 2 Read Channel Urgent Request	16
Port 2 Write Channel Urgent Request	15
Port 3 Read Channel Urgent Request	14
Port 3 Write Channel Urgent Request	13
Port 4 Read Channel Urgent Request	12
Port 4 Write Channel Urgent Request	11
Port 0 Read Channel Normal Request	10
Port 0 Write Channel Normal Request	9
Port 1 Read Channel Normal Request	8
Port 1 Write Channel Normal Request	7
Port 2 Read Channel Normal Request	6
Port 2 Write Channel Normal Request	5
Port 3 Read Channel Normal Request	4
Port 3 Write Channel Normal Request	3
Port 4 Read Channel Normal Request	2
Port 4 Write Channel Normal Request	1 (lowest)

Data Integrity

The following sections provide information on how the L2 system memory ensures data integrity.

ECC Algorithm

Hsaio encoding calculates the ECC syndrome. A 7-bit syndrome is generated during write operation and stored as a 7-bit parity field along with the 32 data bits. Each data bit contributes to three parity bits according. Each parity bit represents the XOR value of 13 or 14 data bits according to the following mapping:

Figure 7-3: Hsaio Parity Bit Mapping

During read operation, the parity bits become part of the syndrome equation. The new syndrome bits are now the XOR values of the 13 or 14 data bits plus the respective stored parity bit. If any of the seven syndrome bits is set, an error situation is detected. An OR gate cross of the 7 bits reports the error, without specifying the type of the error.

If a single parity bit failed, the new 7-bit syndrome has 1 bit that is set. If a single data bit failed, the new syndrome has 3 bits that are set, because all three related parity bits fail. So, an XOR gate cross of all seven syndrome bits detects a single-bit error, indicating that an odd number of syndrome bits is set.

Figure 7-4: Hsiao Error Reports

The XOR gate detects single-bit errors and does not flag any dual-bit error. But, the gate does flag 50% of the other multi-bit errors undesirably. Extra logic is implemented to increase the detection rate of multi-bit errors to 68.7% as shown in the figure.

If a single-bit error is detected, the failing bit can be localized and corrected. If all three syndrome bits corresponding to a specific data bit are 1, a data error is assumed. The respective data bit is toggled on its way to the system bus.

ECC Hardware Control

After reset, ECC protection is enabled. The boot code initializes all L2 SRAM data and checksum cells. ECC protection adds some cycle penalty when 8-bit and 16-bit values write L2 memory. Disable ECC protection for individual SRAM banks by setting the `L2CTL_CTL.BK0EDIS` through `L2CTL_CTL.BK7EDIS` disable bits. Due to caching mechanisms of the processor cores and data bursting of the DMA channels, 8-bit and 16-bit write accesses are rather uncommon. Typically, only two-dimensional DMA operations or uncached 8-bit and 16-bit store instruction can trigger these writes.

ECC Error Management

The L2 system memory flags 2-bit and multi-bit errors to the system by:

- Raising the `ECC_ERR` interrupt
- Reporting a read error to the system bus
- Setting the sticky `L2CTL_STAT.ECCERR7-L2CTL_STAT.ECCERR0` status flag
- Latching the address of the failing operation into the respective `L2CTL_ERRADDR7-L2CTL_ERRADDR0` register.

There is one error status bit and one error address register per L2 SRAM bank.

Typically, ECC_ERR events are declared as system faults in the system event controller (SEC). Whether these faults are reported, the interrupt service routine can consult the `L2CTL_STAT` register and the `L2CTL_ERRADDR0` through `L2CTL_ERRADDR7` registers to determine whether:

- The data at the failing L2 address was critical enough to require an immediate reboot of the system
- The data at the failing L2 address was less critical or can be restored

The `L2CTL_STAT.ECCERR0` through `L2CTL_STAT.ECCERR7` flags are cleared with a W1C operation.

Memory Refresh

If data in L2 SRAM contains single-bit errors, the data is corrected on its way to the system buses. The corrected value is not written back to the SRAM location. To prevent any risk of accumulation of single-bit errors over time and to minimize likelihood of multi-bit errors, the L2 system memory provides a special memory refresh mechanism.

Memory refresh operation is meaningless when the `L2CTL_CTL.BK0EDIS` through `L2CTL_CTL.BK7EDIS` disable bits are set.

Power Modes

Each L2 memory bank supports low-power modes.

If the bank is not in use, put each L2 system memory bank into the following low-power modes to save power.

Deep Sleep Mode

Set the `L2CTL_PCTL.BK7DS` through `L2CTL_PCTL.BK0DS` control bits to enter this mode. This mode preserves the memory contents.

Shut Down Mode

Set the `L2CTL_PCTL.BK7SD` through `L2CTL_PCTL.BK0SD` control bits to enter this mode. The memory banks do not retain the data (existing data is lost).

NOTE: It may take up to 11 SYSCLK cycles to deactivate the power mode after writing to the `L2CTL_PCTL` register. Therefore, L2 access must be issued after this delay.

Access to a memory bank in shut down or deep sleep mode may result in an unpredictable behavior. Ensure that initialization/refresh and memory access to such banks are not issued.

There is no deep sleep or shut down mode for ROM memories.

L2 System Memory Event Control

The following sections describe event control features of the L2 system memory, such as error response.

ECC Error Interrupt

A bus error is signaled under any of the following conditions.

- A write access to ROM address space
- A read/write access to reserved address space
- An ECC multi-bit error in an ECC-enabled bank. A non-modulo, 32-bit write to an ECC-enabled bank can also potentially create a bus error response due to an ECC multi-bit error. This response is because the L2 system memory implements a 32-bit ECC, and therefore a non-modulo, 32-bit write results in a read. This read can create multi-bit errors even if the memory was initialized.

Bus error notifications are stored in the [L2CTL_STAT](#) register, and the addresses that generated the error on a given port are stored in the [L2CTL_EADDR0/L2CTL_EADDR1](#) register of that port. The details of the error are stored in the [L2CTL_ET0/L2CTL_ET1](#) register of the port.

ADSP-2159x L2CTL Register Descriptions

Some description. (L2CTL) contains the following registers.

Table 7-6: ADSP-2159x L2CTL Register List

Name	Description
L2CTL_CTL	Control Register
L2CTL_EADDR0	Error Type 0 Address Register
L2CTL_EADDR1	Error Type 1 Address Register
L2CTL_EADDR2	Error Type 2 Address Register
L2CTL_EADDR3	Error Type 3 Address Register
L2CTL_EADDR4	Error Type 4 Address Register

L2CTL_WPCR1	Write Priority Count Register

Control Register

The `L2CTL_CTL` register includes a write protection bit, enables L2 banks, and selects mapping of banks (as ECC RAM or data RAM).

Figure 7-5: L2CTL_CTL Register Diagram

Table 7-7: L2CTL_CTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W)	LOCK	Lock. If the global lock bit is set (<code>SPU_CTL.GLCK</code> bit =1) and the <code>L2CTL_CTL.LOCK</code> bit is set, the <code>L2CTL_CTL</code> register is read only (locked).
		0 Unlock
		1 Lock
28 (R/W)	DISURP	Disable Urgent Request Priority. The <code>L2CTL_CTL.DISURP</code> disables urgent request priority mode for all L2 banks.
		0 Enable URP
		1 Disable URP
8 (R/W)	BK8EDIS	Bank 8 (ROM) ECC Disable. The <code>L2CTL_CTL.BK8EDIS</code> bit disables L2 bank 8 (ROM) ECC operation. ECC operation should be enabled or disable before the start of L2 bank access.
		0 Enable ECC
		1 Disable ECC

Table 7-7: L2CTL_CTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
7 (R/W)	BK7EDIS	Bank 7 ECC Disable. The L2CTL_CTL.BK7EDIS bit disables L2 bank 7 ECC operation. ECC operation should be enabled or disable before the start of L2 bank access.
		0 Enable ECC
		1 Disable ECC
6 (R/W)	BK6EDIS	Bank 6 ECC Disable. The L2CTL_CTL.BK6EDIS bit disables L2 bank 6 ECC operation. ECC operation should be enabled or disable before the start of L2 bank access.
		0 Enable ECC
		1 Disable ECC
5 (R/W)	BK5EDIS	Bank 5 ECC Disable. The L2CTL_CTL.BK5EDIS bit disables L2 bank 5 ECC operation. ECC operation should be enabled or disable before the start of L2 bank access.
		0 Enable ECC
		1 Disable ECC
4 (R/W)	BK4EDIS	Bank 4 ECC Disable. The L2CTL_CTL.BK4EDIS bit disables L2 bank 4 ECC operation. ECC operation should be enabled or disable before the start of L2 bank access.
		0 Enable ECC
		1 Disable ECC
3 (R/W)	BK3EDIS	Bank 3 ECC Disable. The L2CTL_CTL.BK3EDIS bit disables L2 bank 3 ECC operation. ECC operation should be enabled or disable before the start of L2 bank access.
		0 Enable ECC
		1 Disable ECC
2 (R/W)	BK2EDIS	Bank 2 ECC Disable. The L2CTL_CTL.BK2EDIS bit disables L2 bank 2 ECC operation. ECC operation should be enabled or disable before the start of L2 bank access.
		0 Enable ECC
		1 Disable ECC

Table 7-7: L2CTL_CTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
1 (R/W)	BK1EDIS	Bank 1 ECC Disable. The L2CTL_CTL.BK1EDIS bit disables L2 bank 1 ECC operation. ECC operation should be enabled or disable before the start of L2 bank access.
		0 Enable ECC
		1 Disable ECC
0 (R/W)	BK0EDIS	Bank 0 ECC Disable. The L2CTL_CTL.BK0EDIS bit disables L2 bank 0 ECC operation. ECC operation should be enabled or disable before the start of L2 bank access.
		0 Enable ECC
		1 Disable ECC

Error Type 0 Address Register

The `L2CTL_EADDR0` register holds the address that created an access error on the L2 port 0 bus interface. This register is be updated only if the corresponding error status bit (`L2CTL_STAT.ERR0`) is cleared. After the status bit is set for an error, further errors do not update the `L2CTL_EADDR0` register until a W1C clears the corresponding status bit. If read and write access errors occur simultaneously, the register captures the write access error address.

Figure 7-6: L2CTL_EADDR0 Register Diagram

Table 7-8: L2CTL_EADDR0 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	VALUE	ERRADDR Value. The <code>L2CTL_EADDR0.VALUE</code> bits hold the address causing the bus error.

Error Type 1 Address Register

The `L2CTL_EADDR1` register holds the address that created an access error on the L2 port 1 bus interface. This register is be updated only if the corresponding error status bit (`L2CTL_STAT.ERR1`) is cleared. After the status bit is set for an error, further errors do not update the `L2CTL_EADDR1` register until a W1C clears the corresponding status bit. If read and write access errors occur simultaneously, the register captures the write access error address.

Figure 7-7: L2CTL_EADDR1 Register Diagram

Table 7-9: L2CTL_EADDR1 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	VALUE	ERRADDR Value. The <code>L2CTL_EADDR1.VALUE</code> bits hold the address causing the bus error.

Error Type 2 Address Register

The `L2CTL_EADDR2` register holds the address that created an access error on the L2 port 2 bus interface (cores). This register is be updated only if the corresponding error status bit (`L2CTL_STAT_1.ERR2`) is cleared. After the status bit is set for an error, further errors do not update the `L2CTL_EADDR2` register until a W1C clears the corresponding status bit. If read and write access errors occur simultaneously, the register captures the write access error address.

Figure 7-8: L2CTL_EADDR2 Register Diagram

Table 7-10: L2CTL_EADDR2 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	VALUE	ERRADDR Value. The <code>L2CTL_EADDR2.VALUE</code> bits hold the address causing the bus error.

Error Type 3 Address Register

The `L2CTL_EADDR3` register holds the address that created an access error on the L2 port 3 bus interface (DMA). This register is be updated only if the corresponding error status bit (`L2CTL_STAT_1.ERR3`) is cleared. After the status bit is set for an error, further errors do not update the `L2CTL_EADDR3` register until a W1C clears the corresponding status bit. If read and write access errors occur simultaneously, the register captures the write access error address.

Figure 7-9: L2CTL_EADDR3 Register Diagram

Table 7-11: L2CTL_EADDR3 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	VALUE	ERRADDR Value. The <code>L2CTL_EADDR3.VALUE</code> bits hold the address causing the bus error.

Error Type 4 Address Register

The `L2CTL_EADDR4` register holds the address that created an access error on the L2 port 4 bus interface (DMA). This register is be updated only if the corresponding error status bit (`L2CTL_STAT_1.ERR4`) is cleared. After the status bit is set for an error, further errors do not update the `L2CTL_EADDR4` register until a W1C clears the corresponding status bit. If read and write access errors occur simultaneously, the register captures the write access error address.

Figure 7-10: L2CTL_EADDR4 Register Diagram

Table 7-12: L2CTL_EADDR4 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	VALUE	ERRADDR Value. The <code>L2CTL_EADDR4.VALUE</code> bits hold the address causing the bus error.

ECC Error Address 0 Register

The `L2CTL_ERRADDR0` register holds the address containing an ECC multi-bit error for the corresponding bank. The L2CTL updates this register only if the bank’s status bit (`L2CTL_STAT.ECCERR0`) is cleared. After the bank’s status bit is set for an error, further errors in the same bank are not detected until a W1C clears the status bit.

Figure 7-11: L2CTL_ERRADDR0 Register Diagram

Table 7-13: L2CTL_ERRADDR0 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	VALUE	ERRADDR Value. The <code>L2CTL_ERRADDR0.VALUE</code> bits hold the address containing the ECC double-bit error.

ECC Error Address 1 Register

The `L2CTL_ERRADDR1` register holds the address containing an ECC multi-bit error for the corresponding bank. The L2CTL updates this register only if the bank’s status bit (`L2CTL_STAT.ECCERR1`) is cleared. After the bank’s status bit is set for an error, further errors in the same bank are not detected until a W1C clears the status bit.

Figure 7-12: L2CTL_ERRADDR1 Register Diagram

Table 7-14: L2CTL_ERRADDR1 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	VALUE	ERRADDR Value. The <code>L2CTL_ERRADDR1.VALUE</code> bits hold the address containing the ECC double-bit error.

ECC Error Address 2 Register

The `L2CTL_ERRADDR2` register holds the address containing an ECC multi-bit error for the corresponding bank. The L2CTL updates this register only if the bank’s status bit (`L2CTL_STAT.ECCERR2`) is cleared. After the bank’s status bit is set for an error, further errors in the same bank are not detected until a W1C clears the status bit.

Figure 7-13: L2CTL_ERRADDR2 Register Diagram

Table 7-15: L2CTL_ERRADDR2 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	VALUE	ERRADDR Value. The <code>L2CTL_ERRADDR2.VALUE</code> bits hold the address containing the ECC double-bit error.

ECC Error Address 3 Register

The `L2CTL_ERRADDR3` register holds the address containing an ECC multi-bit error for the corresponding bank. The L2CTL updates this register only if the bank’s status bit (`L2CTL_STAT.ECCERR3`) is cleared. After the bank’s status bit is set for an error, further errors in the same bank are not detected until a W1C clears the status bit.

Figure 7-14: L2CTL_ERRADDR3 Register Diagram

Table 7-16: L2CTL_ERRADDR3 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	VALUE	ERRADDR Value. The <code>L2CTL_ERRADDR3.VALUE</code> bits hold the address containing the ECC double-bit error.

ECC Error Address 4 Register

The `L2CTL_ERRADDR4` register holds the address containing an ECC multi-bit error for the corresponding bank. The L2CTL updates this register only if the bank’s status bit (`L2CTL_STAT.ECCERR4`) is cleared. After the bank’s status bit is set for an error, further errors in the same bank are not detected until a W1C clears the status bit.

Figure 7-15: L2CTL_ERRADDR4 Register Diagram

Table 7-17: L2CTL_ERRADDR4 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	VALUE	ERRADDR Value. The <code>L2CTL_ERRADDR4.VALUE</code> bits hold the address containing the ECC double-bit error.

ECC Error Address 5 Register

The `L2CTL_ERRADDR5` register holds the address containing an ECC multi-bit error for the corresponding bank. The L2CTL updates this register only if the bank’s status bit (`L2CTL_STAT.ECCERR5`) is cleared. After the bank’s status bit is set for an error, further errors in the same bank are not detected until a W1C clears the status bit.

Figure 7-16: L2CTL_ERRADDR5 Register Diagram

Table 7-18: L2CTL_ERRADDR5 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	VALUE	ERRADDR Value. The <code>L2CTL_ERRADDR5.VALUE</code> bits hold the address containing the ECC double-bit error.

ECC Error Address 6 Register

The `L2CTL_ERRADDR6` register holds the address containing an ECC multi-bit error for the corresponding bank. The L2CTL updates this register only if the bank’s status bit (`L2CTL_STAT.ECCERR6`) is cleared. After the bank’s status bit is set for an error, further errors in the same bank are not detected until a W1C clears the status bit.

Figure 7-17: L2CTL_ERRADDR6 Register Diagram

Table 7-19: L2CTL_ERRADDR6 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	VALUE	ERRADDR Value. The <code>L2CTL_ERRADDR6.VALUE</code> bits hold the address containing the ECC double-bit error.

ECC Error Address 7 Register

The `L2CTL_ERRADDR7` register holds the address containing an ECC multi-bit error for the corresponding bank. The L2CTL updates this register only if the bank’s status bit (`L2CTL_STAT.ECCERR7`) is cleared. After the bank’s status bit is set for an error, further errors in the same bank are not detected until a W1C clears the status bit.

Figure 7-18: L2CTL_ERRADDR7 Register Diagram

Table 7-20: L2CTL_ERRADDR7 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	VALUE	ERRADDR Value. The <code>L2CTL_ERRADDR7.VALUE</code> bits hold the address containing the ECC double-bit error.

ECC Error Address 8 Register

The `L2CTL_ERRADDR8` register holds the address containing an ECC multi-bit error for the corresponding bank. The L2CTL updates this register only if the bank’s status bit (`L2CTL_STAT.ECCERR8`) is cleared. After the bank’s status bit is set for an error, further errors in the same bank are not detected until a W1C clears the status bit.

Figure 7-19: L2CTL_ERRADDR8 Register Diagram

Table 7-21: L2CTL_ERRADDR8 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	VALUE	ERRADDR Value. The <code>L2CTL_ERRADDR8.VALUE</code> bits hold the address containing the ECC double-bit error.

Error Type 0 Register

The `L2CTL_ET0` register holds information about the error transaction that has occurred on the bus for the corresponding L2 bus port 0. This register is updated only if the corresponding error status bit `L2CTL_STAT.ERR0` is cleared. After the status bit is set for an error, further errors do not update the `L2CTL_ET0` register until a W1C clears the corresponding status bit. If read and write access errors occur simultaneously, the `L2CTL_ET0` captures the write access error, keeping in sync with the error address register (`L2CTL_EADDR0`).

Figure 7-20: L2CTL_ET0 Register Diagram

Table 7-22: L2CTL_ET0 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
20:8 (R/NW)	ID	Error ID. The <code>L2CTL_ET0.ID</code> bits hold the bus master ID of the access that caused an error.
4 (R/NW)	RDWR	Read/Write Error. The <code>L2CTL_ET0.RDWR</code> bit indicates whether a read or write access caused an error.
		0 Read Access created Error
		1 Write Access created Error
3 (R/NW)	ECCERR	ECC Error. The <code>L2CTL_ET0.ECCERR</code> bit indicates whether the access had an ECC double-bit error.
2 (R/NW)	ACCERR	Access Error. The <code>L2CTL_ET0.ACCERR</code> bit indicates whether the access went to a restricted bank.
0 (R/NW)	ROMERR	ROM Error. The <code>L2CTL_ET0.ROMERR</code> bit indicates whether a write access went to a ROM area.

Error Type 1 Register

The `L2CTL_ET1` register holds information about the error transaction that has occurred on the bus for the corresponding L2 bus port 1. This register is updated only if the corresponding error status bit `L2CTL_STAT.ERR1` is cleared. After the status bit is set for an error, further errors do not update the `L2CTL_ET1` register until a `W1C` clears the corresponding status bit. If read and write access errors occur simultaneously, the `L2CTL_ET1` captures the write access error, keeping in sync with the error address register (`L2CTL_EADDR1`).

Figure 7-21: L2CTL_ET1 Register Diagram

Table 7-23: L2CTL_ET1 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
20:8 (R/NW)	ID	Error ID. The <code>L2CTL_ET1.ID</code> bits hold the bus master ID of the access that caused an error.
4 (R/NW)	RDWR	Read/Write Error. The <code>L2CTL_ET1.RDWR</code> bit indicates whether a read or write access caused an error.
		0 Read access created error
		1 Write access created error
3 (R/NW)	ECCERR	ECC Error. If the <code>L2CTL_ET1.ECCERR</code> bit =1, the access had an ECC double-bit error.
2 (R/NW)	ACCERR	Access Error. If the <code>L2CTL_ET1.ACCERR</code> bit =1, the access went to a restricted bank.
0 (R/NW)	ROMERR	ROM Error. If the <code>L2CTL_ET1.ROMERR</code> bit =1, a write access went to a ROM area.

Error Type 2 Register

The `L2CTL_ET2` register holds information about the error transaction that has occurred on the bus for the corresponding L2 bus port 2 (cores). This register is updated only if the corresponding error status bit `L2CTL_STAT_1.ERR2` is cleared. After the status bit is set for an error, further errors do not update the `L2CTL_ET2` register until a W1C clears the corresponding status bit. If read and write access errors occur simultaneously, the `L2CTL_ET2` captures the write access error, keeping in sync with the error address register (`L2CTL_EADDR2`).

Figure 7-22: L2CTL_ET2 Register Diagram

Table 7-24: L2CTL_ET2 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
20:8 (R/NW)	ID	Error ID. The <code>L2CTL_ET2.ID</code> bits hold the bus master ID of the access that caused an error.
4 (R/NW)	RDWR	Read/Write Error. The <code>L2CTL_ET2.RDWR</code> bit indicates whether a read or write access caused an error.
3 (R/NW)	ECCERR	ECC Error. The <code>L2CTL_ET2.ECCERR</code> bit indicates whether the access had an ECC double-bit error.
2 (R/NW)	ACCERR	Access Error. If the <code>L2CTL_ET2.ACCERR</code> bit =1, the access went to a restricted bank.
0 (R/NW)	ROMERR	ROM Error. If the <code>L2CTL_ET2.ROMERR</code> bit =1, a write access went to a ROM area.

Error Type 3 Register

The `L2CTL_ET3` register holds information about the error transaction that has occurred on the bus for the corresponding L2 bus port 3 (DMA). This register is updated only if the corresponding error status bit `L2CTL_STAT_1.ERR3` is cleared. After the status bit is set for an error, further errors do not update the `L2CTL_ET3` register until a W1C clears the corresponding status bit. If read and write access errors occur simultaneously, the `L2CTL_ET3` captures the write access error, keeping in sync with the error address register (`L2CTL_EADDR3`).

Figure 7-23: L2CTL_ET3 Register Diagram

Table 7-25: L2CTL_ET3 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
20:8 (R/NW)	ID	Error ID. The <code>L2CTL_ET3.ID</code> bits hold the bus master ID of the access that caused an error.
4 (R/NW)	RDWR	Read/Write Error. The <code>L2CTL_ET3.RDWR</code> bit indicates whether a read or write access caused an error.
3 (R/NW)	ECCERR	ECC Error. The <code>L2CTL_ET3.ECCERR</code> bit indicates whether the access had an ECC double-bit error.
2 (R/NW)	ACCERR	Access Error. If the <code>L2CTL_ET3.ACCERR</code> bit =1, the access went to a restricted bank.
0 (R/NW)	ROMERR	ROM Error. If the <code>L2CTL_ET3.ROMERR</code> bit =1, a write access went to a ROM area.

Error Type 4 Register

The `L2CTL_ET4` register holds information about the error transaction that has occurred on the bus for the corresponding L2 bus port 4 (DMA). This register is updated only if the corresponding error status bit `L2CTL_STAT_1.ERR4` is cleared. After the status bit is set for an error, further errors do not update the `L2CTL_ET4` register until a W1C clears the corresponding status bit. If read and write access errors occur simultaneously, the `L2CTL_ET4` captures the write access error, keeping in sync with the error address register (`L2CTL_EADDR4`).

Figure 7-24: L2CTL_ET4 Register Diagram

Table 7-26: L2CTL_ET4 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
20:8 (R/NW)	ID	Error ID. The <code>L2CTL_ET4.ID</code> bits hold the bus master ID of the access that caused an error.
4 (R/NW)	RDWR	Read/Write Error. The <code>L2CTL_ET4.RDWR</code> bit indicates whether a read or write access caused an error.
3 (R/NW)	ECCERR	ECC Error. The <code>L2CTL_ET4.ECCERR</code> bit indicates whether the access had an ECC double-bit error.
2 (R/NW)	ACCERR	Access Error. If the <code>L2CTL_ET4.ACCERR</code> bit =1, the access went to a restricted bank.
0 (R/NW)	ROMERR	ROM Error. If the <code>L2CTL_ET4.ROMERR</code> bit =1, a write access went to a ROM area.

Initialization Register

The `L2CTL_INIT` register initializes memory banks with 128'b0 and ECC bits corresponding to 128'b0. Any writes to the bits in this register while initialization is occurring to any of the banks is ignored. All bits are W1A (Write 1 for Action).

Figure 7-25: L2CTL_INIT Register Diagram

Table 7-27: L2CTL_INIT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
7 (R0/W1A)	BK7	Initialize Bank 7. The write-1 to the <code>L2CTL_INIT.BK7</code> bit initializes bank 7 with 128b0 and ECC bits corresponding to 128b0. Any write to this bit during the initialization of the banks is ignored.
6 (R0/W1A)	BK6	Initialize Bank 6. The write-1 to the <code>L2CTL_INIT.BK6</code> bit initializes bank 6 with 128b0 and ECC bits corresponding to 128b0. Any write to this bit during the initialization of the banks is ignored.
5 (R0/W1A)	BK5	Initialize Bank 5. The write -1 to the <code>L2CTL_INIT.BK5</code> bit initializes bank 5 with 128b0 and ECC bits corresponding to 128b0. Any write to this bit during the initialization of the banks is ignored.
4 (R0/W1A)	BK4	Initialize Bank 4. The write-1 to the <code>L2CTL_INIT.BK4</code> bit initializes bank 4 with 128b0 and ECC bits corresponding to 128b0. Any write to this bit during the initialization of the banks is ignored.

Table 7-27: L2CTL_INIT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
3 (R0/W1A)	BK3	Initialize Bank 3. The write-1 to the L2CTL_INIT.BK3 bit initializes bank 3 with 128b0 and ECC bits corresponding to 128b0. Any write to this bit during the initialization of the banks is ignored.
2 (R0/W1A)	BK2	Initialize Bank 2. The write-1 to the L2CTL_INIT.BK2 bit initializes bank 2 with 128b0 and ECC bits corresponding to 128b0. Any write to this bit during the initialization of the banks is ignored.
1 (R0/W1A)	BK1	Initialize Bank 1. The write-1 to the L2CTL_INIT.BK1 bit initializes bank 1 with 128b0 and ECC bits corresponding to 128b0. Any write to this bit during the initialization of the banks is ignored.
0 (R0/W1A)	BK0	Initialize Bank 0. The write-1 to the L2CTL_INIT.BK0 bit initializes bank 0 with 128b0 and ECC bits corresponding to 128b0. Any write to this bit during the initialization of the banks is ignored.

Initialization Status Register

The `L2CTL_ISTAT` register holds the status of the RAM bank initialization. If set, the corresponding bank is initialized.

Figure 7-26: L2CTL_ISTAT Register Diagram

Table 7-28: L2CTL_ISTAT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
7 (R/NW)	BK7	Bank 7 Initialization Status. The <code>L2CTL_ISTAT.BK7</code> bits hold the bank 7 initialization status. A W1A on a <code>BKxINIT</code> bit clears this bit and the bit is set when initialization completes.
6 (R/NW)	BK6	Bank 6 Initialization Status. The <code>L2CTL_ISTAT.BK6</code> bits hold the bank 6 initialization status. A W1A on a <code>BKxINIT</code> bit clears this bit and the bit is set when initialization completes.
5 (R/NW)	BK5	Bank 5 Initialization Status. The <code>L2CTL_ISTAT.BK5</code> bits hold the bank 5 initialization status. A W1A on a <code>BKxINIT</code> bit clears this bit and the bit is set when initialization completes.
4 (R/NW)	BK4	Bank 4 Initialization Status. The <code>L2CTL_ISTAT.BK4</code> bits hold the bank 4 initialization status. A W1A on a <code>BKxINIT</code> bit clears this bit and the bit is set when initialization completes.
3 (R/NW)	BK3	Bank 3 Initialization Status. The <code>L2CTL_ISTAT.BK3</code> bits hold the bank 3 initialization status. A W1A on a <code>BKxINIT</code> bit clears this bit and the bit is set when initialization completes.
2 (R/NW)	BK2	Bank 2 Initialization Status. The <code>L2CTL_ISTAT.BK2</code> bits hold the bank 2 initialization status. A W1A on a <code>BKxINIT</code> bit clears this bit and the bit is set when initialization completes.

Table 7-28: L2CTL_ISTAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
1 (R/NW)	BK1	Bank 1 Initialization Status. The L2CTL_ISTAT.BK1 bits hold the bank 1 initialization status. A W1A on a BKxINIT bit clears this bit and the bit is set when initialization completes.
0 (R/NW)	BK0	Bank 0 Initialization Status. The L2CTL_ISTAT.BK0 bits hold the bank 0 initialization status. A W1A on a BKxINIT bit clears this bit and the bit is set when initialization completes.

Power Control Register

The `L2CTL_PCTL` register has the various control settings for selectively enabling the deep sleep and shut down power saving features.

NOTE: The corresponding L2 bank should not be accessed if the power control feature is enabled for that bank. An access to a bank in deep sleep/shut down may create unpredictable behavior.

Figure 7-27: L2CTL_PCTL Register Diagram

Table 7-29: L2CTL_PCTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W)	LOCK	Lock.
		If the global lock bit is set (<code>SPU_CTL.GLCK</code> bit =1) and the <code>L2CTL_PCTL.LOCK</code> bit is set, the <code>L2CTL_PCTL</code> register is read only (locked).
		0 Unlock 1 Lock
23 (R/W)	BK7SD	Bank 7 Shut Down Enable. The <code>L2CTL_PCTL.BK7SD</code> bits enables bank 7 shut down.

Table 7-29: L2CTL_PCTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
22 (R/W)	BK6SD	Bank 6 Shut Down Enable. The L2CTL_PCTL.BK6SD bits enables bank 6 shut down.
21 (R/W)	BK5SD	Bank 5 Shut Down Enable. The L2CTL_PCTL.BK5SD bits enables bank 5 shut down.
20 (R/W)	BK4SD	Bank 4 Shut Down Enable. The L2CTL_PCTL.BK4SD bits enables bank 4 shut down.
19 (R/W)	BK3SD	Bank 3 Shut Down Enable. The L2CTL_PCTL.BK3SD bits enables bank 3 shut down.
18 (R/W)	BK2SD	Bank 2 Shut Down Enable. The L2CTL_PCTL.BK2SD bits enables bank 2 shut down.
17 (R/W)	BK1SD	Bank 1 Shut Down Enable. The L2CTL_PCTL.BK1SD bits enables bank 1 shut down.
16 (R/W)	BK0SD	Bank 0 Shut Down Enable. The L2CTL_PCTL.BK0SD bits enables bank 0 shut down.
7 (R/W)	BK7DS	Bank 7 Deep Sleep Enable. The L2CTL_PCTL.BK7DS bits enables bank 7 deep sleep.
6 (R/W)	BK6DS	Bank 6 Deep Sleep Enable. The L2CTL_PCTL.BK6DS bits enables bank 6 deep sleep.
5 (R/W)	BK5DS	Bank 5 Deep Sleep Enable. The L2CTL_PCTL.BK5DS bits enables bank 5 deep sleep.
4 (R/W)	BK4DS	Bank 4 Deep Sleep Enable. The L2CTL_PCTL.BK4DS bits enables bank 4 deep sleep.
3 (R/W)	BK3DS	Bank 3 Deep Sleep Enable. The L2CTL_PCTL.BK3DS bits enables bank 3 deep sleep.
2 (R/W)	BK2DS	Bank 2 Deep Sleep Enable. The L2CTL_PCTL.BK2DS bits enables bank 2 deep sleep.
1 (R/W)	BK1DS	Bank 1 Deep Sleep Enable. The L2CTL_PCTL.BK1DS bits enables bank 1 deep sleep.
0 (R/W)	BK0DS	Bank 0 Deep Sleep Enable. The L2CTL_PCTL.BK0DS bits enables bank 0 deep sleep.

Revision ID Register

The `L2CTL_REVID` register provides the L2 Revision ID.

Figure 7-28: L2CTL_REVID Register Diagram

Table 7-30: L2CTL_REVID Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
7:4 (R/NW)	MAJOR	Major ID. The <code>L2CTL_REVID.MAJOR</code> bit indicates L2 Major ID.
3:0 (R/NW)	REV	Revision ID. The <code>L2CTL_REVID.REV</code> bit indicates the L2 Revision ID.

Read Priority Count Register

The `L2CTL_RPCR0` register stores the count value to be used for priority elevation for bus read channels of Port0 to Port3. If a bus channel is not granted access from the bank arbiter, the channel waits for the programmed number (stored in `RPCx`) of `SYSCLK` cycles, before the request is elevated to a high priority request. If a priority count value is programmed as zero for a channel, that channel does not raise the urgent priority request. Default value wait cycle for each channel is 15..

This is a read/write register, but a new value in the corresponding field must be written only when there are no outstanding transactions on the corresponding bus read channel. A best practice is to program this register before initiating an L2 access.

Figure 7-29: L2CTL_RPCR0 Register Diagram

Table 7-31: L2CTL_RPCR0 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:24 (R/W)	RPC3	Read Priority Count 3. The <code>L2CTL_RPCR0.RPC3</code> bits hold the priority count for L2 bus read channel 3.
23:16 (R/W)	RPC2	Read Priority Count 2. The <code>L2CTL_RPCR0.RPC2</code> bits hold the priority count for L2 bus read channel 2.
15:8 (R/W)	RPC1	Read Priority Count 1. The <code>L2CTL_RPCR0.RPC1</code> bits hold the priority count for L2 bus read channel 1.
7:0 (R/W)	RPC0	Read Priority Count 0. The <code>L2CTL_RPCR0.RPC0</code> bits hold the priority count for L2 bus read channel 0.

Read Priority Count Register

The `L2CTL_RPCR1` register stores the count value to be used for priority elevation for bus read channel 4. If a bus channel is not granted access from the bank arbiter, the channel waits for the programmed number (stored in `RPC4`) of `SYSCCLK` cycles, before the request is elevated to a high priority request. If a priority count value is programmed as zero for a channel, that channel does not raise the urgent priority request. Default value of `RPC4` is 15.

This is a read/write register, but a new value in the corresponding field must be written only when there are no outstanding transactions on the corresponding bus read channel. A best practice is to program this register before initiating an L2 access.

Figure 7-30: L2CTL_RPCR1 Register Diagram

Table 7-32: L2CTL_RPCR1 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
7:0 (R/W)	RPC4	Read Priority Count 4. The <code>L2CTL_RPCR1</code> . <code>RPC4</code> bits hold the priority count for L2 bus read channel 4.

Scrub Start Address Register

The `L2CTL_SADR` register stores the scrub start address value. Writes to this register can be prevented by setting the `L2CTL_SCTL.LOCK` bit and the global lock.

Figure 7-31: L2CTL_SADR Register Diagram

Table 7-33: L2CTL_SADR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	Scrub Start Address. The <code>L2CTL_SADR.VALUE</code> bits hold the scrub start address. The writes to this register can be prevented by setting the <code>L2_SCTL.LOCK</code> and the global lock.

Scrub Count Register

The `L2CTL_SCNT` register determines the number of 128-bit locations scrubbed starting from the start address (`L2CTL_SADR` register). Writes to the `L2CTL_SCNT` register can be prevented by setting the `L2CTL_CTL.LOCK` bit and the global lock.

Figure 7-32: L2CTL_SCNT Register Diagram

Table 7-34: L2CTL_SCNT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
17:0 (R/W)	VALUE	Scrub Count. The <code>L2CTL_SCNT.VALUE</code> bits determines the number of 128-bit locations scrubbed starting from the start address. Ensure value programmed is less than the total addressable 128-bit L2 RAM locations available.

Scrub Control Register

The `L2CTL_SCTL` register holds the automatic scrub related controls. This is a read/write register. Memory scrub can be performed by programming the `L2CTL_SADR` (scrub start address) register with the start address of the scrub and the `L2CTL_SCNT` register with the total number of 128-bit addresses to be scrubbed starting from the `L2CTL_SADR` register. The number of cycles between each scrub can be programmed with the `L2CTL_SCTL.SRT` bit.

During the scrub the controller issues a read followed by write back if there is a single bit ECC error. Once the L2 controller completes scrubbing the memory region mentioned using the `L2CTL_SADR` and the `L2CTL_SCNT` registers, an interrupt is generated and scrubbing re-starts from the start unless the scrub enable bit is disabled in the control register. If scrub enable is cleared before completing the address range used in the `L2CTL_SADR` and `L2CTL_SCNT` registers, the scrub stops after completing any already issued scrub access.

The scrub read/writes always start from the full 128-bit equivalent of the address written into the `L2CTL_SADR` register. A 128-bit value is always read and the 128-bit value is written back. The scrub access has the highest priority. Programs can configure 8-, 16-, or 32-bit addresses in the `L2CTL_SADR` register but the lower 3 bits are treated as don't care because the internal memory array is always accessed in a 128-bit mode.

Figure 7-33: L2CTL_SCTL Register Diagram

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W)	LOCK	Lock.
		If the global lock bit is set (<code>SPU_CTL.GLCK</code> bit =1) and the <code>L2CTL_SCTL.LOCK</code> bit is set, the <code>L2CTL_SCTL</code> register is read only (locked).
		0 Unlock
		1 Lock
30 (R/W)	SEN	Scrub Enable. The <code>L2CTL_SCTL.SEN</code> bits enable automatic scrub.

Table 7-35: L2CTL_SCTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
15:0 (R/W)	SRT	Scrub Rate. The L2CTL_SCTL.SRT bits determines the number of clock cycles that elapsed between two automatic scrubs.

Status Register

The `L2CTL_STAT` register indicates ECC error status, refresh register status, and bus error status of Port0 and Port1.

Figure 7-34: L2CTL_STAT Register Diagram

Table 7-36: L2CTL_STAT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
16 (R/W1C)	ECCERR8	ECC Error Bank 8 (ROM). The <code>L2CTL_STAT.ECCERR8</code> bit indicates that an ECC double-bit error occurred inside L2 bank 8 (ROM).
		0 No Status
		1 ECC Double Bit Error
15 (R/W1C)	ECCERR7	ECC Error Bank 7. The <code>L2CTL_STAT.ECCERR7</code> bit indicates that an ECC double-bit error occurred inside L2 bank 7.
		0 No Status
		1 ECC Double Bit Error

Table 7-36: L2CTL_STAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
14 (R/W1C)	ECCERR6	ECC Error Bank 6. The L2CTL_STAT.ECCERR6 bit indicates that an ECC double-bit error occurred inside L2 bank 6.
		0 No Status
		1 ECC Double Bit Error
13 (R/W1C)	ECCERR5	ECC Error Bank 5. The L2CTL_STAT.ECCERR5 bit indicates that an ECC double-bit error occurred inside L2 bank 5.
		0 No Status
		1 ECC Double Bit Error
12 (R/W1C)	ECCERR4	ECC Error Bank 4. The L2CTL_STAT.ECCERR4 bit indicates that an ECC double-bit error occurred inside L2 bank 4.
		0 No Status
		1 ECC Double Bit Error
11 (R/W1C)	ECCERR3	ECC Error Bank 3. The L2CTL_STAT.ECCERR3 bit indicates that an ECC double-bit error occurred inside L2 bank 3.
		0 No Status
		1 ECC Double Bit Error
10 (R/W1C)	ECCERR2	ECC Error Bank 2. The L2CTL_STAT.ECCERR2 bit indicates that an ECC double-bit error occurred inside L2 bank 2.
		0 No Status
		1 ECC Double Bit Error
9 (R/W1C)	ECCERR1	ECC Error Bank 1. The L2CTL_STAT.ECCERR1 bit indicates that an ECC double-bit error occurred inside L2 bank 1.
		0 No Status
		1 ECC Double Bit Error

Table 7-36: L2CTL_STAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
8 (R/W1C)	ECCERR0	ECC Error Bank 0. The L2CTL_STAT.ECCERR0 bit indicates that an ECC double-bit error occurred inside L2 bank 0.
		0 No Status
		1 ECC Double Bit Error
5 (R/W1C)	INITDN	Initialization Status. The L2CTL_STAT.INITDN bit indicates whether initialization has been completed.
		0 Initialization Not Complete
		1 Initialization Completed
4 (R/W1C)	SCRBDN	Scrub Status. The L2CTL_STAT.SCRBDN bit indicates whether a round of memory scrub has completed.
		0 Scrub Not Complete
		1 Scrub Completed
1 (R/W1C)	ERR1	Error Port 1. The L2CTL_STAT.ERR1 indicates whether the L2CTL has detected a bus access error on L2s bus port 1.
		0 No Error
		1 Bus Access Error
0 (R/W1C)	ERR0	Error Port 0. The L2CTL_STAT.ERR0 indicates whether the L2CTL has detected a bus access error on L2s bus port 0.
		0 No Error
		1 Bus Access Error

L2 Port Error Status Register

The `L2CTL_STAT_1` register stores the AXI Error Status from Port2 onwards. The register bits are sticky - once set it has to be explicitly reset by writing a 1 to that particular bit.

Figure 7-35: L2CTL_STAT_1 Register Diagram

Table 7-37: L2CTL_STAT_1 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
4 (R/W1C)	ERR4	Error Port4. The <code>L2CTL_STAT_1</code> .ERR4 indicates whether the L2CTL has detected a bus access error on L2s bus port 4.
3 (R/W1C)	ERR3	Error Port3. The <code>L2CTL_STAT_1</code> .ERR3 indicates whether the L2CTL has detected a bus access error on L2s bus port 3.
2 (R/W1C)	ERR2	Error Port2. The <code>L2CTL_STAT_1</code> .ERR2 indicates whether the L2CTL has detected a bus access error on L2s bus port 2.

Write Priority Count Register

The `L2CTL_WPCR0` register stores the count value to be used for priority elevation for bus write channels. If a bus channel is not granted access from the bank arbiter, the channel waits for the programmed number of SYSCLK cycles, before the request is elevated to a high priority request. If a priority count value is programmed as zero for a channel, that channel does not raise the urgent priority request.

This is a read/write register, but a new value in the corresponding field must be written only when there are no outstanding transactions on the corresponding bus write channel. A best practice is to program this register before initiating an L2 access.

Figure 7-36: L2CTL_WPCR0 Register Diagram

Table 7-38: L2CTL_WPCR0 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:24 (R/W)	WPC3	Write Priority Count 3. The <code>L2CTL_WPCR0.WPC3</code> bits hold the priority count for L2 bus write channel 3.
23:16 (R/W)	WPC2	Write Priority Count 2. The <code>L2CTL_WPCR0.WPC2</code> bits hold the priority count for L2 bus write channel 2.
15:8 (R/W)	WPC1	Write Priority Count 1. The <code>L2CTL_WPCR0.WPC1</code> bits hold the priority count for L2 bus write channel 1.
7:0 (R/W)	WPC0	Write Priority Count 0. The <code>L2CTL_WPCR0.WPC0</code> bits hold the priority count for L2 bus write channel 0.

Write Priority Count Register

The `L2CTL_WPCR1` register stores the count value to be used for priority elevation for bus write channels. If a bus channel is not granted access from the bank arbiter, the channel waits for the programmed number of `SYSCLK` cycles, before the request is elevated to a high priority request. If a priority count value is programmed as zero for a channel, that channel does not raise the urgent priority request.

This is a read/write register, but a new value in the corresponding field must be written only when there are no outstanding transactions on the corresponding bus write channel. A best practice is to program this register before initiating an L2 access.

Figure 7-37: L2CTL_WPCR1 Register Diagram

Table 7-39: L2CTL_WPCR1 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
7:0 (R/W)	WPC4	Write Priority Count 4. The <code>L2CTL_WPCR1.WPC4</code> bits hold the priority count for L2 bus write channel 4.

8 Dynamic Memory Controller (DMC)

The dynamic memory controller (DMC) provides a glueless interface between DDR3 SDRAMs and the system crossbar interface (SCB). The DMC enables execution of instructions from, as well as transfer of data to and from, DDR3 SDRAM respectively.

NOTE: The term DDR3 is referred to generically as DDR SDRAM in the rest of this chapter unless otherwise noted.

The DMC is partitioned in a manner that allows reconfiguration and maintainability. The memory access protocol state machine along with JEDEC standard specific logic is embedded in the *protocol controller*. An access and operation reordering mechanism is incorporated as an *efficiency controller*. An SCB slave interface is provided to interface with the on-chip interconnect. This interface results in an efficient slave implementation owing to its out-of-order transaction capabilities. The control and status registers present in the DMC can be accessed using the MMR access bus.

The DMC supports access to the external memory by core and DMA accesses.

DMC Features

The DMC includes a protocol controller that supports:

- JESD79-3E compatible double data rate DDR3 SDRAM devices

The features of the dynamic memory controller are:

- Provides 16-bit data only interface to SDRAM devices
- Supports a single external rank (one chip select)
- Provides page hit detection that supports multiple column accesses to the same row
- User-specified active, precharge, and refresh commands.
- Programmable SDRAM access timing parameters
- Enables automatic refresh generation with programmable refresh intervals
- Self-refresh mode to reduce system power consumption
- Efficient transaction processing to improve throughput and bandwidth using:

- Software programmable SCB IDs to allow SCB ID-based priority
- The ability to postpone up to eight auto-refresh commands
- Software selectable closed page scheme on a per bank basis
- Simple transaction scheduling mechanism to reduce read write turnaround frequency on the memory bus
- Accesses with the same SCB ID are scheduled back-to-back to take advantage of same page access in SDRAM
- Caching of SDRAM read data burst for specific masters to reduce the latency for same burst accesses.

The DDR3 features are:

- 512 Mb to 8 Gb device sizes
- Burst length BL = 8
- Support for additive latency
- Support for programmable (and ZQ calibration) ODT and drive impedance
- Support for read leveling
- Support for write leveling

Feature Exclusions

The DMC exclusions are as follows:

For DDR3:

- 4-bit and 8-bit wide DDR3 DRAM memories are not supported
- Burst interleaved accesses are not supported
- Both burst chop-BC4 and BC4-on-the-fly are not supported
- Auto refresh pull-in is not supported
- DLL off mode is not supported

DMC Functional Description

The dynamic memory controller consists of master and slave interfaces, a protocol controller, and an efficiency controller. The following sections describe the function of these interfaces and controllers.

ADSP-2159x DMC Register List

The Dynamic Memory Controller module (DMC) provides an interface to external double-data-rate SDRAM. This interface supports various DDR standards (see chapter descriptions). A set of registers governs DMC controller operations. For more information on DMC controller functionality, see the DMC Controller Register Descriptions.

Table 8-1: ADSP-2159x DMC Register List

Name	Description
DMC_CFG	Configuration Register
DMC_CTL	Control Register
DMC_DLLCTL	DLL Control Register
DMC_DT_CALIB_ADDR	Data Calibration Address Register
DMC_DT_DATA_CALIB_DATA0	Data Calibration Data 0 Register
DMC_DT_DATA_CALIB_DATA1	Data Calibration Data 1 Register
DMC_EFFCTL	Efficiency Control Register
DMC_EM3	Shadow EM3 Register
DMC_MR	Shadow MR0 Register (DDR3)
DMC_MR1	Shadow MR1 Register (DDR3)
DMC_MR2	Shadow MR2 Register (DDR3)
DMC_MSK	Mask (Mode Register Shadow) Register
DMC_PRIO	Priority ID Register 1
DMC_PRIO2	Priority ID Register 2
DMC_PRIOMSK	Priority ID Mask Register 1
DMC_PRIOMSK2	Priority ID Mask Register 2
DMC_RDDATABUFID1	DMC Read Data Buffer ID Register 1
DMC_RDDATABUFID2	DMC Read Data Buffer ID Register 2
DMC_RDDATABUFMSK1	DMC Read Data Buffer Mask Register 1
DMC_RDDATABUFMSK2	DMC Read Data Buffer Mask Register 2
DMC_STAT	Status Register
DMC_TR0	Timing 0 Register
DMC_TR1	Timing 1 Register
DMC_TR2	Timing 2 Register

ADSP-2159x DMC Register List

DMCPHY (DMC) contains the following registers.

Table 8-2: ADSP-2159x DMC Register List

Name	Description
DMC_DDR_CA_CTL	DDR CA Lane Control Register
DMC_DDR_LANE0_CTL0	Data Lane 0 Control Register 0
DMC_DDR_LANE0_CTL1	Data Lane 0 Control Register 1
DMC_DDR_LANE1_CTL0	Data Lane 1 Control Register 0
DMC_DDR_LANE1_CTL1	Data Lane 1 Control Register 1
DMC_DDR_ROOT_CTL	DDR ROOT Module Control Register
DMC_DDR_ZQ_CTL0	DDR Calibration Control Register 0
DMC_DDR_ZQ_CTL1	DDR Calibration Control Register 1
DMC_DDR_ZQ_CTL2	DDR Calibration Control Register 2

Protocol Controller

The DDR SDRAM protocol controller translates memory access requests from the SCB (system crossbar) interface to JEDEC protocol-specific transactions used by DDR SDRAM devices.

The protocol controller ensures that the various timing parameters are met before reading and writing the SDRAM. The controller also performs the SDRAM initialization sequence as mandated by the standard. The protocol controller can:

- Issue reads and writes
- Precharge a row in a bank
- Activate a row in a bank
- Put the SDRAM devices in self-refresh and power-down modes

The protocol controller takes mode register writes from the MMR interface and translates them into mode register writes to SDRAM. Writing into the mode register is restricted through a mask register.

Efficiency Controller

The efficiency controller controls the ordering of transfers buffered in the read and write command buffers. It attempts to order transfers to optimize the available memory bandwidth. The DMC uses a number of schemes, described in the following sections, to increase the throughput.

Page-Based Scheduling

The DMC parses each write and read transaction that it buffered and gets the information of the row (page) and bank address. The protocol controller maintains the information about the pages that are opened in each bank. The efficiency controller uses the information about the opened pages while scheduling the buffered transactions. The transactions to the opened pages are given higher priority than the other outstanding transactions.

Same Master Transaction Scheduling

The DMC also stores the ID of each transaction that it buffered. In most of the cases, the transactions related to a master result in page hits from the locality of reference rule. The efficiency controller uses the ID information of the transactions while scheduling. When the page-based scheduling of the buffered transactions is complete, same master transaction scheduling is triggered. If multiple transactions from a master are received, the efficiency controller schedules the transactions back-to-back.

DMC Read Data Buffer

The DMC read data buffer contains a data buffer and an address buffer. The depth of the data buffer is equal to the burst length that is programmed in SDRAM. The address buffer holds the corresponding SDRAM burst address. When an SDRAM write address from any master matches an address in the DMC read data buffer, the DMC invalidates the related data in the read buffer. When the [DMC_RDDATABUFMSK1](#) or [DMC_RDDATABUFMSK2](#) register is programmed with a value other than zero, the DMC read data buffer operation is enabled. The set of masters whose data is buffered and retrieved are programmed in the [DMC_RDDATABUFID1](#) or [DMC_RDDATABUFID2](#) registers. The DMC can use the [DMC_RDDATABUFMSK1](#) and [DMC_RDDATABUFMSK2](#) ID registers to select a set of masters similar to the programming of the [DMC_PRIOMSK](#) and [DMC_PRIOMSK2](#) registers.

See the [SCB ID-Based Priority](#) section for details.

Closed Page Per Bank

The [DMC_EFFCTL](#) register provides per-bank granularity for closing pages. The software can determine that most accesses to a given bank in memory always result in a missed page. In this case, set the [PREC_BANK](#) bit corresponding to the required bank to close the row after every transfer. This proactive step can result in reduced thrashing and increases memory throughput.

SCB ID-Based Priority

The primary goal of the dynamic memory controller is to improve sustainable memory system bandwidth so that the service time for the average request can be reduced. However, to service critical requests from any master in the system, the DMC provides a mechanism to elevate priority of a given access. The DMC priority ID registers ([DMC_PRIO](#) and [DMC_PRIO2](#)) can be programmed with up to two SCB IDs with elevated priority.

After every access in a snapshot, the command buffers are searched to determine whether an ID of a command matches with the ID programmed in the [DMC_PRIO](#) and [DMC_PRIO2](#) registers. The priority SCB ID access is sent before the subsequent access in the snapshot if:

- A match occurs, and
- The direction of the access (for example write) is the same as the direction of the snapshot (write)

There is an alternative to providing priority to a specific SCB ID. If a number of IDs from the same master require priority, program the DMC priority mask ID registers ([DMC_PRIOMSK](#) and [DMC_PRIOMSK2](#)) so that the corresponding bits are 0. The DMC uses a combination of the [DMC_PRIO](#) and [DMC_PRIO2](#) registers and the [DMC_PRIOMSK/DMC_PRIOMSK2](#) registers to elevate the priority of a select few or all IDs that belong to a master. By default, none of the IDs are prioritized. The following are a few possibilities:

- The `DMC_PRIOMSK` field is set to 0x00000000. If a single ID (7234) needs priority, set the `DMC_PRIOMSK` field to 0xFFFFFFFF and set the `DMC_PRIO` field to 7234.
- If the `DMC_PRIOMSK` field is set to 0xFFFFFFFFE, the SCB IDs 7234 and 7235 are given priority.
- If the `DMC_PRIOMSK` field is set to 0xFFFFFFFEC, the SCB IDs 7234, 7235, 7236, and 7237 are given priority.
- If two transactions with priority, one read and the other a write, are outstanding, the priority transaction that does not change the direction of the DMC access gets priority. The other priority transaction is handled at the beginning of the next snapshot. For example, if a write snapshot is in-progress, the write priority transaction is sent. The read priority transaction is sent at the beginning of the next read snapshot.

NOTE: Use SCB ID-based priority judiciously because it can significantly reduce the throughput of the DMC.

Delaying up to Eight Auto-Refresh Commands

The DMC uses this method to ensure that auto-refresh does not interfere with any critical data transfers. Up to eight auto-refresh commands can accumulate in the DMC. The exact number of auto-refresh commands can be programmed using the `DMC_EFFCTL.NUMREF` bit.

After the first refresh command is accumulated, the DMC constantly looks for an opportunity to schedule a refresh command. When the SCB read and write command buffers become empty for the programmed number of clock cycles (`DMC_EFFCTL.IDLECYC` bit field), the accumulated number of refresh commands are sent back-to-back to the DRAM. (The empty state of the SCB command buffers implies that no access is outstanding.)

After every refresh, the SCB command buffers are checked to ensure that they stay empty. If the SCB command buffers are always full, once the programmed number of refresh commands accumulates, the refresh operation is elevated to urgent priority. One refresh command is sent immediately. After this process, the DMC continues to wait for an opportunity to send out refresh commands. If self-refresh mode is enabled, all pending refresh commands are given out only after that DMC enters into self-refresh mode.

Page and Bank Interleaving

Page and bank interleaving allow consecutive row accesses to fall into the same bank (bank interleaving) or into a different bank (page interleaving). The DMC uses bank interleaving by default (`DMC_CTL.ADDRMODE` bit =0). If the `DMC_CTL.ADDRMODE` bit =1, the DMC uses page interleaving. Page misses in one addressing mode result in hits in the other addressing mode.

System Crossbar Slave Interface

The DMC uses the system crossbar slave interface to move all data. The system crossbar interface accepts interleaved write transactions and sends out-of-order responses. The read and write interfaces consist of buffers for address, data, and control information transferred to or from the system crossbar bus.

The system crossbar interface transactions are sent to the SDRAM only after the SDRAM has been initialized. However, if transactions arrive before or during initialization, they accumulate in the system crossbar interface and are sent out to the protocol controller once the initialization completes.

To increase throughput, the system crossbar write-response is sent out as soon as the final DDR burst is scheduled for transfer into the SDRAM. However, if an auto-refresh is needed, the scheduled write data is sent only after the auto-refresh. A delay can occur. The delay is a maximum of 64 clock cycles from the moment the write response is sent on the SCB to the write operation of the data into SDRAM.

The system crossbar interface performs the following operations:

- Buffers read and write command requests from the system crossbar bus
- Processes the requests by converting them to protocol controller user-interface transfers
- Sends and receives data to or from the protocol controller
- Creates a suitable read/write response and sends read data back to the system crossbar bus

The system crossbar slave interface supports the following:

- All burst lengths (1–16)
- Incremental and wrap bursts
- Data transfer sizes of 8-bit, 16-bit, or 32-bit
- Arrival of write data before write address
- Generation of error responses which include:
 - Any access to an unimplemented region of the external memory space
 - Any access when the SDRAM is in self-refresh mode/power-down mode
 - Any access when the direct command interface is in operation

Read/Write Command and Data Buffers

The system crossbar interface consists of a four-deep read command buffer and a four-deep write command buffer. Up to four write commands and four read commands can be waiting for access to the SDRAM. The system crossbar write buffer is 32 deep. It can support write data interleaving of two. The system crossbar read buffer is 32 deep.

Peripheral Bus Slave Interface

The peripheral bus slave interface connects the dynamic memory controller to the peripheral bus and provides a host controller with access to the registers. The peripheral bus slave interface supports the following features:

- Read and write word accesses
- 32-bit data bus

Architectural Concepts

The following sections provide information on the architecture of the interface.

Controller On Die Termination (ODT)

The controller ODT is enabled with the granularity of a byte lane. The description of this feature can be obtained in the description of the corresponding PHY registers. Controller ODT involves extra overhead in terms of power consumption during reads.

The DMC implements dynamic on die termination at processor pads. When controller ODT is enabled, the termination resistors in the pads are turned on when the controller reads data from the DRAM. These resistors are turned off when the controller writes to the DRAM.

Mode Register Set and Extended Mode Register Set Command

The load mode register command initializes the SDRAM operation parameters. The DMC supports the mode register set and extended mode register set commands. The controller automatically issues the mode register set command during power-on initialization and also when the `DMC_MR` register is written with the `DMC_MSK.MR` bit. The mode register set command is sent after the ongoing data transfer completes.

DDR3 Reset Functionality

DDR3 contains an additional pin corresponding to reset functionality. Reset is part of the initialization sequence but it can be performed asynchronously when needed. The reset procedure is similar to the steps involved in the initialization except the initial part of power-up.

To perform reset on the DDR3 module:

1. Check to ensure the module is in the idle state by polling the `DMC_STAT.IDLE` bit (0x0008).
2. Set the `DMC_CTL.RESET` bit (0x0004).
3. Monitor the `DMC_STAT.RESETDONE` bit for the completion of the reset function.

Do not perform any transactions during a module reset. Wait for the `DMC_STAT.RESETDONE` signal.

DDR3 SDRAM Organization

The DMC supports DDR3 SDRAM memory modules ranging from 512 Mb to 8 Gb. The following tables list the address translation mechanism from the user interface to DDR3 memory interface. The controller also supports two types of addressing modes: bank interleaving (`DMC_CTL.ADDRMODE = 1`) and page interleaving (`DMC_CTL.ADDRMODE = 0`).

Bank Interleaving

The *DDR3 Bank Interleaving* table shows DDR3 bank interleaving.

Table 8-3: DDR3 Bank Interleaving

SDRAM size	Bank address bits	Row address bits	Column address bits
512 Mb	25:24	23:11	10:1
1 Gb	26:24	23:11	10:1
2 Gb	27:25	24:11	10:1

Table 8-3: DDR3 Bank Interleaving (Continued)

SDRAM size	Bank address bits	Row address bits	Column address bits
8 Gb	29:27	26:11	10:1

Page Interleaving

The *DDR3 Page Interleaving* table shows DDR3 page interleaving.

Table 8-4: DDR3 Page Interleaving

SDRAM size	Row address bits	Bank address bits	Column address bits
512 Mb	25:13	12:11	10:1
1 Gb	26:14	13:11	10:1
2 Gb	27:14	13:11	10:1
4 Gb	28:14	13:11	10:1
8 Gb	29:14	13:11	10:1

DMC Clocking

The DMC uses a divided-down version of the *PLLCLK* (PLL clock) to generate an internal clock for clocking the DMC block and interface. The specific value of the *DCLK* frequency is programmed in the *CGU_DIV* register.

For information on the maximum clock frequency supported for specific modes, refer to the processor data sheet.

NOTE: For details on DMC clocking, see the [Clock Generation Unit \(CGU\)](#) and [Clock Generation Unit \(CGU\)](#) chapters.

DMC DMA

The DMC supports DMA-based transfers to and from external DDR SDRAM memory and internal memory.

The DMC DMA controller, part of the distributed DMA engines (DDE) that are dispersed through the infrastructure, connects to the system crossbar fabric.

The DMC uses two DDEs for memory-to-memory DMA (MDMA). One channel is the source channel, and the second, the destination channel.

DMA transfers on the processor are descriptor-based or register-based. Register-based DMA allows the processor to program DMA control registers directly to initiate a DMA transfer. On completion, the control registers can be automatically updated with their original setup values for continuous transfer, if needed. Descriptor-based DMA transfers require a set of parameters stored within memory to initiate a DMA sequence. This transfer allows the chaining together of multiple DMA sequences. In descriptor-based DMA operations, a DMA channel can be programmed to set up and start another DMA transfer automatically after the current sequence completes.

Enhanced DMA operations (such as delay line DMA, scatter or gather DMA) are also supported to or from the DMC module.

DMC Operating Modes

DDR3 Mode

The DMC module supports JESD79-3E compatible double data rate DDR3 SDRAM. To configure this mode of operation, first set (=1) the `DMC_CTL.DDR3EN` bit

Self-Refresh Mode

For low-power consumption, the SDRAM can be put in self-refresh mode. When no data activity occurs, the DMC can put the SDRAM in self refresh to save power. The `DMC_STAT.IDLE` bit indicates the activity on the DMC. If this bit is set, there is no activity in the DMC.

Enable self-refresh mode by writing the `DMC_CTL.SRREQ` bit. The DMC stays in a self-refresh state as long as this bit is asserted. The `DMC_STAT.SRACK` bit indicates when the SDRAM enters self-refresh mode.

When the DMC is in self-refresh mode, the DMC generates an SCB error when any data accesses (read or write requests) is requested.

The DMC can be brought out of self-refresh mode by clearing the `DMC_CTL.SRREQ` bit again. The controller clears the `DMC_STAT.SRACK` bit after the self-refresh operation completes.

DMC Event Control

The DMC has no related interrupt or trigger event information.

DMC Programming Model

The dynamic memory controller contains five groups of memory-mapped registers. The DMC uses the MMR access bus to connect to these registers.

- Control and status registers. These registers control the various operation modes of the dynamic memory controller and provide status.
- Timing parameter registers. The value programmed in these registers depends on the speed grade of the SDRAM device used.
- Mode register mirror registers. These shadow registers are copies of the mode registers residing in the SDRAM device.
- PHY control and status registers. The DMC uses these registers to control the operation of the PHY.
- PAD control registers. The DMC uses these registers to control the various aspects of the I/O pads.

The DMC control registers contain sensitive timing parameters and settings for the DDR SDRAM. These registers are programmed with values that are in the operating range of the DDR used.

Writing to reserved fields or writing any reserved values in register bits can cause the dynamic memory controller to function erroneously.

PHY DLL Calibration

The PHY DLL calibration is performed as part of the SDRAM power-up initialization. It calibrates data against the DQS and CLK signal. However, running DLL calibration after self-refresh or at an arbitrary time is required in certain cases.

The DMC allows PHY DLL calibration to start by setting the `DMC_CTL.DLLCAL` bit. The `DMC_STAT.DLLCALDONE` bit can be used to monitor the progress of the calibration. Once calibration is over, this bit is set. Once the calibration procedure is started by writing to the `DMC_CAL_PADCTL0.CALSTRT` bit, the full calibration takes 300 DCLK cycles to complete.

NOTE: DLL calibration can be initiated only when the DMC is idle (`DMC_STAT.IDLE=1`).

DDR3 ZQ Calibration Short CMD

The ZQ calibration short command is generally used to correct small variations in ZQ (~0.5%). To perform ZQ calibration, the controller is first checked for its idle state. Once the idle bit is obtained, a ZQCS command can be issued by setting the `DMC_STAT.ZQCSDONE` bit (0x0004). The `DMC_STAT.ZQCSDONE` bit (0x0008) can be used to monitor the calibration sequence. When this bit is 0, it indicates that the calibration is ongoing. When it is 1, it indicates that the calibration is done. As an example, a GP timer can be used to periodically trigger a ZQCS command to address tiny variations.

NOTE: The ZQ calibration function is essential for normal operation of DDR3. With the reference of the external resistance ($240\ \Omega \pm 1\%$) connected to the `DMC_RZQ` pin, DDR3 calibrates the R_{on} and R_{tt} values of the ZQ pin against temperature and voltage variations.

DDR3 ZQ Calibration Long CMD

Several DDR3 impedance calibrations are implemented for optimal signal integrity. The long ZQ calibration is used after power-up and the short ZQ calibration is used periodically during normal operation to compensate for voltage and temperature drift. These calibration sequences improve connectivity between the SDRAM pads and the PCB trace. The `DMC_RZQ` pin on the SDRAM is connected to an external precision resistor that adjusts the output driver impedance R_{tt} and ODT values to match the trace impedance. The connection reduces impedance discontinuity and minimizes signal reflections.

The command has two variants named as ZQ calibration long (ZQCL) and ZQ calibration short (ZQCS). The ZQCL command is issued during initialization and after self-refresh exit command. It can be issued later depending on the system environment.

The DMC pads can be autocalibrated to the required driver impedance R_{tt} using an external resistance RZQ and the On Die Termination (ODT) value using the corresponding bits (`DMC_CAL_PADCTL2`). The autocalibration logic translates these values into a corresponding drive strength control inside the PHY and then routed to the PADS. Autocalibration starts as soon as the bit is programmed (set the DCLK at the required frequency before

setting this `DMC_CAL_PADCTL0.CALSTRT` bit). Autocalibration expects the program to select two different member sets of pads (address/command pads versus CLK/Data/DQS/DM pads).

On Die Termination (DDR3)

The DMC supports dynamic On Die Termination (ODT) at the pads. When the controller ODT is set, the termination resistors in the pads are turned on when the controller reads data from the DRAM. These resistors are turned off when the controller is writing to the DRAM. Controller ODT is enabled with the granularity of a byte lane. The description of this feature can be obtained in the description of the corresponding PHY registers.

DDR3 SDRAM provides extended ODT mode.

- *Asynchronous ODT*: ODT timing in the slow exit power-down mode
- *Dynamic ODT*: Function that can dynamically switch the ODT resistance during a write operation without an MRS command. It improves signal quality during a write operation.

Leveling Techniques

The DMC controller supports read and write leveling.

Write Leveling

It is difficult to meet the specifications with the on-board parasitic, trace length variability along with high frequency. The DMC controller supports leveling to compensate the skews between clock and strobe. This skew compensation is done independently for every byte lane. Write leveling is performed by the DDR3 memory controller as a part of initialization by programming the `DMC_MR1.WL` bit.

To dynamically perform write leveling:

1. Ensure that the DMC is idle.
2. Program the `DMC_MR1.WL` bit.
3. Enable the `DMC_MSK` register for the `DMC_MR1` register.
4. Wait for 2000 DMC clock cycles to complete write leveling.

Read Leveling

Read leveling is useful for calibrating read data timing. It is compensated for imbalanced loading on read path. Read leveling can be performed on LSB or byte lane. It is performed as a part of initialization sequence by setting the `DMC_EMR3.MPR` bit.

To dynamically perform read leveling:

1. Ensure that the DMC is idle.
2. Program the `DMC_EMR3.MPR` bit.

3. Enable DMC mask register `DMC_EMR3` register.
4. Wait for 2000 DMC clock cycles to complete read leveling.

Read Leveling during DQS Strobe Gating

To ensure robust read timing, read leveling must be done individually for all data bits. Some DDR3 memory devices do not drive read leveling patterns on all data pins. The devices send pattern only information on the LSBs of each byte lane. In these cases, the `DMC_EMR3` register cannot be used for read leveling. Instead, use the `DMC_CTL.RL_DQS` bit for read leveling.

Read leveling during DQS strobe gating is dynamically supported except during initialization.

Initializing the DMC

Complete the following procedures to initialize the DMC module.

- [Resetting the DMC Lane](#)
- [Performing ZQ Calibration](#)
- [Programming the DMC Controller](#)

Resetting the DMC Lane

If there is a change in the DMC clock frequency, the DDR lane must be reset using the following procedure. Once the lane is reset, wait 9000 DDR clock cycles for the DDR DLL to lock before restarting the DDR.

1. Set the `DMC_DDR_LANE0_CTL0.CB_RSTDLL` and `DMC_DDR_LANE1_CTL0.CB_RSTDLL` bits.
2. Change the DMC clock frequency.
3. Clear the `DMC_DDR_LANE0_CTL0.CB_RSTDLL` and `DMC_DDR_LANE1_CTL0.CB_RSTDLL` bits.

Performing ZQ Calibration

Perform the following ZQ calibration procedure for the proper impedance matching.

1. Program the `DMC_DDR_ZQ_CTL0.IMPWRADD` bit field with the drive strength of the address and command signals. A 100 Ω drive strength is recommended for the drive strength of address and command signals. When programming a drive strength of 100 Ω , write 0x64 into this bit field.
2. Program the `DMC_DDR_ZQ_CTL0.IMPWRDQ` bit field with the drive strength of the DQ, DQS, DM and clock signals. A 100 Ω drive strength is recommended for the drive strength of address and command signals. When programming a drive strength of 100 Ω , write 0x64 into this bit field.
3. Program the `DMC_DDR_ZQ_CTL0.IMPRTT` bit field with the adjusted On Die Termination (ODT) for the Data and DQS signals for the read operation. Due to a correction factor, program this field to 80% of the equivalent ODT.

$DMC_DDR_ZQ_CTL0.IMPRTT \text{ value} = ODT * 2 * 0.8$

For example, if a 50Ω terminating resistance is required on the data pads to match the trace impedance to the board impedance, there will be two 50Ω resistance data pads in parallel. The value is programmed to $100 \times 0.8 = 80$.

4. Write 0 to the [DMC_DDR_ZQ_CTL1](#) register.
5. Program 0x70000000 to the [DMC_DDR_ZQ_CTL2](#) register.
6. Program 0x00000000 to the [DMC_DDR_CA_CTL](#) register.
7. Program 0x00000000 to the [DMC_DDR_ROOT_CTL](#) register.
8. Program 0x00010000 to the [DMC_DDR_ROOT_CTL](#) register.
9. Wait for 8000 DMC clock cycles.
10. Program 0x0C000001 to the [DMC_DDR_CA_CTL](#) register.
11. Wait for 8000 DMC clock cycles.
12. Program 0x00000000 to the [DMC_DDR_CA_CTL](#) register.
13. Program 0x00000000 to the [DMC_DDR_ROOT_CTL](#) register.

Programming the DMC Controller

Perform the following procedure to program the DMC controller.

1. Program the [DMC_CFG](#) register with the size of the DDR memory device. Program the [DMC_CFG.IFWID](#) and [DMC_CFG.SDRWID](#) bit fields to 16-bits wide.
2. Program the [DMC_TR0](#), [DMC_TR1](#), [DMC_TR2](#) registers with the timing parameters as required by the DDR memory device.
3. Program the [DMC_MR](#) and [DMC_MR1](#) registers with the appropriate values. A memory ODT of 120Ω is recommended.
4. Program the [DMC_MR2](#) register. If read leveling is required, program the [DMC_EMR3](#) register.
5. Program the [DMC_DLLCTL](#) register. Program the [DMC_DLLCTL.DATA CYC](#) bit field with 15ns/ddr clock period in ns. Program the [DMC_DLLCTL.DLLCALRDCNT](#) bit field with 240.
6. Wait for 2000 DMC clock cycles.
7. Set the [DMC_DDR_CA_CTL.SW_REFRESH](#) bit, keeping the other bits unchanged.
8. Wait for five DMC clock cycles.
9. Set the [DMC_DDR_ROOT_CTL.SW_REFRESH](#) bit. Program the [DMC_DDR_ROOT_CTL.PIPE_OFSTDCYCLE](#) bit field with 2.
10. Program the [DMC_CTL](#) register.

- `DMC_CTL.RDTOWR = 5`
 - Set the `DMC_CTL.DDR3EN` bit.
 - Set the `DMC_CTL.INIT` bit.
11. If write leveling is enabled, wait for 600 DMC clock cycles or until the `DMC_MR1.WL` bit auto clears.
 12. If read leveling is enabled wait for 2000 DMC clock cycles or until the `DMC_EMR3.MPR` bit auto clears.
 13. If read leveling during data strobe gating is enabled, wait for 600 DMC clock cycles or until the `DMC_CTL.RL_DQS` bit auto clears.
 14. Wait for 722000 DMC clock cycles to complete DMC initialization or until the `DMC_STAT.INITDONE` bit is set.
 15. Set the `DMC_DDR_LANE0_CTL1.COMP_DCYCLE` and `DMC_DDR_LANE1_CTL1.COMP_DCYCLE` bits, without affecting other bits.
 16. Wait for 10 DMC clock cycles.
 17. Clear the `DMC_DDR_LANE0_CTL1.COMP_DCYCLE` and `DMC_DDR_LANE1_CTL1.COMP_DCYCLE` bits, without affecting other bits.
 18. Set and then clear the `DMC_DDR_LANE0_CTL0.CB_RSTDAT` bit, without affecting other bits.
 19. Set and then clear `DMC_DDR_LANE1_CTL0.CB_RSTDAT` bit, without affecting other bits.
 20. Wait for 2500 DMC clock cycles.
 21. Read the `DMC_STAT.PHYRDPHASE` bit field. Program this value into the `DMC_DLLCTL.DATACYC` bit field, without affecting other bits in the [DMC_DLLCTL](#) register.
 22. Reprogram bits: `DMC_CTL.DDR3EN` and `DMC_CTL.RDTOWR` (if operation frequency is above 666MHz).

ADSP-2159x DMC Register Descriptions

Dynamic Memory Controller (DMC) contains the following registers.

Table 8-5: ADSP-2159x DMC Register List

Name	Description
DMC_CFG	Configuration Register
DMC_CTL	Control Register
DMC_DLLCTL	DLL Control Register
DMC_DT_CALIB_ADDR	Data Calibration Address Register
DMC_DT_DATA_CALIB_DATA0	Data Calibration Data 0 Register
DMC_DT_DATA_CALIB_DATA1	Data Calibration Data 1 Register

Table 8-5: ADSP-2159x DMC Register List (Continued)

Name	Description
DMC_EFFCTL	Efficiency Control Register
DMC_EM3	Shadow EM3 Register
DMC_MR	Shadow MR0 Register (DDR3)
DMC_MR1	Shadow MR1 Register (DDR3)
DMC_MR2	Shadow MR2 Register (DDR3)
DMC_MSK	Mask (Mode Register Shadow) Register
DMC_PRIO	Priority ID Register 1
DMC_PRIO2	Priority ID Register 2
DMC_PRIOMSK	Priority ID Mask Register 1
DMC_PRIOMSK2	Priority ID Mask Register 2
DMC_RDDATABUFID1	DMC Read Data Buffer ID Register 1
DMC_RDDATABUFID2	DMC Read Data Buffer ID Register 2
DMC_RDDATABUFMSK1	DMC Read Data Buffer Mask Register 1
DMC_RDDATABUFMSK2	DMC Read Data Buffer Mask Register 2
DMC_STAT	Status Register
DMC_TR0	Timing 0 Register
DMC_TR1	Timing 1 Register
DMC_TR2	Timing 2 Register

Configuration Register

The `DMC_CFG` register selects SDRAM device specific parameters and selects the SDRAM interface width.

Figure 8-1: DMC_CFG Register Diagram

Table 8-6: DMC_CFG Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15:12 (R/W)	EXTBANK	External Banks. The <code>DMC_CFG.EXTBANK</code> bits select the number of external banks connected to the DMC. Note that all values other than those shown are reserved.
		0 1 External Bank
		1-15 Reserved
11:8 (R/W)	SDRSIZE	SDRAM Size. The <code>DMC_CFG.SDRSIZE</code> bits select the size of individual SDRAM connected to the DMC. Note that all values other than those shown are reserved.
		3 512M Bit SDRAM
		4 1G Bit SDRAM
		5 2G Bit SDRAM
		6 4G Bit SDRAM
		7 8G Bit SDRAM
7:4 (R/W)	SDRWID	SDRAM Width. The <code>DMC_CFG.SDRWID</code> bits select the width of the individual SDRAM connected to the DMC. Note that all values other than those shown are reserved.
		0-1 Reserved
		2 16-Bit Wide SDRAM
		3-15 Reserved

Table 8-6: DMC_CFG Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration	
3:0 (R/W)	IFWID	Interface Width. The DMC_CFG.IFWID bits select the width of the interface between the DMC and SDRAM. Note that all values other than those shown are reserved.	
		0-1	Reserved
		2	16-Bit Wide Interface. All other values are reserved. This field specifies the interface width between the controller and the SDRAM.
		3-15	Reserved

Control Register

The `DMC_CTL` register controls DMC modes, DLL calibration, and DRAM initialization.

Figure 8-2: DMC_CTL Register Diagram

Table 8-7: DMC_CTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
27 (R/W)	AL_EN	AL_EN. When set, enables 800MHz operation
		0 Disables greater than 667MHz operation
		1 Enables greater than 667MHz operation
26 (R/W)	RL_DQS	RL_DQS. When set, enables Read leveling during DQS Gating Training. This bit auto-clears on read leveling completion
		0 Enables Read leveling during DQS Gating Training
		1 Disables Read leveling during DQS Gating training

Table 8-7: DMC_CTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
25 (R0/W)	ZQCL	ZQ Calibration Long. The DMC_CTL . ZQCL bit starts the ZQ calibration long sequence. Note that this bit always reads as 0.
		0 No effect
		1 Triggers ZQ calibration long sequence
24 (R0/W)	ZQCS	ZQ Calibration Short. The DMC_CTL . ZQCS bit starts the ZQ calibration short sequence. Note that this bit always reads as 0.
		0 No effect
		1 Triggers ZQ calibration short sequence
13 (R0/W)	DLLCAL	DLL Calibration Start. The DMC_CTL . DLLCAL bit starts the PHY DLL calibration sequence. Note that this bit always reads as 0.
		0 No effect
		1 Start PHY DLL calibration
12 (R/W)	PPREF	Postpone Refresh. The DMC_CTL . PPREF bit enables postponing the DMCs sending of auto-refresh commands. When enabled, the DMC accumulates refresh commands. The DMC_EFFECTL . NUMREF field selects the number of refresh commands that the DMC may accumulate. When disabled, the DMC_TR1 . TREF field selects the interval for auto-refresh command distribution. A maximum of eight auto-refresh commands can be accumulated in DDR3 mode.
		0 Disable Postpone Refresh
		1 Enable Postpone Refresh
11:9 (R/W)	RDTOWR	Read-to-Write Cycle. The DMC_CTL . RDTOWR bits select the number of cycles that the DMC adds when a write operation follows a read operation. For proper operation, it should be programmed with the value of 010.
		0 1 Cycle Added from JEDEC Spec Value
		1 2 Cycles Added from JEDEC Spec Value
		2 3 Cycles Added from JEDEC Spec Value
		3 4 Cycles Added from JEDEC Spec Value
		4 5 Cycles Added from JEDEC Spec Value
		5 6 Cycles Added from JEDEC Spec Value

Table 8-7: DMC_CTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration	
		6	7 Cycles Added from JEDEC Spec Value
		7	8 Cycles Added from JEDEC Spec Value
8 (R/W)	ADDRMODE	Addressing (Page/Bank) Mode. The DMC_CTL.ADDRMODE bit selects whether the DMC uses page or bank interleaving for addressing. When using page interleaving, the bank address bits follow the most significant column address bits. When using bank interleaving, the bank address bits follow the most significant row address bits.	
		0	Bank Interleaving
		1	Page Interleaving
7 (R/W)	RESET	Reset SDRAM. The DMC_CTL.RESET bit starts the reset sequence. Note that this bit always reads as 0.	
		0	No effect
		1	Starts reset sequence
6 (R/W)	PREC	Precharge. The DMC_CTL.PREC bit enables precharge, which closes DRAM rows immediately after access. When disabled, all accesses result in the respective DRAM rows remaining open, until the DMC needs to close them.	
		0	No Effect
		1	Enable Precharge
4 (R/W)	PDREQ	Power Down Request. The DMC_CTL.PDREQ bit enables power-down mode. When the DMC is in power-down mode, any data accesses cause the DMC to generate a bus error. The DRAM remains in power-down mode as long as this bit is 1.	
		0	Disable Power-Down
		1	Enable Power-Down
3 (R/W)	SRREQ	Self-Refresh Request. The DMC_CTL.SRREQ bit enables self-refresh mode. When the DMC is in self-refresh mode, any data accesses cause the DMC to generate a bus error. The DRAM remains in self-refresh mode as long as this bit is 1.	
		0	Disable Self-Refresh
		1	Enable Self-Refresh

Table 8-7: DMC_CTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
2 (R0/W)	INIT	Initialize DRAM Start. The DMC_CTL . INIT bit starts the power up DRAM initialization sequence and DLL calibration sequence. Note that this bit always reads as 0.
		0 No Effect
		1 Start DRAM Initialization
0 (R/W)	DDR3EN	DDR3 Mode. The DMC_CTL . DDR3EN bit selects whether the DMC operates in DDR3 mode.
		0 Reserved
		1 Enable DDR3 mode

DLL Control Register

The `DMC_DLLCTL` register holds the programmable parameters associated with the DLLs within the DMC PHY.

Figure 8-3: DMC_DLLCTL Register Diagram

Table 8-8: DMC_DLLCTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
11:8 (R/W)	DATA CYC	Data Cycles. The <code>DMC_DLLCTL.DATA CYC</code> bits select the latency after which the DMC reads data from the PHY. This field must be written with the value (9). All other values are reserved. Taking round trip delay into account, the DLL indicates whether a latency of 2 cycles is supported by means of status bits.
7:0 (R/W)	DLL CAL RD CNT	DLL Calibration RD Count. The <code>DMC_DLLCTL.DLL CAL RD CNT</code> field selects the number of read operations that the PHY uses for DLL calibration.

Data Calibration Address Register

The `DMC_DT_CALIB_ADDR` register provides the address used for the data calibration for read and write. During the DMC PHY DLL calibration, a particular set of locations in the DRAM is written and a series of reads are performed back to back to calibrate the PHY. The DMC PHY needs prior information about the data that would be read during the PHY DLL calibration. The controller performs one burst write operation to the address programmed in `DMC_DT_CALIB_ADDR` (0x0090).

Note: While the exact address chosen does not matter much during memory initialization, if calibration of the PHY is performed when the DRAM contains valid data, care needs to be taken to ensure that this address points to an unused address. Else, this operation will modify application data stored at the address selected.

Figure 8-4: DMC_DT_CALIB_ADDR Register Diagram

Table 8-9: DMC_DT_CALIB_ADDR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	DMC_DT_CALIB_ADDR	Data calibration address. The <code>DMC_DT_CALIB_ADDR.DMC_DT_CALIB_ADDR</code> bit field contains the address to be programmed for the data calibration for read and write.

Data Calibration Data 0 Register

The `DMC_DT_DATA_CALIB_DATA0` register contains the first 32-bit data used for the write during the data calibration.

Figure 8-5: DMC_DT_DATA_CALIB_DATA0 Register Diagram

Table 8-10: DMC_DT_DATA_CALIB_DATA0 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	DMC_DT_DATA_CAL- IB_DATA0	Data Calibration Data 0. The DMC_DT_DATA_CALIB_DATA0.DMC_DT_DATA_CALIB_DATA0 bit field contains the first 32 bit data used for the write during the data calibration.

Data Calibration Data 1 Register

The `DMC_DT_DATA_CALIB_DATA1` register contains the second 32-bit data used for the write during the data calibration.

Figure 8-6: `DMC_DT_DATA_CALIB_DATA1` Register Diagram

Table 8-11: `DMC_DT_DATA_CALIB_DATA1` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	<code>DMC_DT_DATA_CAL- IB_DATA1</code>	Data Calibration Data 1. The <code>DMC_DT_DATA_CALIB_DATA1.DMC_DT_DATA_CALIB_DATA1</code> bit field contains the second 32 bit data used for the write during the data calibration.

Efficiency Control Register

The `DMC_EFFCTL` register control DMC features that improve throughput efficiency. These include features such as auto-refresh management, precharge options, and write data options.

Figure 8-7: DMC_EFFCTL Register Diagram

Table 8-12: DMC_EFFCTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
23:20 (R/W)	IDLECYC	Idle Cycle. The <code>DMC_EFFCTL.IDLECYC</code> bits select the number of cycles after which the DMC issues any accumulated auto-refresh commands if postpone refresh is enabled (<code>DMC_CTL.PPREF = 1</code>). When <code>DMC_EFFCTL.IDLECYC</code> is set to 0, the DMC ignores the <code>DMC_CTL.PPREF</code> selection and does not accumulate/postpone periodic auto-refresh commands. Note 1: By default, accumulated auto-refresh commands are issued after counting four idle cycles. Note 2: This value is ignored if <code>DMC_CTL.PPREF</code> is not set. Note 3: Setting this value to 0000 overrides the "postpone refresh" feature and does not accumulate/postpone periodic auto refreshes.
		0-15 0 to 15 Idle Cycles to Postpone Refresh Commands

Table 8-12: DMC_EFFCTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
19:16 (R/W)	NUMREF	Number of Refresh Commands. The DMC_EFFCTL.NUMREF bits select the number of auto-refresh commands that the DMC can accumulate if postpone refresh is enabled (DMC_CTL.PPREF =1). In DDR3 mode, the DMC may accumulate up to eight auto-refresh commands. Note 1: By default, accumulated auto-refresh commands are issued after counting four idle cycles. Note 2: This value is ignored if DMC_CTL.PPREF is not set.
		0 No Refresh Commands Accumulate
		1 1 Refresh Command May Accumulate
		2 2 Refresh Commands May Accumulate
		3 3 Refresh Commands May Accumulate
		4 4 Refresh Commands May Accumulate
		5 5 Refresh Commands May Accumulate
		6 6 Refresh Commands May Accumulate
		7 7 Refresh Commands May Accumulate
		8 8 Refresh Commands May Accumulate
15 (R/W)	PRECBANK7	Precharge Bank 7. The DMC_EFFCTL.PRECBANK7 bit enables precharge (closes the page) of bank 7 after each transfer if the DMC precharge feature is enabled (DMC_CTL.PREC =1). Note: The (DMC_CTL.PREC) takes precedence over value in this register. If (DMC_CTL.PREC =1) then all banks are precharged.
		0 Disable Precharge Bank 7
		1 Enable Precharge Bank 7
14 (R/W)	PRECBANK6	Precharge Bank 6. The DMC_EFFCTL.PRECBANK6 bit enables precharge (closes the page) of bank 6 after each transfer if the DMC precharge feature is enabled (DMC_CTL.PREC =1). Note: The (DMC_CTL.PREC) takes precedence over value in this register. If (DMC_CTL.PREC =1) then all banks are precharged.
		0 Disable Precharge Bank 6
		1 Enable Precharge Bank 6

Table 8-12: DMC_EFFCTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
13 (R/W)	PRECBANK5	Precharge Bank 5. The DMC_EFFCTL.PRECBANK5 bit enables precharge (closes the page) of bank 5 after each transfer if the DMC precharge feature is enabled (DMC_CTL.PREC =1). Note: The (DMC_CTL.PREC) takes precedence over value in this register. If (DMC_CTL.PREC =1) then all banks are precharged.
		0 Disable Precharge Bank 5
		1 Enable Precharge Bank 5
12 (R/W)	PRECBANK4	Precharge Bank 4. The DMC_EFFCTL.PRECBANK4 bit enables precharge (closes the page) of bank 4 after each transfer if the DMC precharge feature is enabled (DMC_CTL.PREC =1). Note: The (DMC_CTL.PREC) takes precedence over value in this register. If (DMC_CTL.PREC =1) then all banks are precharged.
		0 Disable Precharge Bank 4
		1 Enable Precharge Bank 4
11 (R/W)	PRECBANK3	Precharge Bank 3. The DMC_EFFCTL.PRECBANK3 bit enables precharge (closes the page) of bank 3 after each transfer if the DMC precharge feature is enabled (DMC_CTL.PREC =1). Note: The (DMC_CTL.PREC) takes precedence over value in this register. If (DMC_CTL.PREC =1) then all banks are precharged.
		0 Disable Precharge Bank 3
		1 Enable Precharge Bank 3
10 (R/W)	PRECBANK2	Precharge Bank 2. The DMC_EFFCTL.PRECBANK2 bit enables precharge (closes the page) of bank 2 after each transfer if the DMC precharge feature is enabled (DMC_CTL.PREC =1). Note: The (DMC_CTL.PREC) takes precedence over value in this register. If (DMC_CTL.PREC =1) then all banks are precharged.
		0 Disable Precharge Bank 2
		1 Enable Precharge Bank 2
9 (R/W)	PRECBANK1	Precharge Bank 1. The DMC_EFFCTL.PRECBANK1 bit enables precharge (closes the page) of bank 1 after each transfer if the DMC precharge feature is enabled (DMC_CTL.PREC =1). Note: The (DMC_CTL.PREC) takes precedence over value in this register. If (DMC_CTL.PREC =1) then all banks are precharged.
		0 Disable Precharge Bank 1
		1 Enable Precharge Bank 1

Table 8-12: DMC_EFFCTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
8 (R/W)	PRECBANK0	Precharge Bank 0. The DMC_EFFCTL.PRECBANK0 bit enables precharge (closes the page) of bank 0 after each transfer if the DMC precharge feature is enabled (DMC_CTL.PREC =1). Note: The (DMC_CTL.PREC) takes precedence over value in this register. If (DMC_CTL.PREC =1) then all banks are precharged.
		0 Disable Precharge Bank 0
		1 Enable Precharge Bank 0

Shadow EMR3 Register

The `DMC_EMR3` register in the DMC shadows the EMR3 register in the SDRAM when the DMC is in DDR3 mode (`DMC_CTL.DDR3EN = 1`). If unmasked by the corresponding bit in the shadow mask register (`DMC_MSK.EMR3 = 1`), a write to `DMC_EMR3` triggers an extended “mode register set” command on the memory interface. If masked, a write to `DMC_EMR3` only updates the register in the DMC, not the register in the SDRAM.

Figure 8-8: DMC_EMR3 Register Diagram

Table 8-13: DMC_EMR3 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
2 (R/W)	MPR	Multi Purpose Read Enable (Read Leveling). The <code>DMC_EMR3.MPR</code> bit enables high temperature self-refresh rate.
		0 Disable
		1 Enable
1:0 (R/NW)	MPR_LOC	Hardcoded to "00". Reads a pre-defined pattern on MPR Read.

Shadow MR0 Register (DDR3)

The **DMC_MR** register in the DMC shadows the MR register in the SDRAM when the DMC is DDR3 mode (**DMC_CTL.DDR3EN** = 1). If unmasked by the corresponding bit in the shadow mask register (**DMC_MSK.MR** = 1), a write to **DMC_MR** triggers a “mode register set” command on the memory interface. If masked, a write to **DMC_MR** only updates the register in the DMC, not the register in the SDRAM.

Figure 8-9: DMC_MR Register Diagram

Table 8-14: DMC_MR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
12 (R/W)	PD	Active Power Down Mode. The DMC_MR.PD bit selects the active power-down mode. Note that this parameter applies only for DDR3 mode. For more information about this mode, see the data sheet for the SDRAM being used in your system.
		0 Fast Exit (normal)
		1 Slow Exit (low power)
11:9 (R/W)	WRRECOV	Write Recovery. The DMC_MR.WRRECOV bit selects the write recovery time in terms of clock cycles (t_{CK}). Note that this parameter applies only for DDR3 mode. For more information about this mode, see the data sheet for the SDRAM being used in your system.
		0 16 clock cycles for DDR3
		1 5 clock cycles for DDR3
		2 6 clock cycles for DDR3
		3 7 clock cycles for DDR3
		4 8 clock cycles for DDR3
		5 10 clock cycles for DDR3
		6 12 clock cycles for DDR3

Table 8-14: DMC_MR Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration	
		7	14 clock cycles for DDR3
8 (R/W)	DLLRST	DLL Reset. The DMC_MR.DLLRST bit initiates a DLL reset on the SDRAM. Note that this parameter applies only for DDR3 mode. For more information about this operation, see the data sheet for the SDRAM being used in your system.	
		0	Normal Operation
		1	Reset DLL
6:4 (R/W)	CL	CAS Latency. The DMC_MR.CL bit field select latency from the assertion of a read/write signal to the SDRAM until the first valid data on the output from the SDRAM in terms of clock cycles. For more information about this operation, see the data sheet for the SDRAM being used in your system. For DDR3 only, Bit[2] of this register must be used along with [6:4]. Following CAS values are seen. "0010": 5 "0100": 6 "0110": 7 "1000": 8 "1010": 9 "1100": 10 "1110": 11 "0001": 12 "0011": 13 "0101": 14 All other combinations are reserved.	
2 (R/W)	CL0	CAS Latency 0. The DMC_MR.CL0 bit is applicable for DDR3 only and is used in conjunction with the DMC_MR.CL bits.	
1:0 (R/W)	BLEN	Burst Length. The DMC_MR.BLEN bits select burst length for transfers. For more information about this operation, see the data sheet for the SDRAM being used in your system. Note that values other than those shown are not supported.	
		0	8-Bit Burst Length - DDR3 only
		2	Reserved
		3	Reserved

Shadow MR1 Register (DDR3)

The `DMC_MR1` register is a mirror of the DDR3 SDRAM Mode register 1. This register is used only when the DMC is operating in DDR3 mode. A write to this register triggers an extended "mode register 1 set" command on the memory interface provided the corresponding mask bit is set in the mask register. Else, only the mirror register is updated.

Figure 8-10: DMC_MR1 Register Diagram

Table 8-15: DMC_MR1 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
12 (R/W)	QOFF	Output Buffer Enable. The <code>DMC_MR1.QOFF</code> bit enables the SDRAM output pins. For more information about this operation, see the data sheet for the SDRAM being used in your system.
		0 Output buffer enabled
		1 Output buffer disabled
11 (R/W)	TDQS	Termination Data Strobe. The <code>DMC_MR1.TDQS</code> bit provides additional termination resistance outputs that may be useful in some system configurations. The <code>DMC_MR1.TDQS</code> bit is not supported in x4 or x16 configurations. When enabled via the mode register, the same termination resistance function is applied to the TDQS/TDQS# pins that is applied to the DQS/DQS# pins.
		0 Enable
		1 Disable

Table 8-15: DMC_MR1 Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration				
9 (R/W)	RTT2	Rtt_nom. The DMC_MR1 . RTT2 bit is used in conjunction with the DMC_MR1 . RTT0 and DMC_MR1 . RTT1 bits. (9 6 2) 0 0 0 Rtt_Nom disabled 0 0 1 RZQ/4 0 1 0 RZQ/2 0 1 1 RZQ/6 1 0 0 RZQ/12 (reserved if Rtt_Nom is used during writes) 1 0 1 RZQ/8 (reserved if Rtt_Nom is used during writes) 1 1 0 Reserved 1 1 1 Reserved				
7 (R/W)	WL	Write Leveling Enable.. The DMC_MR1 . WL bit enables the SDRAM output pins. For more information about this operation, see the data sheet for the SDRAM being used in your system. <table><tr><td>0</td><td>Disable</td></tr><tr><td>1</td><td>Enable</td></tr></table>	0	Disable	1	Enable
0	Disable					
1	Enable					
6 (R/W)	RTT1	Rtt_nom. The DMC_MR1 . RTT1 bit combines with the DMC_MR1 . RTT0 bit to set the termination resistance. See the DMC_MR1 . RTT2 and DMC_MR1 . RTT0 bit description for more information.				
5 (R/W)	DIC1	Output Driver Impedance Control. The DMC_MR1 . DIC1 bit is used in conjunction with the DMC_MR1 . DIC0 bit. (5, 1) 0 0 RZQ/6 0 1 RZQ/7 1 0 Reserved 1 1 Reserved				

Table 8-15: DMC_MR1 Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
4:3 (R/W)	AL	Additive Latency. The DMC_MR1.AL bits select a number of added latency time for CAS operations in terms of clock cycles (t_{CK}). For more information about this operation, see the data sheet for the SDRAM being used in your system.
		0 AL disabled
		1 CL-1
		2 CL-2
		3 Reserved
2 (R/W)	RTT0	Rtt_nom. The DMC_MR1.RTT0 bit combines with the DMC_MR1.RTT1 and DMC_MR1.RTT1 bits to set the termination resistance. See the DMC_MR1.RTT1 and DMC_MR1.RTT2 bit descriptions for more information.
1 (R/W)	DIC0	Output Driver Impedance control. The DMC_MR1.DIC0 bit is used with the DMC_MR1.DIC1 bit.
0 (R/W)	DLLEN	DLL Enable. The DMC_MR1.DLLEN bit enables the DLL in the SDRAM. For more information about this operation, see the data sheet for the SDRAM being used in your system.
		0 Enable
		1 Disable

Shadow MR2 Register (DDR3)

The `DMC_MR2` register mirrors DDR3 SDRAM device Mode register 2 when the controller is operating in DDR3 mode. A write to this register triggers an extended "mode register set" command on the memory interface provided the corresponding mask bit is set in the mask register. Else, only the mirror register is updated.

Figure 8-11: DMC_MR2 Register Diagram

Table 8-16: DMC_MR2 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
7 (R/W)	SRT	Self Refresh Temperature Range. The <code>DMC_MR2</code> . SRT bit enables high temperature self-refresh rate.
		0 Disable
		1 Enable
6 (R/W)	ASR	Auto Self Refresh.
		0 Manual SR Reference (SRT)
		1 ASR enable (Optional)
5:3 (R/W)	CWL	CAS Write Latency.
		0 5 clock cycles
		1 6 clock cycles
		2 7 clock cycles
		3 8 clock cycles
		4 9 clock cycles
		5 10 clock cycles
		6 11 clock cycles
		7 12 clock cycles

Table 8-16: DMC_MR2 Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
2:0 (R/W)	PASR	Partial Array Self refresh. The DMC_MR2 . PASR bits select the amount of memory to be refreshed during self refresh. For more information about this operation, see the data sheet for the SDRAM being used in your system.
		0 4 banks: full array, 8 banks: full array
		1 4 banks: Half Array (BA[1:0]=00&01), 8 banks: Half Array (BA[2:0] = 000, 001, 010, &011)
		2 4 banks: Quarter Array (BA[1:0]=00), 8 banks: Quarter Array (BA[2:0] = 000&001)
		3 4 banks: not defined, 8 banks: 1/8th array (BA[2:0] = 000)
		4 4 banks: 3/4 Array (BA[1:0]=01, 10&11), 8 banks: 3/4 Array (BA[2:0] = 010, 011, 100, 101, 110, &111)
		5 4 banks: Half Array (BA[1:0]=10&11), 8 banks: Half Array (BA[2:0] = 100, 101, 110, &111)
		6 4 banks: Quarter Array (BA[1:0]=11), 8 banks: Quarter Array (BA[2:0] = 110 & 111)
		7 4 banks: not defined, 8 banks: 1/8th array (BA[2:0] = 111)

Mask (Mode Register Shadow) Register

The `DMC_MSK` register permits masking (disabling) writes to the MR and EMRn registers in the SDRAM in DDR3 Mode. When masked, writes to these registers go instead to shadow copies of these registers (`DMC_MR`, `DMC_MR1`, `DMC_MR2`), which are maintained within the DMC. When a shadow register's corresponding bit is unmasked (enabled), the DMC generates the MRS or EMRS command to transfer the contents of the shadow register (in the DMC) to the actual register (in the SDRAM).

Figure 8-12: DMC_MSK Register Diagram

Table 8-17: DMC_MSK Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
11 (R/W)	EMR3	Shadow EMR3 Unmask. The <code>DMC_MSK.EMR3</code> bit masks or unmasks writes to the EMR3 register in the SDRAM. When masked, writes to this register instead go to the EMR3 register. When unmasked, the DMC writes the EMR3 value to the EMR3 register in the SDRAM. After completing the write, the DMC clears this bit.
		0 Mask (Disable) Write to EMR3
		1 Unmask (Enable) Write to EMR3
10 (R/W)	MR2	Shadow MR2 Unmask. The <code>DMC_MSK.MR2</code> bit masks or unmasks writes to the MR2 register (in DDR3 mode) in the SDRAM. When masked, writes to this register instead go to the <code>DMC_MR2</code> register. When unmasked, the DMC writes the <code>DMC_MR2</code> value to the MR2 register (in DDR3 mode) in the SDRAM. After completing the write, the DMC clears this bit.
		0 Mask (Disable) Write to EMR2
		1 Unmask (Enable) Write to EMR2

Table 8-17: DMC_MSK Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
9 (R/W)	MR1	Shadow MR1 Unmask. The DMC_MSK.MR1 bit masks or unmasks writes to the MR1 register in the DDR3 SDRAM. When masked, writes to this register instead go to the DMC_MR1 register. When unmasked, the DMC writes the DMC_MR1 value to the MR1 register in the SDRAM. After completing the write, the DMC clears this bit. Note that this bit is valid only for DDR3 Mode of operation.
		0 Mask (Disable) Write to EMR1
		1 Unmask (Enable) Write to EMR1
8 (R/W)	MR	Shadow MR Unmask. The DMC_MSK.MR bit masks or unmasks writes to the MR register in the SDRAM. When masked, writes to this register instead go to the DMC_MR register. When unmasked, the DMC writes the DMC_MR value to the MR register in the SDRAM. After completing the write, the DMC clears this bit.
		0 Mask (Disable) Write to MR
		1 Unmask (Enable) Write to MR

Priority ID Register 1

The `DMC_PRIO` register allows transactions from selected masters that generate specific SCB IDs to obtain higher priority than the transactions proceeding in the usual fashion. The contents of the register are masked with the contents of the `DMC_PRIOMSK` register to obtain a single SCB ID or a range of IDs that get elevated priority.

Figure 8-13: DMC_PRIO Register Diagram

Table 8-18: DMC_PRIO Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	ID1	SCB ID1 that Requires Elevated Priority.

Priority ID Register 2

The `DMC_PRIO2` register is another register which allows transactions from selected masters that generate specific SCB IDs to obtain higher priority than the transactions proceeding in the usual fashion. The contents of the register are masked with the contents of the `DMC_PRIOMSK2` register to obtain a single SCB ID or a range of IDs that get elevated priority.

Figure 8-14: `DMC_PRIO2` Register Diagram

Table 8-19: `DMC_PRIO2` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	ID2	SCB ID2 that Requires Elevated Priority.

Priority ID Mask Register 1

The `DMC_PRIOMSK` register masks the respective ID bits in the `DMC_PRIOMSK` register. This masking provides for elevating the access priority of either a single ID or a range of IDs.

Figure 8-15: DMC_PRIOMSK Register Diagram

Table 8-20: DMC_PRIOMSK Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	ID1MSK	Mask for SCB ID1.

Priority ID Mask Register 2

The `DMC_PRIOMSK2` register bits mask the respective ID bits in the `DMC_PRIO2` register. This masking provides for elevating the access priority of either a single ID or a range of IDs.

Figure 8-16: `DMC_PRIOMSK2` Register Diagram

Table 8-21: `DMC_PRIOMSK2` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	ID2MSK	Mask for SCB ID2.

DMC Read Data Buffer ID Register 1

The [DMC_RDDATABUFID1](#) register allows read transactions from selected masters to make use of DMC read data buffer. The contents of the register are masked with the contents of the [DMC_RDDATABUFMSK1](#) register to obtain a single SCB ID or a range of IDs that get elevated priority.

Figure 8-17: DMC_RDDATABUFID1 Register Diagram

Table 8-22: DMC_RDDATABUFID1 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	Mask for Read Data Buffer ID1.

DMC Read Data Buffer ID Register 2

The [DMC_RDDATABUFID2](#) register allows read transactions from selected masters to make use of DMC read data buffer. The contents of the register are masked with the contents of the [DMC_RDDATABUFMSK2](#) register to obtain a single SCB ID or a range of IDs that get elevated priority.

Figure 8-18: DMC_RDDATABUFID2 Register Diagram

Table 8-23: DMC_RDDATABUFID2 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	Mask for Read Data Buffer ID2.

DMC Read Data Buffer Mask Register 1

The `DMC_RDDATABUFMSK1` register bits mask the respective ID bits in the DMC Priority Mask ID register.

Figure 8-19: DMC_RDDATABUFMSK1 Register Diagram

Table 8-24: DMC_RDDATABUFMSK1 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	Mask for Read Data Buffer ID1.

DMC Read Data Buffer Mask Register 2

The `DMC_RDDATABUFMSK2` register bits mask the respective ID bits in the DMC Priority Mask ID register.

Figure 8-20: `DMC_RDDATABUFMSK2` Register Diagram

Table 8-25: `DMC_RDDATABUFMSK2` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	Mask for Read Data Buffer ID2.

Status Register

The `DMC_STAT` register indicates status for modes selected with the `DMC_CTL` register and indicates status DMC operations.

Figure 8-21: DMC_STAT Register Diagram

Table 8-26: DMC_STAT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
25 (R/NW)	ZQCLDONE	ZQ Calibration Long Done. The <code>DMC_STAT.ZQCLDONE</code> bit checks if the ZQ calibration long sub routine is done.
		0 ZQ Calibration long is ongoing
		1 ZQ Calibration long is done
24 (R/NW)	ZQCSDONE	ZQ Calibration Short Done. The <code>DMC_STAT.ZQCSDONE</code> bit checks if the ZQ calibration short sub routine is done.
		0 ZQ Calibration short is ongoing
		1 ZQ Calibration Short is done
23:20 (R/NW)	PHYRDPHASE	PHY Read Phase. The <code>DMC_STAT.PHYRDPHASE</code> bits indicate the latency after which the DMC may read from the PHY. Taking round trip delay into account, the DLL indicates the exact number of clock cycles after which the controller needs to read data. Values other than those shown are reserved.
		2 2 Clock Cycles Latency

Table 8-26: DMC_STAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration	
		3	3 Clock Cycles Latency
		4	4 Clock Cycles Latency
		5	5 Clock Cycles Latency
		6	6 Clock Cycles Latency
		7	7 Clock Cycles Latency
		8	8 Clock Cycles Latency
		9	9 Clock Cycles Latency
		10	10 Clock Cycles Latency
		11	11 Clock Cycles Latency
		12	12 Clock Cycles Latency
		13	13 Clock Cycles Latency
		14	14 Clock Cycles Latency
		15	15 Clock Cycles Latency
19:16 (R/NW)	PENDREF	Pending Refresh. The DMC_STAT . PENDREF bits indicate the number of pending auto-refresh commands whose value can be from "0000" to "0111".	
13 (R/NW)	DLLCALDONE	DLL Calibration Done. The DMC_STAT . DLLCALDONE indicates that the PHY DLL calibration sequence is complete.	
		0	No Status
		1	Completed PHY DLL Calibration
7 (R/NW)	RESETDONE	Reset Done. The DMC_STAT . RESETDONE bit indicates that the reset sequence is complete.	
		0	SDRAM Reset is ongoing
		1	SDRAM Reset is done
4 (R/NW)	PDACK	Power-Down Acknowledge. The DMC_STAT . PDACK bit indicates that power-down mode is active.	
		0	Not in Power-Down Mode
		1	Power-Down Mode Active

Table 8-26: DMC_STAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
3 (R/NW)	SRACK	Self-Refresh Acknowledge. The DMC_STAT . SRACK bit indicates that self-refresh mode is active.
		0 Not in Self-Refresh Mode
		1 Self-Refresh Mode Active
2 (R/NW)	INITDONE	Initialization Done. The DMC_STAT . INITDONE bit indicates that the initialization sequence is complete.
		0 No Status
		1 Initialize Done
0 (R/NW)	IDLE	Idle State. The DMC_STAT . IDLE bit indicates whether the DMC is idle or busy.
		0 Busy
		1 Idle

Timing 0 Register

The `DMC_TR0` register selects timing parameters for DMC operation to corresponding with parameters of the SDRAM device that is used in the system. The timing registers must be programmed to match the device for correct operation of the SDRAM and must be programmed before initializing the SDRAM. Note that all values for bit fields in `DMC_TR0` are in increments of clock cycle time (t_{CK}).

Figure 8-22: DMC_TR0 Register Diagram

Table 8-27: DMC_TR0 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:28 (R/W)	TMRD	Timing Mode Register Delay. The <code>DMC_TR0</code> . TMRD field selects the set-to-active timing parameter (t_{MRD}), which is the number of clock cycles that occur after the mode registers in the SDRAM are set and before the next command is issued.
25:20 (R/W)	TRC	Timing Row Cycle. The <code>DMC_TR0</code> . TRC field selects the active-to-active time (t_{RC}), which is the minimum number of clock cycles that occur from an active command to the next active command in the same bank.
16:12 (R/W)	TRAS	Timing Row Active Time. The <code>DMC_TR0</code> . TRAS field selects the active-to-precharge time (t_{RAS}), which is the number of clock cycles that occur from an active command until a precharge command is allowed.
11:8 (R/W)	TRP	Timing RAS Precharge. The <code>DMC_TR0</code> . TRP field selects the precharge-to-active time (t_{RP}), which is the number of clock cycles that occur while the SDRAM recovers from a precharge command and becomes ready to accept the next active command.

Table 8-27: DMC_TR0 Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
7:4 (R/W)	TWTR	Timing Write to Read. The DMC_TR0 . TWTR field selects the write-to-read delay time (t_{WTR}), which is the number of clock cycles that occur from the last write data to the next read command.
3:0 (R/W)	TRCD	Timing RAS to CAS Delay. The DMC_TR0 . TRCD field selects the RAS to CAS delay time (t_{RCD}), which is the number of clock cycles that occur from an active command to a read/write assertion.

Timing 1 Register

The `DMC_TR1` register selects timing parameters for DMC operation to corresponding with parameters of the SDRAM device that is used in the system. The timing registers must be programmed to match the device for correct operation of the SDRAM and must be programmed before initializing the SDRAM. Note that all values for bit fields in `DMC_TR1` are in increments of clock cycle time (t_{CK}).

Figure 8-23: DMC_TR1 Register Diagram

Table 8-28: DMC_TR1 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
30:28 (R/W)	TRRD	Timing Read-Read Delay. The <code>DMC_TR1 . TRRD</code> field selects the active-to-active time (t_{RRD}), which is the minimum number of clock cycles occurring from a bank x active command to a bank y active command.
24:16 (R/W)	TRFC	Timing Refresh-to-Command. The <code>DMC_TR1 . TRFC</code> field selects the refresh-to-active command delay (t_{RFC}), which is the number of clock cycles required for the SDRAM to recover from a refresh signal to be ready to take the next command. It is also the number of clock cycles needed for the SDRAM to recover from executing one active command and ready to accept the next active command.
13:0 (R/W)	TREF	Timing Refresh Interval. The <code>DMC_TR1 . TREF</code> field selects the refresh interval time (t_{REF}), which is the number of clock cycles occurring from one refresh command to the next refresh command. The actual timing of issuing a precharge command may be delayed by if the SDRAM is processing a normal access. However, the delay is not accumulative so there is no need to shorten the refresh interval to account for the memory access time. The non-accumulative refresh delay typically increases memory bandwidth by a few percentage points.

Timing 2 Register

The `DMC_TR2` register selects timing parameters for DMC operation to corresponding with parameters of the SDRAM device that is used in the system. The timing registers must be programmed to match the device for correct operation of the SDRAM and before initializing the SDRAM.

Note that all values for bit fields in `DMC_TR2` are in increments of clock cycle time (t_{CK}).

Figure 8-24: DMC_TR2 Register Diagram

Table 8-29: DMC_TR2 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
23:20 (R/W)	TCKE	Timing Clock Enable. The <code>DMC_TR2.TCKE</code> field selects the CKE minimum pulsewidth (t_{CKE}).
19:16 (R/W)	TXP	Timing Exit Power Down. The <code>DMC_TR2.TXP</code> field selects the exit power down to next valid command time (t_{XP}).
11:8 (R/W)	TRTP	Timing Read-to-Precharge. The <code>DMC_TR2.TRTP</code> field selects the internal read to precharge time (t_{RTP}). If the resulting value is less than 2, the register needs to be programmed with two. Note: Minimum t_{RTP} that needs to be programmed is 2.
5 (RX/W)	TFAW5	Extended Timing Four-Active Window Bit 5. The <code>DMC_TR2.TFAW5</code> bit is the extended bit for FAW timing for 800 MHz operation for values greater than 31. It is only applicable when <code>DMC_CTL.AL_EN = 1</code> . When <code>DMC_CTL.AL_EN = 0</code> , the <code>DMC_TR2.TFAW5</code> bit is reserved. When <code>DMC_CTL.AL_EN = 1</code> , the total <code>FAW[5:0] = {TFAW5, TFAW[4:0]}</code> . NOTE: This bit is write-only. Read as zero.

Table 8-29: DMC_TR2 Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
4:0 (R/W)	TFAW	Timing Four-Activated-Window. The DMC_TR2 . TFAW field selects the four-banks-activated window time (t_{FAW}). No more than four SDRAM banks should be activated within this window.

ADSP-2159x DMC Register Descriptions

1600MHz DMCPHY (DDR3/DDR3L) (DMC) contains the following registers.

Table 8-30: ADSP-2159x DMC Register List

Name	Description
DMC_DDR_CA_CTL	DDR CA Lane Control Register
DMC_DDR_LANE0_CTL0	Data Lane 0 Control Register 0
DMC_DDR_LANE0_CTL1	Data Lane 0 Control Register 1
DMC_DDR_LANE1_CTL0	Data Lane 1 Control Register 0
DMC_DDR_LANE1_CTL1	Data Lane 1 Control Register 1
DMC_DDR_ROOT_CTL	DDR ROOT Module Control Register
DMC_DDR_ZQ_CTL0	DDR Calibration Control Register 0
DMC_DDR_ZQ_CTL1	DDR Calibration Control Register 1
DMC_DDR_ZQ_CTL2	DDR Calibration Control Register 2

DDR CA Lane Control Register

Figure 8-25: DMC_DDR_CA_CTL Register Diagram

Table 8-31: DMC_DDR_CA_CTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
30:26 (R/W)	SLAVE_ID	SW Slave Read/Write Slave ID. The DMC_DDR_CA_CTL.SLAVE_ID bit field is the slave ID for SW slave read or write transactions.
24:23 (R/W)	BYPCODE1	Duty Cycle Level Select. The DMC_DDR_CA_CTL.BYPCODE1 bit field combines with BYPCODE0 to select one of four levels of duty cycle adjustment.
		0
		0
		1
		2
20:19 (R/W)	BYPCODE0	Duty Cycle Level Select. The DMC_DDR_CA_CTL.BYPCODE0 bit field combines with BYPCODE1 to select one of four levels of duty cycle adjustment.
		0
		0
		1
		2

Table 8-31: DMC_DDR_CA_CTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
18 (R/W)	BYPSELP	Duty Cycle Offset Direction Select. The DMC_DDR_CA_CTL.BYPSELP bit selects the direction of the duty cycle offset.
		0 Negative
		1 Positive
17 (R/W)	BYPENB	CLK Duty Cycle Offset Adjustment Enable. The DMC_DDR_CA_CTL.BYPENB bit enables the CLK duty cycle offset adjustment.
		0 Disable
		1 Enable
16:15 (R/W)	MF_SEL	SPI Master Frequency Divider Select. The DMC_DDR_CA_CTL.MF_SEL bit selects the SPI master frequency divider for root to lane transfers.
		0 Divide by 2
		1 Divide by 4
		2 Divide by 8
		3 Divide by 16
14 (R/W)	SW_REFRESH	Refresh Lane DLL Code.

28 (R/W)	CALSTRT	New Impedance Calibration Enable.
27 (R/W)	CALTYPE	Calibration Type. Short or Long Calibration
26:21 (R/W)	BYPPDDQ	Bypass Code for DQ,DQS,CLK,DM Pull-down Driver Code.

Table 8-39: DMC_DDR_ZQ_CTL2 Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
20:15 (R/W)	BYPPUDQ	Bypass Code for DQ,DQS,CLK,DM Pull-up Code.
14:9 (R/W)	BYPPDADD	Address/Command Bypass Pull-down Code.
8:3 (R/W)	BYPPUADD	Address/Command Bypass Pull-up Codes. Bypass pull-up codes for address and command pads
2 (R/W)	BYPIMRD	Bypass Termination Code Enable.
1 (R/W)	BYPIMDQ	DQ/DQS/CLK/DM Bypass Driver Code Enable.
0 (R/W)	BYPIPAD	Address/Command Bypass Code Enable. Bypass code enable for address and command pads.

9 One-Time Programmable Memory Controller (OTPC)

This chapter describes the operation of the OTP controller. The OTP module is a complete system integrating an OTP memory core with a programming controller, charge pump, and voltage regulator. A built-in Hamming Code Error Correction (ECC), and a fully implemented double-redundant program or read scheme protect the OTP data.

OTP memory access is through the [OTP API Overview](#) provided by the ROM.

CAUTION: OTP memory does not support burst transfers, which are required to support cache line fills. As such, OTP memory should not be made cacheable. If it is, the OTP controller returns an error when a read access is attempted.

OTPC Features

The OTP memory and controller have the following features:

- Built-in redundant read mode
- Built-in integrated power supply
- Built-in Hamming Code Error Correction (ECC)
- Full word serial (single bit at a time) programming with internal VPP

OTPC Functional Description

ADSP-2159x OTPC Register List

The One-Time-Programmable Memory controller (OTPC) supports programming the OTP memory. A set of registers governs OTPC operations. For more information on OTPC functionality, see the OTPC register descriptions.

Table 9-1: ADSP-2159x OTPC Register List

Name	Description
OTPC_SECU_STATE	OTP Security State Register

Table 9-1: ADSP-2159x OTPC Register List (Continued)

Name	Description
OTPC_STAT	OTP Status Register

ADSP-2159x OTPC Interrupt List

Table 9-2: ADSP-2159x OTPC Interrupt List

Interrupt ID	Name	Description	Sensitivity	DMA Channel
6	OTPC0_ERR	OTPC0 Dual-bit Error	Level	

Error Correction

The OTP memory features a Hamming error correction implementation. Signal bit errors are automatically corrected, and dual-bit errors are detected. Refer to [OTPC Interrupt Signals](#).

ECC is always enabled. ECC applies to each 16-bit segment. Because of this functionality, each 16-bit location can only be written to once. Writing to a 16-bit location a second time results in unexpected behavior.

OTPC Event Control

The following sections provide information on OTP events and error management.

OTPC Interrupt Signals

When making 32-bit accesses to OTP memory, a double-bit error in any 16-bit segment triggers the OTPC_INT interrupt. The OTPC also has the OTPC dual bit error (OTPC0_ERR) with the SEA ID of 6. See the [System Event Controller \(SEC\)](#) and [Generic Interrupt Controller \(GIC\)](#) chapter for more information.

OTPC Status and Error Signals

The OTP controller does not produce error signals.

OTP API Overview

The ROM provides a set of functions to facilitate OTP field access. The OTP memory is broken up into a set of specialized fields that are described in this section. The API removes the requirement of understanding the details of the layout or OTP access procedures.

All OTP accesses are made through the provided API.

OTP Programming

The OTP programming API provides a simple access, abstracting particulars of the OTP controller.

Any fields that contain zero or null pointers are skipped.

All addresses are assumed to be byte addresses unless otherwise noted.

A list of APIs follows:

<code>bool adi_rom_otp_pgm(otp_data* data);</code>	OTP Program
<code>bool adi_rom_lock();</code>	Lock API

OTP Program

Program OTP memory using a struct containing the following predefined data fields.

Name	OTP Program	-
PP Define	FUNC_ROM_OTPPGM	
Prototype	<code>bool adi_rom_otp_pgm(otp_data* data);</code>	-
Argument	data	struct containing data to program OTP with
Return Value	bool	true for programming success
Stack Requirements	valid stack	-

```
bool res = adi_rom_otp_pgm(data);
```

The following type of struct is available for programming. Refer to the ROM header file for the exact definition

```
typedef struct {
    void      *reserved2;
    uint32_t  ospi_read_data_capture:16;
    uint32_t  (*huk)[ROM_OTP_SZ_huk];
    uint32_t  (*pvt_128key0)[ROM_OTP_SZ_pvt_128key0];
    uint32_t  (*pvt_128key1)[ROM_OTP_SZ_pvt_128key1];
    uint32_t  (*pvt_128key2)[ROM_OTP_SZ_pvt_128key2];
    uint32_t  (*pvt_128key3)[ROM_OTP_SZ_pvt_128key3];
    uint32_t  (*ek)[ROM_OTP_SZ_ek];
    uint32_t  (*secure_emu_key)[ROM_OTP_SZ_secure_emu_key];
    uint32_t  emu_key_disable:16;
    uint32_t  (*public_key0)[ROM_OTP_SZ_public_key0];
    uint32_t  (*public_key1)[ROM_OTP_SZ_public_key1];
    uint32_t  (*boot_info)[ROM_OTP_SZ_boot_info];
    uint8_t   antiroll_nv_cntr;
    uint32_t  (*gpl)[ROM_OTP_SZ_gpl];
    uint32_t  bootModeDisable:8;
    uint32_t  (*preboot_ddr_cfg)[ROM_OTP_SZ_preboot_ddr_cfg];
}
```

```
uint32_t (*stageID) [ROM_OTP_SZ_stageID];
} otp_data;
```

NOTE: Make OTP memory a non-cacheable region if the core needs access to it.

OTP Reading

This API provides a unified source for retrieving OTP data fields.

All addresses are assumed to be byte addresses, unless otherwise noted.

A list of APIs follow:

<code>bool adi_rom_otp_get(OTPCMD cmd, uint32_t* data);</code>	OTP Get Field
---	-------------------------------

OTP Get Field

Retrieves indicated data from OTP memory.

Name	OTP Get Field	
Prototype	<code>bool adi_rom_otp_get(OTPCMD cmd, uint32_t* data);</code>	
Argument	cmd	Indicates what data to fetch, based on theOTPCMD enum.
Argument	data	memory location to write the data to
Return Value	bool	true for a successful read
Stack Requirements	valid stack	

```
bool res = adi_rom_otp_get(otpcmd_info,data);
```

The data specified by the OTPCMD enum parameter is fetched from OTP memory and placed in the location specified by data. The OTPCMD enum contains entries for each field defined in OTP memory, for the most current list, refer to the OTP header file.

An example of the enum style follows:

```
typedef enum {
    otpcmd_reserved0 = 0,
    otpcmd_reserved2,
    otpcmd_ospi_read_data_capture, /*!< OSPI Read Data Capture Register */
    otpcmd_huk, /*!< Hardware Unique Key */
    otpcmd_pvt_128key0, /*!< Customer Privatekey 0 128bits */
    otpcmd_pvt_128key1, /*!< Customer Privatekey 1 128bits */
    otpcmd_pvt_128key2, /*!< Customer Privatekey 2 128bits */
    otpcmd_pvt_128key3, /*!< Customer Privatekey 3 128bits */
    otpcmd_ek, /*!< Endorsement Key */
```

```
otpcmd_secure_emu_key,      /*!< Secure Emulation Key */
```

OTP Counters

The OTPC module implements a counter API to allow easy reading or writing of the counter without dealing with the complexities of rewriting OTP memory sections that are ECC protected.

The OTPC module provides two functional APIs for counters. These APIs are not extra; the module uses the same `get` and `pgm` APIs. The APIs are functionally unique in the way that they set and retrieve data as counters in OTP memory.

The API uses a different method to count bits because each bit in OTP memory can only be set =1 once, and the ECC protects each 16-bit unit. This functionality essentially means that each 16-bit unit can only be written to once. Therefore, a counter that can count 0–31 requires 32×16 bits of memory.

The API receives and returns the value of the counter as a `uint8_t` binary number. Writing a value less than the current value of the counter or greater than the maximum value results in an error.

To implement this functionality, the driver counts by shifting 1's from the left, treating each block as 1 bit. A three-bit counter is encoded as follows.

bit 2	bit 1	bit 0	Value
0000	0000	0000	0
0001	0000	0000	1
0001	0001	0000	2
0001	0001	0001	3

Lock API

This API locks the device.

Name	Lock API	-
PP Define	<code>FUNC_ROM_LOCK</code>	-
Prototype	<code>bool adi_rom_lock();</code>	-
Return Value	<code>bool</code>	true for success
Stack Requirements	valid stack	-

```
bool res = adi_rom_lock();
```

Calling this function locks the device, making it a secure. Once locked, the `OTPC_SECU_STATE` register indicates that the part is locked, and access is limited. For more information, refer to the security documentation regarding a locked device.

NOTE: Locked Status. The `OTPC_SECU_STATE` register is updated only after the part is rebooted. After calling the lock function, the register still indicates that the part is open.

ADSP-2159x OTPC Register Descriptions

OTP Memory Controller (OTPC) contains the following registers.

Table 9-3: ADSP-2159x OTPC Register List

Name	Description
<code>OTPC_SECU_STATE</code>	OTP Security State Register
<code>OTPC_STAT</code>	OTP Status Register

OTP Security State Register

Figure 9-1: OTPC_SECU_STATE Register Diagram

Table 9-4: OTPC_SECU_STATE Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
1:0 (R/NW)	PARTLOCK	Part Locked. The <code>OTPC_SECU_STATE.PARTLOCK</code> bit indicates a locked part.
		0 OPEN part
		1 Locked part
		2 Reserved

OTPC Status Register

The `OTPC_STAT` register bits indicate errors and flag status and control the protection bits.

Figure 9-2: `OTPC_STAT` Register Diagram

Table 9-5: `OTPC_STAT` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
14:13 (R/NW)	ADDRERR	OTP Address Error. The <code>OTPC_STAT.ADDRERR</code> bit field indicates errors which occur when the OTP programming address is out of range or tries to access protected space.
		0 No error - proper OTP address
		1 OTP address out of range
		2 8-bit OTP address
		3 Protected OTP address

10 System Memory Protection Unit (SMPU)

The SMPU provides a flexible way of protecting memory regions against read or write access from any or all masters in the system. In addition, it can guard against memory access depending on security privileges of the system master.

SMPU Features

The system memory protection unit has the following features.

- After reset, the default state of the system is fully open. The SMPUs admit any access to memory spaces by any master.
- Each SMPU instance can be configured to monitor multiple regions. Each can be individually enabled.
- Each region can be configured with its own protection settings.
- Provides general read or write protection.
- Read and write transactions are restricted or allowed depending on the transaction ID.

On the ADSP-2156x processor, four SMPU instances are available to protect the L2, external memory (DMC) interface.

Table 10-1: SMPU Instances

Module	SMPU Instance
Core_L2	2
DMA_L2	3
DMC0	9
SPI Flash Address Space	11

All the SMPU instances can be configured up to eight regions.

- Up to eight outstanding read or write transactions supported on SMPU instances for Core_L2 and DMC0. Up to four outstanding read or write transactions supported on the SMPU instances for DMA_L2 and SPI flash address space.

SMPU Functional Description

The following sections provide details on the function of the SMPU module. If the region security settings allow transactions to go through, the ID in the ID-based region protection settings can still filter the transactions.

For the memory that an SMPU protects, programs can configure region-based settings with the `SMPU_RCTL[n]` registers. (There can be multiple SMPUs in a system.) The `SMPU_RCTL[n]` registers define the ID-based protection for memory regions.

If the target address does not reside in any configured memory region, the transaction permission resorts back to the global configuration setting.

Protection Units

Each SMPU provides two protection units, A and B for ID-based matching in the region-based memory protection. This feature provides a degree of flexibility for the user to match against multiple IDs.

Instruction Fetches

When the core executes instructions from memory, this operation is also considered a memory transaction. If the SMPU is configured to protect a memory region from read accesses that contain instructions, the core cannot fetch and execute these instructions.

Using Cache

When the processor uses both cache and the SMPU, there are a few issues to be aware of. If the SMPU is configured to protect a memory region from write accesses, instruction fetches from a core are still possible since instructions are not updated and replaced during run time.

NOTE: The debugger typically replaces an instruction with a breakpoint instruction for software breakpoints. If a memory region is protected against write accesses, software breakpoints are not possible unless the SMPU is configured with the appropriate system master ID of the debugger. The configuration allows it to perform a write-access.

In the case where memory is used for data, a read access or cache fill is not possible if the memory is blocked from read accesses. If read accesses are allowed but write accesses are disallowed, then there is an issue with coherency. The cache is filled but when the cache is updated and must be written back to the SMPU protected memory, the write-access is blocked.

In general, exercise caution when using both the SMPU and cache.

Speculative Reads

If speculative reads are enabled (`SMPU_CTL.RSDIS = 0`), the SMPU forwards the read transaction directly to the memory before checking the protection setting corresponding to the addressed memory region. This functionality saves one clock cycle in the clock domain of the SMPU. The SMPU checks the protection setting while the read

transaction occurs with the memory. If the protection setting dictates that the target memory address is blocked, the SMPU blocks the read to the master.

If speculative reads are disabled (`SMPU_CTL.RSDIS = 1`), the SMPU checks the protection settings first and forwards the transaction to memory only if it passes the configured protection settings. This functionality incurs a one-cycle latency per read.

NOTE: Reads affect certain memory operations such as automatic clearing of the memory (that is, FIFOs). When the SMPU protects this type of memory, disable read speculation since the blocking can occur without the read transaction reaching the target memory.

ADSP-2159x SMPU Register List

The System Memory Protection Unit (SMPU) provides selective protection of the processor's memory resources. The SMPU includes a set of processor events that can be monitored during program execution. A set of registers governs SMPU operations. For more information on SMPU functionality, see the SMPU register descriptions.

Table 10-2: ADSP-2159x SMPU Register List

Name	Description
<code>SMPU_BADDR</code>	Bus Error Address Register
<code>SMPU_BDTLS</code>	Bus Error Details Register
<code>SMPU_CTL</code>	SMPU Control Register
<code>SMPU_EXACADD[n]</code>	Exclusive Access IDn Address

<code>SMPU_IADDR</code>	Interrupt Address Register
<code>SMPU_IDTLS</code>	Interrupt Details Register
<code>SMPU_RADDR[n]</code>	Region n Address Register
<code>SMPU_RCTL[n]</code>	Region n Control Register
<code>SMPU_REVID</code>	SMPU Revision ID Register
<code>SMPU_RIDA[n]</code>	Region n ID A Register
<code>SMPU_RIDB[n]</code>	Region n ID B Register
<code>SMPU_RIDMSKA[n]</code>	Region n ID Mask A Register
<code>SMPU_RIDMSKB[n]</code>	Region n ID Mask B Register
<code>SMPU_SECURECTL</code>	SMPU Control Secure Accesses Register
<code>SMPU_SECURERCTL[n]</code>	Region n Control Secure Accesses Register
<code>SMPU_STAT</code>	SMPU Status Register

SMPU Interrupts

The SMPU has one interrupt with the SEC ID = 217. See the [System Event Controller \(SEC\) and Generic Interrupt Controller \(GIC\)](#) chapter for complete information on interrupt generation and use.

Memory Writes

A write transaction to address n is prevented when the following is true.

Address n is in memory region m and memory region m is write-protected ($\text{SMPU_RCTL}[n].\text{WPROTEN} = 1$) and ID is not a match. (See [ID Comparison](#)). The block occurs because the memory region is configured for write-protection and the ID comparison does not result in a match. If an ID comparison results in a match, the write transaction is allowed through.

Memory Reads

A read transaction from address n is prevented when the following is true:

- Address n is in memory region and memory region m is read-protected ($\text{SMPU_RCTL}[n].\text{RPROTEN} = 1$) and
- ID is not a match

The block occurs because the memory region is configured for read-protection and the ID comparison does not result in a match. If the ID comparison results in a match, the read transaction is permitted. (See [ID Comparison](#)).

ID Comparison

ID comparison automatically occurs during region-based memory protection. ID matches allow the transaction to bypass the configured memory protection for that region. The following sections describe the calculation of a write ID match and read ID match.

Write Transaction

The state of the following values determines the ID value that is compared with the ID of an incoming write transaction:

- The $\text{SMPU_RCTL}[n].\text{WIDCINV}$ bit
- The $\text{SMPU_RIDA}[n].\text{ID}$ and $\text{SMPU_RIDB}[n].\text{ID}$ bit fields
- The $\text{SMPU_RIDMSKA}[n].\text{MSK}$ and $\text{SMPU_RIDMSKB}[n].\text{MSK}$ bit fields

Write IDA match = $((\text{ID of incoming write transaction AND } \text{SMPU_RIDMSKA}[n].\text{MSK}) == (\text{SMPU_RIDA}[n].\text{ID AND } \text{SMPU_RIDMSKA}[n].\text{MSK}))$

Write IDB match = $((\text{ID of incoming write transaction AND } \text{SMPU_RIDMSKB}[n].\text{MSK}) == (\text{SMPU_RIDB}[n].\text{ID AND } \text{SMPU_RIDMSKB}[n].\text{MSK}))$

Write ID match = $(\text{Write IDA match OR Write IDB match}) \text{ XOR } \text{SMPU_RCTL}[n].\text{WIDCINV}$ bit

Read Transaction

The state of the following values determines the ID value that is compared with the ID of an incoming read transaction:

- The `SMPU_RCTL[n].RIDCINV` bit
- The `SMPU_RIDA[n].ID` and `SMPU_RIDB[n].ID` bit fields
- The `SMPU_RIDMSKA[n].MSK` and `SMPU_RIDMSKB[n].MSK` bit fields

Read IDA match = ((ID of incoming read transaction AND `SMPU_RIDMSKA[n].MSK`) == (`SMPU_RIDA[n].ID` AND `SMPU_RIDMSKA[n].MSK`))

Read IDB match = ((ID of incoming read transaction AND `SMPU_RIDMSKB[n].MSK`) == (`SMPU_RIDB[n].ID` AND `SMPU_RIDMSKB[n].MSK`))

Read ID match = (Read IDA match OR Read IDB match) XOR `SMPU_RCTL[n].RIDCINV`

In the two cases described above, the incoming transaction (either write or read) ID is AND'ed with the configured mask value in protection unit A. It is then compared to the value of the configured ID value which is also AND'ed with the configured mask value in protection unit A. The mask provides a method to allow a group of IDs to match. This process is also performed for protection unit B. The two outcomes (from A and B) are then OR'ed together.

Depending on the setting of the `SMPU_RCTL[n].RIDCINV` or the `SMPU_RCTL[n].WIDCINV` bits, the ID match comparison is inverted or not. The final result after applying the inversion, `SMPU_RCTL[n].RIDCINV`, or `SMPU_RCTL[n].WIDCINV`, determines whether the transaction bypasses the protection.

Usage

The masks, `SMPU_RIDMSKA[n]` and `SMPU_RIDMSKB[n]`, are AND'ed with both the incoming transaction ID and the configured ID in `SMPU_RIDA[n].ID` and `SMPU_RIDB[n].ID`, respectively. By default the masks are zero. If ID-based region protection is enabled by setting the `SMPU_RCTL[n].WPROTEN` or `SMPU_RCTL[n].RPROTEN` bit fields and the masks are not set, the ID comparison essentially compares zeros. The comparison allows all transactions to bypass (if the region-based security setting is also configured in a way to allow transactions to go through for the region). To have the ID-based region protection to function, the mask registers and ID registers must also be set.

System IDs

The *System Master IDs* table provides the IDs for the system masters. An x means that the bit can be a 0 or a 1. There are multiple IDs associated with that particular system master.

Table 10-3: System Master IDs

ASIB Name	IID	SIID	ID
SP0A	0	0	13'b0000x00000000

Table 10-3: System Master IDs (Continued)

Memory Region

Memory regions can start at address 0x00000000 or at any address that is a multiple of its size. The *Supported Memory Region Size and Alignment* table shows the memory region sizes that the processor supports and the alignment of the memory region. (X values are do-not-care).

SMPU supports a maximum of eight regions.

Table 10-4: Supported Memory Region Size and Alignment

Size	SMPU_RCTLn.SIZE	Address	Possible Values for N
4KB	0b00000	0xXXXXX000	-
8KB	0b00001	0xXXXXN000	0x0, 0x2, 0x4, 0x8, 0xA, 0xC, 0xE
16KB	0b00010	0xXXXXN000	0x0, 0x4, 0x8, 0xC
32KB	0b00011	0xXXXXN000	0x0, 0x8
64KB	0b00100	0xXXXX0000	-
128KB	0b00101	0xXXXN0000	0x0, 0x2, 0x4, 0x8, 0xA, 0xC, 0xE

Table 10-4: Supported Memory Region Size and Alignment (Continued)

Size	SMPU_RCTLn.SIZE	Address	Possible Values for N
256KB	0b00110	0xXXXN0000	0x0, 0x4, 0x8, 0xC
512KB	0b00111	0xXXXN0000	0x0, 0x8
1MB	0b01000	0xXXX00000	-
2MB	0b01001	0xXXN00000	0x0, 0x2, 0x4, 0x8, 0xA, 0xC, 0xE
4MB	0b01010	0xXXN00000	0x0, 0x4, 0x8, 0xC
8MB	0b01011	0xXXN00000	0x0, 0x8
16MB	0b01100	0xXX000000	-
32MB	0b01101	0xXN000000	0x0, 0x2, 0x4, 0x8, 0xA, 0xC, 0xE
64MB	0b01110	0xXN000000	0x0, 0x4, 0x8, 0xC
128MB	0b01111	0xXN000000	0x0, 0x8
256MB	0b10000	0xX0000000	-
512MB	0b10001	0xN0000000	0x0, 0x2, 0x4, 0x8, 0xA, 0xC, 0xE
1GB	0b10010	0xN0000000	0x0, 0x4, 0x8, 0xC
2GB	0b10011	0xN0000000	0x0, 0x8
4GB	0b10100	0x00000000	-

For the case where the region size is selected as 4 GB, the region address must be at address 0x00000000.

NOTE: If a memory region address is not aligned to its size, the memory region start address protected by the SMPU is the configured address with the corresponding least significant bits masked. For example, if the size is configured for 16 KB (SMPU_RCTL[n].SIZE = 0b00010), and the base address is configured for SMPU_RADDR[n].BADDR = 0x00005018, the actual base address used by the SMPU is 0x00004000. When SMPU_RADDR[n].BADDR is read back, the program reads 0x00005000. This functionality is because only bits [11:0] are reserved as 0's. Programs must use care when setting the base address as it is not always the true base address.

SMPU Definitions

To make the best use of the SMPU, it is useful to understand the terms in this section.

Global Protection

Guarding of the entire memory space for the particular SMPU instantiation.

Region-Based Protection

Guarding individual segments of memory inside the memory space for the particular SMPU instantiation.

ID Match

A successful comparison of the ID associated with the incoming transaction and the ID and MASK configured in the SMPU.

SMPU Block Diagram

The *SMPU Top-Level Block Diagram* shows the SMPU block.

As seen in the diagram, the SMPU sits between the memory port (SCB master port) and the SCB fabric (SCB slave port). It acts as a gateway analyzing the transaction requests. It either rejects the transaction request or allows access based on the user-programmed configuration of the SMPU.

Figure 10-1: SMPU Top-Level Block Diagram

SMPU Architectural Concepts

The following sections provide brief descriptions of the architecture of the SMPU module.

Default Setting

At reset, the default state of the system is fully open. The SMPUs admit any access to memory spaces.

Latency

The SMPU adds latency to all the transactions to the memory except reads when read speculation is enabled (`SMPU_CTL.RSDIS = 0`). In this case, read accesses are always forwarded to the memory and read responses are generated according to the SMPU settings. If read speculation is disabled (`SMPU_CTL.RSDIS = 1`), reads are blocked if they cause a security or protection violation. The SMPU generates the SCB read response that corresponds to a blocked transaction.

If read speculation is enabled, the SMPU adds 1 clock cycle latency to the read transaction. If read speculation is disabled, the SMPU adds 2 clock cycles latency to the read transaction.

SMPU Operating Modes

The SMPU does not have any strict modes of operation. However, it can be configured for region-based protection where a master with a particular ID can be blocked or allowed based on settings in the `SMPU_RCTL[n]` register.

Region-based protection is programmed with registers:

- `SMPU_RCTL[n]`
- `SMPU_RADDR[n]`
- `SMPU_RIDA[n]`
- `SMPU_RIDMSKA[n]`
- `SMPU_RIDB[n]`
- `SMPU_RIDMSKB[n]`

SMPU Interrupt Signals

There is one interrupt signal associated with the SMPU. If interrupts are enabled, the `SMPU_STAT.IRQ` bit is set. The `SMPU_IRQ` signal is asserted when the SMPU detects a memory access violation. The target address triggering the interrupt is found in the `SMPU_IADDR` register. The `SMPU_IDTLS` register provides further details about the cause of the interrupt.

Write errors are prioritized over read errors.

Protection violations (an ID-based violation) can trigger the SMPU interrupt, and can be enabled independently. The protection violation interrupt is enabled by setting the `SMPU_CTL.PINTEN` bit.

The SMPU interrupt is asserted for any of the following conditions:

If a second memory access violation occurs while the `SMPU_STAT.IRQ` bit is set, the `SMPU_STAT.IOVR` (interrupt overrun) bit is set. The `SMPU_IADDR` and the `SMPU_IDTLS` registers are not updated until the `SMPU_STAT.IRQ` bit is cleared. Any information on the subsequent interrupt is lost. Once the `SMPU_STAT.IRQ` bit and the `SMPU_STAT.IOVR` bit are cleared, any new memory access violations can trigger an interrupt and its details can be captured.

NOTE: When a blocked access occurs, the SMPU triggers an interrupt when interrupt generation is enabled. The SMPU can also be configured to generate a bus error that propagates back to the system master. The system master can also trigger an interrupt due to this bus error.

NOTE: On the processor, each SMPU instance has an interrupt. All of the SMPU interrupts are OR'ed and mapped to a single SMPU interrupt on the SEC. While servicing the SMPU interrupt, check all of the `SMPU_STAT` registers to determine which triggered the interrupt. The interrupt service routine clears the `SMPU_STAT.IRQ` bit of the all of the `SMPU_STAT` registers for which the interrupt is triggered.

SMPU Status and Error Signals

If bus errors are enabled (`SMPU_CTL.PBEDIS = 0`), the SMPU generates and returns a bus error to the master initiating the blocked access. This bit also sets the `SMPU_STAT.BERR` bit. The `SMPU_BADDR` and `SMPU_BDTLS` registers can be read to get the address and details of the transaction that caused the SMPU to generate the error.

Write errors are prioritized over read errors.

A bus error status is returned to the system master if:

- an ID-based violation happened and the `SMPU_CTL.PBEDIS` bit = 0

If a second memory access violation occurs while the `SMPU_STAT.BERR` bit is set, the `SMPU_STAT.BEOVR` bit (bus error overrun) is set. The `SMPU_BADDR` and the `SMPU_BDTLS` registers are not updated until the `SMPU_STAT.IRQ` bit is cleared. The information about the transaction that caused the `SMPU_STAT.BEOVR` bit to be set is lost.

NOTE: If both the protection violation interrupt is not enabled (`SMPU_CTL.PINTEN = 0`) and the protection bus error is disabled (`SMPU_CTL.PBEDIS = 1`), the SMPU blocks invalid transactions. However, it does not provide any status or interrupt information indicating that a transaction is blocked.

ADSP-2159x SMPU Register Descriptions

The System Memory Protection Unit (SMPU) contains the following registers.

Table 10-5: ADSP-2159x SMPU Register List

Name	Description
<code>SMPU_BADDR</code>	Bus Error Address Register
<code>SMPU_BDTLS</code>	Bus Error Details Register
<code>SMPU_CTL</code>	SMPU Control Register
<code>SMPU_EXACADD[n]</code>	Exclusive Access IDn Address
<code>SMPU_EXACSTAT[n]</code>	Exclusive Access Status
<code>SMPU_IADDR</code>	Interrupt Address Register
<code>SMPU_IDTLS</code>	Interrupt Details Register
<code>SMPU_RADDR[n]</code>	Region n Address Register
<code>SMPU_RCTL[n]</code>	Region n Control Register
<code>SMPU_REVID</code>	SMPU Revision ID Register
<code>SMPU_RIDA[n]</code>	Region n ID A Register
<code>SMPU_RIDB[n]</code>	Region n ID B Register
<code>SMPU_RIDMSKA[n]</code>	Region n ID Mask A Register

Table 10-5: ADSP-2159x SMPU Register List (Continued)

Name	Description
SMPU_RIDMSKB[n]	Region n ID Mask B Register
SMPU_SECURECTL	SMPU Control Secure Accesses Register
SMPU_SECURERCTL[n]	Region n Control Secure Accesses Register
SMPU_STAT	SMPU Status Register

Bus Error Address Register

Programs read the `SMPU_BADDR` and the `SMPU_BDTLS` registers to determine the cause of a bus error. Write errors are prioritized over read errors.

Figure 10-2: `SMPU_BADDR` Register Diagram

Table 10-6: `SMPU_BADDR` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	VALUE	Bus Error Address. The <code>SMPU_BADDR.VALUE</code> bit field contains the address of the bus error.

Bus Error Details Register

The `SMPU_BDTLS` register indicates the ID of the bus error transaction, whether the transaction that caused the last bus error was a read, a write, secure or non-secure.

Figure 10-3: SMPU_BDTLS Register Diagram

Table 10-7: SMPU_BDTLS Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
20:8 (R/NW)	ID	ID of Transaction. The <code>SMPU_BDTLS</code> .ID bit field provides the ID of the transaction that caused the bad address error.
1 (R/NW)	RNW	Read/Write Status. The <code>SMPU_BDTLS</code> .RNW bit indicates whether the last transaction that caused the bad address error was a read or write.
		0 Transaction that caused last bus error was a write
		1 Transaction that caused last bus error was a read
0 (R/NW)	SECURE	Secure Status Register. The <code>SMPU_BDTLS</code> .SECURE bit indicates whether the last transaction that caused the bad address error was secure or non-secure.
		0 Transaction that caused last bus error was non-secure
		1 Transaction that caused last bus error was secure

SMPU Control Register

The `SMPU_CTL` register provides access to the locking control, error interrupts and SMPU violations.

Figure 10-4: SMPU_CTL Register Diagram

Table 10-8: SMPU_CTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W)	LOCK	Lock Bit. When the <code>SMPU_CTL</code> .LOCK bit is set and the global lock signal is asserted from the SPU, the <code>SMPU_CTL</code> register is write-protected. Write-protection is disabled only when the global lock signal becomes deasserted again.
		0 CTL Global Lock Disable. The <code>SMPU_CTL</code> register is not write-protected.
		1 CTL Global Lock Enable. The <code>SMPU_CTL</code> register is write-protected.
4 (R/W)	RLOCK	RCTLn, RADDRn, RIDxn and RIDMxn Registers Lock Bit. When the <code>SMPU_CTL</code> .RLOCK bit is set, all the registers associated with region-based control (<code>SMPU_RCTL[n]</code> , <code>SMPU_RADDR[n]</code> , <code>SMPU_RIDA[n]</code> , <code>SMPU_RIDB[n]</code> , <code>SMPU_RIDMSKA[n]</code> and <code>SMPU_RIDMSKB[n]</code>) are write-protected when the global lock signal is active from the SPU. Write access is allowed again when the global lock signal is deasserted.
		0 Region Registers Write-Protect Enable. All region registers are not write-protected.
		1 Region Registers Write-Protect Disable. All region registers are write-protected.

Table 10-8: SMPU_CTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
3 (R/W)	PINTEN	Protection Violation Interrupt Enable. The SMPU_CTL.PINTEN bit controls whether or not an interrupt is generated when a protection violation occurs.
		0 Protection Violation IRQ Disable. The protection violation interrupt is disabled.
		1 Protection Violation IRQ Enable. The protection violation interrupt is enabled.
2 (R/W)	PBETYPE	Protection Violation Bus Error Type. The SMPU_CTL.PBETYPE bit controls whether a protection violation produces a decode error or a slave error.
		0 Decode Error Type. Decode error for transactions that violate the configured protection.
		1 Slave Error Type. Slave Error for transactions which violate the configured protection
1 (R/W)	PBEDIS	Protection Violation Bus Error Disable. If set, the SMPU_CTL.PBEDIS bit blocks protection violations, but does not cause a bus error.
		0 Bus Error Generation Enable. Transactions which violate the configured protection are blocked and cause a bus error.
		1 Bus Error Generation Disable. Transactions which violate the configured protection are blocked but do not cause a bus error.
0 (R/W)	RSDIS	Read Speculation Disable. The SMPU_CTL.RSDIS bit controls whether or not the read addresses are checked before being sent to the slave.
		0 Read Speculation Enable. Read addresses are sent to the slave without checking.
		1 Read Speculation Disable. Read addresses are checked before being sent to the slave.

Exclusive Access IDn Address

The `SMPU_EXACADD[n]` register provides the address ID of an exclusive access.

Figure 10-5: `SMPU_EXACADD[n]` Register Diagram

Table 10-9: `SMPU_EXACADD[n]` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	VALUE	Exclusive Access IDn Address.

Exclusive Access Status

The `SMPU_EXACSTAT[n]` register provides the exclusive access ID, read size and read length as well as the indication that the access was valid.

Figure 10-6: SMPU_EXACSTAT[n] Register Diagram

Table 10-10: SMPU_EXACSTAT[n] Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
20:8 (R/NW)	ARID	Exclusive Access ID.
7:5 (R/NW)	ARSIZE	Exclusive Access Read Size.
4:1 (R/NW)	ARLEN	Exclusive Access Read Length.
0 (R/NW)	VALID	Valid Exclusive Access Read.

Interrupt Address Register

The `SMPU_IADDR` register indicates an attempt to make a read or write access to unimplemented addresses or accesses are non-aligned. The SMPU issues a bus error for this condition.

Figure 10-7: SMPU_IADDR Register Diagram

Table 10-11: SMPU_IADDR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	VALUE	Interrupt Address. The <code>SMPU_IADDR.VALUE</code> bit field is the address where an attempt to access an unimplemented address or a non-aligned access has occurred.

Interrupt Details Register

The `SMPU_IDTLS` register provides the ID of the last signaled interrupt, whether the interrupt was caused by a read or write, and whether the transaction that caused the last signaled interrupt was secure.

Figure 10-8: SMPU_IDTLS Register Diagram

Table 10-12: SMPU_IDTLS Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
20:8 (R/NW)	ID	ID of Transaction. The <code>SMPU_IDTLS.ID</code> bit field provides the ID of the transaction that caused the interrupt.
1 (R/NW)	RNW	Read/Write Status. The <code>SMPU_IDTLS.RNW</code> bit indicates whether the last transaction that caused the interrupt was a read or write.
		0 Transaction that caused last signaled interrupt was a write
		1 Transaction that caused last signaled interrupt was a read
0 (R/NW)	SECURE	Secure Status. The <code>SMPU_IDTLS.SECURE</code> bit indicates whether the last transaction that caused the interrupt was secure or non-secure.
		0 Transaction that caused last signaled interrupt was non-secure
		1 Transaction that caused last signaled interrupt was secure

Region n Address Register

The `SMPU_RADDR[n]` register is used to define the base address for a memory region to be protected.

Figure 10-9: SMPU_RADDR[n] Register Diagram

Table 10-13: SMPU_RADDR[n] Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:12 (R/W)	BADDR	Region n Base Address 20 Most Significant Bits. The <code>SMPU_RADDR[n].BADDR</code> bit field defines the base address for a memory region to be protected.

Region n Control Register

The `SMPU_RCTL[n]` register is used to define the level of protection for a region of memory. The protection of a region is controlled and defined by this register and the `SMPU_RADDR[n]`, `SMPU_RIDA[n]`, `SMPU_RIDB[n]`, `SMPU_RIDMSKA[n]`, and `SMPU_RIDMSKB[n]` registers.

Figure 10-10: `SMPU_RCTL[n]` Register Diagram

Table 10-14: `SMPU_RCTL[n]` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
11 (R/W)	WIDCINV	Write Transaction ID Compare Invert. The <code>SMPU_RCTL[n].WIDCINV</code> bit inverts the write ID match result.
		0 Write transaction ID comparison result not inverted
		1 Write transaction ID comparison result inverted
10 (R/W)	WPROTEN	Write Transaction Protection Enable. The <code>SMPU_RCTL[n].WPROTEN</code> bit enables protection against ID-based write transactions for the memory region.
		0 Write transaction ID-based protection disabled
		1 Write transaction ID-based protection enabled
9 (R/W)	RIDCINV	Read Transaction ID Compare Invert. When the <code>SMPU_RCTL[n].RIDCINV</code> bit is set, the read ID match result is inverted.
		0 Read transaction ID comparison result not inverted
		1 Read transaction ID comparison result inverted

Table 10-14: SMPU_RCTL[n] Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
8 (R/W)	RPROTEN	Read Transaction Protection Enable. The SMPU_RCTL[n] . RPROTEN bit enable bit to turn on protection against ID-based read transactions for the memory region.
		0 Read transaction ID-based protection disabled
		1 Read transaction ID-based protection enabled
5:1 (R/W)	SIZE	Memory Region Size. The SMPU_RCTL[n] . SIZE bit defines the size of the memory region to be protected.
		0 4 KB
		1 8 KB

Table 10-14: SMPU_RCTL[n] Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
0 (R/W)	EN	Region Enable. The SMPU_RCTL[n].EN bit enables the protection of a region.
		0 Disabled
		1 Enabled

SMPU Revision ID Register

The `SMPU_REVID` register provides the major and minor revision numbers of this module.

Figure 10-11: SMPU_REVID Register Diagram

Table 10-15: SMPU_REVID Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
7:4 (R/NW)	MAJOR	Major Version ID.
3:0 (R/NW)	REV	Incremental Version ID.

Region n ID A Register

The `SMPU_RIDA[n]` register is used for ID comparison 'A'. This comparison is performed after a mask is applied to both the transaction ID (from either the read or write IDs) and the register value. An ID match means that the ID is the exception to the rule and the read or write is allowed even if the region is read or write-protected. For more detail, refer to the ID Comparison section.

Figure 10-12: `SMPU_RIDA[n]` Register Diagram

Table 10-16: `SMPU_RIDA[n]` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
12:0 (R/W)	ID	Region n ID Register A. The <code>SMPU_RIDA[n] . ID</code> bit field, combined with the mask provides the means to bypass the configured memory protection for a region.

Region n ID B Register

The `SMPU_RIDB[n]` register is used for ID comparison 'B'. This comparison is performed after a mask is applied to both the transaction ID (from either the read or write IDs) and the register value. An ID match means that the ID is the exception to the rule and the read or write is allowed even if the region is read or write-protected. For more details, refer to the ID Comparison section.

Figure 10-13: `SMPU_RIDB[n]` Register Diagram

Table 10-17: `SMPU_RIDB[n]` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
12:0 (R/W)	ID	Region n ID Register B. The <code>SMPU_RIDB[n] . ID</code> bit field, combined with the mask provides the means to bypass the configured memory protection for a region.

Region n ID Mask A Register

The `SMPU_RIDMSKA[n]` register is used for ID comparison 'A'. The mask allows or disallows certain IDs from affecting the final result of the ID match. For more details, refer to the ID Comparison section.

Figure 10-14: `SMPU_RIDMSKA[n]` Register Diagram

Table 10-18: `SMPU_RIDMSKA[n]` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
12:0 (R/W)	MSK	Region n ID Mask Register A. The <code>SMPU_RIDMSKA[n].MSK</code> bit field, combined with the incoming transaction, provides the means to bypass the configured memory protection for a region.

Region n ID Mask B Register

The `SMPU_RIDMSKB[n]` register is used for ID comparison 'B'. The mask allows or disallows certain IDs from affecting the final result of the ID match. For more details, refer to the ID Comparison section.

Figure 10-15: `SMPU_RIDMSKB[n]` Register Diagram

Table 10-19: `SMPU_RIDMSKB[n]` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
12:0 (R/W)	MSK	Region n ID Mask Register B. The <code>SMPU_RIDMSKB[n].MSK</code> bit field, combined with the incoming transaction provides the means to bypass the configured memory protection for a region.

SMPU Control Secure Accesses Register

The `SMPU_SECURECTL` register provides the bits required to set up the security settings for the processor. These settings includes error generation and read/write security.

Figure 10-16: SMPU_SECURECTL Register Diagram

Table 10-20: SMPU_SECURECTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W)	LOCK	Lock Bit. When the <code>SMPU_SECURECTL.LOCK</code> bit is set and the global lock signal is asserted from the SPU, the <code>SMPU_SECURECTL</code> register is write-protected. Write-protection is disabled only when the global lock signal becomes deasserted again.
		0 <code>SMPU_SECURECTL</code> is not write-protected
		1 <code>SMPU_SECURECTL</code> is write-protected
11 (R/W)	WSECDIS	Secure Write Transaction Disable. The <code>SMPU_SECURECTL.WSECDIS</code> bit disables secure write transactions.
		0 Enable secure write transactions
		1 Disable secure write transactions
10 (R/W)	WNSEN	Non-secure Write Transaction Enable. The <code>SMPU_SECURECTL.WNSEN</code> bit enables non-secure write transactions.
		0 Disable non-secure writes
		1 Enable non-secure writes

Table 10-20: SMPU_SECURECTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
9 (R/W)	RSECDIS	Secure Read Transaction Disable. The SMPU_SECURECTL.RSECDIS bit disables secure read transactions.
		0 Enable secure read transactions
		1 Disable secure read transactions
8 (R/W)	RNSEN	Non-secure Read Transaction Enable. The SMPU_SECURECTL.RNSEN bit enables non-secure read transactions.
		0 Disable non-secure read transactions
		1 Enable non-secure read transactions
3 (R/W)	RLOCK	Secure Region Registers Lock Bit. When the SMPU_SECURECTL.RLOCK bit is set, the secure region control registers, SMPU_SECURECTL[n] , are write-protected when the global lock signal is active from the SPU. When the global lock signal is deasserted, write access is allowed again.
		0 Disable write-protection on secure region registers
		1 Enable write-protection on secure region registers
2 (R/W)	SINTEN	Security Violation Interrupt Enable. The SMPU_SECURECTL.SINTEN bit enables interrupt generation when a security violation occurs.
		0 Disable security settings violation interrupt
		1 Enable security settings violation interrupt
1 (R/W)	SBETYPE	Security Violation Bus Error Type. The SMPU_SECURECTL.SBETYPE bit controls whether a decode error or a slave error is returned when a security violation occurs.
		0 Return a decode error error which violates the security settings
		1 Return a slave error which violates the security settings
0 (R/W)	SBEDIS	Security Violation Bus Error Disable. The SMPU_SECURECTL.SBEDIS bit controls whether or not a bus error is caused when a security violation occurs.
		0 Enable bus error
		1 Disable bus error

Region n Control Secure Accesses Register

The `SMPU_SECURERCTL[n]` register contains bits that configure read/write security for a specific region.

Figure 10-17: `SMPU_SECURERCTL[n]` Register Diagram

Table 10-21: `SMPU_SECURERCTL[n]` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
3 (R/W)	WSECDIS	Secure Write Transaction Disable. The <code>SMPU_SECURERCTL[n].WSECDIS</code> bit disables secure write transactions for the memory region.
		0 Enable secure write transactions to this region
		1 Disable secure write transactions to this region
2 (R/W)	WNSSEN	Non-secure Write Transaction Enable. This <code>SMPU_SECURERCTL[n].WNSSEN</code> bit enables non-secure write transactions for the memory region.
		0 Disable non-secure write transactions to this region
		1 Enable non-secure write transactions to this region
1 (R/W)	RSECDIS	Secure Read Transaction Disable. The <code>SMPU_SECURERCTL[n].RSECDIS</code> bit disables secure read transactions for the memory region.
		0 Enable secure read transactions to this region
		1 Disable secure read transactions to this region
0 (R/W)	RNSSEN	Non-secure Read Transaction Enable. The <code>SMPU_SECURERCTL[n].RNSSEN</code> bit enables non-secure read transactions for the memory region.
		0 Disable non-secure read transactions to this region
		1 Enable non-secure read transactions to this region

SMPU Status Register

The `SMPU_STAT` register provides the state of the SMPU and indicates various errors. All bits in this register are write 1 to clear.

Figure 10-18: SMPU_STAT Register Diagram

Table 10-22: SMPU_STAT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
17 (R/W1C)	LWERR	Lock Write Error. The <code>SMPU_STAT.LWERR</code> bit is set when <code>SMPU_CTL.LOCK</code> bit =1, the global lock signal is asserted from the SPU and a read or write attempt was made to the <code>SMPU_CTL</code> MMR.
		0 No Lock Write Error
		1 Lock Write Error
16 (R/W1C)	ADRERR	Address Error. The <code>SMPU_STAT.ADRERR</code> bit is set when the SMPU MMR is accessed as an un-aligned address, or when a read-only MMR is written to.
		0 No Address Error
		1 Address Error
3 (R/W1C)	BEOVR	Bus Error Overrun. The <code>SMPU_STAT.BEOVR</code> bit indicates that another bus error had occurred. Any new information about the most recent violation which caused the bus error is not captured.
		0 No Bus Error overrun
		1 Bus Error overrun has occurred

Table 10-22: SMPU_STAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
2 (R/W1C)	BERR	Bus Error. This SMPU_STAT . BERR bit indicates if a bus error was generated.
		0 No Bus Error since this bit has been cleared
		1 Bus Error has been generated
1 (R/W1C)	IOVR	Interrupt Overrun. The SMPU_STAT . IOVR bit indicates if another violation occurred while the previous violation interrupt was not finished being serviced. Information about the most recent violation is then not captured.
		0 No Interrupt overrun
		1 Interrupt overrun has occurred
0 (R/W1C)	IRQ	Interrupt Request. The SMPU_STAT . IRQ bit provides an indication that an interrupt has been generated.
		0 No Interrupt since this bit has been cleared
		1 Interrupt has been generated

11 General-Purpose Ports (PORT)

This section describes general-purpose ports, pin multiplexing, general-purpose input/output (GPIO) functionality, and pin interrupts. The general-purpose ports provide the following three functions:

- Pin multiplexing scheme
- GPIO functionality
- Pin interrupt requests

NOTE: In this chapter, the naming convention for registers and bits omits the alphabetic group enumeration to refer to any and all of the ports. For example, `PORT_FER` represents registers `PORTA_FER`, `PORTB_FER`, and so on. Likewise `PORT_FER.PX1` represents bits `PA1`, `PB1`, and so on.

Figure 11-1: Simplified GPIO and Pin Interrupt Signal Flow

PORT Features

The PORTs include the following features:

- Input mode, output mode, and open-drain mode of GPIO operation
- Port multiplexing controlled on a pin-by-pin basis
- No external glue hardware required for unused pins
- All port pins provide interrupt request functionality
- Byte-wide pin-to-interrupt request assignment

PORT Functional Description

The number of ports and each's composition are defined in the processor datasheet. Each port has a dedicated set of MMR registers that control pin functions and operates in general-purpose I/O (GPIO) mode by default, as controlled by the port-specific `PORT_FER` register. Each bit in this register, as well as the other PORT MMRs, represents a specific GPIO pin on the specified port.

Input Mode, Output Mode, and Open-Drain Mode of GPIO Operation

At reset, every GPIO pin defaults to input mode with the input drivers disabled. To enable any GPIO input driver, set the bits corresponding to the individual pins in the appropriate input enable register (`PORT_INEN`).

The GPIO output drivers are enabled by setting the corresponding bits in the direction registers (`PORT_DIR`).

The PORT can use every GPIO in open-drain mode by clearing the respective bit in the `PORT_DATA` register or setting the respective bit in the `PORT_DATA_CLR` register. Then, set the corresponding bit in the `PORT_INEN` register. Read from the `PORT_DATA` register to obtain the status from the pin.

Port Multiplexing Controlled on Pin-by-Pin Basis

Each port has two dedicated MMRs that control the port multiplexing, the 16-bit function enable (`PORT_FER`) registers and the 32-bit port multiplexing (`PORT_MUX`) registers.

All Port Pins Provide Interrupt Functionality

Pin interrupts are completely decoupled from GPIO functionality. Pins are connected to the system event controller (SEC) via the PINTx modules, each of which is configurable in terms of which port pins are sensed for interrupt generation.

ADSP-2159x PORT Register List

The PORT module (PORT) regulates the use of the multiplexable processor pins. Every port pin can operate in general-purpose I/O (GPIO) mode or as an alternate function. This GPIO operation is the default after processor reset and is controlled by a set of registers that control GPIO functionality. Every bit in these registers represents a certain GPIO pin of a specific port. For more information on PORT functionality, see the PORT register descriptions.

Table 11-1: ADSP-2159x PORT Register List

Name	Description

ADSP-2159x PINT Register List

The Pin Interrupt module (PINT) controls the pin-to-interrupt assignment in a byte-wide manner. The pin-interrupt assignment registers do not consist of 32 individual bits. They consist of four control bytes, each functioning as a multiplexer control. For more information, see the PINT register descriptions.

All PINT registers are 32 bits wide and can be accessed by 32-bit load/store instructions. They also support 16-bit operation where the upper 16 bits are ignored and the application uses the lower 16 bits only. Consequently, all PINT registers support 32-bit accesses as well as 16-bit accesses for the lower half words. Applications may use faster 16-bit accesses as long as they do not require functionality of upper register halves.

Table 11-4: ADSP-2159x PINT Register List

Name	Description

PADS_PORTI0_DS	PORTI 0 to 7 pins DS control
PADS_PORT[n]_PDE	PORTx Pull-Down Enable
PADS_PORT[n]_PUE	PORTx Pull-Up Enable

PORT Architectural Concepts

These sections describe in more detail how the PORT module connects externally to pins and internally to the MMR bus. Ports are named alphabetically beginning with A.

- [Internal Interfaces](#)
- [External Interfaces](#)
- [GPIO Pin Function](#)
- [Port Multiplexing Control](#)

Internal Interfaces

All of the pin multiplexing, GPIO, and pin interrupt control block MMRs can be accessed through the MMR bus. There is no DMA support. Each of the pin interrupt (PINTx) modules has its own dedicated interrupt request output signal that connects directly to the system event controller (SEC).

External Interfaces

The pin multiplexing hardware can be seen as a layer between the on-chip peripherals and the silicon pads connecting to the physical pins/balls or the package, as controlled by the PORT unit.

GPIO Pin Function

By default, the PORT sets every GPIO pin to input mode. The input drivers are not enabled, which avoids the need for unnecessary current sinks and external termination resistors on unused pins.

Input Mode

The default mode of every GPIO pin after reset is input mode, but the input drivers are not enabled. To enable GPIO input drivers, set the bits corresponding to the PORT pins in the appropriate input enable register ([PORT_INEN](#)). When enabled, a read from the [PORT_DATA](#) register returns the logical state of the input pins. However, the input signal does not overwrite the state of the internal flip-flop used for providing output to the same pin. Only software can alter the state. If the input driver is enabled, a write to the [PORT_DATA](#) register can alter the state of the flip-flop, but the change cannot be read back.

Output Mode

Any GPIO pin can be configured for output mode. The GPIO output drivers are enabled by setting the bits corresponding to the PORT pins in the appropriate direction register. The PORT implements direction registers as a pair of write-1-to-set (W1S) and write-1-to-clear (W1C) MMRs called [PORT_DIR_SET](#) and [PORT_DIR_CLR](#), respectively. As such, software can alter the direction of the signal flow on individual GPIO pins without impacting other GPIOs on the same port.

Both the [PORT_DIR_SET](#) and [PORT_DIR_CLR](#) registers return the same value when read, and a logical 1 indicates an enabled output. The [PORT_DATA](#) registers control the state of output pins. A logical 0 drives the output low while a logical 1 drives the output high.

While writes to the [PORT_DATA](#) register can alter all of the GPIOs on a specific port at once, there are also a pair of W1S and W1C MMRs called [PORT_DATA_SET](#) and [PORT_DATA_CLR](#), respectively. These registers enable

the manipulation of individual GPIO outputs. The state of the outputs can be obtained by reading the `PORT_DATA` registers. Because the state of the GPIO output can be controlled before the output driver is enabled, set or clear the internal flip-flop first by programming this register to avoid volatile levels on the output pin.

Trigger Toggle Mode

Any GPIO pin that has been configured for output mode can be toggled using a trigger input from the Trigger Routing Unit (TRU). To enable this functionality for a particular GPIO, set the appropriate bit in the `PORT_TRIG_TGL` register. Any subsequent trigger for the designated port causes all GPIO outputs set in the `PORT_TRIG_TGL` register to toggle.

To avoid unpredictable behavior, do not set, clear, or toggle the `PORT_DATA`, `PORT_DATA_SET`, `PORT_DATA_CLR`, or `PORT_DATA_TGL` registers when the GPIO output has the corresponding `PORT_TRIG_TGL` bit set. To change the state of the GPIO output using one of these registers, first clear the corresponding bit in the `PORT_TRIG_TGL` register.

Open-Drain Mode

Every GPIO can also be used in open-drain mode. First, either clear the respective bit in the `PORT_DATA` register or set the respective bit in the `PORT_DATA_CLR` register. Then, set the appropriate bit in the `PORT_INEN` register. Read from the `PORT_DATA` register to return the status from the pin rather than the state of the internal flip-flop.

By toggling the output driver through the `PORT_DIR_SET` and `PORT_DIR_CLR` register pair, the output signal can be pulled low or three-stated, as required. The polarity of the driven signal can be inverted when the internal flip-flop is set. When using a GPIO port in open-drain mode, take care to not exceed the V_{IH} operating condition associated with the respective pins.

Port Multiplexing Control

To configure pins properly, consult the processor datasheet to determine which bits in the `PORT_FER` and `PORT_MUX` register map to the pin of interest, and then set these registers appropriately for the desired function.

After reset, all port pins default to GPIO input mode with their output and input drivers disabled. As a result, all unused port pins can be left unconnected. Disabled pins appear as high-impedance to external circuits.

Each port has two dedicated MMRs that control the port multiplexing, the 16-bit function enable (`PORT_FER`) registers and the 32-bit port multiplexing (`PORT_MUX`) registers.

The function enable register specifies whether the pin is used as a GPIO pin or allocated for use by a specific peripheral, but it does not specify what the peripheral function is. Each bit in the 16-bit `PORT_FER` register corresponds to an individual port pin. For example, if bit 1 (PA1) of the `PORTA_FER` register is cleared, the PA_01 pin is configured as a GPIO. When set, one of the available peripheral functions becomes active on the PA_01 pin instead.

Pairs of bits in the `PORT_MUX` register control the multiplexing between the peripheral functions available to an individual pin, as some PORT pins provide up to four possible peripheral functions.

Refer to the Signal Muxing table in the datasheet for the specific `PORT_MUX` settings.

PORT Event Control

The following sections describe event generation in the PORT module.

PORT Interrupt Signals

The pin interrupts are decoupled from GPIO functionality, providing the following advantages.

- Flexible mapping scheme enables pins from up to four different ports to be grouped into one common interrupt scheme.
- Interrupt requests work on input and output pins regardless of whether the pin is functioning as a GPIO or a peripheral.

The processor has a number of interrupt channels dedicated to pin interrupts, managed by a set of pin interrupt (PINTx) blocks. Each PINTx block can sense up to 32 GPIO pins, as described in the following list and figure.

- PINT0 can sense pin activity on PORTA and PORTB
- PINT1 can sense pin activity on PORTB and PORTC
- PINT2 can sense pin activity on PORTC and PORTD
- PINT3 can sense pin activity on PORTD and PORTE
- PINT4 can sense pin activity on PORTE and PORTF
- PINT5 can sense pin activity on PORTF and PORTG
- PINT6 can sense pin activity on PORTG and PORTH
- PINT7 can sense pin activity on PORTH and PORTI

Note that PORTC to PORTI are not available on the low pin count package.

The processor supports both 32-bit and 16-bit peripheral bus accesses to PINTx registers.

Figure 11-2: GPIO to PINTx Assignment

Pins connect to the PINTx module and then to the system event controller (SEC), as shown in the *PINTx Block Diagram*.

Figure 11-3: PINTx Block Diagram

As shown in the *PINTx Block Diagram*, each port is subdivided into two 8-pin half ports, upper (P×H) and lower (P×L). The `PINT_ASSIGN` registers control the 8-bit multiplexers associated with these half ports, where the lower half units (eight pins) can be forwarded to either byte 0 or byte 2 of the PINTx blocks, and the upper half units (eight pins) can be forwarded to either byte 1 or byte 3 of the PINTx blocks.

When a half port is assigned to a byte in any PINTx block, the state of the eight pins appears in the `PINT_PINSTATE` register, regardless of whether the pin is enabled for GPIO or peripheral functions (input or output). When neither the input nor output drivers of the pin are enabled, the pin state is read as zero. The `PINT_PINSTATE` register reports the inverted state of the pin when the `PINT_INV_SET` register activates the signal inverter. The inverter can be enabled on an individual bit-by-bit basis. Each bit in the `PINT_INV_SET/PINT_INV_CLR` register pair represents a pin signal.

By default, PORT interrupt request generation is level-sensitive, and an interrupt request occurs when the enabled pin is sensed as active high. Use the `PINT_EDGE_SET` register to change the interrupt request generation scheme to instead be edge-sensitive (rising edge generates the interrupt request). Use the `PINT_INV_SET` register to invert the polarity such that the PINTx block generates the interrupt request on active-low signals or falling edges.

The PINTx modules also assist when both signal edges must generate unique interrupt requests. If two different interrupt requests are required, the `PINT_ASSIGN` registers can route a single input signal to two different PINTx blocks, where one block inverts the signal in the `PINT_INV_SET` register and the other one does not. In this fashion, a unique software routine is associated with the hardware PINTx block that is generating the unique interrupt request for each signal edge. When both signal edges can be serviced by the same interrupt request, each half port can be routed to two separate bytes within a single PINTx block using the `PINT_ASSIGN` register, and then one of the half ports needs to have the inversion enabled in the `PINT_INV_SET` register. The servicing software routine can then detect from the `PINT_LATCH` register whether a falling, rising, or both edges have occurred.

Regardless of whether level-sensitive or edge-sensitive mode is used, the hardware always latches an interrupt request. Latched signals can be read from the `PINT_LATCH` registers. Only a software or hardware reset clears the latches. To clear the latch, a W1C operation must be performed to the `PINT_REQ` or `PINT_LATCH` register. When in level-sensitive mode, the interrupt request remains asserted if the pin state does not change by the time the interrupt service routine exits.

Because every PINTx block groups up to 32 pin signals, the `PINT_MSK_SET/ PINT_MSK_CLR` register pair can control which of the signals can request an interrupt at the system level. Software can interrogate the `PINT_REQ` register for signaling pins. The `PINT_REQ` bits represent a logical AND between the mask and the latch. When any of these bits is set, the block output interrupt request is asserted.

PORT Programming Model

The *GPIO Programming Model Flow (Part 1)*, *GPIO Programming Model Flow (Part 2)*, and *GPIO Programming Model Flow (Part 3)* figures show the programming model for the general-purpose ports. This programming includes the GPIO input and output operation, open-drain mode, and the pin interrupt PINTx modules.

NOTE: These process flow diagrams connect where call-out letters appear. For example, call-out A in the *GPIO Programming Model Flow (Part 1)* diagram connects to call-out A in the *GPIO Programming Model Flow (Part 2)* diagram.

The following flowcharts describe the processes for setting up pins for various functions. Begin the process from the start label in the *GPIO Programming Model Flow (Part 1)* figure. The first decision (GPIO or peripheral) determines how to program the `PORT_FER` register. Set the bit(s) corresponding to the pin(s) to 1 to enable peripheral functionality or to 0 to enable GPIO mode. For more information on setting up for peripheral functions, refer to [Port Multiplexing Control](#).

If the pin is to be a GPIO pin, a subsequent series of decisions must be made that will impact how the `PORT_DATA`, `PORT_POL`, `PORT_DIR`, and `PORT_INEN` configuration registers must be programmed. Depending on the type of GPIO pin desired, some configurations do not apply and can have different meanings. The following paragraphs briefly describe the function of the different settings for each of the pin functions in the input, output, and open-drain GPIO modes. It is a best practice to use the SET or CLR versions of the PORT registers, where applicable, to effect changes on a pin-by-pin basis rather than on the full port.

For output mode, first clear the `PORT_DATA` register to set all the pins low. Then write the `PORT_DIR` register to define the direction of each pin (set the bits associated with the desired output pins to 1). In output mode, the other registers are not significant. The *GPIO Programming Model Flow (Part 1)* chart shows this flow starting at label 2.

Figure 11-4: GPIO Programming Model Flow (Part 1)

For input mode, first decide the polarity for each pin using the `PORT_POL` register. Program the `PORT_DIR` register to define the appropriate pins as inputs (write a 0 to the bit location associated with the pin). If interrupt requests are desired, configure the PINT module as shown in the *GPIO Programming Model Flow (Part 3)* figure starting at label B. Finally, write the `PORT_INEN` register to enable the associated input drivers. The *GPIO Programming Model Flow (Part 2)* chart shows this entire flow starting at label 3.

For open-drain mode, set all pins low by clearing the `PORT_DATA` register. Then, use the `PORT_INEN` register to enable the appropriate input drivers. Set the `PORT_DIR` register in this mode to indicate whether the pin is in an active state or not (active being 0). The *GPIO Programming Model Flow (Part 2)* chart shows this flow starting at label 4.

Name	Description
PORT_DIR_SET	Port x GPIO Direction Set Register
PORT_FER	Port x Function Enable Register
PORT_FER_CLR	Port x Function Enable Clear Register
PORT_FER_SET	Port x Function Enable Set Register
PORT_INEN	Port x GPIO Input Enable Register
PORT_INEN_CLR	Port x GPIO Input Enable Clear Register
PORT_INEN_SET	Port x GPIO Input Enable Set Register
PORT_LOCK	Port x GPIO Lock Register
PORT_MUX	Port x Multiplexer Control Register
PORT_POL	Port x GPIO Polarity Invert Register
PORT_POL_CLR	Port x GPIO Polarity Invert Clear Register
PORT_POL_SET	Port x GPIO Polarity Invert Set Register
PORT_TRIG_TGL	Port x GPIO Trigger Toggle Register

Port x GPIO Data Register

The operation of the `PORT_DATA` register depends on whether the bit/pin is in output mode or input mode. In both modes, a set bit in the `PORT_DATA` register corresponds to a signal high on a GPIO pin. A cleared bit in the `PORT_DATA` register corresponds to a signal low on a GPIO pin.

The `PORT_DATA`, `PORT_DATA_SET`, and `PORT_DATA_CLR` registers control the state of GPIO pins in output mode. To enable output mode (and output drivers), use the `PORT_DIR_SET` and `PORT_DIR_CLR` registers.

Writes to the `PORT_DATA` register affect the state of all pins of the port that are in output mode. To set or clear specific pins without impacting other pins of the port, use the `PORT_DATA_SET` and `PORT_DATA_CLR` registers.

When the GPIO pins are in input mode (input driver is enabled with the `PORT_INEN` register), reads from the `PORT_DATA`, `PORT_DATA_SET`, and `PORT_DATA_CLR` registers return the state of the respective GPIO pins.

Note that when the input driver is not enabled, reads from the `PORT_DATA`, `PORT_DATA_SET`, and `PORT_DATA_CLR` registers return the value previously written to the registers.

Figure 11-7: `PORT_DATA` Register Diagram

Table 11-10: PORT_DATA Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15 (R/W)	PX15	Port x Bit 15 Data. The PORT_DATA.PX15 bit indicates a signal on a GPIO pin.
		0 Signal Low
		1 Signal High
14 (R/W)	PX14	Port x Bit 14 Data. The PORT_DATA.PX14 bit indicates a signal on a GPIO pin.
		0 Signal Low
		1 Signal High
13 (R/W)	PX13	Port x Bit 13 Data. The PORT_DATA.PX13 bit indicates a signal on a GPIO pin.
		0 Signal Low
		1 Signal High
12 (R/W)	PX12	Port x Bit 12 Data. The PORT_DATA.PX12 bit indicates a signal on a GPIO pin.
		0 Signal Low
		1 Signal High
11 (R/W)	PX11	Port x Bit 11 Data. The PORT_DATA.PX11 bit indicates a signal on a GPIO pin.
		0 Signal Low
		1 Signal High
10 (R/W)	PX10	Port x Bit 10 Data. The PORT_DATA.PX10 bit indicates a signal on a GPIO pin.
		0 Signal Low
		1 Signal High
9 (R/W)	PX9	Port x Bit 9 Data. The PORT_DATA.PX9 bit indicates a signal on a GPIO pin.
		0 Signal Low
		1 Signal High

Table 11-10: PORT_DATA Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
8 (R/W)	PX8	Port x Bit 8 Data. The PORT_DATA.PX8 bit indicates a signal on a GPIO pin.
		0 Signal Low
		1 Signal High
7 (R/W)	PX7	Port x Bit 7 Data. The PORT_DATA.PX7 bit indicates a signal on a GPIO pin.
		0 Signal Low
		1 Signal High
6 (R/W)	PX6	Port x Bit 6 Data. The PORT_DATA.PX6 bit indicates a signal on a GPIO pin.
		0 Signal Low
		1 Signal High
5 (R/W)	PX5	Port x Bit 5 Data. The PORT_DATA.PX5 bit indicates a signal on a GPIO pin.
		0 Signal Low
		1 Signal High
4 (R/W)	PX4	Port x Bit 4 Data. The PORT_DATA.PX4 bit indicates a signal on a GPIO pin.
		0 Signal Low
		1 Signal High
3 (R/W)	PX3	Port x Bit 3 Data. The PORT_DATA.PX3 bit indicates a signal on a GPIO pin.
		0 Signal Low
		1 Signal High
2 (R/W)	PX2	Port x Bit 2 Data. The PORT_DATA.PX2 bit indicates a signal on a GPIO pin.
		0 Signal Low
		1 Signal High

Table 11-10: PORT_DATA Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
1 (R/W)	PX1	Port x Bit 1 Data. The PORT_DATA.PX1 bit indicates a signal on a GPIO pin.
		0 Signal Low
		1 Signal High
0 (R/W)	PX0	Port x Bit 0 Data. The PORT_DATA.PX0 bit indicates a signal on a GPIO pin.
		0 Signal Low
		1 Signal High

Port x GPIO Data Clear Register

The `PORT_DATA_CLR` register operates differently for port bits/pins, depending on whether the bit/pin is output mode or input mode. For more information, see the `PORT_DATA` register description.

Figure 11-8: `PORT_DATA_CLR` Register Diagram

Table 11-11: `PORT_DATA_CLR` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15 (R/W1C)	PX15	Port x Bit 15 Data Clear. The <code>PORT_DATA_CLR</code> . PX15 bit clears the pin without impacting other pins of the port.
		0 No Effect
		1 Clear Bit. Write 1 for signal low in output mode.
14 (R/W1C)	PX14	Port x Bit 14 Data Clear. The <code>PORT_DATA_CLR</code> . PX14 bit clears the pin without impacting other pins of the port.
		0 No Effect. Write 0 has no effect in output mode.
		1 Clear Bit. Write 1 for signal low in output mode.

Table 11-11: PORT_DATA_CLR Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
13 (R/W1C)	PX13	Port x Bit 13 Data Clear. The PORT_DATA_CLR.PX13 bit clears the pin without impacting other pins of the port.
		0 No Effect. Write 0 has no effect in output mode.
		1 Clear Bit. Write 1 for signal low in output mode.
12 (R/W1C)	PX12	Port x Bit 12 Data Clear. The PORT_DATA_CLR.PX12 bit clears the pin without impacting other pins of the port.
		0 No Effect. Write 0 has no effect in output mode.
		1 Clear Bit. Write 1 for signal low in output mode.
11 (R/W1C)	PX11	Port x Bit 11 Data Clear. The PORT_DATA_CLR.PX11 bit clears the pin without impacting other pins of the port.
		0 No Effect
		1 Clear Bit. Write 1 for signal low in output mode.
10 (R/W1C)	PX10	Port x Bit 10 Data Clear. The PORT_DATA_CLR.PX10 bit clears the pin without impacting other pins of the port.
		0 No Effect. Write 0 has no effect in output mode.
		1 Clear Bit. Write 1 for signal low in output mode.
9 (R/W1C)	PX9	Port x Bit 9 Data Clear. The PORT_DATA_CLR.PX9 bit clears the pin without impacting other pins of the port.
		0 No Effect. Write 0 has no effect in output mode.
		1 Clear Bit. Write 1 for signal low in output mode.
8 (R/W1C)	PX8	Port x Bit 8 Data Clear. The PORT_DATA_CLR.PX8 bit clears the pin without impacting other pins of the port.
		0 No Effect. Write 0 has no effect in output mode.
		1 Clear Bit. Write 1 for signal low in output mode.

Table 11-11: PORT_DATA_CLR Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
7 (R/W1C)	PX7	Port x Bit 7 Data Clear. The PORT_DATA_CLR.PX7 bit clears the pin without impacting other pins of the port.
		0 No Effect. Write 0 has no effect in output mode.
		1 Clear Bit. Write 1 for signal low in output mode.
6 (R/W1C)	PX6	Port x Bit 6 Data Clear. The PORT_DATA_CLR.PX6 bit clears the pin without impacting other pins of the port.
		0 No Effect. Write 0 has no effect in output mode.
		1 Clear Bit. Write 1 for signal low in output mode.
5 (R/W1C)	PX5	Port x Bit 5 Data Clear. The PORT_DATA_CLR.PX5 bit clears the pin without impacting other pins of the port.
		0 No Effect. Write 0 has no effect in output mode.
		1 Clear Bit. Write 1 for signal low in output mode.
4 (R/W1C)	PX4	Port x Bit 4 Data Clear. The PORT_DATA_CLR.PX4 bit clears the pin without impacting other pins of the port.
		0 No Effect. Write 0 has no effect in output mode.
		1 Clear Bit. Write 1 for signal low in output mode.
3 (R/W1C)	PX3	Port x Bit 3 Data Clear. The PORT_DATA_CLR.PX3 bit clears the pin without impacting other pins of the port.
		0 No Effect. Write 0 has no effect in output mode.
		1 Clear Bit. Write 1 for signal low in output mode.
2 (R/W1C)	PX2	Port x Bit 2 Data Clear. The PORT_DATA_CLR.PX2 bit clears the pin without impacting other pins of the port.
		0 No Effect Write 0 has no effect in output mode.
		1 Clear Bit Write 1 for signal low in output mode.

Table 11-11: PORT_DATA_CLR Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration	
1 (R/W1C)	PX1	Port x Bit 1 Data Clear. The PORT_DATA_CLR.PX1 bit clears the pin without impacting other pins of the port.	
		0	No Effect. Write 0 has no effect in output mode.
		1	Clear Bit. Write 1 for signal low in output mode.
0 (R/W1C)	PX0	Port x Bit 0 Data Clear. The PORT_DATA_CLR.PX0 bit clears the pin without impacting other pins of the port.	
		0	No Effect. Write 0 has no effect in output mode.
		1	Clear Bit. Write 1 for signal low in output mode.

Port x GPIO Data Set Register

The `PORT_DATA_SET` register operates differently for port bits/pins, depending on whether the bit/pin is output mode or input mode. For more information, see the `PORT_DATA` register description.

Figure 11-9: PORT_DATA_SET Register Diagram

Table 11-12: PORT_DATA_SET Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration	
15 (R/W1S)	PX15	Port x Bit 15 Data Set.	
		0	No Effect. Write 0 has no effect in output mode.
		1	Set Bit. Write 1 for signal high in output mode.
14 (R/W1S)	PX14	Port x Bit 14 Data Set.	
		0	No Effect. Write 0 has no effect in output mode.
		1	Set Bit. Write 1 for signal high in output mode.
13 (R/W1S)	PX13	Port x Bit 13 Data Set.	
		0	No Effect. Write 0 has no effect in output mode.
		1	Set Bit. Write 1 for signal high in output mode.

Bit No. (Access)	Bit Name	Description/Enumeration	
12 (R/W1S)	PX12	Port x Bit 12 Data Set.	
		0	No Effect. Write 0 has no effect in output mode.
		1	Set Bit. Write 1 for signal high in output mode.
11 (R/W1S)	PX11	Port x Bit 11 Data Set.	
		0	No Effect. Write 0 has no effect in output mode.
		1	Set Bit.
10 (R/W1S)	PX10	Port x Bit 10 Data Set.	
		0	No Effect. Write 0 has no effect in output mode.
		1	Set Bit. Write 1 for signal high in output mode.
9 (R/W1S)	PX9	Port x Bit 9 Data Set.	
		0	No Effect. Write 0 has no effect in output mode.
		1	Set Bit. Write 1 for signal high in output mode.
8 (R/W1S)	PX8	Port x Bit 8 Data Set.	
		0	No Effect. Write 0 has no effect in output mode.
		1	Set Bit. Write 1 for signal high in output mode.
7 (R/W1S)	PX7	Port x Bit 7 Data Set.	
		0	No Effect. Write 0 has no effect in output mode.
		1	Set Bit. Write 1 for signal high in output mode.
6 (R/W1S)	PX6	Port x Bit 6 Data Set.	
		0	No Effect. Write 0 has no effect in output mode.
		1	Set Bit. Write 1 for signal high in output mode.
5 (R/W1S)	PX5	Port x Bit 5 Data Set.	
		0	No Effect. Write 0 has no effect in output mode.
		1	Set Bit. Write 1 for signal high in output mode.
4 (R/W1S)	PX4	Port x Bit 4 Data Set.	
		0	No Effect. Write 0 has no effect in output mode.
		1	Set Bit. Write 1 for signal high in output mode.
3 (R/W1S)	PX3	Port x Bit 3 Data Set.	
		0	No Effect. Write 0 has no effect in output mode.
		1	Set Bit. Write 1 for signal high in output mode.

Table 11-12: PORT_DATA_SET Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration	
2 (R/W1S)	PX2	Port x Bit 2 Data Set.	
		0	No Effect. Write 0 has no effect in output mode.
		1	Set Bit. Write 1 for signal high in output mode.
1 (R/W1S)	PX1	Port x Bit 1 Data Set.	
		0	No Effect. Write 0 has no effect in output mode.
		1	Set Bit. Write 1 for signal high in output mode.
0 (R/W1S)	PX0	Port x Bit 0 Data Set.	
		0	No Effect. Write 0 has no effect in output mode.
		1	Set Bit. Write 1 for signal high in output mode.

Port x GPIO Output Toggle Register

The `PORT_DATA_TGL` register permits toggling the state of output GPIO pins. Setting bits in the `PORT_DATA_TGL` register affects the state of specific pins without impacting other pins of the port.

Reading the `PORT_DATA_TGL` returns the state of the `PORT_DATA` register output pin state, but does not return the input pin/signal state.

Figure 11-10: `PORT_DATA_TGL` Register Diagram

Table 11-13: `PORT_DATA_TGL` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15 (R/W)	PX15	Port x Bit 15 Toggle. The <code>PORT_DATA_TGL</code> , PX15 bit toggles the output GPIO bit/pin state.
		0 No Effect
		1 Toggle Bit.
14 (R/W)	PX14	Port x Bit 14 Toggle. The <code>PORT_DATA_TGL</code> , PX14 bit toggles the output GPIO bit/pin state.
		0 No Effect

		0 No Effect
		1 Toggle Bit
12 (R/W)	PX12	Port x Bit 12 Toggle. The PORT_DATA_TGL.PX12 bit toggles the output GPIO bit/pin state.
		0 No Effect
		1 Toggle Bit
11 (R/W)	PX11	Port x Bit 11 Toggle. The PORT_DATA_TGL.PX11 bit toggles the output GPIO bit/pin state.
		0 No Effect
		1 Toggle Bit
10 (R/W)	PX10	Port x Bit 10 Toggle. The PORT_DATA_TGL.PX10 bit toggles the output GPIO bit/pin state.
		0 No Effect
		1 Toggle Bit
9 (R/W)	PX9	Port x Bit 9 Toggle. The PORT_DATA_TGL.PX9 bit toggles the output GPIO bit/pin state.
		0 No Effect
		1 Toggle Bit
8 (R/W)	PX8	Port x Bit 8 Toggle. The PORT_DATA_TGL.PX8 bit toggles the output GPIO bit/pin state.
		0 No Effect
		1 Toggle Bit
7 (R/W)	PX7	Port x Bit 7 Toggle. The PORT_DATA_TGL.PX7 bit toggles the output GPIO bit/pin state.
		0 No Effect
		1 Toggle Bit

Table 11-13: PORT_DATA_TGL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
6 (R/W)	PX6	Port x Bit 6 Toggle. The PORT_DATA_TGL.PX6 bit toggles the output GPIO bit/pin state.
		0 No Effect
		1 Toggle Bit
5 (R/W)	PX5	Port x Bit 5 Toggle. The PORT_DATA_TGL.PX5 bit toggles the output GPIO bit/pin state.
		0 No Effect
		1 Toggle Bit
4 (R/W)	PX4	Port x Bit 4 Toggle. The PORT_DATA_TGL.PX4 bit toggles the output GPIO bit/pin state.
		0 No Effect
		1 Toggle Bit
3 (R/W)	PX3	Port x Bit 3 Toggle. The PORT_DATA_TGL.PX3 bit toggles the output GPIO bit/pin state.
		0 No Effect
		1 Toggle Bit
2 (R/W)	PX2	Port x Bit 2 Toggle. The PORT_DATA_TGL.PX2 bit toggles the output GPIO bit/pin state.
		0 No Effect
		1 Toggle Bit
1 (R/W)	PX1	Port x Bit 1 Toggle. The PORT_DATA_TGL.PX1 bit toggles the output GPIO bit/pin state.
		0 No Effect
		1 Toggle Bit
0 (R/W)	PX0	Port x Bit 0 Toggle. The PORT_DATA_TGL.PX0 bit toggles the output GPIO bit/pin state.
		0 No Effect
		1 Toggle Bit

Port x GPIO Direction Register

The `PORT_DIR`, `PORT_DIR_SET`, and `PORT_DIR_CLR` registers select output or input mode for GPIO pins and enable output drivers. Use the `PORT_INEN`, `PORT_INEN_SET`, and `PORT_INEN_CLR` registers to enable or disable input drivers.

Writes to the `PORT_DIR` register affect the state of all pins of the port. To select a direction for specific pins without impacting other pins of the port, use the `PORT_DIR_SET` and `PORT_DIR_CLR` registers.

Setting a bit in the `PORT_DIR` register enables output mode on the corresponding a GPIO pin. Clearing a bit in the `PORT_DIR` register disables output mode on the corresponding GPIO pin.

Input Mode - The default mode of every GPIO pin after reset is the input mode, but the input drivers are not enabled. To enable GPIO input drivers, set the corresponding bits in the `PORT_INEN` register. When enabled, a read from the `PORT_DATA` register returns the logical state of the input pin. The input signal does not overwrite the state of the bit used for the output case. That state can only be altered by software. If the input driver is enabled, a write to the `PORT_DATA` register can alter the state of the bit, but the change cannot be read back.

Output Mode - Any GPIO pin can be configured for output mode. The GPIO output drivers are enabled by setting the corresponding bits in the `PORT_DIR`, `PORT_DIR_SET`, or `PORT_DIR_CLR` registers. By using the `PORT_DIR_SET` and `PORT_DIR_CLR` registers, the direction of the signal flow of individual GPIO pins can be altered by separate software threads without mutually impacting other GPIOs on the same port. Both registers return the same value when read. Because the state of the GPIO output can already be controlled before the output driver is enabled, it is recommended to first set or clear the bit (using the `PORT_DATA`, `PORT_DATA_SET`, or `PORT_DATA_CLR` registers) to avoid any volatile levels on the output.

Open-Drain Mode - Every GPIO can also be used in open-drain mode. To accomplish this, first, clear the respective bit in the `PORT_DATA` or `PORT_DATA_CLR` register. Then, set the one bit in the `PORT_INEN` register. Reads from the `PORT_DATA` register then return the status from the pin and do not return the state of the internal flip-flop. By toggling the output driver through the `PORT_DIR_SET` and `PORT_DIR_CLR` register pair, the output signal can be pulled low or three-stated as required. Note that the polarity of the driven signal can be inverted when the internal flip-flop is set instead. When a GPIO port is used in open-drain mode, take care to not exceed the V_{IH} operating condition associated with the respective pin.

Figure 11-11: PORT_DIR Register Diagram

Table 11-14: PORT_DIR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15 (R/W)	PX15	Port x Bit 15 Direction.
		0 Input mode. The output driver is disabled.
		1 Output mode. The output driver is enabled.
14 (R/W)	PX14	Port x Bit 14 Direction.
		0 Input mode. The output driver is disabled.
		1 Output mode. The output driver is enabled.
13 (R/W)	PX13	Port x Bit 13 Direction.
		0 Input mode. The output driver is disabled.
		1 Output mode. The output driver is enabled.
12 (R/W)	PX12	Port x Bit 12 Direction.
		0 Input mode. The output driver is disabled.
		1 Output mode. The output driver is enabled.

Table 11-16: `PORT_DIR_SET` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15 (R/W1S)	PX15	Port x Bit 15 Direction Set. The <code>PORT_DIR_SET</code> . PX15 bit enables the output mode/driver for port x.
		0 No Effect
		1 Enable output mode/driver
14 (R/W1S)	PX14	Port x Bit 14 Direction Set. The <code>PORT_DIR_SET</code> . PX14 bit enables the output mode/driver for port x.
		0 No Effect
		1 Enable output mode/driver

Table 11-16: PORT_DIR_SET Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration	
13 (R/W1S)	PX13	Port x Bit 13 Direction Set. The PORT_DIR_SET.PX13 bit enables the output mode/driver for port x.	
		0	No Effect
		1	Enable output mode/driver
12 (R/W1S)	PX12	Port x Bit 12 Direction Set. The PORT_DIR_SET.PX12 bit enables the output mode/driver for port x.	
		0	No Effect
		1	Enable output mode/driver
11 (R/W1S)	PX11	Port x Bit 11 Direction Set. The PORT_DIR_SET.PX11 bit enables the output mode/driver for port x.	
		0	No Effect
		1	Enable output mode/driver
10 (R/W1S)	PX10	Port x Bit 10 Direction Set. The PORT_DIR_SET.PX10 bit enables the output mode/driver for port x.	
		0	No Effect
		1	Enable output mode/driver
9 (R/W1S)	PX9	Port x Bit 9 Direction Set. The PORT_DIR_SET.PX9 bit enables the output mode/driver for port x.	
		0	No Effect
		1	Enable output mode/driver
8 (R/W1S)	PX8	Port x Bit 8 Direction Set. The PORT_DIR_SET.PX8 bit enables the output mode/driver for port x.	
		0	No Effect
		1	Enable output mode/driver
7 (R/W1S)	PX7	Port x Bit 7 Direction Set. The PORT_DIR_SET.PX7 bit enables the output mode/driver for port x.	
		0	No Effect
		1	Enable output mode/driver

Table 11-16: PORT_DIR_SET Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration	
6 (R/W1S)	PX6	Port x Bit 6 Direction Set. The PORT_DIR_SET . PX6 bit enables the output mode/driver for port x.	
		0	No Effect
		1	Enable output mode/driver
5 (R/W1S)	PX5	Port x Bit 5 Direction Set. The PORT_DIR_SET . PX5 bit enables the output mode/driver for port x.	
		0	No Effect
		1	Enable output mode/driver
4 (R/W1S)	PX4	Port x Bit 4 Direction Set. The PORT_DIR_SET . PX4 bit enables the output mode/driver for port x.	
		0	No Effect
		1	Enable output mode/driver
3 (R/W1S)	PX3	Port x Bit 3 Direction Set. The PORT_DIR_SET . PX3 bit enables the output mode/driver for port x.	
		0	No Effect
		1	Enable output mode/driver
2 (R/W1S)	PX2	Port x Bit 2 Direction Set. The PORT_DIR_SET . PX2 bit enables the output mode/driver for port x.	
		0	No Effect
		1	Enable output mode/driver
1 (R/W1S)	PX1	Port x Bit 1 Direction Set. The PORT_DIR_SET . PX1 bit enables the output mode/driver for port x.	
		0	No Effect
		1	Enable output mode/driver
0 (R/W1S)	PX0	Port x Bit 0 Direction Set. The PORT_DIR_SET . PX0 bit enables the output mode/driver for port x.	
		0	No Effect
		1	Enable output mode/driver

Port x Function Enable Register

The `PORT_FER` register bits indicate each port bit's operating mode: general purpose I/O mode or peripheral mode. After reset, all pins default to GPIO mode. Setting a bit in the `PORT_FER` registers enables a peripheral module to take ownership of the pin. The function enable bits impact output control only. Regardless of the setting of the function enable bits, both GPIO and peripherals can still sense the pin input. After a function is enabled, it is up to the `PORT_MUX` registers as to which peripheral takes control.

Figure 11-14: PORT_FER Register Diagram

Table 11-17: PORT_FER Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15 (R/W)	PX15	Port x Bit 15 Mode. The <code>PORT_FER.PX15</code> bit indicates the operating mode for port x.
		0 GPIO Mode
		1 Peripheral Mode
14 (R/W)	PX14	Port x Bit 14 Mode. The <code>PORT_FER.PX14</code> bit indicates the operating mode for port x.
		0 GPIO Mode
		1 Peripheral Mode

Table 11-17: PORT_FER Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
13 (R/W)	PX13	Port x Bit 13 Mode. The PORT_FER.PX13 bit indicates the operating mode for port x.
		0 GPIO Mode
		1 Peripheral Mode
12 (R/W)	PX12	Port x Bit 12 Mode. The PORT_FER.PX12 bit indicates the operating mode for port x.
		0 GPIO Mode
		1 Peripheral Mode
11 (R/W)	PX11	Port x Bit 11 Mode. The PORT_FER.PX11 bit indicates the operating mode for port x.
		0 GPIO Mode
		1 Peripheral Mode

3 (R/W)	PX3	Port x Bit 3 Mode. The PORT_FER.PX3 bit indicates the operating mode for port x.
		0 GPIO Mode
		1 Peripheral Mode
2 (R/W)	PX2	Port x Bit 2 Mode. The PORT_FER.PX2 bit indicates the operating mode for port x.
		0 GPIO Mode
		1 Peripheral Mode
1 (R/W)	PX1	Port x Bit 1 Mode. The PORT_FER.PX1 bit indicates the operating mode for port x.
		0 GPIO Mode
		1 Peripheral Mode
0 (R/W)	PX0	Port x Bit 0 Mode. The PORT_FER.PX0 bit indicates the operating mode for port x.
		0 GPIO Mode
		1 Peripheral Mode

Port x Function Enable Clear Register

The `PORT_FER_CLR` register permits enabling GPIO mode for each bit and corresponding GPIO pin. Writing 1 to a bit in `PORT_FER_CLR` enables GPIO mode for the corresponding pin.

Figure 11-15: `PORT_FER_CLR` Register Diagram

		0 No Effect
		1 Set Bit for Peripheral Mode

Port x GPIO Input Enable Register

The `PORT_INEN`, `PORT_INEN_SET`, and `PORT_INEN_CLR` registers enable or disable input drivers, which are required for using a GPIO pin in input mode.

Writes to the `PORT_INEN` register affect the input drivers for all pins of the port. To set or clear specific pin drivers without impacting other pin drivers of the port, use the `PORT_INEN_SET` and `PORT_INEN_CLR` registers.

If the input is enabled, reads from the `PORT_DATA`, `PORT_DATA_SET`, or `PORT_DATA_CLR` registers return the state of the pins. However, the state of the output is not overwritten by the input. It is altered by software writes only. Input and output drivers can be enabled at the same time. In this case, a read of the data register returns the true value of the data register and not the pin state.

For more information, see the `PORT_DATA` register description and the `PORT_DIR` register description.

		1	Set Bit. Set to enable the input driver.

Port x GPIO Lock Register

The `PORT_LOCK` register enables (unlocks) or disables (locks) write access selectively for the PORT control registers.

Figure 11-20: PORT_LOCK Register Diagram

Table 11-23: PORT_LOCK Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W)	LOCK	Lock. If the global lock bit is set (<code>SPU_CTL.GLCK</code> bit =1) and the <code>PORT_LOCK.LOCK</code> bit is set, the <code>PORT_LOCK</code> register is read only (locked).
		0 Unlock
		1 Lock
5 (R/W)	POLAR	Polarity Lock. The <code>PORT_LOCK.POLAR</code> disables write access to the <code>PORT_POL</code> , <code>PORT_POL_SET</code> , and <code>PORT_POL_CLR</code> registers.
		0 Unlock POL
		1 Lock POL
4 (R/W)	INEN	Input Enable Lock. The <code>PORT_LOCK.INEN</code> disables write access to the <code>PORT_INEN</code> , <code>PORT_INEN_SET</code> , and <code>PORT_INEN_CLR</code> registers.
		0 Unlock INEN
		1 Lock INEN

Table 11-23: PORT_LOCK Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
3 (R/W)	DIR	Direction Lock. The PORT_LOCK.DIR disables write access to the PORT_DIR, PORT_DIR_SET, PORT_DIR_CLR registers.
		0 Unlock DIR
		1 Lock DIR
2 (R/W)	DATA	Data, TGL Lock. The PORT_LOCK.DATA disables write access to the PORT_DATA, PORT_DATA_SET, PORT_DATA_CLR, and PORT_DATA_TGL registers.
		0 Unlock DATA
		1 Lock DATA
1 (R/W)	MUX	Function Multiplexer Lock. The PORT_LOCK.MUX disables write accesses to the PORT_MUX register.
		0 Unlock MUX
		1 Lock MUX
0 (R/W)	FER	Function Enable Lock. The PORT_LOCK.FER disables write access to the PORT_FER, PORT_FER_SET, and PORT_FER_CLR registers.
		0 Unlock FER
		1 Lock FER

Port x Multiplexer Control Register

When a pin is in peripheral mode (not GPIO mode), the `PORT_MUX` register controls which peripheral takes ownership of a pin. Ports may have multiple, different peripheral functions. Two bits are required to describe every multiplexer on an individual pin-by-pin scheme. For example, bit 0 and bit 1 of the `PORT_MUX` register control the multiplexer of pin 0, bit 2 and bit 3 of `PORT_MUX` control the multiplexer of pin 1, and so on. The value of any `PORT_MUX` bit has no effect on the port pins when the associated bit in the `PORT_FER` register is 0 (selects GPIO mode). Even if a port has only one function, the `PORT_MUX` register is still present. For single function ports (no multiplexing is needed), leave the `PORT_MUX` bits at 0 (default). For all `PORT_MUX` bit fields: 00 = default/reset peripheral option, 01 = first alternate peripheral option, 10 = second alternate peripheral option, and 11 = third alternate peripheral option.

See the processor data sheet for details regarding the peripheral options associated with each port.

Figure 11-21: `PORT_MUX` Register Diagram

Table 11-24: `PORT_MUX` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:30 (R/W)	MUX15	Mux for Port x Bit 15. The <code>PORT_MUX.MUX15</code> bit provides multiplexer control for port x bit 15.

Table 11-24: PORT_MUX Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
29:28 (R/W)	MUX14	Mux for Port x Bit 14. The PORT_MUX.MUX14 bit provides multiplexer control for port x bit 14.
27:26 (R/W)	MUX13	Mux for Port x Bit 13. The PORT_MUX.MUX13 bit provides multiplexer control for port x bit 13.
25:24 (R/W)	MUX12	Mux for Port x Bit 12. The PORT_MUX.MUX12 bit provides multiplexer control for port x bit 12.
23:22 (R/W)	MUX11	Mux for Port x Bit 11. The PORT_MUX.MUX11 bit provides multiplexer control for port x bit 11.
21:20 (R/W)	MUX10	Mux for Port x Bit 10. The PORT_MUX.MUX10 bit provides multiplexer control for port x bit 10.
19:18 (R/W)	MUX9	Mux for Port x Bit 9. The PORT_MUX.MUX9 bit provides multiplexer control for port x bit 9.
17:16 (R/W)	MUX8	Mux for Port x Bit 8. The PORT_MUX.MUX8 bit provides multiplexer control for port x bit 8.
15:14 (R/W)	MUX7	Mux for Port x Bit 7. The PORT_MUX.MUX7 bit provides multiplexer control for port x bit 7.
13:12 (R/W)	MUX6	Mux for Port x Bit 6. The PORT_MUX.MUX6 bit provides multiplexer control for port x bit 6.
11:10 (R/W)	MUX5	Mux for Port x Bit 5. The PORT_MUX.MUX5 bit provides multiplexer control for port x bit 5.
9:8 (R/W)	MUX4	Mux for Port x Bit 4. The PORT_MUX.MUX4 bit provides multiplexer control for port x bit 4.
7:6 (R/W)	MUX3	Mux for Port x Bit 3. The PORT_MUX.MUX3 bit provides multiplexer control for port x bit 3.
5:4 (R/W)	MUX2	Mux for Port x Bit 2. The PORT_MUX.MUX2 bit provides multiplexer control for port x bit 2.
3:2 (R/W)	MUX1	Mux for Port x Bit 1. The PORT_MUX.MUX1 bit provides multiplexer control for port x bit 1.
1:0 (R/W)	MUX0	Mux for Port x Bit 0. The PORT_MUX.MUX0 bit provides multiplexer control for port x bit 0.

Port x GPIO Polarity Invert Register

The `PORT_POL`, `PORT_POL_SET`, and `PORT_POL_CLR` registers enable or disable inverting polarity of GPIO signals. To invert polarity of peripheral signals, use the inversion selection programming in the signal's corresponding module.

Writes to the `PORT_POL` register affect the polarity inversion selection of all pins of the port. To enable or disable polarity inversion for specific pins without impacting other pins of the port, use the `PORT_POL_SET` and `PORT_POL_CLR` registers.

Setting a bit in the `PORT_POL` register enables polarity inversion on the corresponding inversion GPIO pin, making the pin active-low or falling-edge sensitive. Clearing a bit in the `PORT_POL` register disables polarity (default state) on the corresponding GPIO pin, making it active-high or rising-edge sensitive.

Figure 11-22: `PORT_POL` Register Diagram

Table 11-25: `PORT_POL` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15 (R/W)	PX15	Port x Bit 15 Polarity Invert. The <code>PORT_POL.PX15</code> bit enables polarity inversion.
		0 No Invert. GPIO is active high or rising edge sensitive.
		1 Invert. GPIO is active low or falling edge sensitive.

Table 11-25: PORT_POL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
14 (R/W)	PX14	Port x Bit 14 Polarity Invert. The PORT_POL.PX14 bit enables polarity inversion.
		0 No Invert. GPIO is active high or rising edge sensitive.
		1 Invert. GPIO is active low or falling edge sensitive.
13 (R/W)	PX13	Port x Bit 13 Polarity Invert. The PORT_POL.PX13 bit enables polarity inversion.
		0 No Invert. GPIO is active high or rising edge sensitive.
		1 Invert. GPIO is active low or falling edge sensitive.
12 (R/W)	PX12	Port x Bit 12 Polarity Invert. The PORT_POL.PX12 bit enables polarity inversion.
		0 No Invert. GPIO is active high or rising edge sensitive.
		1 Invert. GPIO is active low or falling edge sensitive.
11 (R/W)	PX11	Port x Bit 11 Polarity Invert. The PORT_POL.PX11 bit enables polarity inversion.
		0 No Invert. GPIO is active high or rising edge sensitive.
		1 Invert. GPIO is active low or falling edge sensitive.
10 (R/W)	PX10	Port x Bit 10 Polarity Invert. The PORT_POL.PX10 bit enables polarity inversion.
		0 No Invert. GPIO is active high or rising edge sensitive.
		1 Invert. GPIO is active low or falling edge sensitive.
9 (R/W)	PX9	Port x Bit 9 Polarity Invert. The PORT_POL.PX9 bit enables polarity inversion.
		0 No Invert. GPIO is active high or rising edge sensitive.
		1 Invert. GPIO is active low or falling edge sensitive.
8 (R/W)	PX8	Port x Bit 8 Polarity Invert. The PORT_POL.PX8 bit enables polarity inversion.
		0 No Invert. GPIO is active high or rising edge sensitive.
		1 Invert. GPIO is active low or falling edge sensitive.

Table 11-25: PORT_POL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration	
7 (R/W)	PX7	Port x Bit 7 Polarity Invert. The PORT_POL.PX7 bit enables polarity inversion.	
		0	No Invert. GPIO is active high or rising edge sensitive.
		1	Invert. GPIO is active low or falling edge sensitive.
6 (R/W)	PX6	Port x Bit 6 Polarity Invert. The PORT_POL.PX6 bit enables polarity inversion.	
		0	No Invert. GPIO is active high or rising edge sensitive.
		1	Invert. GPIO is active low or falling edge sensitive.
5 (R/W)	PX5	Port x Bit 5 Polarity Invert. The PORT_POL.PX5 bit enables polarity inversion.	
		0	No Invert. GPIO is active high or rising edge sensitive.
		1	Invert. GPIO is active low or falling edge sensitive.
4 (R/W)	PX4	Port x Bit 4 Polarity Invert. The PORT_POL.PX4 bit enables polarity inversion.	
		0	No Invert. GPIO is active high or rising edge sensitive.
		1	Invert. GPIO is active low or falling edge sensitive.
3 (R/W)	PX3	Port x Bit 3 Polarity Invert. The PORT_POL.PX3 bit enables polarity inversion.	
		0	No Invert. GPIO is active high or rising edge sensitive.
		1	Invert. GPIO is active low or falling edge sensitive.
2 (R/W)	PX2	Port x Bit 2 Polarity Invert. The PORT_POL.PX2 bit enables polarity inversion.	
		0	No Invert. GPIO is active high or rising edge sensitive.
		1	Invert. GPIO is active low or falling edge sensitive.
1 (R/W)	PX1	Port x Bit 1 Polarity Invert. The PORT_POL.PX1 bit enables polarity inversion.	
		0	No Invert. GPIO is active high or rising edge sensitive.
		1	Invert. GPIO is active low or falling edge sensitive.

Table 11-25: PORT_POL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
0 (R/W)	PX0	Port x Bit 0 Polarity Invert. The PORT_POL.PX0 bit enables polarity inversion.
		0 No Invert. GPIO is active high or rising edge sensitive.
		1 Invert. GPIO is active low or falling edge sensitive.

Port x GPIO Polarity Invert Clear Register

The `PORT_POL_CLR` register disables polarity inversion for GPIO pins. For more information, see the `PORT_POL` register description.

Figure 11-23: `PORT_POL_CLR` Register Diagram

Table 11-26: `PORT_POL_CLR` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15 (R/W1C)	PX15	Port x Bit 15 Polarity Invert Clear.
		0 No Effect
		1 Clear Bit. Set to disable GPIO pin polarity invert.
14 (R/W1C)	PX14	Port x Bit 14 Polarity Invert Clear.
		0 No Effect
		1 Clear Bit. Set to disable GPIO pin polarity invert.
13 (R/W1C)	PX13	Port x Bit 13 Polarity Invert Clear.
		0 No Effect
		1 Clear Bit. Set to disable GPIO pin polarity invert.

Table 11-26: PORT_POL_CLR Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration	
12 (R/W1C)	PX12	Port x Bit 12 Polarity Invert Clear.	
		0	No Effect
		1	Clear Bit. Set to disable GPIO pin polarity invert.
11 (R/W1C)	PX11	Port x Bit 11 Polarity Invert Clear.	
		0	No Effect
		1	Clear Bit. Set to disable GPIO pin polarity invert.
10 (R/W1C)	PX10	Port x Bit 10 Polarity Invert Clear.	
		0	No Effect
		1	Clear Bit. Set to disable GPIO pin polarity invert.
9 (R/W1C)	PX9	Port x Bit 9 Polarity Invert Clear.	
		0	No Effect
		1	Clear Bit. Set to disable GPIO pin polarity invert.
8 (R/W1C)	PX8	Port x Bit 8 Polarity Invert Clear.	
		0	No Effect
		1	Clear Bit. Set to disable GPIO pin polarity invert.
7 (R/W1C)	PX7	Port x Bit 7 Polarity Invert Clear.	
		0	No Effect
		1	Clear Bit. Set to disable GPIO pin polarity invert.
6 (R/W1C)	PX6	Port x Bit 6 Polarity Invert Clear.	
		0	No Effect
		1	Clear Bit. Set to disable GPIO pin polarity invert.
5 (R/W1C)	PX5	Port x Bit 5 Polarity Invert Clear.	
		0	No Effect
		1	Clear Bit. Set to disable GPIO pin polarity invert.
4 (R/W1C)	PX4	Port x Bit 4 Polarity Invert Clear.	
		0	No Effect
		1	Clear Bit. Set to disable GPIO pin polarity invert.
3 (R/W1C)	PX3	Port x Bit 3 Polarity Invert Clear.	
		0	No Effect
		1	Clear Bit. Set to disable GPIO pin polarity invert.

Table 11-26: PORT_POL_CLR Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration	
2 (R/W1C)	PX2	Port x Bit 2 Polarity Invert Clear.	
		0	No Effect
		1	Clear Bit. Set to disable GPIO pin polarity invert.
1 (R/W1C)	PX1	Port x Bit 1 Polarity Invert Clear.	
		0	No Effect
		1	Clear Bit. Set to disable GPIO pin polarity invert.
0 (R/W1C)	PX0	Port x Bit 0 Polarity Invert Clear.	
		0	No Effect
		1	Clear Bit. Set to disable GPIO pin polarity invert.

Port x GPIO Polarity Invert Set Register

The `PORT_POL_SET` register enables polarity inversion for GPIO pins. For more information, see the `PORT_POL` register description.

Figure 11-24: `PORT_POL_SET` Register Diagram

Table 11-27: `PORT_POL_SET` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15 (R/W1S)	PX15	Port x Bit 15 Polarity Invert Set. The <code>PORT_POL_SET</code> . <code>PX15</code> bit enables pin polarity inversion.
		0 No Effect
		1 Set Bit. Set to enable GPIO pin polarity invert.
14 (R/W1S)	PX14	Port x Bit 14 Polarity Invert Set. The <code>PORT_POL_SET</code> . <code>PX14</code> bit enables pin polarity inversion.
		0 No Effect
		1 Set Bit. Set to enable GPIO pin polarity invert.

Table 11-27: PORT_POL_SET Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
13 (R/W1S)	PX13	Port x Bit 13 Polarity Invert Set. The PORT_POL_SET . PX13 bit enables pin polarity inversion.
		0 No Effect
		1 Set Bit. Set to enable GPIO pin polarity invert.
12 (R/W1S)	PX12	Port x Bit 12 Polarity Invert Set. The PORT_POL_SET . PX12 bit enables pin polarity inversion.
		0 No Effect
		1 Set Bit. Set to enable GPIO pin polarity invert.
11 (R/W1S)	PX11	Port x Bit 11 Polarity Invert Set. The PORT_POL_SET . PX11 bit enables pin polarity inversion.
		0 No Effect
		1 Set Bit. Set to enable GPIO pin polarity invert.
10 (R/W1S)	PX10	Port x Bit 10 Polarity Invert Set. The PORT_POL_SET . PX10 bit enables pin polarity inversion.
		0 No Effect
		1 Set Bit. Set to enable GPIO pin polarity invert.
9 (R/W1S)	PX9	Port x Bit 9 Polarity Invert Set. The PORT_POL_SET . PX9 bit enables pin polarity inversion.
		0 No Effect
		1 Set Bit. Set to enable GPIO pin polarity invert.
8 (R/W1S)	PX8	Port x Bit 8 Polarity Invert Set. The PORT_POL_SET . PX8 bit enables pin polarity inversion.
		0 No Effect
		1 Set Bit. Set to enable GPIO pin polarity invert.
7 (R/W1S)	PX7	Port x Bit 7 Polarity Invert Set. The PORT_POL_SET . PX7 bit enables pin polarity inversion.
		0 No Effect
		1 Set Bit. Set to enable GPIO pin polarity invert.

Table 11-27: PORT_POL_SET Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
6 (R/W1S)	PX6	Port x Bit 6 Polarity Invert Set. The PORT_POL_SET . PX6 bit enables pin polarity inversion.
		0 No Effect
		1 Set Bit. Set to enable GPIO pin polarity invert.
5 (R/W1S)	PX5	Port x Bit 5 Polarity Invert Set. The PORT_POL_SET . PX5 bit enables pin polarity inversion.
		0 No Effect
		1 Set Bit. Set to enable GPIO pin polarity invert.
4 (R/W1S)	PX4	Port x Bit 4 Polarity Invert Set. The PORT_POL_SET . PX4 bit enables pin polarity inversion.
		0 No Effect
		1 Set Bit. Set to enable GPIO pin polarity invert.
3 (R/W1S)	PX3	Port x Bit 3 Polarity Invert Set. The PORT_POL_SET . PX3 bit enables pin polarity inversion.
		0 No Effect
		1 Set Bit. Set to enable GPIO pin polarity invert.
2 (R/W1S)	PX2	Port x Bit 2 Polarity Invert Set. The PORT_POL_SET . PX2 bit enables pin polarity inversion.
		0 No Effect
		1 Set Bit. Set to enable GPIO pin polarity invert.
1 (R/W1S)	PX1	Port x Bit 1 Polarity Invert Set. The PORT_POL_SET . PX1 bit enables pin polarity inversion.
		0 No Effect
		1 Set Bit. Set to enable GPIO pin polarity invert.
0 (R/W1S)	PX0	Port x Bit 0 Polarity Invert Set. The PORT_POL_SET . PX0 bit enables pin polarity inversion.
		0 No Effect
		1 Set Bit. Set to enable GPIO pin polarity invert.

Port x GPIO Trigger Toggle Register

The `PORT_TRIG_TGL` register permits toggling the state of output GPIO pins in response to a trigger from the TRU for the corresponding port. Setting bits in the `PORT_TRIG_TGL` register enables triggers to toggle the state of those specific pins without impacting other pins of the port.

Figure 11-25: PORT_TRIG_TGL Register Diagram

Table 11-28: PORT_TRIG_TGL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15 (R/W)	PX15	PX15 Data Toggle on Trigger. The <code>PORT_TRIG_TGL</code> . PX15 bit enables triggers to toggle the state of the pin.
14 (R/W)	PX14	PX14 Data Toggle on Trigger. The <code>PORT_TRIG_TGL</code> . PX14 bit enables triggers to toggle the state of the pin.
13 (R/W)	PX13	PX13 Data Toggle on Trigger. The <code>PORT_TRIG_TGL</code> . PX13 bit enables triggers to toggle the state of the pin.
12 (R/W)	PX12	PX12 Data Toggle on Trigger. The <code>PORT_TRIG_TGL</code> . PX12 bit enables triggers to toggle the state of the pin.
11 (R/W)	PX11	PX11 Data Toggle on Trigger. The <code>PORT_TRIG_TGL</code> . PX11 bit enables triggers to toggle the state of the pin.

Table 11-28: PORT_TRIG_TGL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
10 (R/W)	PX10	PX10 Data Toggle on Trigger. The PORT_TRIG_TGL.PX10 bit enables triggers to toggle the state of the pin.
9 (R/W)	PX9	PX9 Data Toggle on Trigger. The PORT_TRIG_TGL.PX9 bit enables triggers to toggle the state of the pin.
8 (R/W)	PX8	PX8 Data Toggle on Trigger. The PORT_TRIG_TGL.PX8 bit enables triggers to toggle the state of the pin.
7 (R/W)	PX7	PX7 Data Toggle on Trigger. The PORT_TRIG_TGL.PX7 bit enables triggers to toggle the state of the pin.
6 (R/W)	PX6	PX6 Data Toggle on Trigger. The PORT_TRIG_TGL.PX6 bit enables triggers to toggle the state of the pin.
5 (R/W)	PX5	PX5 Data Toggle on Trigger. The PORT_TRIG_TGL.PX5 bit enables triggers to toggle the state of the pin.
4 (R/W)	PX4	PX4 Data Toggle on Trigger. The PORT_TRIG_TGL.PX4 bit enables triggers to toggle the state of the pin.
3 (R/W)	PX3	PX3 Data Toggle on Trigger. The PORT_TRIG_TGL.PX3 bit enables triggers to toggle the state of the pin.
2 (R/W)	PX2	PX2 Data Toggle on Trigger. The PORT_TRIG_TGL.PX2 bit enables triggers to toggle the state of the pin.
1 (R/W)	PX1	PX1 Data Toggle on Trigger. The PORT_TRIG_TGL.PX1 bit enables triggers to toggle the state of the pin.
0 (R/W)	PX0	PX0 Data Toggle on Trigger. The PORT_TRIG_TGL.PX0 bit enables triggers to toggle the state of the pin.

ADSP-2159x PINT Register Descriptions

The Pin Interrupt module (PINT) contains the following registers.

Table 11-29: ADSP-2159x PINT Register List

Name	Description
PINT_ASSIGN	PINT Assign Register
PINT_EDGE_CLR	PINT Edge Clear Register
PINT_EDGE_SET	PINT Edge Set Register
PINT_INV_CLR	PINT Invert Clear Register

Table 11-29: ADSP-2159x PINT Register List (Continued)

Name	Description
PINT_INV_SET	PINT Invert Set Register
PINT_LATCH	PINT Latch Register
PINT_MSK_CLR	PINT Mask Clear Register
PINT_MSK_SET	PINT Mask Set Register
PINT_PINSTATE	PINT Pin State Register
PINT_REQ	PINT Request Register

PINT Assign Register

The `PINT_ASSIGN` register controls the pin-to-interrupt request assignment in a byte-wide manner. This register consists of four control bytes that each function as a multiplexer control.

The PINT ports are subdivided into 8-bit half ports, resulting in lower and upper half 8-bit units. Using the multiplexers controlled by the `PINT_ASSIGN` register, the lower half units of eight pins can be forwarded to either byte 0 or byte 2 of either associated PINT block. The upper half units can be forwarded to either byte 1 or byte 3 of the PINT block, without further restrictions.

Figure 11-26: PINT_ASSIGN Register Diagram

Table 11-30: PINT_ASSIGN Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:25 (R/NW)	B3MSB0	Bits [7:1] of B3MAP.
24 (R/W)	B3MAP	Byte 3 Mapping.
		0 B3MAP_PAH. Byte 3 = PA.H
		1 B3MAP_PBH. Byte 3 = PB.H
23:17 (R/NW)	B2MSB0	Bits [7:1] of B2MAP.
16 (R/W)	B2MAP	Byte 2 Mapping.
		0 B2MAP_PAL. Byte 2 = PA.L
		1 B2MAP_PBL. Byte 2 = PB.L
15:9 (R/NW)	B1MSB0	Bits [7:1] of B1MAP.

Table 11-30: PINT_ASSIGN Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration	
8 (R/W)	B1MAP	Byte 1 Mapping.	
		0	B1MAP_PAH. Byte 1 = PA.H
		1	B1MAP_PBH. Byte 1 = PB.H
7:1 (R/NW)	B0MSB0	Bits [7:1] of B0MAP.	
0 (R/W)	B0MAP	Byte 0 Mapping.	
		0	B0MAP_PAL. Byte 0 = PA.L
		1	B0MAP_PBL. Byte 0 = PB.L

PINT Edge Clear Register

The `PINT_EDGE_CLR` register permits selecting level-sensitive interrupts. Writing 1 to a bit in `PINT_EDGE_CLR` enables level sensitivity for the corresponding pin interrupt.

Figure 11-27: `PINT_EDGE_CLR` Register Diagram

Table 11-31: PINT_EDGE_CLR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W1C)	PIQ31	Pin Interrupt 31 Level. Set the PINT_EDGE_CLR.PIQ31 bit to enable level sensitivity.
30 (R/W1C)	PIQ30	Pin Interrupt 30 Level. Set the PINT_EDGE_CLR.PIQ30 bit to enable level sensitivity.
29 (R/W1C)	PIQ29	Pin Interrupt 29 Level. Set the PINT_EDGE_CLR.PIQ29 bit to enable level sensitivity.
28 (R/W1C)	PIQ28	Pin Interrupt 28 Level. Set the PINT_EDGE_CLR.PIQ28 bit to enable level sensitivity.
27 (R/W1C)	PIQ27	Pin Interrupt 27 Level. Set the PINT_EDGE_CLR.PIQ27 bit to enable level sensitivity.
26 (R/W1C)	PIQ26	Pin Interrupt 26 Level. Set the PINT_EDGE_CLR.PIQ26 bit to enable level sensitivity.
25 (R/W1C)	PIQ25	Pin Interrupt 25 Level. Set the PINT_EDGE_CLR.PIQ25 bit to enable level sensitivity.
24 (R/W1C)	PIQ24	Pin Interrupt 24 Level. Set the PINT_EDGE_CLR.PIQ24 bit to enable level sensitivity.
23 (R/W1C)	PIQ23	Pin Interrupt 23 Level. Set the PINT_EDGE_CLR.PIQ23 bit to enable level sensitivity.
22 (R/W1C)	PIQ22	Pin Interrupt 22 Level. Set the PINT_EDGE_CLR.PIQ22 bit to enable level sensitivity.
21 (R/W1C)	PIQ21	Pin Interrupt 21 Level. Set the PINT_EDGE_CLR.PIQ21 bit to enable level sensitivity.
20 (R/W1C)	PIQ20	Pin Interrupt 20 Level. Set the PINT_EDGE_CLR.PIQ20 bit to enable level sensitivity.
19 (R/W1C)	PIQ19	Pin Interrupt 19 Level. Set the PINT_EDGE_CLR.PIQ19 bit to enable level sensitivity.
18 (R/W1C)	PIQ18	Pin Interrupt 18 Level. Set the PINT_EDGE_CLR.PIQ18 bit to enable level sensitivity.
17 (R/W1C)	PIQ17	Pin Interrupt 17 Level. Set the PINT_EDGE_CLR.PIQ17 bit to enable level sensitivity.
16 (R/W1C)	PIQ16	Pin Interrupt 16 Level. Set the PINT_EDGE_CLR.PIQ16 bit to enable level sensitivity.

Table 11-31: PINT_EDGE_CLR Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
15 (R/W1C)	PIQ15	Pin Interrupt 15 Level. Set the PINT_EDGE_CLR.PIQ15 bit to enable level sensitivity.
14 (R/W1C)	PIQ14	Pin Interrupt 14 Level. Set the PINT_EDGE_CLR.PIQ14 bit to enable level sensitivity.
13 (R/W1C)	PIQ13	Pin Interrupt 13 Level. Set the PINT_EDGE_CLR.PIQ13 bit to enable level sensitivity.
12 (R/W1C)	PIQ12	Pin Interrupt 12 Level. Set the PINT_EDGE_CLR.PIQ12 bit to enable level sensitivity.
11 (R/W1C)	PIQ11	Pin Interrupt 11 Level. Set the PINT_EDGE_CLR.PIQ11 bit to enable level sensitivity.
10 (R/W1C)	PIQ10	Pin Interrupt 10 Level. Set the PINT_EDGE_CLR.PIQ10 bit to enable level sensitivity.
9 (R/W1C)	PIQ9	Pin Interrupt 9 Level. Set the PINT_EDGE_CLR.PIQ9 bit to enable level sensitivity.
8 (R/W1C)	PIQ8	Pin Interrupt 8 Level. Set the PINT_EDGE_CLR.PIQ8 bit to enable level sensitivity.
7 (R/W1C)	PIQ7	Pin Interrupt 7 Level. Set the PINT_EDGE_CLR.PIQ7 bit to enable level sensitivity.
6 (R/W1C)	PIQ6	Pin Interrupt 6 Level. Set the PINT_EDGE_CLR.PIQ6 bit to enable level sensitivity.
5 (R/W1C)	PIQ5	Pin Interrupt 5 Level. Set the PINT_EDGE_CLR.PIQ5 bit to enable level sensitivity.
4 (R/W1C)	PIQ4	Pin Interrupt 4 Level. Set the PINT_EDGE_CLR.PIQ4 bit to enable level sensitivity.
3 (R/W1C)	PIQ3	Pin Interrupt 3 Level. Set the PINT_EDGE_CLR.PIQ3 bit to enable level sensitivity.
2 (R/W1C)	PIQ2	Pin Interrupt 2 Level. Set the PINT_EDGE_CLR.PIQ2 bit to enable level sensitivity.
1 (R/W1C)	PIQ1	Pin Interrupt 1 Level. Set the PINT_EDGE_CLR.PIQ1 bit to enable level sensitivity.
0 (R/W1C)	PIQ0	Pin Interrupt 0 Level. Set the PINT_EDGE_CLR.PIQ0 bit to enable level sensitivity.

PINT Edge Set Register

The `PINT_EDGE_SET` register permits selecting edge-sensitive interrupts. Writing 1 to a bit in `PINT_EDGE_SET` enables edge sensitivity for the corresponding pin interrupt.

Figure 11-28: `PINT_EDGE_SET` Register Diagram

Table 11-32: PINT_EDGE_SET Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W1S)	PIQ31	Pin Interrupt 31 Edge. Set the PINT_EDGE_SET.PIQ31 bit to enable edge sensitivity.
30 (R/W1S)	PIQ30	Pin Interrupt 30 Edge. Set the PINT_EDGE_SET.PIQ30 bit to enable edge sensitivity.
29 (R/W1S)	PIQ29	Pin Interrupt 29 Edge. Set the PINT_EDGE_SET.PIQ29 bit to enable edge sensitivity.
28 (R/W1S)	PIQ28	Pin Interrupt 28 Edge. Set the PINT_EDGE_SET.PIQ28 bit to enable edge sensitivity.
27 (R/W1S)	PIQ27	Pin Interrupt 27 Edge. Set the PINT_EDGE_SET.PIQ27 bit to enable edge sensitivity.
26 (R/W1S)	PIQ26	Pin Interrupt 26 Edge. Set the PINT_EDGE_SET.PIQ26 bit to enable edge sensitivity.
25 (R/W1S)	PIQ25	Pin Interrupt 25 Edge. Set the PINT_EDGE_SET.PIQ25 bit to enable edge sensitivity.
24 (R/W1S)	PIQ24	Pin Interrupt 24 Edge. Set the PINT_EDGE_SET.PIQ24 bit to enable edge sensitivity.
23 (R/W1S)	PIQ23	Pin Interrupt 23 Edge. Set the PINT_EDGE_SET.PIQ23 bit to enable edge sensitivity.
22 (R/W1S)	PIQ22	Pin Interrupt 22 Edge. Set the PINT_EDGE_SET.PIQ22 bit to enable edge sensitivity.
21 (R/W1S)	PIQ21	Pin Interrupt 21 Edge. Set the PINT_EDGE_SET.PIQ21 bit to enable edge sensitivity.
20 (R/W1S)	PIQ20	Pin Interrupt 20 Edge. Set the PINT_EDGE_SET.PIQ20 bit to enable edge sensitivity.
19 (R/W1S)	PIQ19	Pin Interrupt 19 Edge. Set the PINT_EDGE_SET.PIQ19 bit to enable edge sensitivity.
18 (R/W1S)	PIQ18	Pin Interrupt 18 Edge. Set the PINT_EDGE_SET.PIQ18 bit to enable edge sensitivity.
17 (R/W1S)	PIQ17	Pin Interrupt 17 Edge. Set the PINT_EDGE_SET.PIQ17 bit to enable edge sensitivity.
16 (R/W1S)	PIQ16	Pin Interrupt 16 Edge. Set the PINT_EDGE_SET.PIQ16 bit to enable edge sensitivity.

Table 11-32: PINT_EDGE_SET Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
15 (R/W1S)	PIQ15	Pin Interrupt 15 Edge. Set the PINT_EDGE_SET.PIQ15 bit to enable edge sensitivity.
14 (R/W1S)	PIQ14	Pin Interrupt 14 Edge. Set the PINT_EDGE_SET.PIQ14 bit to enable edge sensitivity.
13 (R/W1S)	PIQ13	Pin Interrupt 13 Edge. Set the PINT_EDGE_SET.PIQ13 bit to enable edge sensitivity.
12 (R/W1S)	PIQ12	Pin Interrupt 12 Edge. Set the PINT_EDGE_SET.PIQ12 bit to enable edge sensitivity.
11 (R/W1S)	PIQ11	Pin Interrupt 11 Edge. Set the PINT_EDGE_SET.PIQ11 bit to enable edge sensitivity.
10 (R/W1S)	PIQ10	Pin Interrupt 10 Edge. Set the PINT_EDGE_SET.PIQ10 bit to enable edge sensitivity.
9 (R/W1S)	PIQ9	Pin Interrupt 9 Edge. Set the PINT_EDGE_SET.PIQ9 bit to enable edge sensitivity.
8 (R/W1S)	PIQ8	Pin Interrupt 8 Edge. Set the PINT_EDGE_SET.PIQ8 bit to enable edge sensitivity.
7 (R/W1S)	PIQ7	Pin Interrupt 7 Edge. Set the PINT_EDGE_SET.PIQ7 bit to enable edge sensitivity.
6 (R/W1S)	PIQ6	Pin Interrupt 6 Edge. Set the PINT_EDGE_SET.PIQ6 bit to enable edge sensitivity.
5 (R/W1S)	PIQ5	Pin Interrupt 5 Edge. Set the PINT_EDGE_SET.PIQ5 bit to enable edge sensitivity.
4 (R/W1S)	PIQ4	Pin Interrupt 4 Edge. Set the PINT_EDGE_SET.PIQ4 bit to enable edge sensitivity.
3 (R/W1S)	PIQ3	Pin Interrupt 3 Edge. Set the PINT_EDGE_SET.PIQ3 bit to enable edge sensitivity.
2 (R/W1S)	PIQ2	Pin Interrupt 2 Edge. Set the PINT_EDGE_SET.PIQ2 bit to enable edge sensitivity.
1 (R/W1S)	PIQ1	Pin Interrupt 1 Edge. Set the PINT_EDGE_SET.PIQ1 bit to enable edge sensitivity.
0 (R/W1S)	PIQ0	Pin Interrupt 0 Edge. Set the PINT_EDGE_SET.PIQ0 bit to enable edge sensitivity.

PINT Invert Clear Register

The `PINT_INV_CLR` register disables inverting input polarity. Writing 1 to a bit in `PINT_INV_CLR` disables an inverter for input on the corresponding pin.

Figure 11-29: PINT_INV_CLR Register Diagram

Table 11-33: PINT_INV_CLR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W1C)	PIQ31	Pin Interrupt 31 No Invert. Set the PINT_INV_CLR.PIQ31 bit to disable inverted input.
30 (R/W1C)	PIQ30	Pin Interrupt 30 No Invert. Set the PINT_INV_CLR.PIQ30 bit to disable inverted input.
29 (R/W1C)	PIQ29	Pin Interrupt 29 No Invert. Set the PINT_INV_CLR.PIQ29 bit to disable inverted input.
28 (R/W1C)	PIQ28	Pin Interrupt 28 No Invert. Set the PINT_INV_CLR.PIQ28 bit to disable inverted input.
27 (R/W1C)	PIQ27	Pin Interrupt 27 No Invert. Set the PINT_INV_CLR.PIQ27 bit to disable inverted input.
26 (R/W1C)	PIQ26	Pin Interrupt 26 No Invert. Set the PINT_INV_CLR.PIQ26 bit to disable inverted input.
25 (R/W1C)	PIQ25	Pin Interrupt 25 No Invert. Set the PINT_INV_CLR.PIQ25 bit to disable inverted input.
24 (R/W1C)	PIQ24	Pin Interrupt 24 No Invert. Set the PINT_INV_CLR.PIQ24 bit to disable inverted input.
23 (R/W1C)	PIQ23	Pin Interrupt 23 No Invert. Set the PINT_INV_CLR.PIQ23 bit to disable inverted input.
22 (R/W1C)	PIQ22	Pin Interrupt 22 No Invert. Set the PINT_INV_CLR.PIQ22 bit to disable inverted input.
21 (R/W1C)	PIQ21	Pin Interrupt 21 No Invert. Set the PINT_INV_CLR.PIQ21 bit to disable inverted input.
20 (R/W1C)	PIQ20	Pin Interrupt 20 No Invert. Set the PINT_INV_CLR.PIQ20 bit to disable inverted input.
19 (R/W1C)	PIQ19	Pin Interrupt 19 No Invert. Set the PINT_INV_CLR.PIQ19 bit to disable inverted input.
18 (R/W1C)	PIQ18	Pin Interrupt 18 No Invert. Set the PINT_INV_CLR.PIQ18 bit to disable inverted input.
17 (R/W1C)	PIQ17	Pin Interrupt 17 No Invert. Set the PINT_INV_CLR.PIQ17 bit to disable inverted input.
16 (R/W1C)	PIQ16	Pin Interrupt 16 No Invert. Set the PINT_INV_CLR.PIQ16 bit to disable inverted input.

Table 11-33: PINT_INV_CLR Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
15 (R/W1C)	PIQ15	Pin Interrupt 15 No Invert. Set the PINT_INV_CLR.PIQ15 bit to disable inverted input.
14 (R/W1C)	PIQ14	Pin Interrupt 14 No Invert. Set the PINT_INV_CLR.PIQ14 bit to disable inverted input.
13 (R/W1C)	PIQ13	Pin Interrupt 13 No Invert. Set the PINT_INV_CLR.PIQ13 bit to disable inverted input.
12 (R/W1C)	PIQ12	Pin Interrupt 12 No Invert. Set the PINT_INV_CLR.PIQ12 bit to disable inverted input.
11 (R/W1C)	PIQ11	Pin Interrupt 11 No Invert. Set the PINT_INV_CLR.PIQ11 bit to disable inverted input.
10 (R/W1C)	PIQ10	Pin Interrupt 10 No Invert. Set the PINT_INV_CLR.PIQ10 bit to disable inverted input.
9 (R/W1C)	PIQ9	Pin Interrupt 9 No Invert. Set the PINT_INV_CLR.PIQ9 bit to disable inverted input.
8 (R/W1C)	PIQ8	Pin Interrupt 8 No Invert. Set the PINT_INV_CLR.PIQ8 bit to disable inverted input.
7 (R/W1C)	PIQ7	Pin Interrupt 7 No Invert. Set the PINT_INV_CLR.PIQ7 bit to disable inverted input.
6 (R/W1C)	PIQ6	Pin Interrupt 6 No Invert. Set the PINT_INV_CLR.PIQ6 bit to disable inverted input.
5 (R/W1C)	PIQ5	Pin Interrupt 5 No Invert. Set the PINT_INV_CLR.PIQ5 bit to disable inverted input.
4 (R/W1C)	PIQ4	Pin Interrupt 4 No Invert. Set the PINT_INV_CLR.PIQ4 bit to disable inverted input.
3 (R/W1C)	PIQ3	Pin Interrupt 3 No Invert. Set the PINT_INV_CLR.PIQ3 bit to disable inverted input.
2 (R/W1C)	PIQ2	Pin Interrupt 2 No Invert. Set the PINT_INV_CLR.PIQ2 bit to disable inverted input.
1 (R/W1C)	PIQ1	Pin Interrupt 1 No Invert. Set the PINT_INV_CLR.PIQ1 bit to disable inverted input.
0 (R/W1C)	PIQ0	Pin Interrupt 0 No Invert. Set the PINT_INV_CLR.PIQ0 bit to disable inverted input.

PINT Invert Set Register

The `PINT_INV_SET` register enables inverting input polarity. Writing 1 to a bit in `PINT_INV_SET` enables an inverter for input on the corresponding pin.

Figure 11-30: PINT_INV_SET Register Diagram

Table 11-34: PINT_INV_SET Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W1S)	PIQ31	Pin Interrupt 31 Invert. Set the PINT_INV_SET.PIQ31 bit to enable inverted input.
30 (R/W1S)	PIQ30	Pin Interrupt 30 Invert. Set the PINT_INV_SET.PIQ30 bit to enable inverted input.
29 (R/W1S)	PIQ29	Pin Interrupt 29 Invert. Set the PINT_INV_SET.PIQ29 bit to enable inverted input.
28 (R/W1S)	PIQ28	Pin Interrupt 28 Invert. Set the PINT_INV_SET.PIQ28 bit to enable inverted input.
27 (R/W1S)	PIQ27	Pin Interrupt 27 Invert. Set the PINT_INV_SET.PIQ27 bit to enable inverted input.
26 (R/W1S)	PIQ26	Pin Interrupt 26 Invert. Set the PINT_INV_SET.PIQ26 bit to enable inverted input.
25 (R/W1S)	PIQ25	Pin Interrupt 25 Invert. Set the PINT_INV_SET.PIQ25 bit to enable inverted input.
24 (R/W1S)	PIQ24	Pin Interrupt 24 Invert. Set the PINT_INV_SET.PIQ24 bit to enable inverted input.
23 (R/W1S)	PIQ23	Pin Interrupt 23 Invert. Set the PINT_INV_SET.PIQ23 bit to enable inverted input.
22 (R/W1S)	PIQ22	Pin Interrupt 22 Invert. Set the PINT_INV_SET.PIQ22 bit to enable inverted input.
21 (R/W1S)	PIQ21	Pin Interrupt 21 Invert. Set the PINT_INV_SET.PIQ21 bit to enable inverted input.
20 (R/W1S)	PIQ20	Pin Interrupt 20 Invert. Set the PINT_INV_SET.PIQ20 bit to enable inverted input.
19 (R/W1S)	PIQ19	Pin Interrupt 19 Invert. Set the PINT_INV_SET.PIQ19 bit to enable inverted input.
18 (R/W1S)	PIQ18	Pin Interrupt 18 Invert. Set the PINT_INV_SET.PIQ18 bit to enable inverted input.
17 (R/W1S)	PIQ17	Pin Interrupt 17 Invert. Set the PINT_INV_SET.PIQ17 bit to enable inverted input.
16 (R/W1S)	PIQ16	Pin Interrupt 16 Invert. Set the PINT_INV_SET.PIQ16 bit to enable inverted input.

Table 11-34: PINT_INV_SET Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
15 (R/W1S)	PIQ15	Pin Interrupt 15 Invert. Set the PINT_INV_SET.PIQ15 bit to enable inverted input.
14 (R/W1S)	PIQ14	Pin Interrupt 14 Invert. Set the PINT_INV_SET.PIQ14 bit to enable inverted input.
13 (R/W1S)	PIQ13	Pin Interrupt 13 Invert. Set the PINT_INV_SET.PIQ13 bit to enable inverted input.
12 (R/W1S)	PIQ12	Pin Interrupt 12 Invert. Set the PINT_INV_SET.PIQ12 bit to enable inverted input.
11 (R/W1S)	PIQ11	Pin Interrupt 11 Invert. Set the PINT_INV_SET.PIQ11 bit to enable inverted input.
10 (R/W1S)	PIQ10	Pin Interrupt 10 Invert. Set the PINT_INV_SET.PIQ10 bit to enable inverted input.
9 (R/W1S)	PIQ9	Pin Interrupt 9 Invert. Set the PINT_INV_SET.PIQ9 bit to enable inverted input.
8 (R/W1S)	PIQ8	Pin Interrupt 8 Invert. Set the PINT_INV_SET.PIQ8 bit to enable inverted input.
7 (R/W1S)	PIQ7	Pin Interrupt 7 Invert. Set the PINT_INV_SET.PIQ7 bit to enable inverted input.
6 (R/W1S)	PIQ6	Pin Interrupt 6 Invert. Set the PINT_INV_SET.PIQ6 bit to enable inverted input.
5 (R/W1S)	PIQ5	Pin Interrupt 5 Invert. Set the PINT_INV_SET.PIQ5 bit to enable inverted input.
4 (R/W1S)	PIQ4	Pin Interrupt 4 Invert. Set the PINT_INV_SET.PIQ4 bit to enable inverted input.
3 (R/W1S)	PIQ3	Pin Interrupt 3 Invert. Set the PINT_INV_SET.PIQ3 bit to enable inverted input.
2 (R/W1S)	PIQ2	Pin Interrupt 2 Invert. Set the PINT_INV_SET.PIQ2 bit to enable inverted input.
1 (R/W1S)	PIQ1	Pin Interrupt 1 Invert. Set the PINT_INV_SET.PIQ1 bit to enable inverted input.
0 (R/W1S)	PIQ0	Pin Interrupt 0 Invert. Set the PINT_INV_SET.PIQ0 bit to enable inverted input.

PINT Latch Register

The `PINT_LATCH` register indicates the interrupt latch status for pin interrupts. When set, an interrupt request is latched. When cleared, there is no interrupt request latched.

Both the `PINT_REQ` and `PINT_LATCH` registers indicate whether an interrupt request is latched on the respective pin. The `PINT_LATCH` register is a latch that operates regardless of the interrupt masks. Bits of the `PINT_REQ` register depend on the mask register. The `PINT_REQ` register is a logical AND of the `PINT_LATCH` register and the interrupt mask.

Having two separate registers here enables the user to interrogate certain pins in polling mode while others work in interrupt mode. The `PINT_LATCH` registers can be used for edge detection or pin activity detection.

Both registers have W1C behavior. Writing a 1 to either register clears the respective bits in both registers. For interrupt operation, the user may prefer to W1C the `PINT_REQ` register (address still loaded in Px pointer). In polling mode, it might be cleaner to W1C the `PINT_LATCH` register.

Whether in edge-sensitive mode or level-sensitive mode, `PINT_LATCH` bits are never cleared by hardware except at system reset. Even in level-sensitive mode, the `PINT_LATCH` register functions as latch.

Figure 11-31: PINT_LATCH Register Diagram

Table 11-35: PINT_LATCH Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W1C)	PIQ31	Pin Interrupt 31 Latch. If the PINT_LATCH.PIQ31 bit is set, the request is latched.

Table 11-35: PINT_LATCH Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
30 (R/W1C)	PIQ30	Pin Interrupt 30 Latch. If the PINT_LATCH.PIQ30 bit is set, the request is latched.
29 (R/W1C)	PIQ29	Pin Interrupt 29 Latch. If the PINT_LATCH.PIQ29 bit is set, the request is latched.
28 (R/W1C)	PIQ28	Pin Interrupt 28 Latch. If the PINT_LATCH.PIQ28 bit is set, the request is latched.
27 (R/W1C)	PIQ27	Pin Interrupt 27 Latch. If the PINT_LATCH.PIQ27 bit is set, the request is latched.
26 (R/W1C)	PIQ26	Pin Interrupt 26 Latch. If the PINT_LATCH.PIQ26 bit is set, the request is latched.
25 (R/W1C)	PIQ25	Pin Interrupt 25 Latch. If the PINT_LATCH.PIQ25 bit is set, the request is latched.
24 (R/W1C)	PIQ24	Pin Interrupt 24 Latch. If the PINT_LATCH.PIQ24 bit is set, the request is latched.
23 (R/W1C)	PIQ23	Pin Interrupt 23 Latch. If the PINT_LATCH.PIQ23 bit is set, the request is latched.
22 (R/W1C)	PIQ22	Pin Interrupt 22 Latch. If the PINT_LATCH.PIQ22 bit is set, the request is latched.
21 (R/W1C)	PIQ21	Pin Interrupt 21 Latch. If the PINT_LATCH.PIQ21 bit is set, the request is latched.
20 (R/W1C)	PIQ20	Pin Interrupt 20 Latch. If the PINT_LATCH.PIQ20 bit is set, the request is latched.
19 (R/W1C)	PIQ19	Pin Interrupt 19 Latch. If the PINT_LATCH.PIQ19 bit is set, the request is latched.
18 (R/W1C)	PIQ18	Pin Interrupt 18 Latch. If the PINT_LATCH.PIQ18 bit is set, the request is latched.
17 (R/W1C)	PIQ17	Pin Interrupt 17 Latch. If the PINT_LATCH.PIQ17 bit is set, the request is latched.
16 (R/W1C)	PIQ16	Pin Interrupt 16 Latch. If the PINT_LATCH.PIQ16 bit is set, the request is latched.
15 (R/W1C)	PIQ15	Pin Interrupt 15 Latch. If the PINT_LATCH.PIQ15 bit is set, the request is latched.

Table 11-35: PINT_LATCH Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
14 (R/W1C)	PIQ14	Pin Interrupt 14 Latch. If the <code>PINT_LATCH.PIQ14</code> bit is set, the request is latched.
13 (R/W1C)	PIQ13	Pin Interrupt 13 Latch. If the <code>PINT_LATCH.PIQ13</code> bit is set, the request is latched.
12 (R/W1C)	PIQ12	Pin Interrupt 12 Latch. If the <code>PINT_LATCH.PIQ12</code> bit is set, the request is latched.
11 (R/W1C)	PIQ11	Pin Interrupt 11 Latch. If the <code>PINT_LATCH.PIQ11</code> bit is set, the request is latched.
10 (R/W1C)	PIQ10	Pin Interrupt 10 Latch. If the <code>PINT_LATCH.PIQ10</code> bit is set, the request is latched.
9 (R/W1C)	PIQ9	Pin Interrupt 9 Latch. If the <code>PINT_LATCH.PIQ9</code> bit is set, the request is latched.
8 (R/W1C)	PIQ8	Pin Interrupt 8 Latch. If the <code>PINT_LATCH.PIQ8</code> bit is set, the request is latched.
7 (R/W1C)	PIQ7	Pin Interrupt 7 Latch. If the <code>PINT_LATCH.PIQ7</code> bit is set, the request is latched.
6 (R/W1C)	PIQ6	Pin Interrupt 6 Latch. If the <code>PINT_LATCH.PIQ6</code> bit is set, the request is latched.
5 (R/W1C)	PIQ5	Pin Interrupt 5 Latch. If the <code>PINT_LATCH.PIQ5</code> bit is set, the request is latched.
4 (R/W1C)	PIQ4	Pin Interrupt 4 Latch. If the <code>PINT_LATCH.PIQ4</code> bit is set, the request is latched.
3 (R/W1C)	PIQ3	Pin Interrupt 3 Latch. If the <code>PINT_LATCH.PIQ3</code> bit is set, the request is latched.
2 (R/W1C)	PIQ2	Pin Interrupt 2 Latch. If the <code>PINT_LATCH.PIQ2</code> bit is set, the request is latched.
1 (R/W1C)	PIQ1	Pin Interrupt 1 Latch. If the <code>PINT_LATCH.PIQ1</code> bit is set, the request is latched.
0 (R/W1C)	PIQ0	Pin Interrupt 0 Latch. If the <code>PINT_LATCH.PIQ0</code> bit is set, the request is latched.

PINT Mask Clear Register

The `PINT_MSK_CLR` register permits masking (disabling) of interrupt requests. Writing 1 to a bit in `PINT_MSK_CLR` masks the corresponding pin interrupt.

Figure 11-32: PINT_MSK_CLR Register Diagram

Table 11-36: PINT_MSK_CLR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W1C)	PIQ31	Pin Interrupt 31 Mask. Set the PINT_MSK_CLR.PIQ31 bit to disable the interrupt.
30 (R/W1C)	PIQ30	Pin Interrupt 30 Mask. Set the PINT_MSK_CLR.PIQ30 bit to disable the interrupt.
29 (R/W1C)	PIQ29	Pin Interrupt 29 Mask. Set the PINT_MSK_CLR.PIQ29 bit to disable the interrupt.
28 (R/W1C)	PIQ28	Pin Interrupt 28 Mask. Set the PINT_MSK_CLR.PIQ28 bit to disable the interrupt.
27 (R/W1C)	PIQ27	Pin Interrupt 27 Mask. Set the PINT_MSK_CLR.PIQ27 bit to disable the interrupt.
26 (R/W1C)	PIQ26	Pin Interrupt 26 Mask. Set the PINT_MSK_CLR.PIQ26 bit to disable the interrupt.
25 (R/W1C)	PIQ25	Pin Interrupt 25 Mask. Set the PINT_MSK_CLR.PIQ25 bit to disable the interrupt.
24 (R/W1C)	PIQ24	Pin Interrupt 24 Mask. Set the PINT_MSK_CLR.PIQ24 bit to disable the interrupt.
23 (R/W1C)	PIQ23	Pin Interrupt 23 Mask. Set the PINT_MSK_CLR.PIQ23 bit to disable the interrupt.
22 (R/W1C)	PIQ22	Pin Interrupt 22 Mask. Set the PINT_MSK_CLR.PIQ22 bit to disable the interrupt.
21 (R/W1C)	PIQ21	Pin Interrupt 21 Mask. Set the PINT_MSK_CLR.PIQ21 bit to disable the interrupt.
20 (R/W1C)	PIQ20	Pin Interrupt 20 Mask. Set the PINT_MSK_CLR.PIQ20 bit to disable the interrupt.
19 (R/W1C)	PIQ19	Pin Interrupt 19 Mask. Set the PINT_MSK_CLR.PIQ19 bit to disable the interrupt.
18 (R/W1C)	PIQ18	Pin Interrupt 18 Mask. Set the PINT_MSK_CLR.PIQ18 bit to disable the interrupt.
17 (R/W1C)	PIQ17	Pin Interrupt 17 Mask. Set the PINT_MSK_CLR.PIQ17 bit to disable the interrupt.
16 (R/W1C)	PIQ16	Pin Interrupt 16 Mask. Set the PINT_MSK_CLR.PIQ16 bit to disable the interrupt.

Table 11-36: PINT_MSK_CLR Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
15 (R/W1C)	PIQ15	Pin Interrupt 15 Mask. Set the PINT_MSK_CLR.PIQ15 bit to disable the interrupt.
14 (R/W1C)	PIQ14	Pin Interrupt 14 Mask. Set the PINT_MSK_CLR.PIQ14 bit to disable the interrupt.
13 (R/W1C)	PIQ13	Pin Interrupt 13 Mask. Set the PINT_MSK_CLR.PIQ13 bit to disable the interrupt.
12 (R/W1C)	PIQ12	Pin Interrupt 12 Mask. Set the PINT_MSK_CLR.PIQ12 bit to disable the interrupt.
11 (R/W1C)	PIQ11	Pin Interrupt 11 Mask. Set the PINT_MSK_CLR.PIQ11 bit to disable the interrupt.
10 (R/W1C)	PIQ10	Pin Interrupt 10 Mask. Set the PINT_MSK_CLR.PIQ10 bit to disable the interrupt.
9 (R/W1C)	PIQ9	Pin Interrupt 9 Mask. Set the PINT_MSK_CLR.PIQ9 bit to disable the interrupt.
8 (R/W1C)	PIQ8	Pin Interrupt 8 Mask. Set the PINT_MSK_CLR.PIQ8 bit to disable the interrupt.
7 (R/W1C)	PIQ7	Pin Interrupt 7 Mask. Set the PINT_MSK_CLR.PIQ7 bit to disable the interrupt.
6 (R/W1C)	PIQ6	Pin Interrupt 6 Mask. Set the PINT_MSK_CLR.PIQ6 bit to disable the interrupt.
5 (R/W1C)	PIQ5	Pin Interrupt 5 Mask. Set the PINT_MSK_CLR.PIQ5 bit to disable the interrupt.
4 (R/W1C)	PIQ4	Pin Interrupt 4 Mask. Set the PINT_MSK_CLR.PIQ4 bit to disable the interrupt.
3 (R/W1C)	PIQ3	Pin Interrupt 3 Mask. Set the PINT_MSK_CLR.PIQ3 bit to disable the interrupt.
2 (R/W1C)	PIQ2	Pin Interrupt 2 Mask. Set the PINT_MSK_CLR.PIQ2 bit to disable the interrupt.
1 (R/W1C)	PIQ1	Pin Interrupt 1 Mask. Set the PINT_MSK_CLR.PIQ1 bit to disable the interrupt.
0 (R/W1C)	PIQ0	Pin Interrupt 0 Mask. Set the PINT_MSK_CLR.PIQ0 bit to disable the interrupt.

PINT Mask Set Register

The `PINT_MSK_SET` register permits unmasking (enabling) of interrupt requests. Writing 1 to a bit in `PINT_MSK_SET` unmask the corresponding pin interrupt.

Figure 11-33: `PINT_MSK_SET` Register Diagram

Table 11-37: PINT_MSK_SET Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W1S)	PIQ31	Pin Interrupt 31 Unmask. Set the <code>PINT_MSK_SET.PIQ31</code> bit to enable the interrupt.
30 (R/W1S)	PIQ30	Pin Interrupt 30 Unmask. Set the <code>PINT_MSK_SET.PIQ30</code> bit to enable the interrupt.
29 (R/W1S)	PIQ29	Pin Interrupt 29 Unmask. Set the <code>PINT_MSK_SET.PIQ29</code> bit to enable the interrupt.
28 (R/W1S)	PIQ28	Pin Interrupt 28 Unmask. Set the <code>PINT_MSK_SET.PIQ28</code> bit to enable the interrupt.
27 (R/W1S)	PIQ27	Pin Interrupt 27 Unmask. Set the <code>PINT_MSK_SET.PIQ27</code> bit to enable the interrupt.
26 (R/W1S)	PIQ26	Pin Interrupt 26 Unmask. Set the <code>PINT_MSK_SET.PIQ26</code> bit to enable the interrupt.
25 (R/W1S)	PIQ25	Pin Interrupt 25 Unmask. Set the <code>PINT_MSK_SET.PIQ25</code> bit to enable the interrupt.
24 (R/W1S)	PIQ24	Pin Interrupt 24 Unmask. Set the <code>PINT_MSK_SET.PIQ24</code> bit to enable the interrupt.
23 (R/W1S)	PIQ23	Pin Interrupt 23 Unmask. Set the <code>PINT_MSK_SET.PIQ23</code> bit to enable the interrupt.
22 (R/W1S)	PIQ22	Pin Interrupt 22 Unmask. Set the <code>PINT_MSK_SET.PIQ22</code> bit to enable the interrupt.
21 (R/W1S)	PIQ21	Pin Interrupt 21 Unmask. Set the <code>PINT_MSK_SET.PIQ21</code> bit to enable the interrupt.
20 (R/W1S)	PIQ20	Pin Interrupt 20 Unmask. Set the <code>PINT_MSK_SET.PIQ20</code> bit to enable the interrupt.
19 (R/W1S)	PIQ19	Pin Interrupt 19 Unmask. Set the <code>PINT_MSK_SET.PIQ19</code> bit to enable the interrupt.
18 (R/W1S)	PIQ18	Pin Interrupt 18 Unmask. Set the <code>PINT_MSK_SET.PIQ18</code> bit to enable the interrupt.
17 (R/W1S)	PIQ17	Pin Interrupt 17 Unmask. Set the <code>PINT_MSK_SET.PIQ17</code> bit to enable the interrupt.
16 (R/W1S)	PIQ16	Pin Interrupt 16 Unmask. Set the <code>PINT_MSK_SET.PIQ16</code> bit to enable the interrupt.

Table 11-37: PINT_MSK_SET Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
15 (R/W1S)	PIQ15	Pin Interrupt 15 Unmask. Set the PINT_MSK_SET.PIQ15 bit to enable the interrupt.
14 (R/W1S)	PIQ14	Pin Interrupt 14 Unmask. Set the PINT_MSK_SET.PIQ14 bit to enable the interrupt.
13 (R/W1S)	PIQ13	Pin Interrupt 13 Unmask. Set the PINT_MSK_SET.PIQ13 bit to enable the interrupt.
12 (R/W1S)	PIQ12	Pin Interrupt 12 Unmask. Set the PINT_MSK_SET.PIQ12 bit to enable the interrupt.
11 (R/W1S)	PIQ11	Pin Interrupt 11 Unmask. Set the PINT_MSK_SET.PIQ11 bit to enable the interrupt.
10 (R/W1S)	PIQ10	Pin Interrupt 10 Unmask. Set the PINT_MSK_SET.PIQ10 bit to enable the interrupt.
9 (R/W1S)	PIQ9	Pin Interrupt 9 Unmask. Set the PINT_MSK_SET.PIQ9 bit to enable the interrupt.
8 (R/W1S)	PIQ8	Pin Interrupt 8 Unmask. Set the PINT_MSK_SET.PIQ8 bit to enable the interrupt.
7 (R/W1S)	PIQ7	Pin Interrupt 7 Unmask. Set the PINT_MSK_SET.PIQ7 bit to enable the interrupt.
6 (R/W1S)	PIQ6	Pin Interrupt 6 Unmask. Set the PINT_MSK_SET.PIQ6 bit to enable the interrupt.
5 (R/W1S)	PIQ5	Pin Interrupt 5 Unmask. Set the PINT_MSK_SET.PIQ5 bit to enable the interrupt.
4 (R/W1S)	PIQ4	Pin Interrupt 4 Unmask. Set the PINT_MSK_SET.PIQ4 bit to enable the interrupt.
3 (R/W1S)	PIQ3	Pin Interrupt 3 Unmask. Set the PINT_MSK_SET.PIQ3 bit to enable the interrupt.
2 (R/W1S)	PIQ2	Pin Interrupt 2 Unmask. Set the PINT_MSK_SET.PIQ2 bit to enable the interrupt.
1 (R/W1S)	PIQ1	Pin Interrupt 1 Unmask. Set the PINT_MSK_SET.PIQ1 bit to enable the interrupt.
0 (R/W1S)	PIQ0	Pin Interrupt 0 Unmask. Set the PINT_MSK_SET.PIQ0 bit to enable the interrupt.

PINT Pin State Register

When a half port is assigned to a byte in any PINT block, the state of the eight pins (regardless of GPIO or function, input or output) can be seen in the `PINT_PINSTATE` register. While neither input nor output drivers of the pin are enabled, reads of the pin state in `PINT_PINSTATE` return zero. The `PINT_PINSTATE` register reports the inverted state of the pin if the signal inverter is activated by the `PINT_INV_SET` register. The inverter can be enabled on an individual bit-by-bit basis. Every bit in the `PINT_INV_SET` and `PINT_INV_CLR` register pair represents a pin signal.

The pin interrupt pin state registers enable the service routine to read the current state of the pin without reading from GPIO space. If there was an edge-sensitive interrupt, the service routine can check whether the state of the pin is still high or turned low.

Figure 11-34: PINT_PINSTATE Register Diagram

Table 11-38: PINT_PINSTATE Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/NW)	PIQ31	Pin Interrupt 31 State. A read of the <code>PINT_PINSTATE.PIQ31</code> bit returns the pin state.

Table 11-38: PINT_PINSTATE Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
30 (R/NW)	PIQ30	Pin Interrupt 30 State. A read of the PINT_PINSTATE.PIQ30 bit returns the pin state.
29 (R/NW)	PIQ29	Pin Interrupt 29 State. A read of the PINT_PINSTATE.PIQ29 bit returns the pin state.
28 (R/NW)	PIQ28	Pin Interrupt 28 State. A read of the PINT_PINSTATE.PIQ28 bit returns the pin state.
27 (R/NW)	PIQ27	Pin Interrupt 27 State. A read of the PINT_PINSTATE.PIQ27 bit returns the pin state.
26 (R/NW)	PIQ26	Pin Interrupt 26 State. A read of the PINT_PINSTATE.PIQ26 bit returns the pin state.
25 (R/NW)	PIQ25	Pin Interrupt 25 State. A read of the PINT_PINSTATE.PIQ25 bit returns the pin state.
24 (R/NW)	PIQ24	Pin Interrupt 24 State. A read of the PINT_PINSTATE.PIQ24 bit returns the pin state.
23 (R/NW)	PIQ23	Pin Interrupt 23 State. A read of the PINT_PINSTATE.PIQ23 bit returns the pin state.
22 (R/NW)	PIQ22	Pin Interrupt 22 State. A read of the PINT_PINSTATE.PIQ22 bit returns the pin state.
21 (R/NW)	PIQ21	Pin Interrupt 21 State. A read of the PINT_PINSTATE.PIQ21 bit returns the pin state.
20 (R/NW)	PIQ20	Pin Interrupt 20 State. A read of the PINT_PINSTATE.PIQ20 bit returns the pin state.
19 (R/NW)	PIQ19	Pin Interrupt 19 State. A read of the PINT_PINSTATE.PIQ19 bit returns the pin state.
18 (R/NW)	PIQ18	Pin Interrupt 18 State. A read of the PINT_PINSTATE.PIQ18 bit returns the pin state.
17 (R/NW)	PIQ17	Pin Interrupt 17 State. A read of the PINT_PINSTATE.PIQ17 bit returns the pin state.
16 (R/NW)	PIQ16	Pin Interrupt 16 State. A read of the PINT_PINSTATE.PIQ16 bit returns the pin state.
15 (R/NW)	PIQ15	Pin Interrupt 15 State. A read of the PINT_PINSTATE.PIQ15 bit returns the pin state.

Table 11-38: PINT_PINSTATE Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
14 (R/NW)	PIQ14	Pin Interrupt 14 State. A read of the <code>PINT_PINSTATE.PIQ14</code> bit returns the pin state.
13 (R/NW)	PIQ13	Pin Interrupt 13 State. A read of the <code>PINT_PINSTATE.PIQ13</code> bit returns the pin state.
12 (R/NW)	PIQ12	Pin Interrupt 12 State. A read of the <code>PINT_PINSTATE.PIQ12</code> bit returns the pin state.
11 (R/NW)	PIQ11	Pin Interrupt 11 State. A read of the <code>PINT_PINSTATE.PIQ11</code> bit returns the pin state.
10 (R/NW)	PIQ10	Pin Interrupt 10 State. A read of the <code>PINT_PINSTATE.PIQ10</code> bit returns the pin state.
9 (R/NW)	PIQ9	Pin Interrupt 9 State. A read of the <code>PINT_PINSTATE.PIQ9</code> bit returns the pin state.
8 (R/NW)	PIQ8	Pin Interrupt 8 State. A read of the <code>PINT_PINSTATE.PIQ8</code> bit returns the pin state.
7 (R/NW)	PIQ7	Pin Interrupt 7 State. A read of the <code>PINT_PINSTATE.PIQ7</code> bit returns the pin state.
6 (R/NW)	PIQ6	Pin Interrupt 6 State. A read of the <code>PINT_PINSTATE.PIQ6</code> bit returns the pin state.
5 (R/NW)	PIQ5	Pin Interrupt 5 State. A read of the <code>PINT_PINSTATE.PIQ5</code> bit returns the pin state.
4 (R/NW)	PIQ4	Pin Interrupt 4 State. A read of the <code>PINT_PINSTATE.PIQ4</code> bit returns the pin state.
3 (R/NW)	PIQ3	Pin Interrupt 3 State. A read of the <code>PINT_PINSTATE.PIQ3</code> bit returns the pin state.
2 (R/NW)	PIQ2	Pin Interrupt 2 State. A read of the <code>PINT_PINSTATE.PIQ2</code> bit returns the pin state.
1 (R/NW)	PIQ1	Pin Interrupt 1 State. A read of the <code>PINT_PINSTATE.PIQ1</code> bit returns the pin state.
0 (R/NW)	PIQ0	Pin Interrupt 0 State. A read of the <code>PINT_PINSTATE.PIQ0</code> bit returns the pin state.

PINT Request Register

The `PINT_REQ` register indicates the interrupt request status for pin interrupts. When set, an interrupt request is pending. When cleared, there is no interrupt request pending.

Both the `PINT_REQ` and `PINT_LATCH` registers indicate whether an interrupt request is latched on the respective pin. The `PINT_LATCH` register is a latch that operates regardless of the interrupt masks. Bits of the `PINT_REQ` register depend on the mask register. The `PINT_REQ` register is a logical AND of the `PINT_LATCH` register and the interrupt mask.

Figure 11-35: PINT_REQ Register Diagram

Table 11-39: PINT_REQ Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W1C)	PIQ31	Pin Interrupt 31 Request. If the PINT_REQ.PIQ31 bit is set, a request is pending.

Table 11-39: PINT_REQ Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
30 (R/W1C)	PIQ30	Pin Interrupt 30 Request. If the PINT_REQ.PIQ30 bit is set, a request is pending.
29 (R/W1C)	PIQ29	Pin Interrupt 29 Request. If the PINT_REQ.PIQ29 bit is set, a request is pending.
28 (R/W1C)	PIQ28	Pin Interrupt 28 Request. If the PINT_REQ.PIQ28 bit is set, a request is pending.
27 (R/W1C)	PIQ27	Pin Interrupt 27 Request. If the PINT_REQ.PIQ27 bit is set, a request is pending.
26 (R/W1C)	PIQ26	Pin Interrupt 26 Request. If the PINT_REQ.PIQ26 bit is set, a request is pending.
25 (R/W1C)	PIQ25	Pin Interrupt 25 Request. If the PINT_REQ.PIQ25 bit is set, a request is pending.
24 (R/W1C)	PIQ24	Pin Interrupt 24 Request. If the PINT_REQ.PIQ24 bit is set, a request is pending.
23 (R/W1C)	PIQ23	Pin Interrupt 23 Request. If the PINT_REQ.PIQ23 bit is set, a request is pending.
22 (R/W1C)	PIQ22	Pin Interrupt 22 Request. If the PINT_REQ.PIQ22 bit is set, a request is pending.
21 (R/W1C)	PIQ21	Pin Interrupt 21 Request. If the PINT_REQ.PIQ21 bit is set, a request is pending.
20 (R/W1C)	PIQ20	Pin Interrupt 20 Request. If the PINT_REQ.PIQ20 bit is set, a request is pending.
19 (R/W1C)	PIQ19	Pin Interrupt 19 Request. If the PINT_REQ.PIQ19 bit is set, a request is pending.
18 (R/W1C)	PIQ18	Pin Interrupt 18 Request. If the PINT_REQ.PIQ18 bit is set, a request is pending.
17 (R/W1C)	PIQ17	Pin Interrupt 17 Request. If the PINT_REQ.PIQ17 bit is set, a request is pending.
16 (R/W1C)	PIQ16	Pin Interrupt 16 Request. If the PINT_REQ.PIQ16 bit is set, a request is pending.
15 (R/W1C)	PIQ15	Pin Interrupt 15 Request. If the PINT_REQ.PIQ15 bit is set, a request is pending.

Table 11-39: PINT_REQ Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
14 (R/W1C)	PIQ14	Pin Interrupt 14 Request. If the PINT_REQ.PIQ14 bit is set, a request is pending.
13 (R/W1C)	PIQ13	Pin Interrupt 13 Request. If the PINT_REQ.PIQ13 bit is set, a request is pending.
12 (R/W1C)	PIQ12	Pin Interrupt 12 Request. If the PINT_REQ.PIQ12 bit is set, a request is pending.
11 (R/W1C)	PIQ11	Pin Interrupt 11 Request. If the PINT_REQ.PIQ11 bit is set, a request is pending.
10 (R/W1C)	PIQ10	Pin Interrupt 10 Request. If the PINT_REQ.PIQ10 bit is set, a request is pending.
9 (R/W1C)	PIQ9	Pin Interrupt 9 Request. If the PINT_REQ.PIQ9 bit is set, a request is pending.
8 (R/W1C)	PIQ8	Pin Interrupt 8 Request. If the PINT_REQ.PIQ8 bit is set, a request is pending.
7 (R/W1C)	PIQ7	Pin Interrupt 7 Request. If the PINT_REQ.PIQ7 bit is set, a request is pending.
6 (R/W1C)	PIQ6	Pin Interrupt 6 Request. If the PINT_REQ.PIQ6 bit is set, a request is pending.
5 (R/W1C)	PIQ5	Pin Interrupt 5 Request. If the PINT_REQ.PIQ5 bit is set, a request is pending.
4 (R/W1C)	PIQ4	Pin Interrupt 4 Request. If the PINT_REQ.PIQ4 bit is set, a request is pending.
3 (R/W1C)	PIQ3	Pin Interrupt 3 Request. If the PINT_REQ.PIQ3 bit is set, a request is pending.
2 (R/W1C)	PIQ2	Pin Interrupt 2 Request. If the PINT_REQ.PIQ2 bit is set, a request is pending.
1 (R/W1C)	PIQ1	Pin Interrupt 1 Request. If the PINT_REQ.PIQ1 bit is set, a request is pending.
0 (R/W1C)	PIQ0	Pin Interrupt 0 Request. If the PINT_REQ.PIQ0 bit is set, a request is pending.

ADSP-2159x PADS Register Descriptions

Pads Controller (PADS) contains the following registers.

Table 11-40: ADSP-2159x PADS Register List

Name	Description
PADS_DAI0_0_DS	DAI0 1 to 10 pins DS control
PADS_DAI0_1_DS	DAI0 11 to 20 pins DS control
PADS_DAI0_IE	DAI0 Port Input Enable Control Register
PADS_DAI1_0_DS	DAI1 1 to 10 pins DS control
PADS_DAI1_1_DS	DAI1 11 to 20 pins DS control
PADS_DAI1_IE	DAI1 Port Input Enable Control Register
PADS_DAI[n]_PDE	DAIx Pull-Down Enable
PADS_DAI[n]_PUE	DAIx Pull-Up Enable
PADS_NONPORTS_DS	Non-GPIO Drive Strength Register
PADS_PCFG0	Peripheral PAD Configuration0 Register
PADS_PCFG1	Peripheral Configuration1 Register
PADS_PORTA0_DS	PORTA 0 to 7 pins DS control
PADS_PORTA1_DS	PORTA 8 - 15 pins DS control
PADS_PORTB0_DS	PORTB 0 to 7 pins DS control
PADS_PORTB1_DS	PORTB 8 - 15 pins DS control
PADS_PORTC0_DS	PORTC 0 to 7 pins DS control
PADS_PORTC1_DS	PORTC 8 - 15 pins DS control
PADS_PORTD0_DS	PORTD 0 to 7 pins DS control
PADS_PORTD1_DS	PORTD 8 to 15 pins DS control
PADS_PORTE0_DS	PORTE 0 to 7 pins DS control
PADS_PORTE1_DS	PORTE 8 to 15 pins DS control
PADS_PORTF0_DS	PORTF 0 to 7 pins DS control
PADS_PORTF1_DS	PORTF 8 to 15 pins DS control
PADS_PORTG0_DS	PORTG 0 to 7 pins DS control
PADS_PORTG1_DS	PORTG 8 to 15 pins DS control
PADS_PORTH0_DS	PORTH 0 to 7 pins DS control
PADS_PORTH1_DS	PORTH 8 to 15 pins DS control
PADS_PORTI0_DS	PORTI 0 to 7 pins DS control
PADS_PORT[n]_PDE	PORTx Pull-Down Enable

Table 11-40: ADSP-2159x PADS Register List (Continued)

Name	Description
<code>PADS_PORT[n]_PUE</code>	PORTx Pull-Up Enable

DAI0 1 to 10 pins DS control

Figure 11-36: PADS_DAI0_0_DS Register Diagram

Table 11-41: PADS_DAI0_0_DS Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
29:27 (R/W)	DAI10	DS control for DAI10 IO.
		1 Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2 Drive strength 010. To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.
26:24 (R/W)	DAI9	DS control for DAI9 IO.
		1 Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2 Drive strength 010. To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.

Table 11-41: PADS_DAI0_0_DS Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration	
23:21 (R/W)	DAI8	DS control for DAI8 IO.	
		1	Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2	Drive strength 010.To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.
20:18 (R/W)	DAI7	DS control for DAI7 IO..	
		1	Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2	Drive strength 010.To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.
17:15 (R/W)	DAI6	DS control for DAI6 IO.	
		1	Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2	Drive strength 010.To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.
14:12 (R/W)	DAI5	DS control for DAI5 IO.	
		1	Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2	Drive strength 010.To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.
11:9 (R/W)	DAI4	DS control for DAI4 IO.	
		1	Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2	Drive strength 010.To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.

Table 11-41: PADS_DAI0_0_DS Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration	
8:6 (R/W)	DAI3	DS control for DAI3 IO.	
		1	Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2	Drive strength 010. To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.
5:3 (R/W)	DAI2	DS control for DAI2 IO.	
		1	Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2	Drive strength 010. To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.
2:0 (R/W)	DAI1	DS control for DAI1 IO.	
		1	Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2	Drive strength 010. To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.

DAI0 11 to 20 pins DS control

Bit No. (Access)	Bit Name	Description/Enumeration
29:27 (R/W)	DAI20	DS control for DAI20 IO.
		1 Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2 Drive strength 010. To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.
26:24 (R/W)	DAI19	DS control for DAI19 IO.
		1 Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2 Drive strength 010. To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.

Table 11-42: PADS_DAI0_1_DS Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration	
23:21 (R/W)	DAI18	DS control for DAI18 IO.	
		1	Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2	Drive strength 010. To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.
20:18 (R/W)	DAI17	DS control for DAI17 IO.	
		1	Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2	Drive strength 010. To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.
17:15 (R/W)	DAI16	DS control for DAI16 IO.	
		1	Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2	Drive strength 010. To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.
14:12 (R/W)	DAI15	DS control for DAI15 IO.	
		1	Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2	Drive strength 010. To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.
11:9 (R/W)	DAI14	DS control for DAI14 IO.	
		1	Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2	Drive strength 010. To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.

Table 11-42: PADS_DAI0_1_DS Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration	
8:6 (R/W)	DAI13	DS control for DAI13 IO.	
		1	Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2	Drive strength 010. To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.
5:3 (R/W)	DAI12	DS control for DAI12 IO.	
		1	Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2	Drive strength 010. To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.
2:0 (R/W)	DAI11	DS control for DAI11 IO.	
		1	Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2	Drive strength 010. To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.

DAI0 Port Input Enable Control Register

The `PADS_DAI0_IE` register configures input enable control of the DAI0 (20 pins) pads. If =0 implies input buffer disable and if =1 implies enable.

Figure 11-38: PADS_DAI0_IE Register Diagram

Table 11-43: PADS_DAI0_IE Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
19:0 (R/W)	VALUE	DAI0 Input Enable Control.

DAI1 1 to 10 pins DS control

Bit No. (Access)	Bit Name	Description/Enumeration
29:27 (R/W)	DAI10	DS control for DAI10 IO.
		1 Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2 Drive strength 010. To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.
26:24 (R/W)	DAI9	DS control for DAI9 IO.
		1 Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2 Drive strength 010. To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.

Table 11-44: PADS_DAI1_0_DS Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration	
23:21 (R/W)	DAI8	DS control for DAI8 IO.	
		1	Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2	Drive strength 010. To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.
20:18 (R/W)	DAI7	DS control for DAI7 IO.	
		1	Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2	Drive strength 010. To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.
17:15 (R/W)	DAI6	DS control for DAI6 IO.	
		1	Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2	Drive strength 010. To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.
14:12 (R/W)	DAI5	DS control for DAI5 IO.	
		1	Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2	Drive strength 010. To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.
11:9 (R/W)	DAI4	DS control for DAI4 IO.	
		1	Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2	Drive strength 010. To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.

Table 11-44: PADS_DAI1_0_DS Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration	
8:6 (R/W)	DAI3	DS control for DAI3 IO.	
		1	Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2	Drive strength 010. To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.
5:3 (R/W)	DAI2	DS control for DAI2 IO.	
		1	Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2	Drive strength 010. To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.
2:0 (R/W)	DAI1	DS control for DAI1 IO.	
		1	Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2	Drive strength 010. To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.

DAI1 11 to 20 pins DS control

Figure 11-40: PADS_DAI1_1_DS Register Diagram

Bit No. (Access)	Bit Name	Description/Enumeration
29:27 (R/W)	DAI20	DS control for DAI20 IO.
		1 Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2 Drive strength 010. To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.
26:24 (R/W)	DAI19	DS control for DAI19 IO.
		1 Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2 Drive strength 010. To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.

Table 11-45: PADS_DAI1_1_DS Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration	
23:21 (R/W)	DAI18	DS control for DAI18 IO.	
		1	Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2	Drive strength 010. To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.
20:18 (R/W)	DAI17	DS control for DAI17 IO.	
		1	Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2	Drive strength 010. To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.
17:15 (R/W)	DAI16	DS control for DAI16 IO.	
		1	Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2	Drive strength 010. To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.
14:12 (R/W)	DAI15	DS control for DAI15 IO.	
		1	Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2	Drive strength 010. To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.
11:9 (R/W)	DAI14	DS control for DAI14 IO.	
		1	Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2	Drive strength 010. To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.

Table 11-45: PADS_DAI1_1_DS Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration	
8:6 (R/W)	DAI13	DS control for DAI13 IO.	
		1	Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2	Drive strength 010. To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.
5:3 (R/W)	DAI12	DS control for DAI12 IO.	
		1	Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2	Drive strength 010. To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.
2:0 (R/W)	DAI11	DS control for DAI11 IO.	
		1	Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2	Drive strength 010. To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.

DAI1 Port Input Enable Control Register

The `PADS_DAI1_IE` register configures input enable control of the DAI1 (20 pins) pads. If =0 implies input buffer disable and if =1 implies enable.

Figure 11-41: PADS_DAI1_IE Register Diagram

Table 11-46: PADS_DAI1_IE Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
19:0 (R/W)	VALUE	DAI1 Input Enable Control.

DAIx Pull-Down Enable

Figure 11-42: PADS_DAI[n]_PDE Register Diagram

Table 11-47: PADS_DAI[n]_PDE Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
19:0 (R/W)	PUD	Pull-Up Disable.

DAIx Pull-Up Enable

The `PADS_DAI[n]_PUE` register enables the pull-up resistor for DAI pins.

Figure 11-43: PADS_DAI[n]_PUE Register Diagram

Table 11-48: PADS_DAI[n]_PUE Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
19:0 (R/W)	PUE	Pull-Up Enable.

Non-GPIO Drive Strength Register

The `PADS_NONPORTS_DS` register is for ADI internal usage only. The `PADS_NONPORTS_DS` register sets the drive strength and tolerance for the non-GPIO pins. The drive strength can be controlled only for pin groups, classified by the interface type.

Figure 11-44: PADS_NONPORTS_DS Register Diagram

Table 11-49: PADS_NONPORTS_DS Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
20:18 (R/W)	FAULT	FAULT DS control..
17:15 (R/W)	OSPI	OSPI pins DS control..
		1 Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2 Drive strength 010.To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.
14:12 (R/W)	LP0CK	LP0 Clock Drive Strength Control..
		1 Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2 Drive strength 010.To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.

Table 11-49: PADS_NONPORTS_DS Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration	
11:9 (R/W)	LP1CK	LP1 Clock Drive Strength Control..	
		1	Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2	Drive strength 010.To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.
8:6 (R/W)	FAULTB	FAULTB DS control..	
		1	Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2	Drive strength 010.To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.
5:3 (R/W)	RESOUTB	RESOUTB DS control..	
		1	Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2	Drive strength 010.To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.
2:0 (R/W)	CKOUT	CLKOUT DS control..	
		1	Drive strength 001. To be used for operating frequency less than or equal to 62.5MHz. Drive Strength 000/1xx are invalid
		2	Drive strength 010.To be used for operating frequency more than 62.5MHz. Drive Strength 000/1xx are invalid.

Peripheral PAD Configuration0 Register

The `PADS_PCFG0` register provides several configuration options for the pads and multiplexing for peripherals.

Figure 11-45: PADS_PCFG0 Register Diagram

Table 11-50: PADS_PCFG0 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
18 (R/W)	FAULT_DIS	FAULT does not exist.
		0 Disable input
		1 Enable input
17 (R/W)	EMACCAUXIE	Input enable control for PTP_AUXIN pins.
		0 Disable input
		1 Enable input
16 (R/W)	PUTMS	Pull-Up Enable for TMS/SWDIO (debug port).
		0 Disable pull-up
		1 Enable pull-up
7 (R/W)	CNT0DGSEL	CNT0 Down Input Select. The <code>PADS_PCFG0</code> bit selects the input for the CNT0 counter down and gate.
		0 GPIO port pins
		1 Trigger connection

Table 11-50: PADS_PCFG0 Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
6 (R/W)	CNT0UDSEL	CNT0 Up Input Select. The <code>PADS_PCFG0</code> bit selects the input for the CNT0 counter up and direction.
		0 GPIO port pins
		1 Trigger connection
4:3 (R/W)	EMACPHYSEL	Select PHY Interface RGMII/RMII/MII.
		0 MII Interface
		1 RGMII Interface
		2 RMII Interface
		3 Reserved
2 (R/W)	EMACRESET	Reset Enable for RGMII. The <code>PADS_PCFG0.EMACRESET</code> bit asserts the reset on the RGMII interface. To select the PHY interface (RGMII or RMII), set the EMACPHYSEL bit as required and then set <code>PADS_PCFG0.EMACRESET</code> .
		0 RGMII reset is asserted
		1 RGMII reset reset is deasserted
1:0 (R/W)	EMAC0	PTP Clock Source 0. The <code>PADS_PCFG0.EMAC0</code> selects the clock source for the PTP Block in EMAC0.
		0 EMAC0_RMII CLK
		1 SCLK
		2 External Clock
		3 SCLK

Peripheral Configuration1 Register

Figure 11-46: PADS_PCFG1 Register Diagram

Table 11-51: PADS_PCFG1 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
25:16 (R/W)	TIMER_SEC_INP	Selects secondary inputs to timers.. Selects secondary inputs to timers. '0' on each bit selects {PB_02,PA_06, PA_02,PA_08,PA_06,PA_11,PB_00,PB_11,PA_14,PA_07,PB_01}, '1' on each bit selects {PE_03,PG_09,PG10,PI_05,PF15,PG04,PD_10,PD_04,PD_08,PF_05} respectively on {TIMER0_ACLK4, TIMER0_ACLK3,TIMER0_ACLK2,TIMER0_ACLK1,TIMER0_ACI4,TIMER0_ACI3,TIMER0_ACI2,TIMER0_ACI1,TIMER0_ACI0,TIMER0_CLK}

12 Thermal Monitoring Unit (TMU)

The TMU provides on-chip temperature measurement which is important in applications that have substantial power consumption. The TMU is integrated into the processor die and digital infrastructure using an MMR-based system access to measure the die temperature variations in real-time.

TMU Features

The TMU supports the following features:

- On-chip temperature sensing
- Programmable over-temperature and under-temperature limits
- Programmable conversion rate
- Averaging feature available
- Temperature gain and offset correction options
- Uses dedicated channel of HADC for conversion
- Programmable blanking and refresh period for TMU conversion

TMU Functional Description

Following sections provide the functional description of TMU.

ADSP-2159x TMU Register List

Thermal monitoring unit

Table 12-1: ADSP-2159x TMU Register List

Trigger ID	Name	Description	Sensitivity
None			

TMU Definitions

The following definitions are helpful when using the TMU module.

Thermal Diode

A special type of diode whose electrical properties change with the temperature in a defined way.

DTM

Dynamic thermal management is a set of techniques that adapt the run-time behavior of a processor to achieve the highest performance under thermal constraints.

TMU Block Diagram

The *Thermal Monitoring Unit Block Diagram* shows the main block inside TMU.

Figure 12-1: Thermal Monitoring Unit Block Diagram

TMU Architectural Concepts

The following sections provide information on the architecture and system integration of the TMU.

System Integration

Dynamic thermal management (DTM) techniques adapt the run-time behavior of a processor to achieve the highest performance under thermal constraints. One of the most important aspects of DTM is to capture the run-time variations in the temperature caused by power consumption variations due to workload changes.

The accuracy of thermal measurements directly affects the efficiency of thermal management as well as the performance of the processor. Temperature estimations lower or higher than the actual temperature may cause late or early activation of DTM techniques.

- Late activation of DTM can result in degraded reliability because the temperature may exceed the designated thresholds.
- Early activation of DTM can have significant impact on performance.

The TMU is an analog thermal sensor that consists of a temperature-sensing diode, a calibrated reference current source, and a current comparator. The sensor placement error is one of the most important sources of inaccuracy in values obtained from thermal sensors.

The TMU module provides the temperature monitoring capability to the chip and implements thermal management in the end system. It provides many features which ensure the minimum load on the software and also minimal or no external components for a flexible temperature monitoring system.

Digital Thermometer

The TMU functions as a digital thermometer with an MMR-based system access. The on-die temperature value is measured and digitized through an A/D converter. The temperature value is stored and updated periodically in an MMR register. The TMU can be configured to generate an interrupt as it crosses the upper temperature limit (`TMU_FLT_LIM_HI` register). A thermal event is also routed to the interrupt port of the sensor. The event is then routed to the SEC, to ensure that core intervention is not required in the event of overheating.

Temperature Sensor Averaging

The temperature sensor averaging feature enhances the accuracy of the temperature measurements. To enable this feature, the `TMU_AVG` bits must be enabled in the control register after power-up. In this mode, the averaging reduces the effect of noise on the temperature result. The temperature is measured each time a conversion is performed. A moving average method is used to determine the result in the temperature value register. The total time to measure a temperature channel is typically 1 ms.

TMU and HADC

The TMU module uses one of the ADC channels to digitize the temperature reading. Therefore, the HADC module is shared by the TMU. If the TMU is not enabled, the HADC operates at its full throughput. TMU can be enabled periodically or permanently. In periodic enable mode, it is enabled once in a specific refresh period. After enabling, the TMU measures the temperature for a specific blanking period. During the blanking period, the TMU uses the ADC for temperature measurement, so that the ADC is not available for data conversion.

The typical value of blanking period is 1×10^6 system clock (SCLK) cycles

The typical value of refresh period is 21×10^6 SCLK cycles

So, for every 21×10^6 cycles, 1×10^6 cycles are used for temperature measurement. Program these values for blanking period and refresh period through the TMU registers.

When TMU is enabled, the HADC module is not available for external input conversion. This state is indicated by the `HADC_STAT.TMUHADC_BUSY` status bit. All the requests for HADC conversion are ignored when `HADC_STAT.TMUHADC_BUSY` bit is high.

In the periodic enable mode, the ongoing HADC conversion is completed activating the TMU to measure temperature as shown. If HADC is in autoscan mode, the TMU is activated after completing the ongoing sequence. If HADC is in fixed-conversion mode, all the fixed conversions are completed and followed by TMU activation.

TMU Event Control

The TMU generates different events depending on the state of the TMU temperature measurement and the different thresholds set in thresh hold registers. These events are reported in the `TMU_STAT` register as shown below. It can generate an event for each of following conditions.

- The fault high limit is configured in the `TMU_FLT_LIM_HI` register. The interrupt is generated when the temperature value is greater than or equal to this value.
- The alert high limit is configured in the `TMU_ALRT_LIM_HI` register. The interrupt is generated when the temperature value is greater than or equal to this value.
- The fault low limit is configured in the `TMU_FLT_LIM_LO` register. The `TMU_STAT.FLTLO` status bit is set when the temperature value is less than or equal to this value.
- The alert low limit is configured in the `TMU_ALRT_LIM_LO` register. The `TMU_STAT.FLTLO` status bit is set when the temperature value is less than or equal to this value.

Interrupts and status conditions can be masked (disabled) or unmasked (enabled) by setting and clearing bits in the `TMU_IMSK` register.

NOTE: Only `TMU_FLT_LIM_HI` and `TMU_ALRT_LIM_HI` generate an interrupt to core. Other events only result in status change in the `TMU_STAT` register.

Status and Error Signals

When the measured temperature value exceeds the high or low limits that are configured in the `TMU_FLT_LIM_HI`/`TMU_FLT_LIM_LO` and the `TMU_ALRT_LIM_HI`/`TMU_ALRT_LIM_LO` registers, corresponding thermal events are triggered.

The fault and alert events are sent to the core through the status register (`TMU_STAT`). Both the `TMU_STAT.FLTHI` and `TMU_STAT.ALRTHI` bits are sticky bits and are cleared by a W1C operation by the core.

The alert and fault registers can be programmed through the MMR bus interface as shown in the TMU block diagram. A write into the `TMU_FLT_LIM_HI`/`TMU_FLT_LIM_LO` and `TMU_ALRT_LIM_HI`/`TMU_ALRT_LIM_LO` registers or the `TMU_TEMP` register is not allowed when the events are being triggered.

TMU Programming Guidelines

The following section provides basic programming information for the TMU module.

To get the best performance and accuracy from the TMU, initialize the `TMU_GAIN`, `TMU_OFFSET` and `TMU_AVG` registers before enabling the module. Contact Analog Devices, Inc for the current best values to use.

After these registers are programmed, the rest of the TMU initialization can take place. This includes setting up the fault and alert limits and then enabling the TMU.

ADSP-2159x TMU Register Descriptions

Thermal monitoring unit (TMU) contains the following registers.

Table 12-5: ADSP-2159x TMU Register List

Name	Description
<code>TMU_ALERT_LIM_HI</code>	Alert High Limit Register
<code>TMU_ALERT_LIM_LO</code>	Alert Low Limit Register
<code>TMU_AVG</code>	Averaging Register
<code>TMU_CNV_BLANK</code>	Temperature conversion blank register
<code>TMU_CTL</code>	TMU Control Register
<code>TMU_FLT_LIM_HI</code>	Fault High Limit Register
<code>TMU_FLT_LIM_LO</code>	Fault Low Limit Register
<code>TMU_GAIN</code>	Gain Value Register
<code>TMU_IMSK</code>	Interrupt Mask Register
<code>TMU_OFFSET</code>	Offset Register
<code>TMU_REFR_CNTR</code>	Temperature Refresh Counter
<code>TMU_STAT</code>	Status Register
<code>TMU_TEMP</code>	Temperature Value Register

Alert High Limit Register

The `TMU_ALERT_LIM_HI` register sets the temperature alert high limit as an integer value. The value is stored in two's complement format. Asserts `TMU_STAT.ALRTHI` if the `TMU_TEMP` value is greater than or equal to `TMU_ALERT_LIM_HI`. The `TMU_ALERT_LIM_HI` value should be programmed for value greater than 8'h3C (60 degC).

Figure 12-2: TMU_ALERT_LIM_HI Register Diagram

Table 12-6: TMU_ALERT_LIM_HI Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
8:0 (R/W)	VALUE	Value. The <code>TMU_ALERT_LIM_HI.VALUE</code> bit field configures the alert temperature high limit as an integer value stored in two's complement format. If the temperature value is greater than or equal to the high-limit the <code>TMU_STAT.ALRTHI</code> bit is set.

Alert Low Limit Register

The `TMU_ALERT_LIM_LO` register configures the alert temperature low limit.

Figure 12-3: `TMU_ALERT_LIM_LO` Register Diagram

Table 12-7: `TMU_ALERT_LIM_LO` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
8:0 (R/W)	VALUE	Value. The <code>TMU_ALERT_LIM_LO.VALUE</code> bit field configures the alert temperature low limit as an integer value stored in two's complement format. If the temperature value is less than or equal to the low-limit the <code>TMU_STAT.ALRTLO</code> bit is set.

Averaging Register

The `TMU_AVG` register enables averaging on the TMU.

Figure 12-4: `TMU_AVG` Register Diagram

Table 12-8: `TMU_AVG` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
0 (R/W)	EN	Value. The <code>TMU_AVG.EN</code> bit enables averaging on the TMU. Averaging is done using the formula $(7 \times \text{previous_avg_value} + \text{current_value})/8$. Initially the <code>current_value</code> is taken as <code>previous_avg_value</code> .
		0 No averaging
		1 Enable averaging

Temperature conversion blank register

Figure 12-5: TMU_CNv_BLANK Register Diagram

Table 12-9: TMU_CNv_BLANK Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
28:24 (R/W)	PERIOD	Blanking Period. The TMU_CNv_BLANK.PERIOD specifies the blanking period. TMU uses the HADC for temperature conversion during this period. The conversion time is calculated as: (CNV_BLANK+1)*50k SCLK cycles. So, the minimum conversion time is 50k SCLK cycles. Default conversion time is 20*10^4 SCLK cycles. For this duration, the system cannot use HADC for data conversion and HADC does take input for data-conversion. The status is indicated by TMUHADC_BUSY bit of the HADC block.

TMU Control Register

The `TMU_CTL` register contains bits that allow programs to configure and enable the TMU.

Figure 12-6: TMU_CTL Register Diagram

Table 12-10: TMU_CTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
13 (R/W)	TMEN_FORCE	Indefinite Enable. Asserting the <code>TMU_CTL.TMEN_FORCE</code> bit enables the TMU indefinitely. HADC is always used by the TMU, so the HADC cannot be used to convert channel inputs.
11:4 (R/W)	SCLKDIV	System Clock Divide. The <code>TMU_CTL.SCLKDIV</code> bit selects the division ratio for the system clock (SCLK). SCLK is divided by $(21+4*SCLKDIV)$. Thus, by default the SCLK is divided by 21.
3 (R/W)	TMEN	Periodic Enable. Asserting the <code>TMU_CTL.TMEN</code> bit enables the TMU periodically. TMU is enabled once in every refresh period defined by the <code>TMU_REFR_CNTR</code> register. And in each refresh period, TMU measures temperature for the blanking period (Tblank). It is defined by CNV_BLANK bit.
		0 Disable TMU
		1 Enable TMU periodically
0 (R/W)	TMPU	TMU Enable. The <code>TMU_CTL.TMPU</code> bit enables the TMU. By default, the module is in power-down mode. The peripheral interface is active even in power-down mode (the TMU registers can be read/written).
		0 Power Down the analog circuitry of TMU
		1 Power Up the analog circuitry of TMU

Fault High Limit Register

The `TMU_FLT_LIM_HI` register sets the temperature fault high limit as an integer value. The value is stored in two's complement format. Asserts `TMU_STAT.FLTHI` if the `TMU_TEMP` value is greater than or equal to `TMU_FLT_LIM_HI`. The `TMU_FLT_LIM_HI` value should be programmed for value greater than 8'h3C (60 degC).

Figure 12-7: TMU_FLT_LIM_HI Register Diagram

Table 12-11: TMU_FLT_LIM_HI Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
8:0 (R/W)	VALUE	Value. The <code>TMU_FLT_LIM_HI.VALUE</code> bit field sets the temperature high limit as an integer in two's complement format. If the limit value is greater than or equal to the high-limit the <code>TMU_STAT.FLTHI</code> bit is set.

Fault Low Limit Register

The `TMU_FLT_LIM_LO` register configures the fault temperature low limit.

Figure 12-8: `TMU_FLT_LIM_LO` Register Diagram

Table 12-12: `TMU_FLT_LIM_LO` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
8:0 (R/W)	VALUE	Value. The <code>TMU_FLT_LIM_LO.VALUE</code> bit field configures the fault temperature low limit as an integer which is stored in two's complement format. If the temperature value is less than or equal to the low-limit, the <code>TMU_STAT.FLTLO</code> bit is set.

Gain Value Register

The `TMU_GAIN` register is used to configure the gain value in two's complement format. This value is used to correct the gain error in the `TMU_TEMP` register.

Figure 12-9: TMU_GAIN Register Diagram

Table 12-13: TMU_GAIN Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
9:0 (R/W)	VALUE	Value. The <code>TMU_GAIN.VALUE</code> bit field configures the gain value in two's complement format. This value is used to correct the gain error in the <code>TMU_TEMP</code> register.

Interrupt Mask Register

The `TMU_IMSK` register provides bit that are used to mask and unmask the interrupts associated with the TMU module.

Figure 12-10: TMU_IMSK Register Diagram

Table 12-14: TMU_IMSK Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
3 (R/W)	ALRTLO	Alert Low Mask. The <code>TMU_IMSK.ALRTLO</code> bit masks or unmasks the alert low status change (<code>TMU_STAT.ALRTLO</code>).
		0 Unmask alert low status change
		1 Mask alert low status change
2 (R/W)	FLTLO	Fault Low Mask. The <code>TMU_IMSK.FLTLO</code> bit masks or unmasks the fault low status change (<code>TMU_STAT.FLTLO</code>).
		0 Unmask fault low status change
		1 Mask fault low status change
1 (R/W)	ALRTHI	Alert High Mask. The <code>TMU_IMSK.ALRTHI</code> bit masks or unmasks the alert high status change (<code>TMU_STAT.ALRTHI</code>).
		0 Unmask alert high status change
		1 Mask alert high status change
0 (R/W)	FLTHI	Fault High Mask. The <code>TMU_IMSK.FLTHI</code> bit masks or unmasks the fault high interrupt (<code>TMU_STAT.FLTHI</code>).
		0 Unmask fault high interrupt
		1 Mask fault high interrupt

Offset Register

The value programmed in the `TMU_OFFSET` register is used to correct the offset error in `TMU_TEMP` register.

Figure 12-11: TMU_OFFSET Register Diagram

Table 12-15: TMU_OFFSET Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
14:0 (R/W)	VALUE	Value. The <code>TMU_OFFSET.VALUE</code> bit field provides the offset value which is used to correct the offset error in the <code>TMU_TEMP</code> register. This value is in a two's complement fixed point Q7.7 format i.e 8 MSB's represent integer part in 2's complement format. and remaining 7 LSB's represent decimal part. Offset will be applied after multiplying gain.

Temperature Refresh Counter

Figure 12-12: TMU_REFR_CNTR Register Diagram

Table 12-16: TMU_REFR_CNTR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
5:0 (R/W)	VALUE	Refresh Period. The TMU_REFR_CNTR.VALUE bit field defines the period to refresh the temperature value. Temperature is refreshed for every (VALUE+1)*(21+4*SCLKDIV)*1M system-clock cycles. SCLKDIV is defined in TMU_CTL register. So, by default, the period is 21 million system-clock cycles.

Status Register

The `TMU_STAT` register bits indicate when an error or fault is detected.

Figure 12-13: `TMU_STAT` Register Diagram

Table 12-17: `TMU_STAT` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
7 (R/NW)	ALRTLO	Alert Low. The <code>TMU_STAT.ALRTLO</code> bit is set when the temperature value is less than or equal to the setting in the <code>TMU_ALRT_LIM_LO</code> register. The bit assertion is masked if <code>TMU_IMSK.ALRTLO</code> is HIGH.
6 (R/NW)	FLTLO	Fault Low. The <code>TMU_STAT.FLTLO</code> bit is set when the temperature value is less than or equal to the setting in the <code>TMU_FLT_LIM_LO</code> register. The bit assertion is masked if <code>TMU_IMSK.FLTLO</code> is HIGH.
5 (R/W1C)	ALRTHI	Alert High. The <code>TMU_STAT.ALRTHI</code> bit is set when the temperature value is greater than or equal to the setting in the <code>TMU_ALRT_LIM_HI</code> register. The temperature value register is set to 16'h2C00 (effective temperature value of 44 degrees C) when a W1C operation is done on this bit. The bit assertion is masked if <code>TMU_IMSK.ALRTHI</code> is HIGH.
4 (R/W1C)	FLTHI	Fault High. The <code>TMU_STAT.FLTHI</code> bit is set when the temperature value is greater than or equal to the setting in the <code>TMU_FLT_LIM_HI</code> register. The temperature value register is set to 16'h2C00 (effective temperature value of 44) when a W1C is done on this bit. The bit assertion is masked if <code>TMU_IMSK.FLTHI</code> is HIGH.

Temperature Value Register

The `TMU_TEMP` register provides the temperature value from the A/D converter and the status.

Figure 12-14: `TMU_TEMP` Register Diagram

Table 12-18: `TMU_TEMP` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15:0 (R/NW)	VALUE	Value. The <code>TMU_TEMP.VALUE</code> bit field is the temperature value from A/D converter. This value is stored in two's complement fixed point Q7.8 format where the 8 MSB's represent the integer part in 2's complement, and the remaining 8 LSB's represent the decimal part.

13 Housekeeping ADC (HADC)

The Housekeeping ADC is a 12-bit (with 10-bit accuracy), successive approximation ADC. It operates from single supply and features throughput rates up to 1 MSPS. The HADC can be used for the collection of housekeeping parameters like voltages, temperatures in the system or for any general-purpose use as well.

NOTE: HADC is used by the TMU for temperature monitor, so it may be unavailable during temperature conversion. For details, refer to the [TMU and HADC](#) section.

HADC Features

The HADC supports following features:

- 12-bit ADC core with built-in sample and hold
- ENOB = 10 bit
- 8 input channels which can be extended to 15 channels by putting an external channel multiplexer
- Throughput rates up to 1 MSPS
- Single ended operation
- External reference nominal at 1.8 V
- Analog input 0 V to 1.8 V.
- Selectable ADC clock frequency through a pre-scaler
- Conversion type adaptable to each application: allows single or continuous conversion with option of auto-scan
- Number of channels: 4 for BGA and 2 for LQFP
- Auto sequencing capability provides up to 8 *auto-conversions* in a single session. Each conversion can be programmed to select any of the available input channels.

HADC Functional Description

The HADC provides the analog to digital conversion capability for general-purpose housekeeping tasks, such as voltage and temperature monitoring. The core of HADC is a 12-bit SAR ADC, providing multiple analog input channels.

The HADC has the following functionality:

Fixed and continuous conversion modes

ADC converts the input channel sequence for a fixed number of times or continuously converts an input channel sequence.

Auto scanning

All the input channels can be sampled in a sequential manner.

Channel sequence programming

The sequence of a channel can be selected by programming the channel mask register. If the bit corresponding to the channel is programmed to zero, that channel is included in the auto-scan chain.

ADSP-2159x HADC Register List

The Housekeeping ADC (HADC) provides a general purpose, multi-channel successive approximation A-to-D converter. A set of registers governs HADC operations. For more information on HADC functionality, see the HADC register descriptions.

Table 13-1: ADSP-2159x HADC Register List

HADC Definitions

The following definitions are helpful when using the HADC module.

Auto-scan

Auto-scan is a feature which allows the multiple channels to be scanned and converted in sequence one after the other.

HADC Wakeup Time

It is the time required by the module after coming out of power down before it can start converting.

Signal-to-Noise and Distortion Ratio (SINAD)

The measured ratio of signal-to-noise and distortion at the output of the ADC. The signal is the rms amplitude of the fundamental. Noise is the sum of all non-fundamental signals up to half the sampling frequency ($f_s/2$), excluding dc. The ratio depends on the number of quantization levels in the digitization process; the more levels, the smaller the quantization noise. The theoretical signal-to-noise and distortion ratio for an ideal N-bit converter with a sine wave input is given by:

$$\text{Signal-to-(Noise + Distortion)} = (6.02 N + 1.76) \text{ dB}$$

Total Harmonic Distortion (THD)

The ratio of the rms sum to the harmonics to the fundamental.

Peak Harmonic or Spurious Noise

The ratio of the rms value of the next largest component in the ADC output spectrum (up to $f_s/2$ and excluding dc) to the rms value of the fundamental. Typically, the value of this specification is determined by the largest harmonic in the spectrum, but for ADCs where the harmonics are buried in the noise floor, it is a noise peak.

Integral Nonlinearity

The maximum deviation from a straight line passing through the endpoints of the ADC transfer function. The endpoints are zero scale, a point 1 LSB below the first code transition, and full scale, a point 1 LSB above the last code transition.

Differential Nonlinearity

The difference between the measured and the ideal 1 LSB change between any two adjacent codes in the ADC.

Offset Error

The deviation of the first code transition (00...000) to (00...001) from the ideal—that is, $\text{GND1} + 1 \text{ LSB}$.

Offset Error Match

The difference in offset error between any two channels.

Gain Error

The deviation of the last code transition (111...110) to (111...111) from the ideal (that is, $\text{REFIN} - 1 \text{ LSB}$) after the offset error has been adjusted out.

Gain Error Matching

The difference in gain error between any two channels.

Power Supply Rejection Ratio (PSRR)

PSRR is defined as the ratio of the power in the ADC output at full-scale frequency, f , to the power of a 100 mV p-p sine wave applied to the ADC VDD supply of frequency, f_s . The frequency of the input varies from 5 kHz to 25 MHz. $\text{PSRR (dB)} = 10 \log(P_f/P_{f_s})$ where: P_f is the power at frequency, f , in the ADC output. P_{f_s} is the power at frequency, f_s , in the ADC output.

HADC Block Diagram

The *HADC Block Diagram* figure shows the functional blocks within the HADC and the interface to the processor core and the peripherals. The HADC has an internal 8 channel multiplexer that is controlled by a programmable sequencer which selects the desired channel or sequence of channels.

Figure 13-1: HADC Block Diagram

HADC Signal Descriptions

The *HADC Signal Descriptions* table provides descriptions of the signals used by the HADC.

Table 13-5: HADC Signal Descriptions

Signal Name	Signal Description
AVDD	ADC I/O supply
AVSS	I/O ground for analog blocks
VREFP	External reference for ADC
VREFN	Ground reference for ADC
VINn	Analog input at channel n

HADC Architectural Concepts

The HADC is based on a 12-bit SAR ADC that provides a simple register-based access model to obtain the results of conversion. The digital front end of the HADC provides a set of registers to configure the mode of operation, sampling frequency, and input channel selection control. The ADC supports multiple input analog channels which can be individually selected or deselected for conversion. The results of each analog channel are stored in a register. The core can access the register to read the conversion results once the conversion is complete. The HADC also provides the interrupts on completion of each channel conversion to avoid polling by the core. The following sections provide more details about the architecture of the HADC.

Converter Operation

The housekeeping ADC is a 12-bit successive approximation ADC based around a capacitive DAC. The *ADC Acquisition Phase* figure and the *ADC Conversion Phase* figure show simplified schematics of the ADC. The ADC is comprised of control logic, SAR, and a capacitive DAC. The components are used to add and subtract fixed amounts of charge from the sampling capacitor to bring the comparator back into a balanced condition. The *ADC Conversion Phase* figure shows the ADC during its acquisition phase. SW2 is closed and SW1 is in Position A. The

comparator is held in a balanced condition and the sampling capacitor acquires the signal on the selected V_{IN} channel.

Figure 13-2: ADC Acquisition Phase

When the ADC starts a conversion (see the *ADC Conversion Phase* figure), SW2 opens and SW1 moves to Position B, causing the comparator to become unbalanced. The control logic and the capacitive DAC are used to add and subtract fixed amounts of charge to bring the comparator back into a balanced condition. When the comparator is rebalanced, the conversion is complete. The control logic generates the ADC output code.

Figure 13-3: ADC Conversion Phase

Auto-Scan

The HADC features auto-scan mode where all the input channels can be sampled in a sequential manner. The number of channels enabled in auto-scan mode can be selected by programming the `HADC_CHAN_MSK` register. If the bit corresponding to the channel is set high, that particular channel is masked, and is not included in the auto-scan chain. In this way programs can sample all, none, or a selected set of channels by writing a high or a low for the individual channel. Auto sequencing allows the system to convert the same channel multiple times, allowing programs to perform oversampling algorithms.

For example, if the `HADC_CHAN_MSK` register bits [3:0] are set to 1101, then channel 0, channel 2 and channel 3 are not included in the auto-scan chain. Whether the conversion is a single or fixed number or continuous depends on the status of `HADC_CTL.CONT` bit. If this bit is low, the `HADC_CTL.FIXEDCNV` bits determine the number of sequence conversions.

The maximum number of fixed sequence conversions is 15. By default, the first eight channels of the HADC are enabled and extended channels are masked. An extended channel is the increased number of channels when a single channel of ADC is externally multiplexed, effectively increasing the total number of available channels. The total number of channels supported is 15. The program must configure the `HADC_CHAN_MSK` register to enable any desired channel.

Channel Sequence Programming

The sequence of a channel can be selected by programming the `HADC_CHAN_MSK` register. If the bit corresponding to the channel is programmed to zero, that channel is included in the auto-scan chain. If the program must get the conversion results from a particular channel, then the bit corresponding to that channel should be zero.

Channels 8-15 are virtual channels, in that they can connect an external multiplexer and increase the effective number of channels. As the output of the external multiplexer is routed to channel 7, this channel is not available (or converted) separately when the virtual channels are not masked in the `HADC_CHAN_MSK` register. The auto-scan section has more details.

ADC Transfer Function

The output coding is straight binary for the analog input channel conversion. The designed code transitions occur at successive LSB values (that is, 1 LSB, 2 LSBs, and so forth). The LSB size is $V_{REF}/4096$ for the HADC. The *ADC Transfer Function* figure shows the ideal transfer characteristic for straight binary coding.

Figure 13-4: ADC Transfer Function

Results

The HADC takes 20 cycles of f_{SAMPLE} for one channel conversion. (The value of the `HADC_CTL.FDIV` bit field determines f_{SAMPLE}). The time taken to complete one sequence depends on the number of channels in the auto-scan chain. There is a latency of 1 cycle from the time the channel is selected internally to sample to the time the data is ready. After the end of each channel conversion, the data is written into the corresponding data register. An interrupt is generated (if the interrupt mask is not enabled) to signal that the data is ready for that particular channel.

HADC Operating Modes

The HADC has two modes of operation described in the following sections.

Fixed Conversion Mode

In this mode, the ADC converts the input channel sequence for a fixed number of times. The frequency is configured in the `HADC_CTL.FIXEDCNV` bit field. To use this mode, clear the `HADC_CTL.CONT` bit.

Continuous Conversion Mode

In this mode ADC continuously converts an input channel sequence, as long as `HADC_CTL.STARTCNV` bit is held high. To use this mode, set the `HADC_CTL.CONT` bit.

HADC Event Control

The HADC generates different events depending on the state of the ADC and the status of channel conversions. It can generate an event for each of the following conditions:

- When ADC is ready for conversion
- At the end of sequence conversion
- At the end of each individual channel conversion

Each of these events can generate an interrupt. To generate an interrupt on any desired event, clear the respective bit in the [HADC_IMSK](#) register.

HADC Programming Model

Following sections provide some guidelines for HADC programming.

Powering Up the HADC

To power-up the HADC, program the following bits in the [HADC_CTL](#) register.

- Deassert the `HADC_CTL.PD` bit (HADC power down)
- Set the `HADC_CTL.NRST` bit (Reset)
- Set the `HADC_CTL.ENLS` bit (Enable level shifters)

After deasserting `HADC_CTL.PD`, the HADC requires a finite wake-up time (t_{WAKEUP}) before it can start converting. The HADC requires only two f_{SAMPLE} clocks from the assertion of the `HADC_CTL.NRST` bit before the module is ready to convert. (`HADC_CTL.PD` is low). Poll the `HADC_STAT.RDY` bit. A 1 on this bit indicates that the HADC is ready to convert data.

Enabling the HADC

Setting the `HADC_CTL.STARTCNV` bit enables the HADC. When this bit is kept high, the HADC can work in either continuous or fixed conversion mode. After the `HADC_CTL.STARTCNV` bit is set =1, the [HADC_CHAN_MSK](#) can still be re-programmed, but the new sequence only comes into effect after the current sequence conversion is complete.

ADSP-2159x HADC Register Descriptions

Housekeeping ADC (HADC) contains the following registers.

Table 13-6: ADSP-2159x HADC Register List

Name	Description
HADC_CHAN_MSK	Channel Mask Register

Table 13-6: ADSP-2159x HADC Register List (Continued)

Name	Description
HADC_CTL	Control Register
HADC_DATA[nn]	Channel Data Registers
HADC_IMSK	Interrupt Mask Register
HADC_STAT	Status Register

Channel Mask Register

The `HADC_CHAN_MSK` register provides bits that mask each channel. The LSB corresponds to channel 0 , the second LSB to channel 1 and so on. If a mask bit is set, the corresponding channel is not converted. By default, channels 0-7 are not masked and the extended channels 8-15 are masked.

Figure 13-5: HADC_CHAN_MSK Register Diagram

Table 13-7: HADC_CHAN_MSK Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15:0 (R/W)	VALUE	Mask for Each Channel. The <code>HADC_CHAN_MSK.VALUE</code> bit field is the mask bit for each channel. The first MSB corresponds to channel 15, the second MSB to channel 14 and so on. If the mask is set for a particular channel, that channel is not converted. By default, channels 0-7 are not masked and the extended channels 8-15 are masked. The first MSB corresponds to channel 7, the second MSB to channel 6 and so on. If the mask is set for a particular channel, that channel is not converted. By default, channels 0-7 are not masked.

Control Register

The `HADC_CTL` register contains control bits that configure various module settings start or reset the module.

Figure 13-6: HADC_CTL Register Diagram

Table 13-8: HADC_CTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
13 (R/W)	ENLS	Enable Level Shifters. Setting the <code>HADC_CTL.ENLS</code> bit enables the level shifters, allowing the HADC analog side (which works in the <code>VDD_EXT</code> domain) to work with the digital core and interface is (in the <code>VDD_INT</code> domain).
		0 Disable down level shifters
		1 Enable down level shifters
12 (R/W)	DOUTOREOCB	Serial data on DOUT.. If the <code>HADC_CTL.DOUTOREOCB</code> bit =1, serial data arrives on the <code>EOC_DOUT</code> pin. If this bit =0 (default) it acts as an EOC only if the external multiplexer is connected.
		0 Reserved
		1 Reserved
11:8 (R/W)	FIXEDCNV	Fixed Conversion. The <code>HADC_CTL.FIXEDCNV</code> bit configures the number of conversions = <code>FIXEDCNV</code> . This value determines how many times a sequence is converted when the HADC is in fixed conversion mode. This only applies when the <code>HADC_CTL.CONT</code> bit =0. Before changing the <code>HADC_CTL.FIXEDCNV</code> bit, clear the <code>HADC_CTL.NRST</code> bit (=0).

Table 13-8: HADC_CTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
7 (R/W)	CONT	Continuous Conversion. When the HADC_CTL.CONT bit =0, the ADC converts a sequence for a fixed number of times. This number is configured using the HADC_CTL.FIXEDCNV bit field. When the HADC_CTL.CONT bit =1, the ADC continuously converts a given sequence, provided the HADC_CTL.STARTCNV is held high.
		0 ADC converts sequence for fixed number of times
		1 ADC continuously converts given sequence
6:3 (R/W)	FDIV	Frequency Divider. The HADC_CTL.FDIV bit field configures the $f_{\text{SAMPLE}} = f_{\text{CLK}} / (\text{FDIV} + 1)$. Select f_{CLK} and HADC_CTL.FDIV values so that f_{SAMPLE} is in range of 50 kHz to 22.5 MHz. The minimum value for HADC_CTL.FDIV is 1. Before changing the HADC_CTL.FDIV bits, clear the HADC_CTL.NRST bit.
2 (R/W)	STARTCNV	Start conversion.. The HADC_CTL.STARTCNV bit needs to be set for the ADC to start converting data. If the ADC is running in non continuous mode, it is reset by hardware after the desired number of conversions is completed.
		0 No action
		1 Start converting
1 (R/W)	PD	Power down.. The HADC_CTL.PD bit powers down the analog circuitry of the ADC. After this bit returns to 0 a finite power-up time is required before the ADC can start converting data.
		0 No action
		1 Power down the analog circuitry of the ADC
0 (R/W)	NRST	Reset.. The HADC_CTL.NRST bit resets the ADC.
		0 Reset the ADC
		1 No action

Channel Data Registers

The `HADC_DATA[nn]` registers NN ranges from 0-14. Each corresponding to an ADC channel. `ADC_DATA_0` corresponds to channel 0, `ADC_DATA_1` to channel 1 and so on.

Figure 13-7: `HADC_DATA[nn]` Register Diagram

Table 13-9: `HADC_DATA[nn]` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
11:0 (R/NW)	VALUE	Converted Data. The <code>HADC_DATA[nn].VALUE</code> bit field contains the digital code for the sampled analog value. Each channel has its own data register.

Interrupt Mask Register

The `HADC_IMSK` register masks (disables) or unmasks (enables) the interrupts as programmed.

Figure 13-8: HADC_IMSK Register Diagram

Table 13-10: HADC_IMSK Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
17 (R/W)	RDY	Mask interrupt when ADC ready to convert. The <code>HADC_IMSK.RDY</code> bit masks the interrupt generated when ADC is ready to convert.
16 (R/W)	SEQ	Mask interrupt at end of sequence completion. The <code>HADC_IMSK.SEQ</code> bit masks the interrupt which is generated at the end of sequence completion.
		0 Interrupt is unmasked
		1 Interrupt is masked
15:0 (R/W)	CHAN	Channel Mask. The <code>HADC_IMSK.CHAN</code> bit field provides the interrupt mask bit for each channel. N ranges from 0-15. The MSB corresponds to channel 15, the second MSB to channel 14 and so on. If the bit is SET, interrupt is masked for corresponding channel.

Status Register

The `HADC_STAT` register contains bits that provide status information on the HADC module.

Figure 13-9: HADC_STAT Register Diagram

Table 13-11: HADC_STAT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
20 (R/NW)	TMUHADC_BUSY	Temperature Conversion Status. The <code>HADC_STAT.TMUHADC_BUSY</code> bit, if high, indicates to the system that temperature conversion is ongoing. All ADC conversion requests are ignored.
19:4 (RX/W1C)	INTRW1C	Conversion Complete Interrupt. The <code>HADC_STAT.INTRW1C</code> bit field indicates when the corresponding ADC channel completes conversion. N ranges from 0-15 and the MSB corresponds to channel 15, the second MSB to channel 14 and so on. N ranges from 0-7 and the MSB corresponds to channel 7, the second MSB to channel 6 and so on. These bits are sticky and are W1C.
3 (RX/W1C)	SEQOVRW1C	End of Sequence Conversion. The <code>HADC_STAT.SEQOVRW1C</code> bit indicates the end of a sequence conversion and is a sticky status bit which is W1C.
2 (RX/W1C)	RDYW1C	Ready to Convert. The <code>HADC_STAT.RDYW1C</code> bit is the stick version of the <code>HADC_STAT.RDY</code> bit.
0 (R/NW)	RDY	ADC Ready. The <code>HADC_STAT.RDY</code> bit is set (=1) when the ADC is ready to convert data.

14 Watchdog Timer (WDOG)

The processor has a 32-bit watchdog timer that can be used to verify system reliability by generating an event to the processor core when the watchdog expires before software updates it.

WDOG Features

The watchdog timer has the following features:

- Programmable 32-bit watchdog count value
- 8-bit disable bit pattern
- General-purpose core event generation

The watchdog timer can supervise system software stability by periodically reloading it to prevent expiration of the downward-counting timer (such that the count never becomes 0). When used in this fashion, an expiring timer can indicate the system software is not running normally.

Expiration of the WDOG counter generates a general-purpose interrupt, which can be used in a variety of ways:

- as an interrupt vector sent through the System Event Controller (SEC) to the core to be serviced by a handler function, providing full software control of device resources (for example, GPIO management and reset control).
- as a fault condition through the SEC to provide hardware-automated:
 - signalling of the fault condition on external pins to the system,
 - system reset requests to the Reset Control Unit (RCU), and/or
 - trigger outputs (SEC0_FAULT trigger master) through the Trigger Routing Unit (TRU) to initiate activities in a variety of potential trigger slaves (for example, GPIO control).

To facilitate debugging, the watchdog timer does not decrement (even if enabled) when the processor is in emulation mode.

WDOG Functional Description

When enabled, the 32-bit watchdog timer counts downward every SCLK0_0 cycle. If it reaches zero, the watchdog expiration event is generated, which can be used in many ways.

To start the watchdog timer:

1. Program the watchdog timeout period (in SCLK0_0 cycles) in the [WDOG_CNT](#) register. With the watchdog disabled, this write also preloads the [WDOG_STAT](#) register.
2. Enable the watchdog timer by writing any value other than 0xAD to the [WDOG_CTL.WDEN](#) field.

Once the watchdog is enabled, writes to the [WDOG_CNT](#) register are ignored. The counter begins decrementing, and the current counter value can be read from the 32-bit [WDOG_STAT](#) register at any time.

To prevent the counter from expiring, software must "kick" the watchdog by writing any value to the [WDOG_STAT](#) register while the current count is non-zero. While the value written is irrelevant and ignored, this action resets the current counter in the [WDOG_STAT](#) register to the programmed [WDOG_CNT](#) value, and decrementing continues. The internal counter continues decrementing until it reaches zero, at which point the expiration event is generated, and the [WDOG_CTL.WDRO](#) rollover bit is set.

Watchdog operation continues in this manner unless disabled by explicitly writing 0xAD to the [WDOG_CTL.WDEN](#) field.

The watchdog expiration event can be used in a variety of ways, as listed below.

- The watchdog expiration event itself is one of numerous interrupt sources that is managed by the System Event Controller. Like other peripheral sources, this event can be used to cause a vector to a handler function that executes based on interrupt priority.
- The watchdog expiration event can be used to initiate automated hardware response through the SEC Fault Interface (SFI).

For this, the WDOG expiry has to be configured as the fault source in the SEC. Then the response to the WDOG expiry can be set to any of the below:

- Signalling through the external fault pin.
- System reset
- Trigger outputs to numerous potential trigger slaves.

For further details on how watchdog expiration event can be used with the SFI, see [Configuring the WDOG Expiry Event to Issue a System Reset](#).

ADSP-2159x WDOG Register List

The Watchdog Timer unit (WDOG) provides a software-based watchdog timer that can improve system reliability by generating an event to the processor core if the watchdog expires before being updated by software. A set of registers governs WDOG operations. For more information on WDOG functionality, see the WDOG register descriptions.

Table 14-1: ADSP-2159x WDOG Register List

Name	Description
WDOG_CNT	Count Register
WDOG_CTL	Control Register

WDOG Block Diagram

The *Watchdog Timer Block Diagram* figure shows the detailed block diagram for the watchdog timer.

Figure 14-1: Watchdog Timer Block Diagram

Internal Interface

The system clock (SCLK0) clocks the watchdog timer. The registers are accessed through the 16-bit peripheral MMR access bus. 32-bit read/write operations always access the 32-bit [WDOG_CNT](#) and [WDOG_STAT](#) registers. Hardware ensures that those accesses are atomic. When the counter expires, the WDOG expiration event is generated.

External Interface

The watchdog timer does not directly interact with any external pins.

ADSP-2159x WDOG Register Descriptions

Watchdog Timer Unit (WDOG) contains the following registers.

Table 14-3: ADSP-2159x WDOG Register List

Name	Description
WDOG_CNT	Count Register
WDOG_CTL	Control Register
WDOG_STAT	Watchdog Timer Status Register
WDOG_WIN	Watchdog Timer Window Register

Count Register

The `WDOG_CNT` register holds the programmable, unsigned count value. A valid write to this register also pre-loads the WDOG counter. For added safety, the `WDOG_CNT` register can be updated only when the WDOG timer is disabled. A write to the `WDOG_CNT` register while the timer is enabled does not modify the contents of this register. This register must be accessed with 32-bit read/writes only.

Figure 14-2: WDOG_CNT Register Diagram

Table 14-4: WDOG_CNT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	Count Value. The <code>WDOG_CNT.VALUE</code> bit field holds the programmable, unsigned count value.

Control Register

The `WDOG_CTL` register controls the watchdog timer. This register supports enabling/disabling the watchdog timer and supports checking the timer rollover status. Note that when the processor is in emulation mode, the watchdog timer counter will not decrement even if it is enabled.

Figure 14-3: WDOG_CTL Register Diagram

Table 14-5: WDOG_CTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
16 (R/W1C)	WDWE	Watchdog Window Event. Software can determine whether the timer has been serviced unexpectedly early by interrogating the <code>WDOG_CTL.WDWE</code> status bit. This is a sticky bit that is set whenever the watchdog is serviced and the <code>WDOG_STAT</code> value is greater than the <code>WDOG_WIN</code> value. It is cleared only by disabling the watchdog timer and by writing a 1 to the bit.
		0 Window Event has not occurred
		1 Window Event has occurred
15 (R/W1C)	WDRO	Watch Dog Rollover. Software can determine whether the timer has rolled over by interrogating the <code>WDOG_CTL.WDRO</code> status bit. This is a sticky bit that is set whenever the watch dog timer count reaches 0 and cleared only by disabling the watch dog timer and then writing a 1 to the bit.
		0 WDT Has Not Expired
		1 WDT Has Expired
11:4 (R/W)	WDEN	Watch Dog Enable. The <code>WDOG_CTL.WDEN</code> field is used to enable and disable the watchdog timer. Writing any value other than the disable value into this field enables the watchdog timer. This multi-bit disable key minimizes the chance of inadvertently disabling the watchdog timer.
		173 Counter Disabled. All other values mean that the counter is enabled.

Watchdog Timer Status Register

The `WDOG_STAT` register contains the current count value of the watchdog timer. Reads of this register return the current count value. When the watchdog timer is enabled, the `WDOG_STAT` register is decremented by 1 on each `SCLK0` cycle. When the count value reaches 0, the watchdog timer stops counting, and the expiry event is generated. The `WDOG_STAT` register is a 32-bit unsigned system MMR that must be accessed with 32-bit reads and writes.

Values cannot be stored directly in this register but are instead copied from the `WDOG_CNT` register. This copy process can happen in two ways:

- While the watchdog timer is disabled, writing the `WDOG_CNT` register pre-loads the `WDOG_STAT` register.
- While the watchdog timer is enabled, writing the `WDOG_STAT` register loads it with the value in the `WDOG_CNT` register.
- While the watchdog timer is disabled, writing to the `WDOG_STAT` register also reloads it with the value in the `WDOG_CNT` register.

When the processor executes a write (of an arbitrary value) to the `WDOG_STAT` register, the value in the `WDOG_CNT` register is copied into the `WDOG_STAT` register. Typically, software sets the value of `WDOG_CNT` at initialization, then periodically writes to the `WDOG_STAT` register before the watchdog timer expires. This reloads the watchdog timer with the value from `WDOG_CNT` and prevents generation of the expiry event.

If the program does not reload the counter before `SCLK0` x count register cycles, an expiry event is generated, and the `WDOG_CTL.WDRO` bit is set. When this happens, the counter stops decrementing and remains at zero. If the counter is enabled with a zero loaded to the counter, the `WDOG_CTL.WDRO` bit is set immediately and the counter remains at zero and does not decrement.

Figure 14-4: `WDOG_STAT` Register Diagram

Table 14-6: WDOG_STAT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	Current Count Value (Status). The <code>WDOG_STAT.VALUE</code> bit field contains the current count value of the watchdog timer.

Watchdog Timer Window Register

Watchdog window register holds the unsigned window value programmed. The window register can be programmed while the WDOG is disabled; any write to the register when WDOG is enabled doesn't alter the contents of the register. When the WDOG is enabled and the core services the WDOG by doing a write to `WDOG_STAT` register while the `WDOG_STAT` value is greater than `WDOG_WIN`, the WDWE event is generated and also the counter stops decrementing.

Figure 14-5: WDOG_WIN Register Diagram

Table 14-7: WDOG_WIN Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	Window Value. The WDOG_WIN.VALUE bit field contains the unsigned window value.

15 Link Port (LP)

Link ports allow the processor to connect to other processors or peripheral link ports using a simple communication protocol for high-speed parallel data transfer. This peripheral allows various I/O peripheral interconnection schemes to I/O peripheral devices as well as co-processing and multiprocessing schemes.

The link ports of the processor support 8-bit wide data transfers. The link port pins are multiplexed in the GPIO ports. For information on processor multiplexing, see the data sheet for the specific processor.

Link ports can operate independently and simultaneously, allowing glueless high-speed connectivity of up to four external processors.

NOTE: Reference to SCLK in this chapter can be considered as OCLK0_0.

LP Features

All link ports are identical in their design and have the following common features.

- Bidirectional ports with eight data signals (LP_D0 - LP_D7), an acknowledge signal (LP_ACK), and a clock signal (LP_CLK).
- Provide high-speed, point-to-point data transfers to other processors, allowing different types of interconnections between multiple processors.
- Pack data into 32-bit words. The processor can directly read this data or transfer it through DMA to or from on-chip memory.
- Support for data buffering through a 2-deep FIFO for transmit and a 4-deep FIFO for receive.
- Programmable clock and acknowledge based handshake mechanism for efficient communication.
- A dedicated DMA channel.
- Support for data transfer in 2-bit mode (non-DDR only) and 4-bit mode (DDR/non-DDR)

LP Functional Description

This section provides a description of the link port, including a list of its registers and a functional block diagram.

ADSP-2159x LP Register List

The Link Port LP is an 8-bit wide parallel port that can connect to another processor's LP or another LP-compatible device. This port allows a variety of interconnection schemes to I/O peripheral devices as well as co-processing and multiprocessing schemes. A set of registers governs LP operations. For more information on LP functionality, see the LP register descriptions.

Block Diagram

The *Link Port Block Diagram* shows the block diagram of a link port.

Figure 15-1: Link Port Block Diagram

External Connections

As shown in the *Link Port Pin Connections* figure, a link port has eight data lines (LP_D0 – LP_D7), a clock line (LP_CLK), and an acknowledge line (LP_ACK). A link port can act as either a transmitter or a receiver but not both at the same time.

Figure 15-2: Link Port Pin Connections

Use external pull-downs for the LP_CLK and LP_ACK pins so that the link port can enable the transmitter and receiver, irrespective of the state of the other.

Internal Blocks

As shown in the block diagram, the link ports have independent modules for transmit and receive. If enabled as transmitter, the link port uses a 2 deep 32-bit FIFO. If enabled as a receiver, the port uses a 4 deep 32-bit FIFO. The core MMR access bus interfaces with these FIFOs. The distributed DMA engines (DDE) use the system cross bar (SCB) interface to access the FIFO. The link port uses the LP_CTL.TRAN bit to determine whether the module is enabled for transmit or receive operation.

Architectural Concepts

The following sections describe the architectural concepts of the link port.

- [Link Port Protocol](#)
- [FIFO Buffers](#)
- [Handshake for Link Port Enable Process](#)
- [Clocking](#)
- [Multi-Processor Connectivity](#)

Link Port Protocol

A link port transmitted word consists of 4 bytes and the communication proceeds as follows.

1. The transmitter asserts the link port clock (LP_CLK) with each byte of data. The receiver uses the falling edge of LP_CLK driven by the transmitter to latch the byte.
2. When the receiver is ready to accept another word in the receive buffer it asserts the acknowledge signal, LP_ACK.

3. The transmitter samples LP_ACK driven by the receiver at the beginning of each word transmission. If LP_ACK is deasserted, then the transmitter does not transmit the next word.
4. The transmitter leaves LP_CLK high and continues to drive the first byte of the next word until LP_ACK is asserted.
5. When this assertion occurs, the transmitter drives LP_CLK low. The transmission of the next word starts. If the transmit buffer is empty, LP_CLK remains low until the buffer refills, regardless of the state of LP_ACK.

The LP_ACK signal can deassert when it anticipates that the buffer could fill. The receiver reasserts the LP_ACK signal as soon as the internal DMA grant signal has occurred or the core reads the receive buffer. Either of these actions frees a buffer location.

NOTE: The LP_ACK signal inhibits transmission of the next word and not of the current byte.

The LP_ACK signal provides a handshake between the receiver and transmitter in the following configurations.

- When configured as a transmitter, the port drives both the data and the clock while LP_ACK is three-stated. In this mode, LP_CLK is always synchronous with OCLK0_0.
- When configured as a receiver, the link port drives the acknowledge signal and the data and clock lines are three-stated. In this case, the external LP_CLK signal can either be synchronous or asynchronous with OCLK0_0.
- When the link port is disabled, the data, clock, and acknowledge signals are three-stated.

Figure 15-3: Link Port Communication and Handshake Waveform

The following list describes the stages shown in the *Link Port Communication and Handshake Waveform* figure.

1. LP_CLK stays high at byte 0 when LP_ACK is sampled low on the previous LP_CLK rising edge. LP_CLK high indicates a stall.
2. The LP_ACK signal can deassert after byte 0.

3. The LP_ACK signal reasserts as soon as the link buffer is not full (depending on Rx FIFO conditions).
4. The transmitter samples LP_ACK to determine whether to transmit the next word.
5. The receiver accepts the remaining word even if LP_ACK is deasserted. The transmitter does not send the following word.
6. Transmission of data for next word is held until LP_ACK is asserted.

The transmitter samples the LP_ACK signal. If the signal is high, the transmitter gives out the falling edges of LP_CLK for data sampling. The LP_ACK signal is first sampled at the rising edge of OCLK0_0. One more OCLK0_0 stage synchronizes the signal further. This synchronized signal is given to the subsequent logic. The LP_CLK falling edge is aligned with OCLK0_0 falling edge in a 1:1 clock ratio mode and with the OCLK0_0 rising edge for the rest of the clock ratios. The following figures explain how the synchronization is maintained between the LP_ACK and LP_CLK signals.

In the following figure, synchronizing time is guaranteed to be 1.5 OCLK0_0 cycles.

Figure 15-4: LP_ACK Synchronization for OCLK0_0:LP_CLK=1:1

In the following figure, synchronizing time is guaranteed to be 2 OCLK0_0 cycles.

Figure 15-5: LP_ACK Synchronization for OCLK0_0: LP_CLK=1:2, 1:4 and Up

The link port uses the value programmed in the `LP_DIV` register at the transmitter to determine the frequency of the link port clock (LP_CLK). However, the signal appearing on the LP_CLK pin is also dependent on the status of the LP_ACK pin driven by the receiver. The *Relationship Between Internal Link Port Clock and Link Port Clock at the Pins* figure shows this relationship.

Figure 15-6: Relationship Between Internal Link Port Clock and Link Port Clock at the Pins

FIFO Buffers

When a link port is configured as transmitter, the link port uses a 2-deep FIFO buffer. A shift register unpacks the single 32-bit word to four 8-bit data bytes. As the FIFO has space for more data, the link port makes a new DMA request. If the FIFO becomes empty, the LP_CLK signal is deasserted. The core can access FIFO through the `LP_TX` register.

The core or DMA makes three writes (2-stage FIFO and 1 shift register) to the transmit buffer before it signals a full condition. The link port uses the `LP_STAT.FFST` bit field to reflect the status of the FIFO but not the shift register full or empty condition. However, the program can poll the `LP_STAT.LPBS` bit to discover whether the link

port is driving data from the shift register to the pins. The `LP_STAT.LPBS` bit is also set when receiver has held off transmission by driving `LP_ACK` low.

NOTE: When the 2-deep FIFO and the output shift-register overflow, any further write to the link port buffer overwrites the input stage of the FIFO.

NOTE: The core can also read the transmit FIFO through the data `LP_TX` register.

NOTE: If the transmitter is disabled while performing writes to the transmit FIFO, a FIFO full condition is signaled after two writes.

The transmit buffer registers have shadow registers. Using these shadow registers, both stages of the 2-deep FIFO can be read without updating the status registers. The `LP_TXIN_SHDW` register corresponds to the input stage of the FIFO. The `LP_TXOUT_SHDW` register corresponds to the output stage of the FIFO as shown in the *Transmit FIFO path* figure.

Figure 15-7: Transmit FIFO path

When a link port is configured as receiver, data transfers to the core or DMA from the full 4-deep receive FIFO. An internal packing register packs data to 32 bits. Four reads can occur from the receive buffer by the core or DMA before it signals an empty condition. The link port uses the `LP_STAT.FFST` bits to reflect the status of the 4-deep read buffer FIFO. The core can access this FIFO through the `LP_RX` register.

NOTE: When receive FIFO overflows (`LP_STAT.ROVF` bit=1), any further data from the transmitter is lost. Only the data retained in the receive FIFO can be retrieved further.

The receiver drives the `LP_ACK` output signal low, after the first byte of data for the next-to-last empty slot (in the 4-deep FIFO) is received. This functionality prevents data loss due to the transmitter starting transmission of the next word before the `LP_ACK` signal reaches the transmitter. (The timing is due to the larger delay in synchronization.) This functionality guarantees that even after allowing for the extra synchronization cycle in the transmitter and receiver, there is no overflow in the receive FIFO. The *LACK Generation Based on Receive FIFO Status* figure

shows how FIFO slots influence the acknowledge signal generation. The grayed sections show received data. The white sections show empty locations where the decision to pull LP_ACK high is taken.

Figure 15-8: LACK Generation Based on Receive FIFO Status

NOTE: The link port uses a 4-deep receive FIFO only under a worst case situation, as mentioned. In all other cases, respond as if the FIFO has only a 3-deep stage. The LP_ACK signal is pulled high before the last stage of the FIFO.

The link port has memory-mapped buffers for both receive and transmit operations. A JTAG-based emulator can read the FIFO which can cause unexpected problems in data transfers. This activity can only happen during an emulation event (typically hitting a breakpoint or single-stepping). The emulator issues core reads through JTAG. To work around this issue, see the tools documentation for more information.

Handshake for Link Port Enable Process

In a link port-based system, the transmitter and the receiver can be enabled at different times. Use external pull-downs for the LP_CLK and LP_ACK signals.

If the receiver is enabled before the transmitter, the external pull-down holds the LP_CLK signal of the transmitter low. The receiver is held off. The receiver can wait for a rising edge on the LP_CLK signal to assert its receive service request interrupt. This rising edge occurs only when transmitter starts driving the first data on to the bus, after the application enables it.

If the transmitter is enabled before the receiver, the external pull-down holds the LP_ACK signal of the receiver low. Transmission is held off. Refer to the *Enable the Transmitter Before the Receiver* figure. The transmitter can wait for a rising edge on the LP_ACK signal to assert its transmit service request interrupt. This rising edge is asserted as soon as the receiver is enabled after the hardware drives the LP_ACK high.

Figure 15-9: Enable the Transmitter Before the Receiver

NOTE: Service request interrupts or status are asserted only when the link port (receiver or transmitter) is disabled.

Clocking

The link port clock (LP_CLK) is derived from the internal system clock (OCLK0_0). The link port clock to system clock ratio can be configured in the [LP_DIV](#) register. This value applies to the transmitter only. The receiver can operate at any asynchronous frequency up to the maximum frequency, independent of the ratio programmed. The following formula describes the relationship between the frequency of the link port clock, the OCLK0_0 frequency, and the [LP_DIV](#) value.

- $f_{LP_CLK} = f_{OCLK0_0}$ or $f_{LP_CLK_MAX}$ if $DIV = 0$
- $f_{LP_CLK} = f_{OCLK0_0} / (2 \times DIV)$ if $DIV > 0$

Where: f_{LP_CLK} = link clock frequency, $f_{LP_CLK_MAX}$ = link clock maximum frequency, and f_{OCLK0_0} = system clock frequency.

While programming the [LP_DIV](#) register to select the clock ratio, ensure that the LP_CLK frequency does not exceed the maximum frequency supported for the device. For supported frequencies, see the product-specific data sheet.

NOTE: The Drive Strength (DS) value must be changed to b(010) for the LPCLK pin to operate the link port at the maximum frequency of 125 MHz. Refer the [PADS_PORTB0_DS](#) and [PADS_PORTC0_DS](#) register bit descriptions for details.

Multi-Processor Connectivity

Link ports can operate independently, allowing glueless connection with external processors. Link ports have dedicated DMA channels, allowing independent data transfers. The following group of figures shows some examples of different bus connection topology that can be used in multi-processor system design. The inter-connection methods are not limited to these examples.

Figure 15-10: Central Processor-Based Model

Figure 15-11: Link Port Full-Duplex Transfer Model

Figure 15-12: Link Port Ring Model

The link port protocol does not include built-in support for multiple masters. However, there can be situations where multiple devices try to become the bus master at the same time. Multi-master conflicts can be resolved using token passing. In token passing, the token is a software flag that passes between processors.

At reset, the token is set to reside in the link port of one device, making it the master and the transmitter. When a receiver (slave) wants to become the master, it can assert its `LP_ACK` signal to get the attention of the master. The master knows, through the software protocol, whether to respond with actual data or whether the token is requested. If the master wishes to give up the token, it can send back a user-defined token release word and thereafter clear its token flag.

Simultaneously, the slave sets its token and can thereafter transmit. The token release word can be any user-defined value. Because the transmitter and receiver expect a code word, this word does not need to be exclusive of normal

data transmission. If the master wishes to give up the token, it can send back a user-defined token release word and thereafter clear its token flag. Simultaneously, the slave examines the data sent back and if it is the token release word, the slave sets its token, and can thereafter transmit.

The link port protocol includes handshake mechanism to inform the other end of transfer (transmit or receive) of an enable instance. However, it does not support handshakes to inform a disable instance, while a chunk of data transfers. The application must assume the disabled state of the other end, and take appropriate action.

For example, in a multi-processing environment, a receiver did not read its full FIFO for an extended time due to internal bus arbitrations. The transmitter can require software or a peripheral timer-based timeout to inform the application that the `LP_ACK` signal is low for an extended time period.

LP Operating Modes

The link port does not have particular modes of operation, as the peripheral is based on a simple protocol. The following sections explain the data transfer modes, using the core and using DMA.

- [Core Data Transfers](#)
- [DMA Data Transfers](#)

LP Data Transfer Modes

This section describes link port DMA and core data transfers.

Core Data Transfers

If DMA is disabled for a link port buffer, the processor core can write or read internal FIFO buffers as a memory-mapped register through the MMR access bus. In order to avoid FIFO overflow or underflow, the core can access the FIFO registers in one of the two following ways.

1. Access link port registers using an interrupt service routine (ISR) mapped to the data request interrupt of the link port. The interrupt request remains high only if the FIFO is accessible (if the FIFO is not full in transmit mode and not empty in receive mode).
2. Poll the FIFO status bits of the `LP_STAT` register. Write to the transmit FIFO if not full or read from the receive FIFO if not empty.

DMA Data Transfers

Dedicated DMA channels are available for each link port. DMA-related activity is explained in the following steps.

1. Data Receive – Once the DMA channel and link port module are configured and enabled, the external device begins writing data to the FIFO through the data pins of the link port. The FIFO detects this activity and in turn sends a DMA request. After the request is granted, the DMA transfer progresses until the FIFO is empty.
2. Data Transmit – Once the DMA channel and link port module are configured and enabled, setting the `LP_CTL.EN` bit automatically asserts a DMA request when the transmit FIFO is empty. After the request is granted, DMA fills the FIFO. The external device begins reading data from the FIFO through the data pins of

the link port. The FIFO detects that there is room in the buffer and asserts another DMA request, continuing the process.

LP Event Control

This section describes how the link port uses interrupts and status signals.

Interrupt Signals

Each link port has two dedicated interrupt lines registered with the system event controller—a data request interrupt and a status interrupt. Data request interrupts are asserted based on FIFO conditions for data transfer. Status interrupts are asserted when a service request status or an overflow status is set. The following list explains each of these interrupts.

- **Data Request Interrupt.** Asserted if the FIFO is not full in transmission mode and the FIFO is not empty in reception mode. This functionality serves as a core triggered interrupt in non-DMA mode and as the DMA interrupt request in DMA mode. Generation of this interrupt is based on the `LP_STAT.FFST` (status bit of the link port buffer).
- **Link Port Transmit Service Request Interrupt (LTRQ).** Allow a disabled link port to generate an interrupt when an external access is attempted. When a link port is configured as transmitter, the transmit service request interrupt is enabled by setting the `LP_CTL.TRQMSK` bit. When set, an external receiver can indicate to the disabled transmitter that it must receive data through the connected link port. The receiver does so by driving a high level on the `LP_ACK` line. When the `LP_ACK` of the disabled transmitter link port is detected high, a `LP_STAT.LTRQ` interrupt is generated. The transmitter can enable itself for data transfer with the receiver. The link port needs a pull-down on `LP_ACK` for this feature to function properly.
- **Link Port Receive Service Request Interrupt (LRRQ).** When a link port is configured as receiver, this interrupt is enabled by setting the `LP_CTL.RRQMSK` bit. When set, an external transmitter can indicate to the disabled receiver that it must receive data through the connected link port. The transmitter does so by driving out the first data. When the `LP_CLK` of the disabled receiver link port is detected high, a `LP_STAT.LRRQ` interrupt is generated. The receiver can further enable itself for data transfer with the transmitter. The link port needs a pull-down on the `LP_CLK` signal for this feature to function properly.
- **Link Port Receive Overflow Interrupt (LPOVF).** Generated when the receiver FIFO overflows and is enabled by setting the `LP_CTL.ROVFMSK` bit. This interrupt can happen if the transmitter continues to transmit data even though the receiver has deasserted `LP_ACK` signal causing the receive FIFO to overflow.

Enabling Link Port Interrupts

A data request interrupt is fed to the system event controller directly and can be controlled separately from the application.

To mask the interrupt, set the mask bits in `LP_CTL` register corresponding to service interrupts and the overflow interrupt. These interrupts are OR'ed and fed to the SIC as a single `LP_STAT` interrupt. These interrupts are latched and stored in the associated bits of `LP_STAT` register. If an `LP_STAT` interrupt occurs, in the ISR, programs

can read the [LP_STAT](#) register bits to determine the type of interrupt. These bits are write-one-to-clear (W1C); writing one to the bit resets the bit and disables the corresponding interrupt.

Status and Error Signals

This section explains the various status signals in the [LP_STAT](#) register.

- **Transfer Status signals.** The link port uses the bus status bit ([LP_STAT.LPBS](#)) to give the status of the bus condition (busy or idle), when the link port is configured as transmitter. The [LP_STAT.LPBS](#) is high if the link port drives data into the link port pins. Programs can poll this bit after polling the [LP_STAT.FFST](#) bit to disable the link port safely.

The link buffer status ([LP_STAT.FFST](#)) field directly indicates the status of the FIFO (including empty or full conditions) during data transfer. Software can poll this field in the [LP_STAT](#) register before writing to the FIFO (in case of transmission) or reading from the FIFO (in case of reception). The [LP_STAT.FFST](#) bit is automatically cleared when the link port is disabled.

- **Transfer Request Status signals.** The link port uses the receive request status ([LP_STAT.LRRQ](#)) bit to indicate that an external receiver wants to receive data (in case the link port is a disabled transmitter). The link port uses the transmit request status ([LP_STAT.LTRQ](#)) bit to indicate that an external transmitter wants to send data (in case the link port is a disabled receiver). Software can poll these bits to enable the transmitter or receiver accordingly.
- **Error Status signals.** In receive mode 32-bit data is received in four chunks of 8-bit data. This data is then packed to a single 32-bit data before loading the FIFO. The link buffer error status ([LP_STAT.LPACK](#)) bit is high during this packing process and goes low after packing.

The link port overflow status ([LP_STAT.ROVF](#)) bit is set when the receive FIFO overflows. This event can occur if the transmitter continues to transmit data even though the receiver has deasserted [LP_ACK](#) causing the receiver FIFO to overflow.

LP Programming Model

The following sections provide information on configuring the operating mode and enabling the link ports.

- [Setting Up a DMA Transmit Operation](#)
- [Setting Up a DMA Receive Operation](#)
- [Setting Up a Core Transmit Operation](#)
- [Setting Up a Core Receive Operation](#)

Setting Up a DMA Transmit Operation

This following procedure describes the typical steps for configuring the link ports in DMA transmit mode.

1. Enable the link port pins in the GPIO port mux using the appropriate [PORT_FER](#) and [PORT_MUX](#) registers.

2. Configure the drive strength value to b(010) for the link port clock pins to operate the link port at maximum frequency (`PADS_PORTB0_DS` and `PADS_PORTC0_DS` registers).
3. Install interrupt handlers for DMA and for transfer status (service request interrupt).
4. Configure the link port to transmit by setting the `LP_CTL` bit and enable the transmit request interrupt mask by setting the `LP_CTL.TRQMSK` bit.
5. Program the link port clock divider by writing a value to the `LP_DIV` register.
6. If using DMA stop mode or auto buffer mode, program the appropriate DMA registers.
ADDITIONAL INFORMATION: An example configuration is: `DMA_ADDRSTART`, `DMA_XCNT`, `DMA_XMOD`, and `DMA_CFG` registers (Stop/Auto, `DMA_CFG.PSIZE` =1, `DMA_CFG.MSIZE` =4, interrupt generation and memory read).
7. Wait for the link port receiver (connected externally) to be enabled. The application can wait for the transmit service request interrupt to assert.
8. Clear the transmit service request interrupt status by writing 1 to the `LP_STAT.LTRQ` bit.
9. Enable DMA by setting the `DMA_CFG.EN` bit.
10. Enable the link port by setting the `LP_CTL.EN` bit.
11. Wait for DMA to assert a transfer completion interrupt.
12. Clear the DMA interrupt source by writing 1 to the `DMA_STAT.IRQDONE` bit.

Setting Up a DMA Receive Operation

This section describes the typical steps for using the link ports in DMA receive mode.

1. Enable the link port pins in GPIO port mux using the appropriate `PORT_FER` and `PORT_MUX` registers.
2. Install interrupt handlers for DMA and for transfer status (service request interrupt).
3. Configure the link port for reception (clear the `LP_CTL.TRAN` bit) and enable the receive request interrupt mask by setting the `LP_CTL.RRQMSK` bit.
4. If using DMA stop mode or auto buffer mode, program the DMA registers.

ADDITIONAL INFORMATION: An example configuration is: `DMA_ADDRSTART`, `DMA_XCNT`, `DMA_XMOD`, and `DMA_CFG` registers (Stop/Auto, `DMA_CFG.PSIZE`=1, `DMA_CFG.MSIZE`=4, interrupt generation and memory write).

5. If using DMA array mode or list mode, create DMA configuration data structures filled with components.

ADDITIONAL INFORMATION: An example configuration is: `DMA_ADDRSTART`, `DMA_XCNT`, `DMA_XMOD`, and `DMA_CFG` registers (Array/List, `DMA_CFG.PSIZE` =1, `DMA_CFG.MSIZE` =4, interrupt generation, memory write and fetch =4/5) and `DMA_DSCPTR_NXT` register (if list mode). Further, program

DMA configuration register (Array/List, `DMA_CFG.PSIZE = 1`, `DMA_CFG.MSIZE = 4`, Memory Write and Fetch = 4/5) and program the `DMA_DSCPTR_NXT` register (if list mode).

6. Wait for the link port transmitter (connected externally) to be enabled with subsequent data transmission. The application can wait for the receive service request interrupt to assert.
7. Clear the receive service request interrupt status by writing 1 to the `LP_STAT.LRRQ` bit.
8. Enable DMA by setting the `DMA_CFG.EN` bit.
9. Enable the link port by setting the `LP_CTL.EN` bit.
10. Wait for DMA to assert the transfer complete interrupt.
11. Clear the DMA interrupt source by writing 1 to the `DMA_STAT.IRQDONE` bit of the DMA status register.

Setting Up a Core Transmit Operation

This section describes the typical steps for using the link ports in processor core based transmission.

1. Enable the link port pins in the GPIO port mux using the appropriate `PORT_FER` and `PORT_MUX` registers.
2. Configure the drive strength value to b(010) for the link port clock pins to operate the link port at maximum frequency (`PADS_PORTB0_DS` and `PADS_PORTC0_DS` registers).
3. Install interrupt handlers for data transfer and for transfer status (service request interrupt). The interrupt handlers for data transfer are the same source or ID as the DMA interrupt line in the SEC.
4. Configure the link port for transmission by setting the `LP_CTL.TRAN` bit) and enable the transmit request interrupt mask by setting the `LP_CTL.TRQMSK` bit).
5. Program the link port clock divider by writing a value in to the `LP_DIV` register.
6. Wait for the link port receiver (connected externally) to be enabled. The application can wait for a transmit service request interrupt to assert.
7. Clear the transmit service request interrupt status by writing 1 to the `LP_STAT.LTRQ` bit.
8. Enable the link port by setting the `LP_CTL.EN` bit.
9. The data request interrupt is asserted whenever there is free space in the FIFO. The application can write to the `LP_TX` register based on the FIFO conditions (half or empty) reflected in the `LP_STAT.FFST` bit field.

Setting Up a Core Receive Operation

This section describes the typical steps for using the link ports in processor core-based reception.

1. Enable the link port pins in the GPIO port mux using the appropriate `PORT_FER` and `PORT_MUX` registers.
2. Install interrupt handlers for data transfer and for transfer status (service request interrupt). The interrupt handlers for data transfer are the same source or ID as the DMA interrupt line in the SEC).

3. Configure link port for reception (clear `LP_CTL.TRAN` bit). Enable the receive request interrupt mask bit (set `LP_CTL.RRQMSK`).
4. Wait for the link port transmit (connected externally) to be enabled with subsequent transmission of data. The application can wait for receive service request interrupt to be asserted.
5. Clear the receive service request interrupt status by writing 1 to the `LP_STAT.LRRQ` bit.
6. Enable the link port by setting the `LP_CTL.EN` bit.
7. The data request interrupt is asserted whenever there is free space in the FIFO. The application can read from the `LP_RX` register based on the FIFO conditions (1 or 2 or 3 data available) which is reflected in the `LP_STAT.FFST` bit field.

ADSP-2159x LP Register Descriptions

Link Port (LP) contains the following registers.

Table 15-6: ADSP-2159x LP Register List

Name	Description
<code>LP_CTL</code>	Control Register
<code>LP_DIV</code>	Clock Divider Value Register
<code>LP_RX</code>	Receive Buffer Register
<code>LP_STAT</code>	Status Register
<code>LP_TX</code>	Transmit Buffer Register
<code>LP_TXIN_SHDW</code>	Shadow Input Transmit Buffer Register
<code>LP_TXOUT_SHDW</code>	Shadow Output Transmit Buffer Register

Control Register

The LP_CTL register provides LP interrupt masking, selection of transfer direction, and link port enable.

Figure 15-13: LP_CTL Register Diagram

Table 15-7: LP_CTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
14:12 (R/W)	MODE	Select Mode of operation. select each mode of operations - SDR (2bit and 4 bit) , DDR (2 bit, 4bit and 8bit)
		0 8BIT Single Data Rate Mode selected (D0, D1, D2, D3, D4, D5, D6 and D7 data pins used), Default Mode
		1 4BIT Single Data Rate Mode selected (D0, D1, D2 and D3 data pins used)
		2 2BIT Single Data Rate Mode selected (D0 and D1 data pins used)
		4 Reserved
		5 4BIT Double Data Rate Mode selected (D0, D1, D2 and D3 data pins used)
		6 2BIT Double Data Rate Mode selected (D0 and D1 data pins used)
11 (R/W)	ROVFMSK	Receive FIFO Overflow Interrupt Mask. Receive FIFO Overflow Interrupt Mask
		0 Mask Disable Receive FIFO Overflow Interrupt
		1 Unmask Enable Receive FIFO Overflow Interrupt

Table 15-7: LP_CTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
9 (R/W)	RRQMSK	Receive Request Interrupt Mask. Link Port Receive Request Mask
		0 Mask Disable Receive Request interrupt.
		1 Unmask Enable Receive Request interrupt.
8 (R/W)	TRQMSK	Transmit Request Interrupt Mask. Link Port Transmit Request Mask
		0 Mask Disable Transmit Request interrupt.
		1 Unmask Enable Transmit Request interrupt.
3 (R/W)	TRAN	Transfer Direction. The LP_CTL . TRAN bit selects the transfer direction as transmit (if set) or receive (if cleared) for link buffer.
		0 Receive Direction transfer is receive
		1 Transmit Direction transfer is transmit
0 (R/W)	EN	Enable. The LP_CTL . EN enables or disables the link port. When the processor disables the port (LP_CTL . EN transitions from high to low), the processor clears the corresponding LP_STAT bits.
		0 Disable Disable linkport
		1 Enable linkport Enable linkport

Clock Divider Value Register

The `LP_DIV` register selects the divisor for ratio between the internal LP clock (LCLK) and system clock (CLKO8). This programming is applicable only for the transmitter. The receiver can operate at any asynchronous frequency up to the maximum frequency independent of the ratio programmed.

Figure 15-14: LP_DIV Register Diagram

Table 15-8: LP_DIV Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
7:0 (R/W)	VALUE	Divisor Value. The <code>LP_DIV.VALUE</code> bits select the clock divider (relating the LP' internally generated clock (LCLK) to the system clock (CLKO8). The <code>LP_DIV.VALUE</code> should be programmed prior to LP enable. For <code>LP_DIV.VALUE</code> = 0, LCLK = CLKO8 For <code>LP_DIV.VALUE</code> = xxxxxxxx, LCLK = CLKO8 / (2 x DIV)

Receive Buffer Register

The `LP_RX` register buffers the receive data flow through the LP. The receive buffer is a four-location deep FIFO. In the receive buffer, data is transferred to the core or DMA from the receive FIFO where an internal register does the packing. This packing register is not software accessible. For more information on LP buffer features and operations, see the LP functional description.

Figure 15-15: LP_RX Register Diagram

Table 15-9: LP_RX Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	DATA	Receive Buffer.

Status Register

The `LP_STAT` register provides status information on link port interrupts, FIFO, buses, and receive/transmit requests.

Figure 15-16: LP_STAT Register Diagram

Table 15-10: LP_STAT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
8 (R/NW)	LPBS	Bus Status. The <code>LP_STAT.LPBS</code> bit indicates the LPDAT bus status. <code>LP_STAT.LPBS</code> is kept high if data is being driven by the link port into the <code>LP_D[n]</code> pins.
		0 Bus is Idle Link Port Bus is idle
		1 Bus Busy Link Port Bus is busy
7 (R/NW)	LPACK	Buffer Pack Status. The <code>LP_STAT.LPACK</code> bit indicates packing status. In receive mode, 32-bit data is received in 4 blocks of 8-bit data. Then, the data is packed to get a single 32-bit data before loading the FIFO. The <code>LP_STAT.LPACK</code> bit is high during this packing process and goes low after packing. In transmit mode, 32-bit data in the FIFO is unpacked to 4 blocks of 8-bit data before sending. The <code>LP_STAT.LPACK</code> is high during unpacking.
		0 Packing Complete Packing done
		1 Packing Incomplete Packing is in progress
6:4 (R/NW)	FFST	FIFO Status. The <code>LP_STAT.FFST</code> bits indicate the FIFO status. These bits are cleared when the LP is disabled.
		0 TX - Empty; RX - Empty Link buffer (TX OR RX) empty

Table 15-10: LP_STAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
		1 TX - Reserved ; RX - Has 1 data word RX has 1 word of data. TX reserved
		2 TX - Reserved; RX - Has 2 data words RX has 2 word of data. TX reserved.
		3 TX - Reserved; RX - Has 3 data words RX has 3 word of data. TX reserved.
		4 TX - One Word; RX -Has 4 data words RX has 4 word of data. TX 1 word of data.
		5 Reserved
		6 TX - FIFO Full; RX - Reserved RX reserved. TX reserved.
		7 Reserved
3 (R/W1C)	ROVF	Receive FIFO Overflow Interrupt. This interrupt is generated when the receiver FIFO overflows. This overflow may happen if the transmitter continues to transmit data even though the receiver has de-asserted the LP_ACK pin.
1 (R/W1C)	LRRQ	Receive Request. The LP generates this interrupt when the LP_CLK pin of a disabled link port (the receiver) is forced high by another link port (the transmitter).
0 (R/W1C)	LTRQ	Transmit Request. The LP generates this interrupt when the LP_ACK pin of a disabled link port (the transmitter) is forced high by another link port (the receiver).

Transmit Buffer Register

The `LP_TX` register buffers the transmit data flow through the LP. The transmit buffer is two words deep. In the transmit buffer, the input stage of the FIFO is used to accept core data or DMA data from internal memory, and the data is transferred to the link port interface from the output stage of the FIFO. The output stage performs the unpacking in the transmit buffer. The least significant byte is transmitted first. As each word is unpacked and transmitted, the next location in FIFO becomes available and a new DMA request is made if DMA is enabled. If the register becomes empty, the LP asserts the `LP_CLK` signal. For more information on LP buffer features and operations, see the LP functional description.

16 Serial Peripheral Interface (SPI)

The serial peripheral interface is an industry-standard synchronous serial link that supports communication with multiple SPI-compatible devices. The baseline SPI peripheral is a synchronous, four-wire interface consisting of two data pins, one device select pin, and a gated clock pin. The two data pins allow full-duplex operation to other SPI-compatible devices. Two extra (optional) data pins are provided on specific SPIs to support quad SPI operation. Enhanced modes of operation such as flow control, fast mode, and dual-I/O mode (DIOM) are also supported. In addition, a direct memory access (DMA) mode allows for transferring several words with minimal CPU interaction.

With a range of configurable options, the SPI ports provide a glueless hardware interface with other SPI-compatible devices in master mode, slave mode, and multimaster environments. The SPI peripheral includes programmable baud rates, clock phase, and clock polarity. The peripheral can operate in a multimaster environment by interfacing with several other devices, acting as either a master device or a slave device. In a multimaster environment, the SPI peripheral uses open-drain outputs to avoid data bus contention. The flow control features enable slow slave devices to interface with fast master devices by providing an SPI ready pin which flexibly controls the transfers.

NOTE: SPI peripherals (SPI0, SPI1, and SPI3) on the processor operate in the SCLK0 domain. SPI2 operates in the SCLK1 domain. For more details on SCLK programming, refer the *Clock Generation Unit (CGU)* chapter.

SPI Features

The SPI module supports the following features:

- Full-duplex, synchronous serial interface
- 8, 16-bit and 32-bit word sizes
- Programmable baud rate, clock phase, and polarity
- Programmable interframe latency
- Flow control
- Support for Fast and DIOM modes
- SPI1, SPI2 and SPI3 support quad mode. Memory-mapped mode is supported by SPI2 only.
- Independent receive and transmit DMA channels

- Burst transfer mode for non-DMA write accesses

SPI Functional Description

This section provides information on the function of the SPI module.

Shift register functionality

The SPI is essentially a shift register that serially transmits and receives data bits to or from other SPI devices. During an SPI transfer, data is simultaneously transmitted (shifted out serially) and received (shifted in serially). A serial clock line synchronizes shifting and sampling of the information on the two serial data lines.

Master slave functionality

During a data transfer, one SPI system acts as the link master which controls the data flow. The other system acts as the slave, which has data shifted into and out of it by the master. Different devices can take turn being masters, and one master can simultaneously shift data into multiple slaves (broadcast mode). However, only one slave can drive its output to write data back to the master at any given time. This rule must be enforced in the broadcast mode. Several slaves can be selected to receive data from the master in this mode. But only one slave can be enabled to send data back to the master.

Enhanced operating modes

SPI supports enhanced modes of operation like fast mode, DIOM, and Quad-SPI, and optional flow control. In fast mode, received data is sampled on the transmit edge instead of the standard receive edge, thus enabling a full-cycle path for the received data. In DIOM, both MOSI and MISO are configured as input or output pins, and 2 bits are shifted in or out on each receive or transmit edge. In Quad-SPI mode, SPI_D3:0 are configured as input or output pins and 4 bits are shifted in or out on each receive or transmit edge. A slower slave can use flow control to stall a faster master device.

Single and multi-master use

The SPI can be used in a single master as well as multi-master environment. The `SPI_MOSI`, `SPI_MISO`, and the `SPI_CLK` signals are all tied together in both configurations. SPI transmission and reception can be enabled simultaneously or individually, depending on `SPI_RXCTL` and `SPI_TXCTL` settings. In broadcast mode, several slaves can be enabled to receive, but only one slave must be in transmit mode and driving the `SPI_MISO` line.

ADSP-2159x SPI Register List

The Serial Peripheral Interface (SPI) provides a full-duplex, synchronous serial interface, which supports both master/slave modes and multi-master environments. The SPI's baud rate and clock phase/polarities are programmable, and it has integrated DMA channels for both transmit and receive data streams. A set of registers governs SPI operations. For more information on SPI functionality, see the SPI register descriptions.

Table 16-1: ADSP-2159x SPI Register List

Name	Description
SPI_CLK	Clock Rate Register
SPI_CTL	Control Register
SPI_DLY	Delay Register
SPI_ILAT	Masked Interrupt Condition Register
SPI_ILAT_CLR	Masked Interrupt Clear Register
SPI_IMSK	Interrupt Mask Register
SPI_IMSK_CLR	Interrupt Mask Clear Register
SPI_IMSK_SET	Interrupt Mask Set Register
SPI_MMRDH	Memory Mapped Read Header
SPI_MMTOP	SPI Memory Top Address

SPI Block Diagram

The *SPI Controller Block Diagram* illustrates the blocks of the SPI module. The module is comprised of three primary parts:

- SPI core contains the receive and transmit FIFOs and their associated shift registers
- Control blocks contain the synchronizer and logic to control the data flow through the data pipelines
- Register block

Transfer Protocol

The SPI module implements two channels that are independent of each other. The SPI module uses the [SPI_RXCTL](#) and [SPI_TXCTL](#) dedicated control registers to control these channels. Except in dual and quad modes, SPI can enable and use both channels simultaneously.

The SPI protocol supports four different combinations of serial clock phase and polarity. These combinations are selected through the `SPI_CTL.CPOL` and `SPI_CTL.CPHA` bits.

The *SPI Transfer Protocol* figures demonstrate the two basic transfer formats as defined by the `CPHA` bit. Two waveforms are shown for `SPI_CLK`; one for `SPI_CTL.CPOL=0` and the other for `SPI_CTL.CPOL=1`. The diagrams can be interpreted as master or slave timing diagrams since the `SPI_CLK`, `SPI_MISO`, and `SPI_MOSI` pins are directly connected between the master and the slave. The `SPI_MISO` signal is the output from the slave (slave transmission), and the `SPI_MOSI` signal is the output from the master (master transmission). The master generates the `SPI_CLK` signal. The `SPI_SS` signal is the slave device select input to the slave from the master. The diagrams represent an 8-bit transfer (`SPI_CTL.SIZE=0`) with the MSB first (`SPI_CTL.LSBF=0`). Any combination of the `SPI_CTL.SIZE` and `SPI_CTL.LSBF` bits is permissible. For example, a 16-bit transfer with the LSB first is another possible configuration.

The clock polarity and the clock phase could be identical for the master device and the slave device involved in the communication link. The transfer format from the master can be changed between transfers to adjust for various requirements of a slave device.

The SPI module uses the `SPI_CTL.ASSEL` bit to determine when the SPI hardware or software control the `SPI_SEL[n]` line. When `SPI_CTL.ASSEL=1`, the slave select line must be set to the polarity set in the `SPI_CTL.SELST` field between each serial transfer. The actual behavior of `SPI_SEL[n]` also depends on the parameters programmed into the `SPI_DLY` register. The SPI hardware logic automatically controls this functionality. When `SPI_CTL.ASSEL=0`, `SPI_SEL[n]` can either remain active between successive transfers or be inactive. The software must control this activity through manipulation of the `SPI_SLVSEL` register.

The *SPI Transfer Protocol* pair of figures illustrates the case when `SPI_CTL.ASSEL = 1` and the `SPI_SEL[n]` line is inactive between frames. If `ASSEL = 0`, the `SPI_SEL[n]` line can remain active between frames; however, the first bit is only driven when an active transition of `SPI_CLK` occurs.

Figure 16-1: SPI Transfer Protocol for `CPHA=0`

Figure 16-2: SPI Transfer Protocol for CPHA=1

Clock Considerations

The `SPI_CLK` signal is a gated clock that is only active during data transfers, for the time of the transferred word. In normal mode, the number of active edges is equal to the number of bits to be transmitted or received. In dual-I/O mode, it is half of the number of bits to be transmitted or received, and in quad-SPI mode it is one-fourth of the number. The clock rate can be derived using both even and odd dividers from `CLKO6`.

For master devices, the SPI uses the `SPI_CLK` register value to determine the clock rate, whereas this value is ignored for slave devices.

When the SPI controller is a master, `SPI_CLK` is an output signal. Conversely, when the SPI controller is a slave, `SPI_CLK` is an input signal. Slave devices ignore the SPI clock when the slave select input is driven inactive. The SPI uses the `SPI_CLK` signal to shift out and shift in the data driven onto the `SPI_MISO` and `SPI_MOSI` lines. The data is always shifted out on one edge of the clock (the active edge) and sampled on the opposite edge of the clock (the sampling edge). Clock polarity and clock phase relative to data are programmable through the `SPI_CTL` register and define the transfer format.

Controlling Delay Between Frames

The *SPI Timing with Lead and Lag Programming (Independent of SPI_CTL.CPHA Setting)* figure illustrates SPI timing using the `SPI_DLY.LEADX` and `SPI_DLY.LAGX` programming. The SPI uses the `SPI_DLY.LAGX` bits to control the timing between the slave select (`SPI_SS`) signal assertion and the first `SPI_CLK` edge. The SPI uses the `SPI_DLY.LEADX` bits to control the timing between the last `SPI_CLK` edge and deassertion of the `SPI_SS` signal. The lead and lag timing can be extended by a 1 `SPI_CLK` duration to ease timing restrictions on the slave device.

Figure 16-3: SPI Timing with Lead and Lag Programming (Independent of SPI_CTL.CPHA Setting)

The *SPI Timing with SPI_DLY.STOP Programming (Independent of SPI_CTL.CPHA Setting)* figure illustrates SPI timing with STOP programming. The SPI module uses this timing to insert multiples of SPI_CLK period delays between transfers. The SPI_SS line is deasserted for the duration specified in the SPI_DLY.STOP bit field, assuming the SPI_CTL.SELST bit is configured for deassertion between transfers.

If the SPI_DLY.STOP bit = 0, the master operates in a *continuous mode*. This mode causes an immediate start of the second word after the last bit is transferred from the first word. During this mode of operation, the slave select line is continuously asserted.

Figure 16-4: SPI Timing with SPI_DLY.STOP Programming (Independent of SPI_CTL.CPHA Setting)

When the `SPI_DLY.STOP` bit = 0 and initial conditions for a transfer are not met, the interface pauses before the next transfer. During this pause, the SPI uses the `SPI_CTL.SELST` bit to determine the state of the slave select pin. The SPI uses the `SPI_DLY.LEADX` and `SPI_DLY.LAGX` bits to determine the timing between `SPI_CLK` edges and the slave select line.

Flow Control

In master mode, the slave device must drive the `SPI_RDY` pin. The pin acts as an input signal. The slave can deassert the `SPI_RDY` pin to stop the master from initiating any new transfer. If `SPI_RDY` is deasserted in the middle of a transfer, the current transfer continues, and the next transfer will not start unless the slave asserts the `SPI_RDY` signal. Whenever the slave deasserts `SPI_RDY` and stalls the master, the SPI controller goes into a waiting state, and the `SPI_STAT.FCS` bit is set. When the slave asserts `SPI_RDY`, the SPI controller resumes operation, and the `SPI_STAT.FCS` bit is cleared.

In slave mode, the `SPI_RDY` pin acts as an output signal. Flow control can be configured on either the TX channel or the RX channel. The SPI uses the `SPI_CTL.FCCH` bit to control this configuration. If flow control is configured on the TX channel, as the `SPI_TFIFO` status nears the empty condition, the `SPI_RDY` pin is deasserted. If flow control is configured on the RX channel, as the `SPI_RFIFO` status nears the full condition, the `SPI_RDY` pin is deasserted. The SPI uses the `SPI_CTL.FCWM` bits to control the FIFO status at which `SPI_RDY` deassertion takes place. Flow control in slave mode is purely based on the FIFO status and does not depend on the word counters.

The *SPI Flow Control Timing in Master Mode* figure illustrates this timing.

Figure 16-5: SPI Flow Control Timing in Master Mode.

Slave Select Operation

If the SPI is in slave mode, $\overline{\text{SPI_SS}}$ acts as the slave select input. When SPI is enabled as a master, $\overline{\text{SPI_SS}}$ can serve as an error detection input for the SPI in a multi-master environment. The SPI_CTL.PSSE bit enables this feature. When $\text{SPI_CTL.PSSE}=1$, the $\overline{\text{SPI_SS}}$ input is the master mode error input. Otherwise, $\overline{\text{SPI_SS}}$ is ignored.

The $\overline{\text{SPI_SS}}$ signal is an active-low signal. The master asserts the signal during the transfer. The signal can be deasserted or remain asserted between transfers. When $\overline{\text{SPI_SS}}$ is deasserted, SPI_CLK and inputs are ignored, and outputs are three-stated.

The slave select bits ($\text{SPI_SLVSEL.SSEL1} - \text{SPI_SLVSEL.SSEL7}$) are used in a multiple-slave SPI environment. For example, if there are eight SPI devices in the system including a processor master, the master processor can support the SPI mode transactions across the other seven devices. This configuration requires only one master processor in this multi-slave environment.

For example, assume that the SPI of the processor is the master. The $\text{SPI_SLVSEL.SSEL1} - \text{SPI_SLVSEL.SSEL7}$ bits on the processor can be connected to the slave select pin of each slave device. In this configuration, the slave select bits can be used in three ways. In cases 1 and 2, the processor is the master and the seven microcontrollers or peripherals with SPI interfaces are slaves. The processor can do one of the following:

1. Transmit to all seven SPI devices at the same time in a broadcast mode. Here, all slave select bits are set.

2. Receive and transmit from one SPI device by enabling only one slave SPI device at a time.
3. If all the slaves are also processors, then the requester can receive data from only one processor at a time. (The functionality is enabled by clearing the `SPI_CTL.EMISO` bit in the six other slave processors.) The requestor can transmit broadcast data to all seven at the same time. This MISO enabling feature is available in some other microcontrollers. Therefore, it is possible to use the MISO enabling feature with any other SPI device that includes this functionality.

Figure 16-6: Single-Master, Multiple-Slave Configuration

Beginning and Ending a Non-DMA SPI Transfer

The start and finish of a non-DMA SPI transfer depend on the following settings.

1. Whether the device is configured as a master or a slave.
2. The state of the `SPI_CTL.ASSEL` bit, which selects between hardware and software control over `SPI_SLVSEL`.

When `SPI_CTL.CPHA=0`, the enabled slave select outputs are driven active. However, the `SPI_CLK` signal remains inactive for the first half of the first cycle of `SPI_CLK`. For a slave with `SPI_CTL.CPHA=0`, the transfer starts as soon as the `SPI_SS` input goes low.

When `SPI_CTL.CPHA=1`, a transfer starts with the first active edge of `SPI_CLK` for both slave and master devices. For a master device, a transfer is complete after it sends the last data and simultaneously receives the last data bit. A transfer for a slave device ends after the last sampling edge of `SPI_CLK`. If `SPI_CTL.ASSEL=1`, the hardware maintains responsibility for toggling `SPI_SS` between frames. If `SPI_CTL.ASSEL=0`, software controls the `SPI_SS` line and can keep it active between frames.

The `SPI_STAT.RFE` bit defines when the receive buffer can be read, indicating that `SPI_RFIFO` is not empty. The `SPI_STAT.TFF` bit defines when the transmit buffer can be written, indicating that the `SPI_TFIFO` is not full. The end of a single word transfer occurs when the `SPI_STAT.RFE` bit is cleared. The status indicates that a new word has been received and written into the receive FIFO. The `SPI_STAT.RFE` bit remains cleared as long as the receive FIFO has valid data.

To maintain software compatibility with other SPI devices, the `SPI_STAT.SPIF` bit is also available for polling. This bit can have a slightly different behavior from other commercially available devices.

In master mode with the `SPI_CTL.ASSEL` bit cleared, software manually asserts the required slave select signal before starting the transaction. After all data transfers, software typically releases the slave select line.

When the receive or transmit word counters are enabled in the `SPI_TXCTL` or `SPI_RXCTL` registers, the SPI generates a finish interrupt at the end of the transfer. It signals the end of all transfers related to that transaction.

Transmit Operation in Non-DMA Mode

The transmit operation in non-DMA mode is enabled through the `SPI_TXCTL.TEN` bit. It can be enabled independently from the receive operation, and the transmit channel can become the initiating channel based on the `SPI_TXCTL.TTI` bit setting.

Transmit underrun is not possible in this mode, as no new transfer initiates unless the transmit FIFO is empty (in the case that `SPI_TXCTL.TTI = 1`). A receive overflow is detected when data from a new frame transfer replaces older data in a full receive FIFO. This event can occur if `SPI_TXCTL.TTI = 1` and the receive channel is enabled in a non-initiating capacity.

An SPI transmit interrupt request is signaled once the transmit channel has been enabled and the transmit FIFO is not full. The SPI uses the `SPI_TXCTL.TDR` bit setting to control the frequency of the interrupt request.

Receive Operation in Non-DMA Mode

The receive operation in non-DMA mode is enabled through the `SPI_RXCTL.REN` bit. It can be enabled independently from the transmit operation, and the receive channel can become the initiating channel based on the `SPI_RXCTL.RTI` bit setting.

Receive overflow is not possible in this mode, as no new transfer initiates when the receive FIFO is full (in the case of `SPI_RXCTL.RTI = 1`). A transmit underrun can occur (`SPI_TXCTL.TDU` bit) when no valid data is in the `SPI_TFIFO` register when a transfer is initiated. This event can occur if `SPI_RXCTL.RTI = 1` and the transmit channel is enabled in a non-initiating capacity.

An SPI receive interrupt request is signaled once the receive channel has been enabled and there is data waiting to be read. The SPI uses the `SPI_RXCTL.RDR` bit setting to control the frequency of the interrupt request.

Dual I/O Mode

In Dual I/O mode, the `SPI_MISO` and `SPI_MOSI` pins are configured to operate in the same direction which doubles bandwidth. The SPI uses the `SPI_CTL.SOSI` bit to determine the order of bits on the pins. When set, the processor sends the first bit on the `SPI_MOSI` pin and the second bit on the `SPI_MISO` pin. If the `SPI_CTL.SOSI` bit is cleared, the order is reversed. Since dual I/O mode uses both pins to transmit or receive data, only one channel can be enabled, either transmit or receive. Flow control through the `SPI_RDY` pin is supported. Interrupt request generation is unaffected by dual I/O mode. However, the interrupt service interval is reduced, since the individual transfer latency is halved.

Changing to quad SPI mode must be done when the SPI is in a quiescent state.

Figure 16-7: Dual I/O Mode Transfer Protocol for CPHA=0, SOSI=1, 8-Bit Transfer, LSBF=0.

Figure 16-8: Dual I/O Mode Transfer Protocol for CPHA=1, SOSI=0, 8-Bit Transfer, LSBF=0.

Quad I/O Mode (SPI2 only)

In quad SPI mode, the `SPI_MISO` and `SPI_MOSI` pins, in tandem with the `SPI_D2` and `SPI_D3` pins, are configured to operate in the same direction. The SPI uses the `SPI_CTL.SOSI` bit to determine the order of bits on the pins. When set, the processor sends:

- The first bit on the `SPI_MOSI` pin
- The second bit on the `SPI_MISO` pin
- The third bit on the `SPI_D2` pin
- The fourth bit on the `SPI_D3` pin

If the `SPI_CTL.SOSI` bit is cleared, the order is reversed. Since quad SPI mode uses all four pins to transmit or receive data, only one channel can be enabled as either transmit or receive. Flow control through the `SPI_RDY` pin is supported. Interrupt generation is unaffected by quad SPI mode.

Changing to quad SPI mode must be done when the SPI is in a quiescent state.

While using dual or quad I/O mode for communicating with flash devices, program the `SPI_CTL.CPHA` and the `SPI_CTL.CPOL` bits = 1. This programming avoids bus contention during read operations, because the flash device starts driving out the bits immediately after dummy cycles in read header.

Figure 16-9: Quad Mode Timing for CPHA=0, SOSI=1, 16-Bit Transfer, LSBF=0.

NOTE: The SPI does support quad SPI 8-bit transfer in slave continuous mode of operation with an SCLK:SPI_CLK ratio of less than 1:2. A minimum of 2 SCLK cycles is required between transfers in 8-bit quad SPI slave mode with an SCLK:SPI_CLK ratio of less than 1:2.

Fast Mode

Fast mode is similar to the normal mode of operation when transmitting. When receiving, data is sampled at the next transmit edge allowing a full cycle of timing in the receive direction. This mode is valid in master mode operation only. When the SPI operates in fast mode, the slave drives the data for one full cycle.

Figure 16-10: SPI Transfer Protocol in Fast Mode for SPI_CTL.CPHA = 0

Figure 16-11: SPI Transfer Protocol in Fast Mode for SPI_CTL.CPHA = 1

Memory-Mapped Mode (SPI2 only)

The SPI supports direct memory-mapped read accesses from a SPI memory device, enabled by setting the SPI_CTL.MMSE bit. This mode allows for direct execution of instructions from a SPI memory device without the need for a low-level software driver, as hardware handles all overhead tasks (for example, transmission of the read header, pin turnaround timing, and receive data sizing). The SPI features configurable options in the memory-mapped read header register (SPI_MMRDH) to provide compatibility with a wide range of SPI memory devices.

In non-memory-mapped mode, the software is responsible for providing the command and required dummy words for the read response, whereas this is all handled by hardware when the SPI is in memory-mapped mode. The memory of the SPI device is accessible directly through reads of the processor address space. The read accesses can be code or data accesses in core mode or when using memory DMA (MDMA). These accesses allow code to execute directly from SPI memory devices (true eXecute-In-Place operations), and the contents can be cached to improve performance. It is not necessary to access the SPI data buffer registers nor poll status bits; however, the hardware does not support peripheral DMA accesses nor write operations to the SPI memory space.

The *Types of Operations* table is a comparison of the permitted operations in the non-memory-mapped and memory-mapped modes supported by the SPI controller.

Table 16-6: Types of Operations

SPI Operation	Non-Memory-Mapped Mode	Memory-Mapped Mode
Core data write	Yes	No
Core data read	Yes	Yes
Code fetch: Execute-In-Place (XIP)	No	Yes
Read/Write accesses using SPI Peripheral DMA	Yes	No
Read/Write accesses by other peripheral DMA channels	No	No
MDMA read*	No	Yes

Table 16-6: Types of Operations (Continued)

SPI Operation	Non-Memory-Mapped Mode	Memory-Mapped Mode
MDMA write	No	No

NOTE: MDMA read* - Only standard bandwidth MDMA (MDMA0 and MDMA1) and Enhanced Bandwidth MDMA (MDMA2) can be used for accessing flash address space in memory mapped mode. The maximum bandwidth MDMA (MDMA3) cannot access flash address space.

Memory-Mapped Description of Operation

Memory-mapped mode is enabled by setting the `SPI_CTL.MMSE` bit. When enabled, the SPI (if ready) accepts the read requests through a dedicated on-chip slave interface. The memory subsystem master drives this dedicated interface through the SCB fabric.

In a typical scenario, the memory subsystem master issues read requests to the fabric, and the fabric routes these requests to the slave port of the SPI peripheral. The master describes the read access using a number of parameters such as starting address, transfer size, and burst type. The SPI responds to this read access request when it is ready for a new transfer. It loads the opcode, a specified number of address bytes, and an optional mode byte into the transmit FIFO. The SPI memory state machine begins when both the transmit and receive channels of the SPI are enabled with:

- the transmit transfer initiation bit is set (`SPI_TXCTL.TTI=1`), *and*
- the receive initiation bit is cleared (`SPI_RXCTL.RTI=0`)

The SPI memory read sequence starts with the assertion of `SPI_SEL1`. If the SPI memory state machine is in the reset state, it looks for a command. The SPI hardware then sends the specific 8-bit read command (which can be optionally skipped), followed by the SPI memory read address. After this, a dummy period is inserted, in which a mode byte is optionally sent and the pins are held or three-stated during the dummy clocking period.

NOTE: This read header is transmitted over the SPI standard protocol pins (`SPI_CLK`, `SPI_MOSI`, `SPI_MISO`, `SPI_SEL1`) or over the extended SPI protocol pins (`SPI_CLK`, `SPI_MOSI`, `SPI_MISO`, `SPI_D2`, `SPI_D3`, `SPI_SEL1`), based on the `SPI_MMRDH.CMDPINS`, `SPI_MMRDH.ADRPINS`, and `SPI_CTL.MIOM` bit settings. SPI memory devices usually support communication in MSB-first mode. In dual mode, the SPI typically uses `SPI_MISO` as IO1 and `SPI_MOSI` as IO0. In quad mode, the SPI typically uses `SPI_D3` pin as IO3, `SPI_D2` as IO2, `SPI_MISO` as IO1, and `SPI_MOSI` as IO0.

When all I/O data pins are three-stated, the SPI continues clocking the SPI memory device, which drives out the data bits at the addressed location, until all bytes are received. The SPI hardware reads the data as configured by the `SPI_CTL.MIOM` bit setting. Upon reception of the last byte, the SPI typically deasserts `SPI_SEL1` to prepare for the next requested read header.

Application code must ensure that the opcode sent is consistent with multiple I/O programming and that the parameters specified in the memory-mapped read header register are consistent with flash read access timing.

The *SPI Memory-Mapped Register Operations Flow* diagram shows how the fields of the `SPI_MMRDH` register determine the read header while initiating transfers in memory-mapped mode.

Figure 16-12: SPI Memory-Mapped Register Operations Flow

Memory-Mapped Architectural Concepts

In memory-mapped mode, the SPI accepts read requests through a dedicated on-chip slave interface. The SPI (if ready) accepts these requests and begins the process of assembling the read header based on access attributes described in both the `SPI_MMRDH` register and the internal bus request. After the read header transmission is complete, a pin turnaround period is timed and the receiver is enabled. The SPI continues clocking the SPI memory device until all bytes are received.

The SPI memory-mapped hardware accommodates various memory devices with different read timing. The capabilities include extra mode bits, flexible dummy period timing, and three-state control, as configured in the `SPI_MMRDH` register.

The *Memory-Mapped Protocol* figure shows the protocol for the SPI controller in memory-mapped mode.

Figure 16-13: Memory-Mapped Protocol

As shown in the figure, the COMMAND field (`SPI_MMRDH.OPCODE`) is transmitted upon assertion of the `SPI_SEL[n]` signal. The SPI memory interprets this 8-bit value as a read command. Any 8-bit read opcode whose timing is compliant with the processor SPI and features provided by memory-mapped hardware is allowed, the most common being:

- Standard Read (0x03)
- Fast Read (0x0B)
- Fast Read Dual Output (0x3B)
- Fast Read Dual I/O (0x6B)
- Fast Read Quad Output (0xBB)
- Fast Read Quad I/O (0xEB)

NOTE: The SPI hardware does not validate the content of the `SPI_MMRDH.OPCODE` field prior to transmitting.

DMYSIZE (Number of Dummy Bytes)

When operating at a high clock frequency in multi-IO modes, most flash devices require some dummy clocks after the address bits. These dummy clock cycles allow the internal circuits of the device extra time for setting up the initial address. These bits specify the number of bytes separating address transmission and read data return.

The number of dummy cycles required varies per manufacturer, the read command used, and the SPI access time. The SPI hardware allows dummy cycles to be programmed in bytes in the `SPI_MMRDH.DMYSIZE` field, the value of which is a function of the number of pins used to transmit the address (`SPI_MMRDH.ADRPINS`), as shown in the *Pins Used to Transmit the Address (ADRPINS)* table.

Table 16-7: Pins Used to Transmit the Address (ADRPINS)

SPI_MMRDH. DMYSIZE	Dummy clock cycles		
	(SPI_MMRDH.ADRPINS=0, SPI_CTL.MIOM=x) Dummy bytes elapse over 1-pin	(SPI_MMRDH.ADRPINS=1, SPI_CTL.MIOM=1) Dummy bytes elapse over 2- pins	(SPI_MMRDH.ADRPINS=1, MIOM=2) Dummy bytes elapse over 4- pins
000	0	0	0
001	8	4	2
010	16	8	4
011	24	12	6
100	32	16	8
101	40	20	10
110	48	24	12
111	56	28	14

This dummy clocking period allows the mode bits to be sent, the pins to be three-stated, and the pins to be turned around in preparation for the receive data.

Memory-Mapped Read Accesses

The SPI hardware supports the most commonly used read operations.

- Two standard SPI reads (read and read fast), which use the unidirectional SPI_MOSI and SPI_MISO pins in addition to SPI_SEL[n] and SPI_CLK
- Four extended SPI multiple I/O reads: dual output, quad output, dual I/O, and quad I/O reads

The *SPI Read Operations* table and *SPI Flash Fast Read Sequence* figures summarize the types of read operations. Program each read operation in a way that is compatible with the description given in the SPI flash data sheet.

Table 16-8: SPI Read Operations

Operation	Read Command (Opcode)	CMDPIN	ADRPIN	DMYSIZE	Three-state	Multiple I/O Mode	Data Pins
Read	0x03	1	1	Zero	No	No	1
Fast Read	0x0B	1	1	Non-Zero	Yes	No	1
Dual Output Read	0x3B	1	1	Non-Zero	Yes	Yes(IO0-1)	2
Quad Output Read	0x6B	1	1	Non-Zero	Yes	Yes(IO0-3)	4
Dual I/O Read	0xBB	1, 2	2	Non-Zero	Yes	Yes (IO0-1)	2
Quad I/O Read	0xEB	1, 4	4	Non-Zero	Yes	Yes (IO0-3)	4

Some memory devices also support word quad I/O read (0xE7) and octal quad I/O read (0xE3) operations. These operations require fewer dummy cycles than normal quad I/O read operations.

Figure 16-14: SPI Flash Fast Read Sequence

Figure 16-15: SPI Flash Fast Read (Dual Output) Sequence

Figure 16-16: SPI Flash Fast Read (Dual I/O) Sequence

Figure 16-17: SPI Flash Quad Output Read Sequence

Figure 16-18: SPI Flash Quad I/O Read Sequence

SPI memory-mapped reads can be made cacheable in the core's internal memory by properly configuring the region as cacheable memory without bypass (see the related core's cache configuration documentation for details). In the figures, the number of read data bytes (N) is based on the following:

- For an instruction fetch by core (when in XIP mode); the number of instruction bytes to be fetched depends on the cache line size of the cache.

- For a data fetch by the core (data read), the number of data bytes to be fetched depends on the cache line size of the cache.

Although the minimum size of a memory-mapped data read transfer is 4 bytes, applications can fetch a single byte or a 2-byte data. (For example, it can fetch an unsigned char or short access in C code). In this case, only the required bytes are provided to the core and the other bytes are cached.

The on-chip memory subsystem master provides a starting address for the burst and the SPI hardware issues this address as part of the read header. The address provided is N-byte aligned. For example, to read the 30th byte from SPI memory, then the typical address to provide is:

- 28 (0x0000_001C) for a 32-bit cache line
- 24 (0x0000_0018) for a 64-bit cache line
- 16 (0x0000_0010) for a 128-bit cache line
- 0 (0x0000_0000) for a 256-bit cache line

The read data is returned to the memory subsystem in the order provided by the SPI memory. There can be considerable delay for the expected data provided to the master.

To minimize this delay, the wrap feature can be used where the memory subsystem provides the address of the critical word.

- For MDMA reads, the number of read data bytes (N) is always equal to 4 bytes. The MDMA read does not depend on the cache setting. For MDMA reads, limit the `DMA_CFG.MSIZE` field to 1, 2 or 4 bytes. The address provided by the memory subsystem master to the SPI hardware is always 4 byte-aligned.

Memory-Mapped High-Performance Features

In addition to automating the SPI memory read accesses, the memory-mapped hardware also provides some features to improve SPI memory fetches and increase the system performance. The following sections describe these features.

Merged Read Accesses

It is common for the memory subsystem to fetch two or more cache lines from consecutive addresses (the address sequencing is linear without any jumps). To take advantage of this situation, the SPI memory-mapped hardware provides a feature called merging. Enable merging by setting the `SPI_MMRDH.MERGE` bit.

When enabled, the hardware compares the address of an incoming read request to the address of a request the SPI memory is actively servicing. It can decide to merge two accesses when the address for the second access is incremental. For example, if the first address of a 32-byte cache line fetch is 0x0000_0000 and the second fetch is to address 0x0000_0020, then these two accesses can be merged. Merging increases efficiency and overall fetch bandwidth by eliminating the read header for those accesses which only require continuation of the SPI clock.

Wrap Around Accesses

Many SPI flash memory devices support wrapping which is used to enhance critical word fetching of cache lines. In this mode, the SPI device automatically wraps the read address to the base of a cache line once the end of the cache line is reached.

Wrap around accesses are enabled by setting the `SPI_MMRDH.WRAP` bit.

Some flash devices require programs to send a *Set Wrap* command to place the device in wrap mode. Other flash devices provide a configuration register which must be programmed to set the flash in wrap mode. Since the SPI memory-mapped hardware does not support any write operations to flash, perform this step in non-memory-mapped mode (`SPI_CTL.MMSE=0`) by accessing the SPI registers.

Data access is limited to 8-byte, 16-byte, or 32-byte sections of flash page in wrap mode. The Arm core uses the Wrap 4 access (64-bit data) for L1 cache. The Arm core uses Wrap 4 and Wrap 8 accesses (64-bit data) for L2 cache. The cores use the Wrap 8 accesses for unaligned accesses. During the read request to the SPI memory-mapped hardware, the memory subsystem master of the processor provides the address of a critical word instead of the line base. The read-data starts at the address specified in the instruction. Once it reaches the end boundary of the 8, 16, or 32-byte section, the output automatically wraps around to the beginning boundary to the line base address. The data fetch continues. It is not necessary to deassert the SPI `SPI_SEL[n]` signal or resend the read header to wrap to the cache line base when servicing misaligned cache fill requests.

The *Byte Sequence in Wrap Modes* table shows byte sequences in various wrap modes.

Table 16-9: Byte Sequence in Wrap Modes

Starting Address	8-Byte Wrap (cache_line = 8 byte)
0	0-1-2- . . . -6-7
1	1-2- 3-. . . -7-0
7	7-0-1- . . . -5-6
15	15-8-9- . . . -13-14
31	31-24-25-. . . -29-30

The burst with wrap feature allows applications to fetch a critical address quickly. Applications then fill the cache afterwards within a fixed length (8/16/32-byte) of data without issuing multiple read commands. Certain applications can benefit from this feature to improve cache fill efficiency and overall performance of system code execution.

NOTE: Do not use the merge and wrap feature together. Using wrap bursts can unintentionally disable merging (merging cannot occur for unaligned wrapping bursts). A wrap burst can start fetching data words in the middle of the cache line and cannot be merged with the next access.

Execute-In-Place (XIP, SPI2 only)

Execute-In-Place, most commonly known as XIP, allows software code to execute directly from an SPI flash device rather than downloading the code and executing it out of RAM. XIP, also known as Command Skip mode, is a general term and can be applied to fetching data as well.

There is a difference between XIP mode and standard mode. In XIP mode, after the SPI memory device is selected (`CS# =LOW`), the memory device does not decode the first input byte as command code. Instead, it expects the read header to directly start with address bytes. In standard mode, the memory decodes the first input byte it receives as a command code.

The XIP mode dramatically reduces random access time for applications that require fast code execution without shadowing the memory content on a RAM. The SPI memory-mapped hardware provides a control bit, `SPI_MMRDH.CMDSKIP` to skip the command from read header.

Some SPI memory devices require configuration of their control register to enable the XIP mode of operation, using the non-memory-mapped mode of the processor SPI. Typically, during the dummy cycle period, the mode bits are used to confirm the XIP operation and the `SPI_MMRDH.MODE` field must be set appropriately. A dummy memory-mapped access may be needed before setting the `SPI_MMRDH.CMDSKIP` bit in order to set the SPI memory device in Command Skip mode.

For more details about how to configure SPI memories into XIP mode, refer to the device data sheet.

NOTE: When configuring the flash to XIP mode from the SHARC+ core, ensure that the routine that configures flash to XIP is not routed through the L2CC. This is accomplished by first configuring the flash to XIP mode, then enabling the L2CC from the core.

Memory-Mapped Mode Error Status Bits

The SPI memory-mapped hardware provides bits in the `SPI_STAT` register to report errors. It provides these bits for notification only and their state has no effect on SPI operations. The status register bits are sticky. A W1C (write-1-to-clear) operation clears the bits.

- Memory-Mapped Write Error (`SPI_STAT.MMWE`). This bit is set (=1) if an attempt is made to write to address space that is reserved for memory-mapped SPI memory. The SPI memory-mapped hardware does not support automated write access to SPI memory space.
- Memory-Mapped Read Error (`SPI_STAT.MMRE`). This bit is set (=1) if an attempt is made to read address space reserved for memory-mapped SPI memory while memory mapping is disabled (`SPI_CTL.MMSE = 0`).
- Memory-Mapped Access Error (`SPI_STAT.MMAE`). This bit is set (=1) if an attempt is made to access either the TX or RX FIFO while memory-mapped access of SPI memory is enabled. In this case, attempts to communicate with the SPI device using legacy methods are blocked and receive fabric reports an error. Legacy methods include any direct access made to the TX and RX FIFOs, whether by DMA or processor MMR.
- Memory-Mapped Write Error Mask (`SPI_CTL.MMWEM`) bit specifies whether an error response is returned to the fabric on write attempts to address space that is reserved for memory-mapped SPI memory reads. Regardless of whether a write error response is masked using this bit, the memory-mapped write error (`SPI_STAT.MMWE`) sticky notification bit is still set.

NOTE: Unlike other bits in the `SPI_STAT` register, these memory-mapped mode error bits do not have associated bits in the SPI interrupt mask (`SPI_IMSK`) and SPI interrupt condition (`SPI_ILAT`) registers.

The memory-mapped top register (`SPI_MMTOP`) is used to specify the upper limit of the SPI memory address. The memory-mapped accesses to SPI memory addresses equal to or above this range are considered illegal. The accesses are blocked and a bus error response is generated.

This register is useful to block the invalid SPI memory address accesses. Some SPI memory vendors do not clearly specify (guarantee) that overrange address bits are ignored (address spaces can be wrapped).

Memory-Mapped Programming Guidelines

Setting the `SPI_CTL.MMSE` bit enables SPI memory-mapped mode. When enabled, the SPI interface is forced to be consistent with SPI memory requirements regardless the settings of certain control bits. The following tables specify typical settings for configuring the SPI in memory-mapped mode:

Table 16-10: SPI Control (SPI_CTL) Register

Bits	Typical values to set	Description	Comments
<code>SPI_CTL.MSTR</code>	1	Master mode enable	
<code>SPI_CTL.PSSE</code>	0	Protected slave select enable	
<code>SPI_CTL.ODM</code>	0	Open-drain mode enable	
<code>SPI_CTL.CPHASPI_CTL.CPOL</code>	0–0 or 1–1	SPI mode of communication	Flash dependent, usually SPI flash supports mode-0 (<code>CPHA=CPOL=0</code>) and mode-3 (<code>CPHA=CPOL=1</code>)
<code>SPI_CTL.ASSEL</code>	1	Hardware slave select pin control	
<code>SPI_CTL.SELST</code>	1	Slave select asserted between transfers	
<code>SPI_CTL.EMISO</code>	1	MISO pin enable	
<code>SPI_CTL.SIZE</code>	2	32-bit transfer size	
<code>SPI_CTL.LSBF</code>	0	MSB bit first mode	Flash dependent, usually SPI flash communicates in MSB bit first mode
<code>SPI_CTL.FCEN</code> <code>SPI_CTL.FCCH</code> <code>SPI_CTL.FCPL</code> <code>SPI_CTL.FCWM</code>	0	Hardware flow control related bits	
<code>SPI_CTL.FMODE</code>	1	Fast mode enable	Typically set to 1 for full cycle timing, 0 only works at low speed
<code>SPI_CTL.SOSI</code>	0	Treat <code>SPI_MOSI</code> pin as IO0 pin.	

Table 16-11: SPI Receive Control Register

Bits	Typical values to set	Description
<code>SPI_RXCTL.REN</code>	1	Receive channel enable
<code>SPI_RXCTL.RTI</code>	0	Receive transfer initiation disable
<code>SPI_RXCTL.RWCEN</code>	0	Receive word counter disable

Table 16-11: SPI Receive Control Register (Continued)

Bits	Typical values to set	Description
SPI_RXCTL.RDR	0	Receive data request disable
SPI_RXCTL.RDO	0	Discard incoming data if RFIFO is full
SPI_RXCTL.RRWM	0	Receive FIFO regular watermark
SPI_RXCTL.RUWM	0	Receive FIFO urgent watermark disable

Table 16-12: SPI Transmit Control Register

Bits	Typical values to set	Description
SPI_TXCTL.TEN	1	Transmit channel enable
SPI_TXCTL.TTI	1	Transmit transfer initiation disable
SPI_TXCTL.TWCEN	0	Transmit word counter disable
SPI_TXCTL.TDR	0	Transmit data request disable
SPI_TXCTL.TDU	0	Send last word when TFIFO is empty
SPI_TXCTL.TRWM	0	Transmit FIFO regular watermark
SPI_TXCTL.TUWM	0	Transmit FIFO urgent watermark disable

Table 16-13: SPI DLY Control Register

Bits	Typical values to set	Description	Comments See Flash data sheet for CS (for example, SSEL) timing specs
SPI_DLY.LAGX	1	Extended lag timing	
SPI_DLY.LEADX	1	Extended lead timing	
SPI_DLY.STOP	3	Stop bit between the transfers	Can be set to 1 at lower SPI clock frequencies.

The multiple I/O mode (SPI_CTL.MIOM) bits are partially ignored:

- The command (opcode) is transmitted using either just one or the number of pins specified by the SPI_CTL.MIOM bits, depending on SPI_MMRDH.CMDPINS bit setting.
- The address is then transmitted using either just one or the number of pins specified by the SPI_CTL.MIOM bits, depending on SPI_MMRDH.ADRPINS bit setting.
- The data is always read with the number of pins specified by the SPI_CTL.MIOM bits.

NOTE: Set the SPI module enable bits SPI_CTL.EN last after configuring all registers.

Use the following programming guidelines for memory-mapped mode:

- The SPI memory-mapped hardware does not check the flash status before initiating the access. It assumes that SPI memory is always able to respond to a read access. Before enabling memory-mapped mode (for example, setting the `SPI_CTL.MMSE` bit) ensure that SPI flash is ready for a read access. When using non-memory-mapped mode, a write-complete status can be examined prior to enabling the SPI in memory-mapped mode. (See the write in progress bit in the SPI flash memory status register.) Also, immediately after initial power-up, SPI memory devices can be inaccessible for a vendor-specified period.
- When SPI is enabled in memory-mapped mode, attempts to communicate with the SPI device using legacy methods are blocked. Legacy methods include any direct access made to the transmit or receive FIFOs, whether initiated by DMA or by a processor MMR access.
- To use some of the features offered by SPI memory devices, programs can first configure the SPI memory device by setting its control word or sending some commands. Since SPI memory-mapped hardware does not allow any type of SPI write operations, configure the SPI in non-memory-mapped mode prior to enabling memory-mapped mode.
- The memory-mapped hardware does not interpret the opcode. It does not check the validity of the timing that is specified in the `SPI_MMRDH` register for a particular opcode. Programs must set the fields of the `SPI_MMRDH` register to be consistent with the read-type selected.
- When the core requests the data or code fetch, the memory-mapped transfer depends on cache settings. The cache configuration register in the SPI memory device must be appropriately configured before enabling memory-mapped mode. Some of the high performance modes like merge, wrap, and transfer size depend on cache parameters.
- SPI memory-mapped MDMA reads do not support wrapping. For MDMA reads, limit the `DMA_CFG.MSIZE` field to 1 byte, 2 bytes or 4 bytes.
- There is not always tool support to change the SPI memory-mapped hardware setting or cache settings on-the-fly. Changing these settings can optimize the performance of code that accesses SPI memory in memory-mapped mode. It is expected that the SPI memory, SPI peripheral, and cache are programmed to one specific set of control settings for the whole application. Profiling or benchmarking of the actual application can be done to find the setting that works best.

SPI Interrupt Signals

The SPI controller supports three types of interrupt request signals that correspond to data, status, and error conditions.

Data Interrupts

The SPI peripheral supports two data interrupt channels – receive and transmit. These interrupt signals are multiplexed into the DMA request lines. Since the peripheral interfaces with separate read and write interfaces with DMA, the read and write data interrupts are independent. When the DMA channels are not used, the interrupts are routed directly to the system event controller. The interrupts occupy the same vector locations as the corresponding DMA channels.

Each of the data interrupt requests can be individually controlled. Program the `SPI_RXCTL.RDR` and `SPI_TXCTL.TDR` bit fields for receive and transmit, respectively. When receive is enabled, the RX interrupt request is issued whenever there is data available in the receive datapath for reading. (The event occurs according to the `SPI_RXCTL.RDR` bit setting.) When transmit is enabled, the TX interrupt request is issued whenever the transmit datapath can be written. (The event occurs according to the `SPI_TXCTL.TDR` setting.) DMA data interrupts are compatible with second-generation DMA to incorporate urgent data requests and transfer finish interrupt requests apart from the usual data request interrupts. Transmit interrupt requests operate independently from the word counter-value in the `SPI_TWC` register.

Status Interrupts

The SPI controller supports several status interrupt requests to indicate different conditions of the receiver and transmitter. All status interrupt requests can be masked. Status interrupt requests are signaled directly through a single SPI status IRQ line. The line cannot be combined with the SPI error IRQ line for some processors. The *SPI Status Interrupts* table describes the status interrupt requests that are available for the SPI controller.

Table 16-14: SPI Status Interrupts

SPI_STAT Bit	Description
<code>SPI_STAT.RUWM</code>	Receive FIFO urgent watermark interrupt request. Issued when the level of the RFIFO breaches the watermark set in the <code>SPI_RXCTL.RUWM</code> field. It is cleared when the level of the RFIFO reaches the watermark set in the <code>SPI_RXCTL.RRWM</code> field. If the RX channel is configured in DMA mode, <code>SPI_RXCTL.RUWM</code> is multiplexed with the data request.
<code>SPI_STAT.TUWM</code>	Transmit FIFO urgent watermark interrupt request. Issued when the level of the TFIFO breaches the watermark set using the <code>SPI_TXCTL.TUWM</code> bit. It is cleared when the level of the TFIFO reaches the watermark set in the <code>SPI_TXCTL.TRWM</code> field. If the TX channel is configured in DMA mode, <code>SPI_STAT.TUWM</code> is multiplexed with the data request.
<code>SPI_STAT.TS</code>	Transmit start interrupt request. Issued when the start of a transmit burst is detected by loading of the <code>SPI_TWC</code> register with the contents of the <code>SPI_TWCR</code> register.
<code>SPI_STAT.RS</code>	Receive start interrupt request. Issued when the start of a receive burst is detected by the loading of <code>SPI_RWC</code> with the contents of <code>SPI_RWCR</code> .
<code>SPI_STAT.TF</code>	Transmit finish interrupt request. Issued when a transmit burst completes (<code>SPI_TWC</code> decrements to zero).
<code>SPI_STAT.RF</code>	Receive finish interrupt request. Issued when a receive burst completes (<code>SPI_RWC</code> decrements to zero).

Error Conditions

The SPI controller supports interrupt requests upon several different error conditions. All interrupt requests are maskable. The individual error indications combine into a single SPI error IRQ signal, which can be multiplexed on some processors with the aggregated SPI status IRQ signal. The *SPI Error Interrupts* table details the possible error indications.

Error conditions arise depending on which of the channels (transmit or receive) are enabled. If a channel is disabled, all errors related to it are ignored. When both channels are enabled, errors from both channels are enabled.

Table 16-15: SPI Error Interrupts

Bit	Description
<code>SPI_STAT.MF</code>	Mode fault. Signaled when another device also tries to be a master in a multi-master system and drives the <code>SPI_SS</code> input low. This error is signaled in master mode operation.
<code>SPI_STAT.TUR</code>	Transmission error. Signaled when an underflow condition occurs on the transmit channel. This event occurs when a new transfer starts but <code>SPI_TFIFO</code> is empty. This error does not occur in master transmit initiating mode since <code>SPI_TFIFO Not Empty</code> is one of the conditions for transfer initiation.
<code>SPI_STAT.ROR</code>	Reception error. Signaled when an overflow condition occurs on the receive channel. This event occurs when a new data word is received, but the <code>SPI_RFIFO</code> is full. This error condition does not occur in master receive initiating mode since <code>SPI_RFIFO Not Full</code> is one of the conditions for transfer initiation.
<code>SPI_STAT.TC</code>	Transmit collision error. Signaled when loading data to the transmit shift register happens near the first transmitting edge of <code>SPI_CLK</code> . In slave mode of operation, the SPI controller is unaware of when the next transfer starts. Loading of data to the transmit shift register can happen just after the transmitting edge. This event results in the setup time not being met for the first bit transmitted. The transmitted data is corrupt. In <code>SPI_CTL.CPHA 1</code> mode, the first <code>SPI_CLK</code> edge is taken as the first transmitting edge. If <code>SPI_CTL.CPHA = 0</code> , then the last <code>SPI_CLK</code> edge of the last transmission (<code>SPI_CTL.SELST = 1</code>) or slave select deassertion (<code>SPI_CTL.SELST = 0</code>) is taken as the first transmitting edge. This error is signaled only in the slave mode of operation. In master mode of operation, loading of data happens before the first transmitting edge of <code>SPI_CLK</code> .

SPI Programming Concepts

The following sections provide general programming guidelines and procedures.

Programming Guidelines

It is acceptable to program `SPI_RXCTL` and `SPI_TXCTL` registers after programming the `SPI_CTL` register. However, program the initiating mode register and its counter-register, if enabled, after the non-initiating mode register. For example, if transmit is the initiating mode and receive is the non-initiating mode, then program the `SPI_RXCTL` and `SPI_RWC` registers before the `SPI_TXCTL` and `SPI_TWC` registers. If enabling both transmit and receive in initiating mode, enable the `SPI_CTL` register after programming both the `SPI_RXCTL` and `SPI_TXCTL` registers.

These programming guidelines prevent SPI from starting a transfer when SPI registers are not fully programmed. Other ways of programming are also allowed as long as the initiating conditions prevent the start of communication until after programming of SPI registers is complete.

Avoid data corruption when changing the SPI module configuration. Do not change the configuration during a data transfer. Additionally, change the clock polarity only when no slave is selected. However, an exception to this rule exists. When an SPI communication link consists of a single master and slave, `SPI_CTL.ASSEL = 0`. The slave select input of the slave is permanently tied low. In this case, the slave is always selected. Avoid data corruption by enabling the slave only after both the master and slave devices are configured.

The module supports 8, 16-bit and 32-bit word sizes. To ensure correct operation, configure both the master and slave with the same word size.

Master Operation in Non-DMA Modes

This section describes the operation of the SPI as a master in non-DMA mode.

1. Write to the `SPI_SLVSEL` register, setting one or more of the SPI select enable bits. This operation ensures that the desired slaves are properly deselected while the master is configured.
2. The `SPI_RXCTL.RTI` and `SPI_TXCTL.TTI` bits determine the SPI initiating mode. The initiating mode defines the primary transfer channel, and also the initiating condition for the transfer.
3. Write to the `SPI_CLK`, `SPI_CTL`, `SPI_RXCTL`, and `SPI_TXCTL` registers. This operation enables the device as a master and configures the SPI system. It specifies the transfer modes and channels, appropriate word length, transfer format, baud rate, and other control information.

ADDITIONAL INFORMATION: If `SPI_RXCTL.RTI` is enabled and `SPI_TXCTL.TTI` is not, write to the `SPI_RXCTL` register after writing into `SPI_CTL`, `SPI_TXCTL`, and `SPI_TFIFO` registers to prevent a transmit underrun for the first transfer.

4. If `SPI_CTL.ASSEL=0`, activate the desired slaves by clearing one or more of the `SPI_SLVSEL` flag bits. Otherwise, the SPI hardware performs slave activation.
5. The SPI controller then generates the programmed clock pulses on `SPI_CLK` and simultaneously shifts data out of `SPI_MOSI` while shifting data in from `SPI_MISO`. Before a shift, the shift register is loaded with the contents of the `SPI_TFIFO` register. At the end of the transfer, the contents of the shift register are loaded into `SPI_RFIFO`.
6. Whenever the initiating conditions are satisfied, the SPI continues to send and receive words. If the transmit buffer remains empty or the receive buffer remains full, the device operates according to the states of the `SPI_TXCTL.TDU` and `SPI_RXCTL.RDO` bits.
7. It is possible to program a secondary channel in addition to the initiating channel. This feature allows usage of available channel resources for receives or transmits simultaneously with the initiating channel.

Slave Operation in Non-DMA Modes

When a device is enabled as a slave in a non-DMA mode, a transition of the `SPI_SS` select signal to the active state (low) triggers the the start of a transfer. Or, the first active edge of `SPI_CLK` triggers the start, depending on the state of `SPI_CTL.CPHA` bit. The interface operates in the following manner.

1. The core writes to the `SPI_CTL`, `SPI_RXCTL`, and `SPI_TXCTL` registers. The operation defines the mode of the serial link to be the same as the mode setup in the SPI master.
2. To prepare for the data transfer, the core writes data to be transmitted into `SPI_TFIFO`.
3. Once the `SPI_SS` falling edge is detected, the slave starts sending data on active `SPI_CLK` edges and sampling data on inactive `SPI_CLK` edges.
4. Reception or transmission continues until `SPI_SS` is released or until the slave has received the proper number of clock cycles.

5. The slave device continues to receive or transmit with each new falling edge transition on $\overline{\text{SPI_SS}}$ or active SPI_CLK edge. If the transmit buffer remains empty or the receive buffer remains full, the device operates according to the states of the SPI_TXCTL.TDU and SPI_RXCTL.RDO bits.

Configuring DMA Master Mode

The SPI interface supports a write DMA channel and a read DMA channel. It can use these functions individually or in a lock-step manner in duplex mode ($\text{SPI_TXCTL.TTI} = \text{SPI_RXCTL.RTI} = 1$).

1. Write to the appropriate DMA registers to enable the SPI DMA channel and to configure the necessary work units, access direction, word count, and so on.
2. Write to the [SPI_SLVSEL](#) register, setting one or more of the SPI flag select bits.
3. Write to the SPI_CLK and [SPI_CTL](#) registers, enabling the device as a master and configuring the SPI system by specifying the appropriate word length, transfer format, baud rate, and so forth.
4. Write to [SPI_RXCTL](#) to configure SPI master receive mode, or write to [SPI_TXCTL](#) to configure SPI master transmit mode.
5. Finally, write to the SPI_RXCTL.REN bit to enable the receive channel, or write to SPI_TXCTL.TEN to enable the transmit channel.
6. If the SPI_RXCTL.RTI bit is enabled, a receive transfer is initiated upon enabling SPI_CTL.EN bit. If the receive word counter is enabled (SPI_RXCTL.RWCEN), then the [SPI_RWC](#) register must be non-zero for a transfer to initiate.

ADDITIONAL INFORMATION: If enabling both receive and transmit DMA channels, but not enabling SPI_TXCTL.TTI , write to the [SPI_RXCTL](#) register after writing the [SPI_CTL](#) and [SPI_TXCTL](#) registers. In this way, a transmit underrun can be prevented for the first transfer. Subsequent transfers are initiated as the SPI reads data from the receive shift register and writes to the SPI receive FIFO. The SPI then requests a write from DMA to memory. Upon a DMA grant, the DMA engine reads a word from the SPI receive FIFO and writes to memory. New requests continue to be initiated as long as the receive FIFO does not fill up, when [SPI_RWC](#) does not become zero while $\text{SPI_RXCTL.RWCEN} = 1$.

7. If SPI_TXCTL.TTI is enabled, the SPI controller requests DMA reads from memory as long as there is space for more data in the transmit pipe. Upon a DMA grant, the DMA engine reads a word from memory and writes to the transmit FIFO. As long as transmit data is available in the FIFO, and the [SPI_TWC](#) register is non-zero when $\text{SPI_TXCTL.TWCEN} = 1$, the SPI continues to initiate transfers until disabled.
8. If both the SPI_TXCTL.TTI and SPI_RXCTL.RTI bits are enabled, the SPI controller requests a DMA read from memory. However, there must be space for more data in the transmit pipe and the number of words written into the SPI must be less than [SPI_TWC](#) if $\text{SPI_TXCTL.TWCEN} = 1$. Upon a DMA grant, the DMA engine reads a word from memory and writes to the transmit FIFO.

ADDITIONAL INFORMATION: As the SPI writes data from the transmit FIFO into the transmit shift register, it initiates a transfer on the SPI link. Data received from the transfer is moved from the SPI receive shift register to the receive FIFO. The SPI controller requests a write from DMA to memory. Upon a DMA grant,

the DMA engine reads a word from the receive FIFO and writes to memory. Transfer continues to be initiated as long as both receives and transmits can accommodate new data.

9. If the receive pipe fills up due to unavailability of DMA grants, the transmit pipe stalls until the pipe is drained. If the transmit pipe fills up, the SPI stops requesting for DMA writes. If the value in `SPI_RWC` expires, further write-requests to DMA stop. However, data already written into the transmit FIFO is sent, and read requests to DMA continue until the receive data is read from the receive FIFO.
10. The SPI then generates the programmed clock pulses on `SPI_CLK` and simultaneously shifts data out of `SPI_MOSI` while shifting data in from `SPI_MISO`. For receive transfers, the value in the shift register is loaded into the `SPI_RFIFO` register at the end of the transfer. For transmit transfers, the value in the `SPI_TFIFO` register is loaded into the shift register at the start of the transfer.

Configuring DMA Slave Mode Operation

This mode occurs when the SPI is enabled as a slave and the DMA engine is configured to transmit or receive data. A transition of the `SPI_SS` signal to the active-low state triggers the start of a transfer. Or, the first active edge of `SPI_CLK` triggers the start of a transfer, depending on the state of the `SPI_CTL.CPHA` bit. The following steps illustrate the SPI receive or transmit DMA sequence in an SPI slave (in response to a master command). The SPI supports a receive DMA channel and a transmit DMA channel.

1. Write to the appropriate DMA registers to enable the SPI DMA channel and configure the necessary work units, access direction, word count, and so on.
2. Write to the `SPI_CTL`, `SPI_RXCTL`, and `SPI_TXCTL` registers to define the mode of the serial link to be the same as the mode configured in the SPI master.
3. If the receive channel is enabled (`SPI_RXCTL.REN` is asserted), the following actions occur:
 - a. Once the slave select input is active, the slave starts receiving and transmitting data on active `SPI_CLK` edges.
 - b. The value in the shift register is loaded into the `SPI_RFIFO` register at the end of the transfer.
 - c. Once `SPI_RFIFO` has valid data, it requests a write from DMA to memory.
 - d. Upon a DMA grant, the DMA engine reads a word from the receive FIFO and writes to memory.
 - e. As long as there is data in the receive FIFO, the SPI slave continues to request a DMA write to memory. The DMA engine continues to read a word from the FIFO and writes to memory. The SPI slave continues receiving words on active `SPI_CLK` edges as long as the `SPI_SS` input is active.
 - f. If the data collected in the receive pipe breaches the set level, and the DMA engine cannot keep up with the receive rate, the slave can deassert the `SPI_RDY` signal. This signaling throttles the master. The receive pipe level is set according to the `SPI_CTL.FCWM` field. The signal is deasserted as the DMA drains the receive FIFO. Alternatively, the SPI can use the `SPI_RXCTL.RDO` bit to decide when the incoming data is discarded or overwritten into the receive FIFO (when `SPI_CTL.FCEN` is inactive).
4. If the transmit channel is enabled (`SPI_TXCTL.TEN` is asserted), the following actions occur:

- a. The SPI requests a DMA read from memory.
 - b. Upon a DMA grant, the DMA engine reads a word from memory and writes to the transmit FIFO.
 - c. The SPI then reads DMA data from the transmit FIFO and writes to the transmit shift register, awaiting the start of the next transfer.
 - d. Once the slave select input is active, the slave starts receiving and transmitting data on active `SPI_CLK` edges.
 - e. As long as there is room in the transmit FIFO, the SPI slave continues to request a DMA read from memory. The DMA engine continues to read a word from memory and write to the transmit FIFO. The SPI slave continues transmitting words on active `SPI_CLK` edges as long as the `SPI_SS` input is active.
 - f. If the number of outstanding data entries in the transmit pipe breaches the level set and the DMA cannot keep up with the transmit rate, the slave deasserts the `SPI_RDY` signal. This signaling throttles the master. The transmit pipe level is set according to the `SPI_CTL.FCWM` field. The signal is deasserted as the DMA fills the transmit FIFO. Alternately, the `SPI_TXCTL.TDU` bit decides the state of the transmit data (when `SPI_CTL.FCEN` is deasserted).
5. If both receive and transmit channels are enabled, the following actions occur after the actions for each channel. Transfers continue as long as both receive and transmit channels can accommodate new data.
- a. If the receive pipe fills up due to the unavailability of DMA grant, the SPI interface stalls the master by asserting the `SPI_RDY` pin. This signal is deasserted as the DMA drains the receive FIFO. Alternately, the SPI uses the `SPI_RXCTL.RDO` bit to decide when the incoming data is discarded or overwritten in the receive FIFO (when `SPI_CTL.FCEN` is deasserted).
 - b. If the transmit pipe fills up, the SPI stops requesting DMA writes until the pipe clears.
 - c. If there is an underflow problem in the transmit pipe, the slave stalls the master by deasserting `SPI_RDY` while the DMA fills the transmit FIFO. Alternately, the SPI uses the `SPI_TXCTL.TDU` bit to decide the state of the transmit data (when `SPI_CTL.FCEN` is deasserted).

ADSP-2159x SPI Register Descriptions

Serial Peripheral Interface (SPI) contains the following registers.

Table 16-16: ADSP-2159x SPI Register List

Name	Description
<code>SPI_CLK</code>	Clock Rate Register
<code>SPI_CTL</code>	Control Register
<code>SPI_DLY</code>	Delay Register
<code>SPI_ILAT</code>	Masked Interrupt Condition Register
<code>SPI_ILAT_CLR</code>	Masked Interrupt Clear Register

Table 16-16: ADSP-2159x SPI Register List (Continued)

Name	Description
SPI_IMSK	Interrupt Mask Register
SPI_IMSK_CLR	Interrupt Mask Clear Register
SPI_IMSK_SET	Interrupt Mask Set Register
SPI_MMRDH	Memory Mapped Read Header
SPI_MMTOP	SPI Memory Top Address
SPI_RFIFO	Receive FIFO Data Register
SPI_RWC	Received Word Count Register
SPI_RWCR	Received Word Count Reload Register
SPI_RXCTL	Receive Control Register
SPI_SLVSEL	Slave Select Register
SPI_STAT	Status Register
SPI_TFIFO	Transmit FIFO Data Register
SPI_TWC	Transmitted Word Count Register
SPI_TWCR	Transmitted Word Count Reload Register
SPI_TXCTL	Transmit Control Register

Clock Rate Register

The `SPI_CLK` register selects the baud rate for SPI data transfers, relating this rate to the SPI serial clock (SPI clock) and the system clock (CLKO6).

Figure 16-19: SPI_CLK Register Diagram

Table 16-17: SPI_CLK Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15:0 (R/W)	BAUD	Baud Rate. The <code>SPI_CLK.BAUD</code> bits set the SPI baud rate according to the formula: $BAUD = (CLKO6 / SPI\ Clock) - 1$

Control Register

The `SPI_CTL` register enables the SPI and configures settings for operating modes, communication protocols, and buffer operations.

Figure 16-20: SPI_CTL Register Diagram

Table 16-18: SPI_CTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W)	MMSE	Memory-Mapped SPI Enable. When the <code>SPI_CTL.MMSE</code> bit is asserted, communication to an SPI memory device is automated such that the memory it contains is accessible directly through the read of processor address space assigned to it. (As far as the SPI peripheral is concerned, this includes all read accesses received by the SPI peripherals system crossbar slave port.) Note that when memory-mapped access of SPI memory is enabled, attempts to communicate with the SPI device using legacy methods are blocked and receive fabric error responses are generated. Legacy methods include any direct access made to the Tx and Rx FIFOs, whether initiated by DMA or processor MMR access.
		0 Hardware automated access of memory-mapped SPI memory disabled.
		1 Hardware-automated access of memory-mapped SPI memory enabled.
30 (R/W)	MMWEM	Memory Mapped Write Error Mask. The <code>SPI_CTL.MMWEM</code> bit specifies whether an error response is returned to the fabric upon write attempts to address space reserved for memory-mapped reads of SPI memory.
		0 Write error response returned upon write attempts to memory-mapped SPI memory
		1 Write error response masked (not returned) upon write attempts to memory-mapped SPI memory
22 (R/W)	SOSI	Start on MOSI. The <code>SPI_CTL.SOSI</code> bit is valid only when <code>SPI_CTL.MIOM</code> is enabled for either DIOM or QIOM, and this bit selects the starting pin and the bit placement on pins for these modes. In DIOM, by default, (<code>SPI_CTL.SOSI = 0</code>) SPI sends the first bit on the <code>SPI_MISO</code> pin and the second bit on the <code>SPI_MOSI</code> pin. In QIOM, by default, the SPI sends the first bit on the <code>SPI_D3</code> pin, the second bit on the <code>SPI_D2</code> pin, the third bit on the <code>SPI_MISO</code> pin and the fourth bit on the <code>SPI_MOSI</code> pin. This order can be reversed by setting the <code>SPI_CTL.SOSI</code> bit. When this bit is set, the SPI sends the first bit on the <code>SPI_MOSI</code> pin. The first bit referred to here depends on the <code>SPI_CTL.LSBF</code> bit setting (MSB bit or LSB bit).
		0 Start on MISO (DIOM) or start on SPI_D3
		1 Start on MOSI

Table 16-18: SPI_CTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
21:20 (R/W)	MIOM	Multiple I/O Mode. The <code>SPI_CTL.MIOM</code> bits enable SPI operation in dual I/O mode (DIOM) or quad I/O mode (QIOM). These bits can only be changed when the SPI is disabled (<code>SPI_CTL.EN = 0</code>).
		0 No MIOM (disabled)
		1 DIOM operation
		2 QIOM operation
		3 Reserved
18 (R/W)	FMODE	Fast-Mode Enable. The <code>SPI_CTL.FMODE</code> bit enables fast mode operation for SPI receive transfers. SPI transmit operations in fast mode are the same as normal mode.
		0 Disable
		1 Enable
17:16 (R/W)	FCWM	Flow Control Watermark. The <code>SPI_CTL.FCWM</code> bits select the watermark level of the transmit channel (<code>SPI_TFIFO</code> buffer) or receive channel (<code>SPI_RFIFO</code> buffer) that triggers flow control operation. These bits are applicable only when the SPI is a slave (<code>SPI_CTL.MSTR = 0</code>) and flow control is enabled (<code>SPI_CTL.FCEN = 1</code>). When the watermark condition is met, the SPI slave deasserts the <code>SPI_RDY</code> pin.
		0 TFIFO empty or RFIFO full
		1 TFIFO 75% or more empty, or RFIFO 75% or more full
		2 TFIFO 50% or more empty, or RFIFO 50% or more full
		3 Reserved
15 (R/W)	FCPL	Flow Control Polarity. The <code>SPI_CTL.FCPL</code> bit selects flow control polarity for the <code>SPI_RDY</code> pin when flow control is enabled. When the <code>SPI_RDY</code> pin is active, the SPI is indicating it is ready for data transfer.
		0 Active-low RDY
		1 Active-high RDY

Table 16-18: SPI_CTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
14 (R/W)	FCCH	Flow Control Channel Selection. The <code>SPI_CTL.FCCH</code> bit selects whether the SPI applies flow control to the transmit channel (<code>SPI_TFIFO</code> buffer) or receive channel (<code>SPI_RFIFO</code> buffer). This bit is applicable only when the SPI is a slave and flow control is enabled.
		0 Flow control on RX buffer
		1 Flow control on TX buffer
13 (R/W)	FCEN	Flow Control Enable. The <code>SPI_CTL.FCEN</code> bit enables SPI flow control operation, which permits slow slave devices to interface with fast master devices. This bit controls the operation of the <code>SPI_RDY</code> pin. Note that options for flow control operation are available using the <code>SPI_CTL.FCCH</code> , <code>SPI_CTL.FCPL</code> , and <code>SPI_CTL.FCWM</code> bits.
		0 Disable
		1 Enable
12 (R/W)	LSBF	Least Significant Bit First. The <code>SPI_CTL.LSBF</code> bit selects whether the SPI transmits/receives data as LSB first (little endian) or MSB first (big endian). This bit can only be changed when the SPI is disabled.
		0 MSB sent/received first (big endian)
		1 LSB sent/received first (little endian)
10:9 (R/W)	SIZE	Word Transfer Size. The <code>SPI_CTL.SIZE</code> bits select the SPI transfer word size as 8, 16 or 32 bits. To ensure correct operation, both the master and slave must be configured with the same word size. This bit can only be changed when the SPI is disabled (<code>SPI_CTL.EN = 0</code>).
		0 8-bit word
		1 16-bit word
		2 32-bit word
		3 Reserved
8 (R/W)	EMISO	Enable MISO. The <code>SPI_CTL.EMISO</code> bit enables master-in-slave-out (MISO) mode. This SPI mode is applicable only when the SPI is a slave.
		0 Disable
		1 Enable

Table 16-18: SPI_CTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
7 (R/W)	SELST	Slave Select Polarity Between Transfers. The SPI_CTL.SELST bit selects the state (polarity) for the $\overline{\text{SPI_SEL[n]}}$ pin between SPI transfers when the SPI is a master and hardware slave select assertion is enabled (SPI_CTL.ASSEL = 1). In slave mode, this bit affects the detection of both transmit collision (SPI_STAT.TC and underrun (SPI_STAT.TUR) errors.
		0 Deassert slave select (high)
		1 Assert slave select (low)
6 (R/W)	ASSEL	Slave Select Pin Control. The SPI_CTL.ASSEL bit selects whether the SPI hardware sets the $\overline{\text{SPI_SEL[n]}}$ pin output value (ignoring the slave select SPI_SLVSEL.SSEL1 - SPI_SLVSEL.SSEL7 bits) or whether software control of the slave select bits set the $\overline{\text{SPI_SEL[n]}}$ pin output value. This feature is applicable only when the SPI is a master. When hardware control is enabled, the $\overline{\text{SPI_SEL[n]}}$ pin output is asserted during the transfers, and the pin polarity between transfers is selected by the SPI_CTL.SELST bit. When software control is enabled, the $\overline{\text{SPI_SEL[n]}}$ pin output value is set through software control of the slave select bits, and as such, the pin may either remain asserted (low) or be deasserted between transfers.
		0 Software slave select control
		1 Hardware slave select control
5 (R/W)	CPOL	Clock Polarity. The SPI_CTL.CPOL bit selects whether the SPI uses an active-low or active-high signal for the SPI clock (SPI_CLK). This bit works with the SPI_CTL.CPHA bit to select combinations of clock phase and polarity for the SPI_CLK pin. This bit can only be changed when the SPI is disabled.
		0 Active-high SPI CLK
		1 Active-low SPI CLK
4 (R/W)	CPHA	Clock Phase. The SPI_CTL.CPHA bit selects whether the SPI starts toggling the signal for the SPI clock (SPI_CLK) from the start of the first data bit or from the middle of the first data bit. The SPI_CTL.CPHA bit works with the SPI_CTL.CPOL bit to select combinations of clock phase and polarity for the SPI_CLK pin. This bit can only be changed when the SPI is disabled.
		0 SPI CLK toggles from middle
		1 SPI CLK toggles from start

Table 16-18: SPI_CTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
3 (R/W)	ODM	Open Drain Mode. The SPI_CTL.ODM bit configures the data output pins (SPI_MOSI and SPI_MISO) to behave as open drain outputs, which prevents contention and possible damage to pin drivers in multi-master or multi-slave SPI systems. When SPI_CTL.ODM is enabled and the SPI is a master, the SPI three-states the SPI_MOSI pin when the data driven out on MOSI is a logic-high. The SPI does not three-state the SPI_MOSI pin when the driven data is a logic-low. When SPI_CTL.ODM is enabled and the SPI is a slave, the SPI three-states the SPI_MISO pin when the data driven out on SPI_MISO is a logic-high. Note that an external pull-up resistor is required on both the SPI_MOSI and SPI_MISO pins when SPI_CTL.ODM is enabled.
		0 Disable
		1 Enable
2 (R/W)	PSSE	Protected Slave Select Enable. The SPI_CTL.PSSE bit enables the <u>SPI_SS</u> pin to provide error detection input in a multi-master environment when the SPI is in master mode. If some other device in the system asserts the <u>SPI_SS</u> pin while SPI is enabled as master (and SPI_CTL.PSSE is enabled), this condition causes a mode fault error.
		0 Disable
		1 Enable
1 (R/W)	MSTR	Master/Slave. The SPI_CTL.MSTR bit toggles the SPI between master mode and slave mode. This bit can only be changed when the SPI is disabled.
		0 Slave
		1 Master
0 (R/W)	EN	Enable. The SPI_CTL.EN bit enables SPI operation.
		0 Disable SPI module
		1 Enable

Delay Register

The `SPI_DLY` register selects a transfer delay and the lead/lag timing between slave select signals and SPI clock edge assertion/deassertion.

Figure 16-21: SPI_DLY Register Diagram

Table 16-19: SPI_DLY Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
9 (R/W)	LAGX	Extended SPI Clock Lag Control. The <code>SPI_DLY.LAGX</code> bit enables insertion of a 1-SPI_CLK cycle lag (extend lag) in the timing between the slave select (<code>SPI_SEL[n]</code>) assertion and first SPI clock edge.
		0 Disable
		1 Enable
8 (R/W)	LEADX	Extended SPI Clock Lead Control. The <code>SPI_DLY.LEADX</code> bit enables insertion of a 1-SPI_CLK cycle lead (extend lead) in the timing between the slave select (<code>SPI_SEL[n]</code>) deassertion and last SPI clock edge.
		0 Disable
		1 Enable
7:0 (R/W)	STOP	Transfer Delay Time in Multiples of SPI Clock Period. The <code>SPI_DLY.STOP</code> bits select a delay (number of stop bits in multiples of SPI clock duration) at the end of each SPI transfer. The default delay is the minimum value required to comply with the SPI protocol (1-bit duration). The <code>SPI_DLY.STOP</code> bits can be programmed with smaller delay values, resulting in continuous operation (for example, stop bits =0).

Masked Interrupt Condition Register

The `SPI_ILAT` register latches interrupts, queuing the interrupt requests for service. When a condition is indicated by a bit in the `SPI_STAT` register and the corresponding interrupt request is unmasked in `SPI_IMSK`, the SPI latches the interrupt request bit in `SPI_ILAT`.

Figure 16-22: SPI_ILAT Register Diagram

Table 16-20: SPI_ILAT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
11 (R/NW)	TF	Transmit Finish Interrupt Latch.
		0 No interrupt request
		1 Latched interrupt request
10 (R/NW)	RF	Receive Finish Interrupt Latch.
		0 No interrupt request
		1 Latched interrupt request
9 (R/NW)	TS	Transmit Start Interrupt Latch.
		0 No interrupt request
		1 Latched interrupt request
8 (R/NW)	RS	Receive Start Interrupt Latch.
		0 No interrupt request
		1 Latched interrupt request

Table 16-20: SPI_ILAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
7 (R/NW)	MF	Mode Fault Interrupt Latch.
		0 No interrupt request
		1 Latched interrupt request
6 (R/NW)	TC	Transmit Collision Interrupt Latch.
		0 No interrupt request
		1 Latched interrupt request
5 (R/NW)	TUR	Transmit Underrun Interrupt Latch.
		0 No interrupt request
		1 Latched interrupt request
4 (R/NW)	ROR	Receive Overrun Interrupt Latch.
		0 No interrupt request
		1 Latched interrupt request
2 (R/NW)	TUWM	Transmit Urgent Watermark Interrupt Latch.
		0 No interrupt request
		1 Latched interrupt request
1 (R/NW)	RUWM	Receive Urgent Watermark Interrupt Latch.
		0 No interrupt request
		1 Latched interrupt request

Masked Interrupt Clear Register

The `SPI_ILAT_CLR` register permits clearing individual mask bits in the `SPI_ILAT` register without affecting other bits in the register. Use write-1-to-clear on a bit in the `SPI_ILAT_CLR` register to clear the corresponding bit in the `SPI_ILAT` register.

Figure 16-23: `SPI_ILAT_CLR` Register Diagram

Table 16-21: `SPI_ILAT_CLR` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
11 (R/W1C)	TF	Clear Transmit Finish. The <code>SPI_ILAT_CLR.TF</code> bit clears the corresponding mask bit in the <code>SPI_ILAT</code> register.
		0 No effect
		1 Clear mask bit
10 (R/W1C)	RF	Clear Receive Finish. The <code>SPI_ILAT_CLR.RF</code> bit clears the corresponding mask bit in the <code>SPI_ILAT</code> register.
		0 No effect
		1 Clear mask bit
9 (R/W1C)	TS	Clear Transmit Start. The <code>SPI_ILAT_CLR.TS</code> bit clears the corresponding mask bit in the <code>SPI_ILAT</code> register.
		0 No effect
		1 Clear mask bit

Table 16-21: SPI_ILAT_CLR Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
8 (R/W1C)	RS	Clear Receive Start. The <code>SPI_ILAT_CLR.RS</code> bit clears the corresponding mask bit in the <code>SPI_ILAT</code> register.
		0 No effect
		1 Clear mask bit
7 (R/W1C)	MF	Clear Mode Fault. The <code>SPI_ILAT_CLR.MF</code> bit clears the corresponding mask bit in the <code>SPI_ILAT</code> register.
		0 No effect
		1 Clear mask bit
6 (R/W1C)	TC	Clear Transmit Collision. The <code>SPI_ILAT_CLR.TC</code> bit clears the corresponding mask bit in the <code>SPI_ILAT</code> register.
		0 No effect
		1 Clear mask bit
5 (R/W1C)	TUR	Clear Transmit Underrun. The <code>SPI_ILAT_CLR.TUR</code> bit clears the corresponding mask bit in the <code>SPI_ILAT</code> register.
		0 No effect
		1 Clear mask bit
4 (R/W1C)	ROR	Clear Receive Overrun. The <code>SPI_ILAT_CLR.ROR</code> bit clears the corresponding mask bit in the <code>SPI_ILAT</code> register.
		0 No effect
		1 Clear mask bit
2 (R/NW)	TUWM	Clear Transmit Urgent Watermark. The <code>SPI_ILAT_CLR.TUWM</code> bit clears the corresponding mask bit in the <code>SPI_ILAT</code> register.
		0 No effect
		1 Clear mask bit

Table 16-21: SPI_ILAT_CLR Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
1 (R/NW)	RUWM	Clear Receive Urgent Watermark. The <code>SPI_ILAT_CLR.RUWM</code> bit clears the corresponding mask bit in the <code>SPI_ILAT</code> register.
		0 No effect
		1 Clear mask bit

Interrupt Mask Register

The `SPI_IMSK` register unmask (enables) or mask (disables) SPI interrupt requests. When a condition is indicated by a bit in the `SPI_STAT` register and the corresponding interrupt request is unmasked in `SPI_IMSK`, the SPI latches the interrupt request bit in the `SPI_ILAT` register, queuing the interrupt request for service.

Figure 16-24: SPI_IMSK Register Diagram

Table 16-22: SPI_IMSK Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
11 (R/NW)	TF	Transmit Finish. The <code>SPI_IMSK.TF</code> bit unmask (enables) or mask (disables) the TF interrupt.
		0 Disable (mask) interrupt request
		1 Enable (unmask) interrupt request
10 (R/NW)	RF	Receive Finish. The <code>SPI_IMSK.RF</code> bit unmask (enables) or mask (disables) the RF interrupt.
		0 Disable (mask) interrupt request
		1 Enable (unmask) interrupt request
9 (R/NW)	TS	Transmit Start. The <code>SPI_IMSK.TS</code> bit unmask (enables) or mask (disables) the TS interrupt.
		0 Disable (mask) interrupt request
		1 Enable (unmask) interrupt request

Table 16-22: SPI_IMSK Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
8 (R/NW)	RS	Receive Start. The <code>SPI_IMSK.RS</code> bit unmask (enables) or masks (disables) the RS interrupt.
		0 Disable (mask) interrupt request
		1 Enable (unmask) interrupt request
7 (R/NW)	MF	Mode Fault. The <code>SPI_IMSK.MF</code> bit unmask (enables) or masks (disables) the MF interrupt.
		0 Disable (mask) interrupt request
		1 Enable (unmask) interrupt request
6 (R/NW)	TC	Transmit Collision. The <code>SPI_IMSK.TC</code> bit unmask (enables) or masks (disables) the TC interrupt.
		0 Disable (mask) interrupt request
		1 Enable (unmask) interrupt request
5 (R/NW)	TUR	Transmit Underrun. The <code>SPI_IMSK.TUR</code> bit unmask (enables) or masks (disables) the TUR interrupt.
		0 Disable (mask) interrupt request
		1 Enable (unmask) interrupt request
4 (R/NW)	ROR	Receive Overrun. The <code>SPI_IMSK.ROR</code> bit unmask (enables) or masks (disables) the ROR interrupt.
		0 Disable (mask) interrupt request
		1 Enable (unmask) interrupt request
2 (R/NW)	TUWM	Transmit Urgent Watermark. The <code>SPI_IMSK.TUWM</code> bit unmask (enables) or masks (disables) the TUWM interrupt.
		0 Disable (mask) interrupt request
		1 Enable (unmask) interrupt request
1 (R/NW)	RUWM	Receive Urgent Watermark. The <code>SPI_IMSK.RUWM</code> bit unmask (enables) or masks (disables) the RUWM interrupt.
		0 Disable (mask) interrupt request
		1 Enable (unmask) interrupt request

Interrupt Mask Clear Register

The `SPI_IMSK_CLR` register permits clearing individual mask bits in the `SPI_IMSK` register without affecting other bits in the register. Use write-1-to-clear on a bit in the `SPI_IMSK_CLR` register to clear the corresponding bit in the `SPI_IMSK` register.

Figure 16-25: SPI_IMSK_CLR Register Diagram

Table 16-23: SPI_IMSK_CLR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
11 (R/W1C)	TF	Clear Transmit Finish. The <code>SPI_IMSK_CLR.TF</code> bit clears the corresponding mask bit in the <code>SPI_IMSK</code> register.
		0 No effect
		1 Clear mask bit
10 (R/W1C)	RF	Clear Receive Finish. The <code>SPI_IMSK_CLR.RF</code> bit clears the corresponding mask bit in the <code>SPI_IMSK</code> register.
		0 No effect
		1 Clear mask bit
9 (R/W1C)	TS	Clear Transmit Start. The <code>SPI_IMSK_CLR.TS</code> bit clears the corresponding mask bit in the <code>SPI_IMSK</code> register.
		0 No effect
		1 Clear mask bit

Table 16-23: SPI_IMSK_CLR Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
8 (R/W1C)	RS	Clear Receive Start. The <code>SPI_IMSK_CLR.RS</code> bit clears the corresponding mask bit in the <code>SPI_IMSK</code> register.
		0 No effect
		1 Clear mask bit
7 (R/W1C)	MF	Clear Mode Fault. The <code>SPI_IMSK_CLR.MF</code> bit clears the corresponding mask bit in the <code>SPI_IMSK</code> register.
		0 No effect
		1 Clear mask bit
6 (R/W1C)	TC	Clear Transmit Collision. The <code>SPI_IMSK_CLR.TC</code> bit clears the corresponding mask bit in the <code>SPI_IMSK</code> register.
		0 No effect
		1 Clear mask bit
5 (R/W1C)	TUR	Clear Transmit Underrun. The <code>SPI_IMSK_CLR.TUR</code> bit clears the corresponding mask bit in the <code>SPI_IMSK</code> register.
		0 No effect
		1 Clear mask bit
4 (R/W1C)	ROR	Clear Receive Overrun. The <code>SPI_IMSK_CLR.ROR</code> bit clears the corresponding mask bit in the <code>SPI_IMSK</code> register.
		0 No effect
		1 Clear mask bit
2 (R/W1C)	TUWM	Clear Transmit Urgent Watermark. The <code>SPI_IMSK_CLR.TUWM</code> bit clears the corresponding mask bit in the <code>SPI_IMSK</code> register.
		0 No effect
		1 Clear mask bit

Table 16-23: SPI_IMSK_CLR Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration	
1 (R/W1C)	RUWM	Clear Receive Urgent Watermark. The <code>SPI_IMSK_CLR.RUWM</code> bit clears the corresponding mask bit in the <code>SPI_IMSK</code> register.	
		0	No effect
		1	Clear mask bit

Interrupt Mask Set Register

The `SPI_IMSK_SET` register permits setting individual mask bits in the `SPI_IMSK` register without affecting other bits in the register. Use write-1-to-set on a bit in the `SPI_IMSK_SET` register to set the corresponding bit in the `SPI_IMSK` register.

Figure 16-26: SPI_IMSK_SET Register Diagram

Table 16-24: SPI_IMSK_SET Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
11 (R/W1S)	TF	Set Transmit Finish. The <code>SPI_IMSK_SET.TF</code> bit sets the corresponding mask bit in the <code>SPI_IMSK</code> register.
		0 No effect
		1 Set mask bit
10 (R/W1S)	RF	Set Receive Finish. The <code>SPI_IMSK_SET.RF</code> bit sets the corresponding mask bit in the <code>SPI_IMSK</code> register.
		0 No effect
		1 Set mask bit
9 (R/W1S)	TS	Set Transmit Start. The <code>SPI_IMSK_SET.TS</code> bit sets the corresponding mask bit in the <code>SPI_IMSK</code> register.
		0 No effect
		1 Set mask bit

Table 16-24: SPI_IMSK_SET Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
8 (R/W1S)	RS	Set Receive Start. The <code>SPI_IMSK_SET.RS</code> bit sets the corresponding mask bit in the <code>SPI_IMSK</code> register.
		0 No effect
		1 Set mask bit
7 (R/W1S)	MF	Set Mode Fault. The <code>SPI_IMSK_SET.MF</code> bit sets the corresponding mask bit in the <code>SPI_IMSK</code> register.
		0 No effect
		1 Set mask bit
6 (R/W1S)	TC	Set Transmit Collision. The <code>SPI_IMSK_SET.TC</code> bit sets the corresponding mask bit in the <code>SPI_IMSK</code> register.
		0 No effect
		1 Set mask bit
5 (R/W1S)	TUR	Set Transmit Underrun. The <code>SPI_IMSK_SET.TUR</code> bit sets the corresponding mask bit in the <code>SPI_IMSK</code> register.
		0 No effect
		1 Set mask bit
4 (R/W1S)	ROR	Set Receive Overrun. The <code>SPI_IMSK_SET.ROR</code> bit sets the corresponding mask bit in the <code>SPI_IMSK</code> register.
		0 No effect
		1 Set mask bit
2 (R/W1S)	TUWM	Set Transmit Urgent Watermark. The <code>SPI_IMSK_SET.TUWM</code> bit sets the corresponding mask bit in the <code>SPI_IMSK</code> register.
		0 No effect
		1 Set mask bit

Table 16-24: SPI_IMSK_SET Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
1 (R/W1S)	RUWM	Set Receive Urgent Watermark. The <code>SPI_IMSK_SET</code> .RUWM bit sets the corresponding mask bit in the <code>SPI_IMSK</code> register.
		0 No effect
		1 Set mask bit

Memory Mapped Read Header

The `SPI_MMRDH` register enables the use of memory-mapped mode. This mode allows direct memory-mapped read accesses of an SPI memory device and is primarily used to directly execute instructions from an SPI FLASH memory without using a low-level software driver. All overhead tasks such as transmission of the read header, pin turnaround timing and receive data sizing are handled in hardware.

The memory-mapped access mode is enabled by setting the `SPI_CTL.MMSE` bit. The features within the `SPI_MMRDH` register include a command skip mode, variable length byte addressing, and independent multi-pin support for command transmission, address transmission and data reception. In addition, the command opcode and mode bytes are fully programmable.

Figure 16-27: SPI_MMRDH Register Diagram

Table 16-25: SPI_MMRDH Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
29 (R/W)	CMDPINS	Pins Used for Command.
		The <code>SPI_MMRDH.CMDPINS</code> bit specifies the number of pins to be used for command transmission. This bit must be set consistent with the expectations established by the read opcode. Hardware does not interpret <code>SPI_MMRDH.OPCODE</code> , but rather relies on this bit to specify behavior. When cleared, it overrides the <code>SPI_CTL.MIOM</code> bits. When set, it uses bits specified by the <code>SPI_CTL.MIOM</code> bit setting.
		0 Use only one pin: MOSI (overrides <code>SPI_CTL.MIOM</code> bits)
		1 Use pins specified by <code>SPI_CTL.MIOM</code> bits

Table 16-25: SPI_MMRDH Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
28 (R/W)	CMDSKIP	Command Skip Enable. The <code>SPI_MMRDH.CMDSKIP</code> bit enables command skip mode where the address is sent first and the <code>OPCODE</code> field is not sent (<code>SPI_MMRDH.CMDSKIP</code> bit =1). This mode is useful for supporting XIP (Execute-In-Place) operation where only the address is sent and the same read command is assumed. The SPI flash device must be primed with an initial read command, before the <code>SPI_MMRDH.CMDSKIP</code> bit is set.
		0 <code>OPCODE</code> field is sent first followed by address
		1 <code>OPCODE</code> field is not sent; address is sent first
27 (R/W)	WRAP	SPI Memory Wrap Indicator. The <code>SPI_MMRDH.WRAP</code> bit must be set by software if software places a connected SPI memory device into a 8-byte, 16-byte or 32-byte wrap mode based on the <code>ILINE</code> and <code>DLINE</code> field setting of the cache configuration register address wrap mode. Software achieves this by transmitting a vendor specified command to the SPI memory device while the <code>SPI_CTL.MMSE</code> bit =0. If the <code>SPI_MMRDH.WRAP</code> bit =1, the SPI does not need to deassert the SPI slave select signal and resend the read header in order to wrap to the cache line base when servicing misaligned cache fill requests. Although this improves cache fill efficiency, it requires that the SPI deassert the SPI slave select pin and resend the read header whenever a DMA burst requests crosses 32 byte alignments. Setting this bit improves cache throughput but decreases DMA throughput.
		0 SPI Memory auto increments address purely sequentially
		1 SPI Memory auto increments address but wraps within 32 Byte lines
26 (R/W)	MERGE	Merge Enable. When the <code>SPI_MMRDH.MERGE</code> bit is set, SPI hardware combines the two successive transfers. This increases the throughput rate when accessing a large number of sequential memory locations. For more information refer to the Merged Read Accesses section.

Table 16-25: SPI_MMRDH Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
25:24 (R/W)	TRIDMY	Tristate Dummy Timing. The <code>SPI_MMRDH.TRIDMY</code> bits specify whether and when output pins are three-stated during the interval of time specified by the <code>SPI_MMRDH.DMYSIZE</code> bits. Output pins potentially three-stated include all pins which were used to transmit the address
		0 Tristate outputs immediately
		1 Tristate outputs after 4 bits of dummy/mode are transmitted
		2 Tristate outputs after 8 bits of dummy/mode are transmitted
		3 Never tristate outputs (previously specified output state is held)
23:16 (R/W)	MODE	Mode Field. These bits specify up to a leading byte to be transmitted during the interval of time specified by the <code>SPI_MMRDH.DMYSIZE</code> bit field. This first byte, or a portion of it, is interpreted as mode bits when certain opcodes are used in conjunction with certain SPI memory devices. Mode bits are sent using the same number of pins which were used to transmit the address. Once sent, output pins will be held in their final resultant state until the conclusion of all dummy byte periods, unless three-stating the outputs is specified first by the <code>SPI_MMRDH.TRIDMY</code> bits.
14:12 (R/W)	DMYSIZE	Bytes of Dummy/Mode. The <code>SPI_MMRDH.DMYSIZE</code> bit field specifies the number of bytes separating address transmission and read data return. Dummy bytes elapse assuming dummy bits are transmitted using the same number of pins which were used to transmit address.
		0 0 Bytes
		1 1 Bytes
		2 2 Bytes
		3 3 Bytes
		4 4 Bytes
		5 5 Bytes
		6 6 Bytes
		7 7 Bytes

Table 16-25: SPI_MMRDH Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
11 (R/W)	ADRPINS	Pins Used for Address. The <code>SPI_MMRDH.ADRPINS</code> bit specifies the number of pins to be used for address transmission. This bit must be set consistent with expectations established by read opcode. Hardware does not interpret the <code>SPI_MMRDH.OPCODE</code> , but rather relies on this bit to specify behavior.
		0 Use only one pin: MOSI (overrides <code>SPI_CTL.MIOM</code> bits)
		1 Use pins specified by <code>SPI_CTL.MIOM</code> bits
10:8 (R/W)	ADRSIZE	Bytes of Read Address. The <code>SPI_MMRDH.ADRSIZE</code> bit field defines the number of bytes used to specify the read address. The read address is sent immediately following the transmission of opcode. Unlike opcode bits, address bits may be sent using either one or multiple pins. The number of pins is selected using the <code>SPI_MMRDH.ADRPINS</code> bit. The address sent to a connected SPI memory device is an echo of the read address received by the SPI peripheral slave port. The least significant bytes of address are sent when the entire address is not sent.
		0 1 Byte
		1 1 Byte
		2 2 Bytes
		3 3 Bytes
		4 4 Bytes
7:0 (R/W)	OPCODE	Read Opcode. The <code>SPI_MMRDH.OPCODE</code> bit field specifies the initial bits transmitted in response to a read request of SPI memory. Although any opcode may be sent, values 0x03, 0x0B, 0x3B, 0x6B, 0xBB, and 0xEB are likely to be the most commonly used. <code>SPI_MMRDH.OPCODE</code> is sent by the SPI without interpretation; the states of these bits have no effect beyond specifying what is initially shifted across the SPI interface.

SPI Memory Top Address

The `SPI_MMTOP` register specifies the top populated address of a connected SPI memory device.

Figure 16-28: SPI_MMTOP Register Diagram

Table 16-26: SPI_MMTOP Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	TOPADR	SPI Memory Top Address. The <code>SPI_MMTOP.TOPADR</code> bit field specifies the top populated address of a connected SPI memory device. Attempts to access SPI memory are not blocked if this address is exceeded and an error is generated as part of the read response.

Receive FIFO Data Register

The `SPI_RFIFO` register has an interface to the receive shift register in the SPI and has an interface to the processor's data buses. The top level of the buffer is visible to programs as the 32-bit `SPI_RFIFO` register, but the size (number of word locations) of the receive FIFO is actually flexible with transfer word size. The size of the receive FIFO is 8 if the word size is 8-bit, or the size is 4 if the word size is 16-bit, or the size is 2 if the word size is 32-bit.

Both masters and slaves may stop or stall receive transfers based on FIFO status. When the receive FIFO is full, the SPI master stops initiating new transfers on the SPI if `SPI_RXCTL.RTI` is enabled. A slave may stall the SPI interface when the content of the FIFO crosses the selected watermark. If data reception continues after `SPI_RFIFO` is full, the data in the receive FIFO is invalid. The SPI indicates this condition with receive overrun (`SPI_STAT.ROR`) error. This condition is possible when `SPI_RXCTL.RTI = 0` and `SPI_RXCTL.REN = 1` for a master, or for a slave that does not exercise flow control.

Note that the receive FIFO is reset (cleared) when the SPI is disabled after being enabled.

Figure 16-29: SPI_RFIFO Register Diagram

Table 16-27: SPI_RFIFO Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	DATA	Receive FIFO Data. The <code>SPI_RFIFO.DATA</code> bit field contains the FIFO receive data.

Received Word Count Register

The `SPI_RWC` register holds a count of the number of words remaining to be received by the SPI. To start the decrement of the word count in `SPI_RWC`, enable the receive word counter (`SPI_RXCTL.RWCEN = 1`). The SPI uses the word count to control the duration of transfers and to signal the completion of a burst of transfers with the receive finish interrupt (`SPI_ILAT.RF`). In DMA mode, the SPI uses the `SPI_RWC` register to ensure that the number of frames received during a DMA transfer is equal to the number of words programmed in the DMA channel controller. The values programmed into the `SPI_RWC` registers should match the word count in the DMA configuration. The `SPI_RWC` register maintains the number of frames to be received in a transfer. The `SPI_RWC` should only be changed when the counter is disabled.

Figure 16-30: SPI_RWC Register Diagram

Table 16-28: SPI_RWC Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15:0 (R/W)	VALUE	Received Word Count. The <code>SPI_RWC.VALUE</code> bits hold the receive transfer word count.

Received Word Count Reload Register

The `SPI_RWCR` register holds the receive word count value that the SPI loads into the `SPI_RWC` register when the transfer count decrements to zero. To prevent the SPI from reloading the counter, use zero for the reload count value. The `SPI_RWCR` register should only be changed when the counter is disabled.

Figure 16-31: SPI_RWCR Register Diagram

Table 16-29: SPI_RWCR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15:0 (R/W)	VALUE	Received Word Count Reload. The <code>SPI_RWCR.VALUE</code> bits hold the receive transfer word count reload value.

Receive Control Register

The `SPI_RXCTL` register enables the SPI receive channel, initiates receive transfers, and configures `SPI_RFIFO` buffer watermark settings.

Figure 16-32: SPI_RXCTL Register Diagram

Table 16-30: SPI_RXCTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
18:16 (R/W)	RUWM	Receive FIFO Urgent Watermark. The <code>SPI_RXCTL.RUWM</code> bits select the receive FIFO (<code>SPI_RFIFO</code>) watermark level for urgent data bus requests. The SPI also uses this watermark level for generation of the <code>SPI_ILAT.RUWM</code> interrupt. When an urgent <code>SPI_RFIFO</code> watermark is enabled with <code>SPI_RXCTL.RUWM</code> , the <code>SPI_RXCTL.RRWM</code> selection is used as the deassertion condition for any <code>SPI_ILAT.RUWM</code> interrupts that are latched.
		0 Disabled
		1 25% full RFIFO
		2 50% full RFIFO
		3 75% full RFIFO
		4 Full RFIFO
		5 Reserved
		6 Reserved
		7 Reserved

Table 16-30: SPI_RXCTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
13:12 (R/W)	RRWM	Receive FIFO Regular Watermark. The SPI_RXCTL.RRWM bits select the receive FIFO (SPI_RFIFO) watermark level for regular data bus requests. When an urgent SPI_RFIFO watermark is enabled with SPI_RXCTL.RUWM, the SPI_RXCTL.RRWM selection is used as the deassertion condition for any SPI_ILAT.RUWM interrupts that are latched.
		0 Empty RFIFO
		1 RFIFO less than 25% full
		2 RFIFO less than 50% full
		3 RFIFO less than 75% full
8 (R/W)	RDO	Receive Data Overrun. The SPI_RXCTL.RDO bit selects handling for receive data requests when the receive buffer (SPI_RFIFO) is full. If enabled and SPI_RFIFO is full, the SPI overwrites old data in the buffer with incoming data. If disabled and SPI_RFIFO is full, the SPI keeps old data in the buffer and discards incoming data.
		0 Discard incoming data if SPI_RFIFO is full
		1 Overwrite old data if SPI_RFIFO is full
6:4 (R/W)	RDR	Receive Data Request. The SPI_RXCTL.RDR bits select receive FIFO (SPI_RFIFO) watermark conditions that direct the SPI to generate a receive data request.
		0 Disabled
		1 Not empty RFIFO
		2 25% full RFIFO
		3 50% full RFIFO
		4 75% full RFIFO
		5 Full RFIFO
		6 Reserved
		7 Reserved
3 (R/W)	RWCEN	Receive Word Counter Enable. The SPI_RXCTL.RWCEN bit enables the decrement of the SPI_RWC register when the count is not zero and SPI_RXCTL.RTI is enabled. Enabling SPI_RXCTL.RWCEN prevents receive overrun errors from occurring. The SPI_RXCTL.RWCEN bit is valid only when the SPI is a master.
		0 Disable
		1 Enable

Table 16-30: SPI_RXCTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
2 (R/W)	RTI	Receive Transfer Initiate. The <code>SPI_RXCTL.RTI</code> bit enables initiation of receive transfers if the receive FIFO (<code>SPI_RFIFO</code>) is not full. The bit also enables this initiation if <code>SPI_RWC</code> is not zero when <code>SPI_RXCTL.RWCEN</code> is enabled. Enabling <code>SPI_RXCTL.RTI</code> prevents receive overrun errors from occurring. The <code>SPI_RXCTL.RTI</code> bit is valid only when the SPI is a master.
		0 Disable
		1 Enable
0 (R/W)	REN	Receive Enable. The <code>SPI_RXCTL.REN</code> bit enables SPI receive channel operation.
		0 Disable
		1 Enable

Slave Select Register

The `SPI_SLVSEL` register enables the `SPI_SEL[n]` pins for output and indicates the state (high or low) of these pins when enabled.

Figure 16-33: SPI_SLVSEL Register Diagram

Table 16-31: SPI_SLVSEL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15 (R/W)	SSEL7	Slave Select 7 Output. The <code>SPI_SLVSEL.SSEL7</code> bit state indicates the value driven on the related <code>SPI_SEL[n]</code> pin.
		0 Low
		1 High
14 (R/W)	SSEL6	Slave Select 6 Output. The <code>SPI_SLVSEL.SSEL6</code> bit state indicates the value driven on the related <code>SPI_SEL[n]</code> pin.
		0 Low
		1 High

Bit No. (Access)	Bit Name	Description/Enumeration
13 (R/W)	SSEL5	Slave Select 5 Output. The <code>SPI_SLVSEL.SSEL5</code> bit state indicates the value driven on the related <code>SPI_SEL[n]</code> pin.
		0 Low
		1 High
12 (R/W)	SSEL4	Slave Select 4 Output. The <code>SPI_SLVSEL.SSEL4</code> bit state indicates the value driven on the related <code>SPI_SEL[n]</code> pin.
		0 Low
		1 High
11 (R/W)	SSEL3	Slave Select 3 Output. The <code>SPI_SLVSEL.SSEL3</code> bit state indicates the value driven on the related <code>SPI_SEL[n]</code> pin.
		0 Low
		1 High
10 (R/W)	SSEL2	Slave Select 2 Output. The <code>SPI_SLVSEL.SSEL2</code> bit state indicates the value driven on the related <code>SPI_SEL[n]</code> pin.
		0 Low
		1 High
9 (R/W)	SSEL1	Slave Select 1 Output. The <code>SPI_SLVSEL.SSEL1</code> bit state indicates the value driven on the related <code>SPI_SEL[n]</code> pin.
		0 Low
		1 High
7 (R/W)	SSE7	Slave Select 7 Enable. The <code>SPI_SLVSEL.SSE7</code> bit enables the related <code>SPI_SEL[n]</code> pin for output. If disabled, the SPI three-states the related <code>SPI_SEL[n]</code> pin.
		0 Disable
		1 Enable

Table 16-31: SPI_SLVSEL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
6 (R/W)	SSE6	Slave Select 6 Enable. The SPI_SLVSEL.SSE6 bit enables the related $\overline{\text{SPI_SEL}}[n]$ pin for output. See the SPI_SLVSEL.SSE7 bit description for more information.
		0 Disable
		1 Enable
5 (R/W)	SSE5	Slave Select 5 Enable. The SPI_SLVSEL.SSE5 bit enables the related $\overline{\text{SPI_SEL}}[n]$ pin for output. See the SPI_SLVSEL.SSE7 bit description for more information.
		0 Disable
		1 Enable
4 (R/W)	SSE4	Slave Select 4 Enable. The SPI_SLVSEL.SSE4 bit enables the related $\overline{\text{SPI_SEL}}[n]$ pin for output. See the SPI_SLVSEL.SSE7 bit description for more information.
		0 Disable
		1 Enable
3 (R/W)	SSE3	Slave Select 3 Enable. The SPI_SLVSEL.SSE3 bit enables the related $\overline{\text{SPI_SEL}}[n]$ pin for output. See the SPI_SLVSEL.SSE7 bit description for more information.
		0 Disable
		1 Enable
2 (R/W)	SSE2	Slave Select 2 Enable. The SPI_SLVSEL.SSE2 bit enables the related $\overline{\text{SPI_SEL}}[n]$ pin for output. See the SPI_SLVSEL.SSE7 bit description for more information.
		0 Disable
		1 Enable
1 (R/W)	SSE1	Slave Select 1 Enable. The SPI_SLVSEL.SSE1 bit enables the related $\overline{\text{SPI_SEL}}[n]$ pin for output. See the SPI_SLVSEL.SSE7 bit description for more information.
		0 Disable
		1 Enable

Status Register

The `SPI_STAT` register indicates SPI status including FIFO status, error conditions, and interrupt conditions. When an interrupt condition from this register is unmasked (enabled) by the corresponding bit in the `SPI_IMSK` register, the interrupt request is latched into the corresponding bit in the `SPI_ILAT` register.

Figure 16-34: SPI_STAT Register Diagram

Table 16-32: SPI_STAT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W1C)	MMAE	Memory Mapped Access Error. The <code>SPI_STAT.MMAE</code> bit =1 if an attempt is made to access either the Tx or Rx FIFO while memory-mapped access of SPI memory is enabled (see the <code>SPI_CTL.MMSE</code> bit). The <code>SPI_STAT.MMAE</code> bit =0 when a 1 is written to it. The <code>SPI_STAT.MMAE</code> bit is provided for software notification only. Its state has no further effect.

Table 16-32: SPI_STAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
29 (R/W1C)	MMRE	Memory Mapped Read Error. The <code>SPI_STAT.MMRE</code> bit =1 if an attempt is made to read address space reserved for memory-mapped SPI memory while memory mapping is disabled (see the <code>SPI_CTL.MMSE</code> bit). The <code>SPI_STAT.MMRE</code> bit =0 when a 1 is written to it. This bit is provided for software notification only. Its state has no further effect.
28 (R/W1C)	MMWE	Memory Mapped Write Error. The <code>SPI_STAT.MMWE</code> bit =1 if an attempt is made to write address space reserved for memory-mapped SPI memory. The <code>SPI_STAT.MMWE</code> bit =0 when a 1 is written to it. This bit is provided for software notification only. Its state has no further effect.
23 (R/NW)	TFF	SPI_TFIFO Full. The <code>SPI_STAT.TFF</code> bit indicates whether the <code>SPI_TFIFO</code> is full or not full.
		0 Not full Tx FIFO
		1 Full Tx FIFO
22 (R/NW)	RFE	SPI_RFIFO Empty. The <code>SPI_STAT.RFE</code> bit indicates whether the <code>SPI_RFIFO</code> is empty or not empty.
		0 Rx FIFO not empty
		1 Rx FIFO empty
20 (R/NW)	FCS	Flow Control Stall Indication. The <code>SPI_STAT.FCS</code> bit indicates whether a slave has deasserted the <code>SPI_RDY</code> pin to stall the SPI master while the slave is unable to service the SPI masters request. This bit is valid only when the SPI is a master (<code>SPI_CTL.MSTR</code> =1) and flow control is enabled (<code>SPI_CTL.FCEN</code> =1).
		0 No Stall (RDY pin asserted)
		1 Stall (RDY pin deasserted)
18:16 (R/NW)	TFS	SPI_TFIFO Status. The <code>SPI_STAT.TFS</code> bits indicate the status of the <code>SPI_TFIFO</code> . The SPI uses this status when evaluating transmit watermark conditions.
		0 Full TFIFO
		1 25% empty TFIFO
		2 50% empty TFIFO
		3 75% empty TFIFO
		4 Empty TFIFO

Table 16-32: SPI_STAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
14:12 (R/NW)	RFS	SPI_RFIFO Status. The <code>SPI_STAT.RFS</code> bits indicate the status of the <code>SPI_RFIFO</code> . The SPI uses this status when evaluating receive watermark conditions.
		0 Empty RFIFO
		1 25% full RFIFO
		2 50% full RFIFO
		3 75% full RFIFO
		4 Full RFIFO
11 (R/W1C)	TF	Transmit Finish Indication. The <code>SPI_STAT.TF</code> bit indicates that the SPI has detected the finish of a transmit burst transfer (the <code>SPI_TWC</code> count decrements to zero). This condition can only occur when <code>SPI_TXCTL.TTI</code> and <code>SPI_TXCTL.TWCEN</code> are enabled.
		0 No status
		1 Transmit finish detected
10 (R/W1C)	RF	Receive Finish Indication. The <code>SPI_STAT.RF</code> bit indicates that the SPI has detected the finish of a receive burst transfer (the <code>SPI_RWC</code> count decrements to zero). This condition can only occur when <code>SPI_RXCTL.RTI</code> and <code>SPI_RXCTL.RWCEN</code> are enabled.
		0 No status
		1 Receive finish detected
9 (R/W1C)	TS	Transmit Start. The <code>SPI_STAT.TS</code> bit indicates that the SPI has detected the start of a transmit burst transfer. A transmit bursts starts with the load of <code>SPI_TWC</code> from the <code>SPI_TWCR</code> . This condition can only occur when <code>SPI_TXCTL.TTI</code> and <code>SPI_TXCTL.TWCEN</code> are enabled.
		0 No status
		1 Transmit start detected
8 (R/W1C)	RS	Receive Start. The <code>SPI_STAT.RS</code> bit indicates that the SPI has detected the start of a receive burst transfer. A receive bursts starts with the load of <code>SPI_RWC</code> from the <code>SPI_RWCR</code> . This condition can only occur when <code>SPI_RXCTL.RTI</code> and <code>SPI_RXCTL.RWCEN</code> are enabled.
		0 No status
		1 Receive start detected

Table 16-32: SPI_STAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
7 (R/W1C)	MF	Mode Fault Indication. The <code>SPI_STAT.MF</code> bit, when SPI is a master and <code>SPI_CTL.PSSE</code> is enabled, indicates that multiple masters have asserted slave select inputs.
		0 No status
		1 Mode fault occurred
6 (R/W1C)	TC	Transmit Collision Indication. The <code>SPI_STAT.TC</code> bit, when SPI is a slave, indicates that the load of data into the shift register has occurred too close to the first transmitting edge of the SPI clock.
		0 No status
		1 Transmit collision occurred
5 (R/W1C)	TUR	Transmit Underrun Indication. The <code>SPI_STAT.TUR</code> bit, when the transmit FIFO (<code>SPI_TFIFO</code>) is empty, indicates that the last word in the transmit FIFO has been re-sent as transmit data. Alternately, it indicates that zero has been sent as transmit data.
		0 No status
		1 Transmit underrun occurred
4 (R/W1C)	ROR	Receive Overrun Indication. The <code>SPI_STAT.ROR</code> bit, when the receive FIFO (<code>SPI_RFIFO</code>) is full, indicates that a word in the receive FIFO has been overwritten with incoming receive data. Alternately, it indicates that incoming receive data has been discarded.
		0 No status
		1 Receive overrun occurred
2 (R/NW)	TUWM	Transmit Urgent Watermark Breached. The <code>SPI_STAT.TUWM</code> bit indicates that the transmit urgent watermark (<code>SPI_TXCTL.TUWM</code>) has been reached. This condition is cleared when the transmit FIFO fills enough to reach the transmit regular watermark (<code>SPI_TXCTL.TRWM</code>).
		0 Tx regular watermark reached
		1 Tx urgent watermark breached
1 (R/NW)	RUWM	Receive Urgent Watermark Breached. The <code>SPI_STAT.RUWM</code> bit indicates that the receive urgent watermark (<code>SPI_RXCTL.RUWM</code>) has been reached. This condition is cleared when the receive FIFO empties enough to reach the receive regular watermark (<code>SPI_RXCTL.RRWM</code>).
		0 Rx regular watermark reached
		1 Rx urgent watermark breached

Table 16-32: SPI_STAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
0 (R/NW)	SPIF	SPI Finished. The <code>SPI_STAT.SPIF</code> bit indicates that a single word transfer is complete.
		0 No status
		1 Completed single word transfer

Transmit FIFO Data Register

The `SPI_TFIFO` register has an interface to the transmit shift register in the SPI and has an interface to the processor's data buses. The top level of the buffer is visible to programs as the 32-bit `SPI_TFIFO` register, but the size (number of word locations) of the transmit FIFO is actually flexible with transfer word size. The size of the transmit FIFO is 8 if the word size is 8-bit, or the size is 4 if the word size is 16-bit, or the size is 2 if the word size is 32-bit.

Both masters and slaves may stop or stall transmit transfers based on FIFO status. When the transmit FIFO is empty, the SPI master stops initiating new transfers on the SPI if `SPI_TXCTL.TTI` is enabled. A slave may stall the SPI interface when the content of the FIFO crosses the selected watermark. If data transmit requests continue after `SPI_TFIFO` is empty, the data sent from the transmit FIFO is invalid, and the SPI indicates this condition with transmit underrun (`SPI_STAT.TUR`). This condition is possible when `SPI_TXCTL.TTI = 0` and `SPI_TXCTL.TEN = 1` for a master, or for a slave that does not exercise flow control.

Note that the transmit FIFO is reset (cleared) when the SPI is disabled after being enabled.

Figure 16-35: `SPI_TFIFO` Register Diagram

Table 16-33: `SPI_TFIFO` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	DATA	Transmit FIFO Data. The <code>SPI_TFIFO.DATA</code> bit field contains the FIFO transmit data.

Transmitted Word Count Register

The `SPI_TWC` register holds a count of the number of words remaining to be transmitted by the SPI. To start the decrement of the word count in `SPI_TWC`, enable the transmit word counter (`SPI_TXCTL.TWCEN = 1`). The SPI uses the word count to control the duration of transfers and to signal the completion of a burst of transfers with the transmit finish interrupt request. In DMA mode, the SPI uses the `SPI_TWC` to ensure that the number of frames transmitted during a DMA transfer is equal to the number of words programmed in the DMA channel controller. The values programmed into the `SPI_TWC` registers should match the word count in the DMA configuration. The `SPI_TWC` maintains the number of frames to be transmitted in a transfer. The `SPI_TWC` should only be changed when the counter is disabled.

Figure 16-36: SPI_TWC Register Diagram

Table 16-34: SPI_TWC Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15:0 (R/W)	VALUE	Transmitted Word Count. The <code>SPI_TWC.VALUE</code> bits hold the transmit transfer word count.

Transmitted Word Count Reload Register

The `SPI_TWCR` register holds the transmit word count value that the SPI loads into the `SPI_TWC` register when the transfer count decrements to zero. To prevent the SPI from reloading the counter, use zero for the reload count value. The `SPI_TWCR` should only be changed when the counter is disabled.

Figure 16-37: SPI_TWCR Register Diagram

Table 16-35: SPI_TWCR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15:0 (R/W)	VALUE	Transmitted Word Count Reload. The <code>SPI_TWCR.VALUE</code> bits hold the transmit transfer word count reload value.

Transmit Control Register

The `SPI_TXCTL` register enables the SPI transmit channel, initiates transmit transfers, and configures `SPI_TFIFO` buffer watermark settings.

Figure 16-38: SPI_TXCTL Register Diagram

Table 16-36: SPI_TXCTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
18:16 (R/W)	TUWM	FIFO Urgent Watermark. The <code>SPI_TXCTL.TUWM</code> bits select the transmit FIFO (<code>SPI_TFIFO</code>) watermark level for urgent data bus requests. The SPI also uses this watermark level for generation of the <code>SPI_ILAT.TUWM</code> interrupt request. When an urgent <code>SPI_TFIFO</code> watermark is enabled with <code>SPI_TXCTL.TUWM</code> , the <code>SPI_TXCTL.TRWM</code> selection is used as the deassertion condition for any <code>SPI_ILAT.TUWM</code> interrupt requests that are latched.
		0 Disabled
		1 25% empty TFIFO
		2 50% empty TFIFO
		3 75% empty TFIFO
		4 Empty TFIFO

Table 16-36: SPI_TXCTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
13:12 (R/W)	TRWM	FIFO Regular Watermark. The SPI_TXCTL.TRWM bits select the transmit FIFO (SPI_TFIFO) watermark level for regular data bus requests. When an urgent SPI_TFIFO watermark is enabled with SPI_TXCTL.TUWM, the SPI_TXCTL.TRWM selection is used as the deassertion condition for any SPI_ILAT.TUWM interrupt requests that are latched.
		0 Full TFIFO
		1 TFIFO less than 25% empty
		2 TFIFO less than 50% empty
		3 TFIFO less than 75% empty
8 (R/W)	TDU	Transmit Data Underrun. The SPI_TXCTL.TDU bit selects handling for transmit data requests when the transmit buffer (SPI_TFIFO) is empty. If enabled and SPI_TFIFO is empty, the SPI transmits zero as data. If disabled and SPI_TFIFO is empty, the SPI transmits the last word in the buffer as data.
		0 Send last word when SPI_TFIFO is empty
		1 Send zeros when SPI_TFIFO is empty
6:4 (R/W)	TDR	Transmit Data Request. The SPI_TXCTL.TDR bits select transmit FIFO (SPI_TFIFO) watermark conditions that direct the SPI to generate a transmit status interrupt request.
		0 Disabled
		1 Not full TFIFO
		2 25% empty TFIFO
		3 50% empty TFIFO
		4 75% empty TFIFO
		5 Empty TFIFO
3 (R/W)	TWCEN	Transmit Word Counter Enable. The SPI_TXCTL.TWCEN bit enables the decrement of the transmit word count (SPI_TWC) register when the count is not zero and SPI_TXCTL.TTI is enabled. Enabling SPI_TXCTL.TWCEN prevents transmit underrun errors from occurring. The SPI_TXCTL.TWCEN bit is valid only when the SPI is a master.
		0 Disable
		1 Enable

Table 16-36: SPI_TXCTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
2 (R/W)	TTI	Transmit Transfer Initiate. The SPI_TXCTL.TTI bit enables initiation of transmit transfers if the transmit FIFO (SPI_TFIFO) is not empty. The bit also enables this initiation if SPI_TWC is not zero when SPI_TXCTL.TWCEN is enabled. Enabling SPI_TXCTL.TTI prevents transmit underrun errors from occurring. The SPI_TXCTL.TTI bit is valid only when the SPI is a master.
		0 Disable
		1 Enable
0 (R/W)	TEN	Transmit Enable. The SPI_TXCTL.TEN bit enables SPI transmit channel operation.
		0 Disable
		1 Enable

17 Octal Serial Peripheral Interface (OSPI)

The Octal Serial Peripheral Interface (OSPI) controller provides access to serial flash devices. It is designed to access flash devices with its modes enabling efficient communication, with minimum overhead on software. Standard SPI is supported along with high performance dual, quad, and octal SPI modes where data can be transferred on up to 8 data pins. Along with normal mode of operation in single transfer (STR) mode, the OSPI controller supports dual transfer rate (DTR) mode, where data, address, and commands are transferred on both edges of the serial clock. With direct access mode support, any read/write to the OSPI memory space triggers a read/write to flash memory.

Direct read accesses using core and DMA are possible, with the latter minimizing software overhead. The OSPI controller also provides Software Triggered Instruction Generation (STIG) mode, which can be used to erase the data on flash devices and access volatile and nonvolatile configuration registers, legacy flash status register, and other status/protection registers.

The OSPI provides a glueless hardware interface with SPI flash devices. The OSPI peripheral includes programmable baud rates, clock phase, clock polarity, separate dummy cycles for read and write accesses, data sampling control, programmable page size/block size, and so on. With this independent control of how many lines to use for command, address, and data allows to virtually interface any flash device with the processor through OSPI controller.

The OSPI also provides support for DQS when sampling data to improve read data capture and PHY mode support to enable high-speed data transfers.

OSPI Features

The OSPI controller supports the following features:

- Full-duplex, synchronous, serial interface
- Memory mapped direct mode operation for performing flash data transfers
- STIG mode operation to issue flash commands
- Automatic flash status polling support for flash program through direct access mode
- XIP (Execute in Place) support
- Support for single, dual, quad, or octal modes of operation
- Support for DDR mode and DTR protocol (including Octal DDR protocol)

- Up to 16-bit data transfer in each SPI clock cycle
- Programmable baud rate, clock phase, and polarity
- Programmable interrupt generation
- Programmable chip select control timing
- Programmable dummy cycles for read and write operations
- Tune data capture mechanism to improve high speed operation
- Programmable write protected regions to block system writes
- Support for DQS to sample the data to improve read data capturing
- PHY mode support to allow the high speed data transfers

OSPI Functional Description

ADSP-2159x OSPI Register List

The OSPI is a Octal SPI controller.

Table 17-1: ADSP-2159x OSPI Register List

Name	Description
OSPI_CTL	Octal SPI Control Register
OSPI_DLY	Device Delay Register
OSPI_DRICTL	Device Read Instruction Control Register
OSPI_DWICTL	Device Write Instruction Control Register
OSPI_DSCTL	Device Size Control Register
OSPI_DLLOB_LWR	DLL Observable Register (Lower)
OSPI_DLLOB_UP	DLL Observable Register (Upper)
OSPI_FCA	Flash Command Address Register
OSPI_FCCTL	Flash Command Control Register
OSPI_FCMCTL	Flash Command Control Memory Register
OSPI_FCRD_LWR	Flash Command Read Data Register (Lower)
OSPI_FCRD_UP	Flash Command Read Data Register (Upper)
OSPI_FCWD_LWR	Flash Command Write Data Register (Lower)
OSPI_FCWD_UP	Flash Command Write Data Register (Upper)
OSPI_IMSK	Interrupt Mask Register
OSPI_ISTAT	Interrupt Status Register

Table 17-1: ADSP-2159x OSPI Register List (Continued)

Name	Description
OSPI_WRPROT_LWR	Lower Write Protection Register
OSPI_MBCTL	Mode Bit Control Register
OSPI_MODID	Module ID Register
OSPI_POLLEXP	Polling Expiration Register
OSPI_OE_LWR	Opcode Extension Register (Lower)
OSPI_OE_UP	Opcode Extension Register (Upper)
OSPI_PHYCTL	PHY Control Register
OSPI_PHYMCTL	PHY DLL Master Control Register
OSPI_POLSTAT	Polling Flash Status Register
OSPI_RDC	Read Data Capture Register
OSPI_REMAPADDR	Remap Address Register
OSPI_WRPROT_UP	Upper Write Protection Register
OSPI_WRPROT_CTL	Write Protection Control Register
OSPI_WCCTL	Write Completion Control Register

OSPI Block Diagram

The OSPI module is comprised of:

- Low level SPI protocol controller
- Internal transmit/receive FIFOs
- DAC
- STIG controller
- Register interface

The figure shows the OSPI controller block diagram.

Figure 17-1: OSPI Controller Block Diagram

Architectural Concepts

There are two clock sources for the OSPI controller and one generated clock for clocking external flash device.

The SYSClk is the main system clock used to transfer data over the AHB bus between the master (core/DMA) and the OSPI controller. The SCLK0_0 clock is used to access the OSPI controller registers to perform basic configuration of the controller and interrupt handling. The SYSClk, which also acts as a reference clock, is used to serialize the data and drive the OSPI interface. The external clock driven on the OSPI_CLK pin, which is synchronous to the reference clock, is derived from the reference and divided using internal baud rate dividers. Using the reference clock, allows the core to decouple the frequency of the SPI flash device from system clocks, thereby providing a flexible clocking solution.

The OSPI controller supports two independent controllers (to support different types of flash accesses):

- Direct Access Controller (DAC)
- Software Triggered Instruction Generator (STIG)

The high-level architecture of the OSPI controller is divided into two blocks. The first is the high-level OSPI controller that interfaces with the rest of the SoC. It also queues flash transactions based on data from AHB and APB bus interfaces. The second module is the low-level SPI Protocol Controller. It is used for serializing data from high-level OSPI controller and translating them into the SPI transfer protocol where there are two possible data paths. The first path preserves backward compatibility with the previous SoCs. This path bypasses the PHY module. Use this path when there is no strict requirement for high performance (clock divider is greater or equal 4).

The second data path is through the PHY Module and is for dividers lower than 4. The configuration is set by software. The controller waits for a valid direct access from the AHB bus (which runs off SYSClk) or for a software triggered read from the APB bus. When such an event occurs, the corresponding internal controller is selected

(DAC or STIG). The flash command generator block arbitrates between accesses and forwards control into the low-level SPI module. This block works on the reference clock. Transmit data is synchronized internally to the TX FIFO and then serialized to the SPI interface. When the direction of transfer changes and the device returns data to the controller, data is read into the RX FIFO and then synchronized to the internal clocks. The SPI control logic selects the source of the data path (with or without PHY) based on the register configuration. The reference clock and the associated delayed variants are relevant for this transfer type when the PHY mode is enabled.

Direct Access Controller (DAC)

Direct access refers to the operation where AHB bus accesses targeted to the OSPI memory mapped space of processor directly triggers a read/write on flash memory. It is memory mapped and used to access and directly execute the code from external flash memory. When DAC is enabled through the `OSPI_CTL.DACEN` field, any incoming AHB access is serviced by the DAC. Direct accesses can be launched by accessing the OSPI memory address space using core or via one of the MDMA channels. In memory mapped mode, communication to a flash device is automated. The flash memory is accessible directly through reads/write of the processor address space. This access allows code to execute directly from flash devices (true XIP operations). The content can be cached for good performance.

When servicing AHB reads, the DAC sends an additional access downstream apart from the one issued by the AHB in single AHB burst. This is invisible from the system interface. It is a predicted read and ensures that the SPI core operates with maximum bandwidth. The AHB burst not defined by AMBA. It is defined as follows:

- The first access of the AHB burst is defined by:
An AHB access that is non-sequential (based on address comparison).
An AHB access that is non-sequential or sequential when the downstream modules are idle.
- The last access of the AHB burst is defined by an AHB access that is sequential and precedes a new burst.
- Size of the AHB burst is the number of AHB accesses (first access to last access).
- The number of DAC requests per AHB burst is equal to the size of the AHB burst + 1.

When AHB clock is slower than the SPI data rate, the sequential read transfer may be interrupted on the SPI side and continues after the AHB clock accepts the last data. The limiting value gets narrower as the SPI clock divider and AHB access size decrease and the number of data IOs (single, dual, quad, or octal) increase. If the system cannot meet the SPI data rate, use higher SPI clock divider. This decreases the SPI data rate, but prevents OSPI accesses to external flash to break in between and pass the *Opcode-Address-Dummy* sequence each time. This increases the overall performance by keeping the data transfer continuous.

The controller is designed to work at high data rates. This predicted read results in redundant data during mixed AHB accesses on slow system data rate. Mixed accesses implies that direct AHB sequence of single non-sequential access following few sequential accesses. The predicted read cannot be dropped because of SPI transfer interruption. It is sent as a separate SPI transaction which creates redundant data on the interface for one access. To avoid this issue, drop this data by system or introduce wait states on AHB before issuing a non-sequential direct AHB access.

For AHB writes, the DAC triggers a sequence of write commands that mimic the way reads are processed, though the number of DAC write requests are equal to the number of AHB write requests received. The AHB controller ensures that flash bursts do not break the flash page boundary. When a page boundary is detected, only the number

of byte accesses up to that boundary are forwarded. A sequential direct write request that crosses a page boundary must be detected as non-sequential, causing the controller to force the flash device to enter a self-timed page program cycle. The controller supports splitting the writes crossing the page boundaries only for word-aligned addresses.

The external AHB master supplying data for writes must guarantee write data for a particular page that can be provided to the controller in a timely fashion to avoid downstream starvation. If there is a large delay in the system issuing a sequential write, flash write cycle may be prematurely initiated, reducing the device life time.

Flash erase operations, which may be required before a page write, are triggered by software using the STIG. Once a page program cycle has been started, the OSPI controller automatically polls for write cycle to complete before allowing any AHB accesses to complete. This is achieved by holding the subsequent AHB direct accesses in wait state.

Software Triggered Instruction Generator (STIG)

DAC is primarily used to transfer data. To access the volatile and nonvolatile configuration registers, the legacy Flash SPI Status register, other status/protection registers and perform erase operations, a separate software controller is required.

The STIG is controlled using the `OSPI_FCCTL` register by setting up the command to issue to the flash device. This is a generic controller used to perform instructions that the flash device supports from the extended SPI protocol. The STIG controller command is sent to the flash device and written to the software in the `OSPI_FCCTL.OPCODE` field. This is different from the `OSPI_DRICTL.OPCODERD` and `OSPI_DWICTL.OPCODEWR` fields, as these fields do not impact the STIG operation.

Configuring instructions that are not compliant with the flash specifications can cause unpredictable behavior of the controller. Bit 0 is used to trigger the command, bit 1 used by software to poll the status of the command execution. For reads, when the command has been serviced (bit 1 toggles from 1 to 0), up to 8 bytes of read data is placed in the `OSPI_FCRD_LWR` and `OSPI_FCRD_UP` registers. For writes, data must be placed in the `OSPI_FCWD_LWR` and `OSPI_FCWD_UP` registers. The STIG completion request can be also checked by the corresponding interrupt. The interrupt indicates that the controller is ready to accept a new STIG request. The STIG completion request is not equivalent to completion on the SPI side. For example, if STIG is configured to the data command only on transmit, data is taken from the corresponding STIG register fields and put into TX FIFO. As all write bytes are known, another STIG can be queued before completing serialization of the current one.

There are few commands that require more data to read than 8 bytes (for example, READ ID command). Additional STIG memory bank is implemented to accommodate this data, if required. The STIG memory bank is controlled by the `OSPI_FCMCTL` register. If enabled, the number of bytes to read in the STIG is extended to 16 bytes, as defined in the `OSPI_FCMCTL.RDSZ` field. There are few commands (excluding read arrays that are not intended to be handled in STIG mode, but in Direct Access Mode) that return more than 8 bytes to the controller.

If the number of read bytes in the STIG, as defined in the `OSPI_FCMCTL.RDSZ` field, exceeds the memory bank depth, the remaining data overwrites the STIG memory bank locations starting from its first address. When memory bank is enabled, the `OSPI_FCRD_LWR` and `OSPI_FCRD_UP` registers keep the last 8 bytes read from the flash device by the STIG. For example, to get a single byte from the last eight bytes of a long continuous read SPI data chain, there is no need to access the STIG memory bank as data can be obtained from the `OSPI_FCRD_LWR` and

`OSPI_FCRD_UP` registers. To access more data, STIG memory bank data request must be triggered. It is controlled by the `OSPI_FCMCTL` register and works analogously to trigger the STIG. Bit 0 (`OSPI_FCMCTL.TRIGREQ`) is used to trigger the command. Bit 1 (`OSPI_FCMCTL.BNKREQ`) used by software to poll the status of the command execution. When bit 1 toggles from 1 to 0, the data byte (`OSPI_FCMCTL.BNKDATA`) from the corresponding address (`OSPI_FCMCTL.BNKADDR`) is valid. The address must be set before triggering the STIG memory bank access. Each consecutive STIG access overwrites the previous one so that the data in the bank fits into byte index fetched by the last STIG access configured to use the memory bank (first incoming byte equals first address of the memory bank, second one equals the second address and so on).

NOTE: In ADSP-21569, the STIG memory bank depth is 16 bytes.

Servicing STIG Request

The OSPI controller determines the number of bytes in the `OSPI_FCCTL` register to be sent to the flash device, when there is a STIG request. The `OSPI_FCCTL.OPCODE` field indicates the instruction to be sent and is always pushed first. If there is an address to send, the address (size is also programmed in the same register) is sent next. The address is stored in the `OSPI_FCA` register. If there are dummy cycles (size of which is also programmed in the `OSPI_FCCTL` register), they are sent next.

For write data (size of which is also programmed in the `OSPI_FCCTL` register), up to 8 bytes can be sent (as stored in the `OSPI_FCWD_LWR` and `OSPI_FCWD_UP` registers). When read data is collected from the flash device, the OSPI controller stores it in the `OSPI_FCRD_LWR` and `OSPI_FCRD_UP` registers.

Arbitration Between DAC and STIG Access

When multiple controllers are simultaneously active, a simple, fixed priority arbitration scheme is used to arbitrate between each interface and to access the external flash.

The fixed priority is defined as follows, highest priority first:

1. Direct Access Write
2. STIG Access
3. Direct Access Read

When one controller is servicing the request, the other controller is back pressured while waiting to be serviced.

Auto Polling for DAC Write Access

For DAC write accesses, which initiate flash program operation, the OSPI controller provides an option to automatically poll the flash status for program completion. When a flash write operation is triggered through DAC, the OSPI controller sends the write data up to page size defined in the `OSPI_DSCTL.PGSZ` field. Once a page boundary is reached, the DAC stops sending data to the flash device as the flash device enters the program mode. Once the device is in program mode, the OSPI controller can automatically send the flash status read commands to check the state of the flash.

The `OSPI_WCCTL` register defines the setting to poll the flash device correctly. By default, it is configured to poll bit 0 of the Device STATUS register (using opcode 0x05), which is common across all devices to indicate Write in Progress (WIP). However, in some devices (such as Micron devices, where size is > 512 MB), it is required that the

controller polls a different bit of a different device register. This means the controller must issue a different command during this polling phase. For example, in Micron N25Q devices, it is bit 7 of the FLAG STATUS register (opcode 0x70) instead of bit 0 of the STATUS register that must be polled. For this reason, the `OSPI_WCCTL` register has been provided for software to determine the bit and the opcode to use to poll for write completion, and also the number of successive valid polls that should take place.

To ensure that the bandwidth of the device is not affected by continuous read status SPI transactions, prolong the delay between the successive flash status read command by programming the `OSPI_WCCTL.REPDLY` field. This feature is implemented to free up the SPI bandwidth, if required. However, defining this delay is not always desired as the ready bit indication can come later what impacts the overall performance. This register must be setup while the controller is idle.

When the OSPI controller starts to service a STIG request, it sets the `OSPI_FCCTL.STAT` bit to indicate a command execution is in progress. When the OSPI controller is in the auto polling state, servicing a STIG request is different. Several devices are inaccessible after a program operation until the device has completed that write. Few of them have a possibility to suspend the programming page. It can be controlled by the `OSPI_POLSTAT.STAT` bit, which indicates active auto polling phase. After requesting a STIG, the OSPI controller issues an appropriate opcode to memory. While servicing a STIG (in auto polling phase), the `OSPI_FCCTL.STAT` bit remains steady and other parts of transfer such as address or dummy bits are disabled (to issue program suspend command, only opcode is needed).

SPI Command Translation

Requests issued by the DAC or STIG are translated into a sequence of byte transfers to send downstream (before serializing the flash device). These sequences depend on the requested transfer, except the following example (1-byte non-sequential read):

INSTRUCTION OPCODE > ADDRESS > MODEBYTE > DUMMY CYCLES > 1-DATA BYTE

For sequential accesses, an extra data byte per read is pushed to the flash device on the back of the above sequence, assuming that it can be done without any gap between each transferred byte.

The actual sequence sent to the flash device depends on the requested transfers (non-sequential or sequential), whether the device is configured in XIP mode or not, and the state of the `OSPI_DRICTL` and `OSPI_DWICTL` registers. For writes, the write enable latch (WEL) within the flash device must be high before a write sequence can be issued. The OSPI controller automatically issues a WEL command before triggering a write command via DAC (user need not perform this operation). To increase flexibility and performance, turn off this feature by setting the `OSPI_DWICTL.WELDIS`. The opcode for WEL is 0x06 and common between the devices. However, user can program this using the `OSPI_OE_LWR.XRDBYT/OSPI_OE_UP.FSTBYTWEL` and optionally `OSPI_OE_LWR.XWRBYT/OSPI_OE_UP.XBYTWEL` (flash device requires 2-byte command code for WEL).

When write requests from the DAC are not received and all outstanding requests have been sent, the flash device automatically starts the page program write cycle. Any incoming request at this time is held in wait state until the cycle is completed. The OSPI controller automatically polls the flash device legacy SPI status register to identify when the write cycle has completed. This is achieved by sending the Read Status Register (RDSR) opcode to the flash device and waiting until the device indicates that the write cycle is completed (the Write in Progress bit is

cleared to zero and WEL bit is cleared to zero or device ready bit is set to one). The WREN and RDSR device instructions are only sent by the controller. For other specific instruction that the user determines must be sent to the device (for example, if the device needs to be unprotected before a write command is issued), has to be separately handled by issuing flash commands via the STIG.

Hold and Reset Control

There is an option to trigger hold and reset features on the I/Os of the flash device. The hold functionality is common across the devices and takes an alternative function of the DQ3 pin (applicable when device does not operate in quad SPI or DDR modes). The transfer can be held and resumed by the `OSPI_CTL.HLD` bit. Devices with hold feature on DQ3 need another dedicated pin for hardware reset. Devices without hold feature have an alternative reset on the DQ3 pin, which makes the additional reset pin redundant. The controller supports both variants. The `OSPI_CTL.RSTCFG` field allows the user to configure the hardware reset solution implemented in the device. After configuration, it is possible to trigger hold or reset features using I/Os (`OSPI_CTL.HLD` or `OSPI_CTL.RST` bits).

NOTE: The OSPI controller does not support dedicated reset pin to control the reset of flash devices. Flash devices with reset functionality on DQ3 can be controlled directly via OSPI controller.

After hold activation, the controller is in waiting state. Any other operations must not be requested before de-asserting the `OSPI_CTL.HLD` bit. The hold feature is useful when any SPI transaction needs to be prolonged to adjust it into specific point in time. To check if the hold request is suspended, the `OSPI_CTL.IDLE` bit can be polled for. If SPI is not in the idle state, the transfer is suspended. Software must reset the `OSPI_CTL.HLD` bit before any new SPI transaction. In case hold request is set before starting any transfer, it will be in hold state after it starts.

Hardware reset must be activated when CS is high (no valid transaction is present on SPI bus). It can be checked by polling the `OSPI_CTL.IDLE` bit. If the controller is in the idle state and no other transfer requests are queued, hardware reset can be triggered. Reset feature is useful when any write, program, or erase operation needs to be cancelled. No transfer request is permitted before driving the reset back to inactive. Triggering hold or reset on the DQ3 pin at the time the device is configured to work in Quad SPI or DDR mode, overwrites transfer data on the DQ3 with 0. This behaviour is considered as a software error. Ensure that the flash device is introduced to suitable SPI Mode (by polling its Configuration Register) before triggering alternative DQ3 function.

Flash Instruction Type Support

To send correct read and write opcodes, software must initialize the `OSPI_DRICTL` and `OSPI_DWICTL` registers. These registers include fields to setup the required instruction opcodes that is intended to be used to access the flash (default is basic read and basic page program) as well as the instruction type, edge mode (DDR or SDR) and whether the instruction uses single, dual, quad, or octal pins for address and data transfers.

To ensure that the controller can operate from a reset state, the registers are reset to an opcode compatible with single I/O standard SPI devices. Though it is applicable for both reads and writes, the `OSPI_DRICTL.INSTRTYP` field appears only once (not included in the `OSPI_DWICTL` register). If software sets this to any value other than 0, the `OSPI_DRICTL.ADDRTRNSFR/OSPI_DWICTL.ADDRTRNSFR/OSPI_DRICTL.DATATRNSFR/OSPI_DWICTL.DATATRNSFR` bits become don't care. It is made available to

allow software to support less common flash instructions, where opcode, address, and data are sent on 2 or 4 data lines (opcode from several instructions are sent serially to the flash device, even for dual/quad instructions).

Dual Data Rate (DDR) Operations

The OSPI controller supports DDR mode of operation, in which some or all transfer phases happen in DDR mode, where the I/O lines are driven/sampled on both rising and falling edges of the clock.

In DDR mode, the OSPI controller supports the following modes:

- Dual Transfer Rate (DTR) mode, where command is driven in SDR mode and address/dummy cycles/data are driven in DDR mode.
- DTR protocol mode, where everything including command is driven in DDR mode.

For DTR mode, there are specific commands which are recognized by the flash as DTR commands. These are DTR Read commands which can be handled in STR Protocol (but in DTR Mode). This is achieved by setting the `OSPI_CTL.DTREN` bit to 0 and `OSPI_DRICTL.DDREN` bit to 1.

For DTR protocol mode, all normal commands can be sent in DDR fashion, provided the flash is already configured in a mode to accept the commands in DDR mode. Support for DTR protocol provides significant enhancement. This is enabled in the OSPI controller by setting the `OSPI_DRICTL.DDREN` bit to 1. It allows the device to work in DTR mode for each possible command (not only DTR read ones). It can also handle opcode phase in DTR mode, which improves the overall performance.

There are several devices (for example, Micron N25Q512A) that can handle read operations in DTR mode. They can issue and capture data on both rising and falling edges while working with a dedicated command type. This enables the controller to maintain same throughput twice the lower frequency of `SPI_CLK` for STR mode.

In MT25Q family of Micron devices, DTR protocol is implemented. It enables device to handle all commands in DTR mode. DTR Read commands detect DTR mode based on dedicated opcode. Therefore, opcode has to be sent as STR. When DTR protocol is enabled, the device does not need opcode to detect edge mode, as it can recognize based on the volatile or nonvolatile bit in the flash configuration register.

The table illustrates how software must configure the controller for selected specific read and write instruction supported by the different devices.

Table 17-3: Read Configuration Examples

Command	Opcode (Number of Lanes/ Edge Mode)	Address/ Dummy/ Mode (Number of Lanes/ Edge Mode)	Data (Number of Lanes/ Edge mode)	Instruction Type <code>OSPI_DRICTL.INSTRYP</code>	Address Transfer Type <code>OSPI_DRICTL.ADDRTRNSFR</code>	Data Transfer Type <code>OSPI_DRICTL.DATATRNSFR</code>	DDR Bit Enable <code>OSPI_DRICTL.DDREN</code>
READ	1/SDR	1/SDR	1/SDR	0	0	0	0

DTR OIOR (Octal I/O Fast Read)	1/SDR	8/DDR	8/DDR	0	3	3	1
DCFR (Dual Command Fast Read)	2/SDR	2/SDR	2/SDR	1	don't care	don't care	0

Table 17-3: Read Configuration Examples (Continued)

Command	Opcode (Number of Lanes/ Edge Mode)	Address/ Dummy/ Mode (Number of Lanes/ Edge Mode)	Data (Number of Lanes/ Edge mode)	Instruction Type OSPI_DRICTL. INSTRTYP	Address Transfer Type OSPI_DRICTL. ADDRTRNSFR	Data Transfer Type OSPI_DRICTL. DATATRNSFR	DDR Bit Enable OSPI_DRICTL. DDREN
DTR DCFR (Dual Command Fast Read)	2/SDR	2/DDR	2/DDR	1	don't care	don't care	1
QCFR (Quad Command Fast Read)	4/SDR	4/SDR	4/SDR	2	don't care	don't care	0
DTR QCFR (Quad Command Fast Read)	4/SDR	4/DDR	4/DDR	2	don't care	don't care	1
OCFR (Octal Command Fast Read)	8/SDR	8/SDR	8/SDR	3	don't care	don't care	0
DTR OCFR (Octal Command Fast Read)	8/SDR	8/DDR	8/DDR	3	don't care	don't care	1

NOTE: This data is applicable for 3-byte and 4-byte address variants of the commands.

In DTR protocol, all transfer phases (including opcode) take DDR edge mode independent of the command under execution. DTR protocol is enabled by the OSPI_CTL.DTREN bit. It has higher priority than the OSPI_DRICTL.DDREN bit. Therefore, if the OSPI_CTL.DTREN bit is set, irrespective of value programmed in the OSPI_DRICTL.DDREN bit, all command, address, dummy cycles, and data are transferred in DDR mode.

Table 17-4: Write Configuration Examples

Command	Opcode (Number of Lanes)	Address/ Dummy/ Mode (Number of Lanes)	Data (Number of Lanes)	Instruction OSPI_DRICTL. INSTRTYP	Address Transfer Type OSPI_DWICTL. ADDRTRNSFR	Data Transfer Type OSPI_DWICTL. DATATRNSFR

OIEFP (Octal Input Extended Fast Program)	1	8	8	0	3	3
DCPP (Dual Command Page Program)	2	2	2	1	don't care	don't care
QCPP (Quad Command Page Program)	4	4	4	2	don't care	don't care
OCPP (Octal Command Page Program)	8	8	8	3	don't care	don't care

NOTE: This data is applicable for both 3-byte or 4-byte address variants of the commands.

In DTR protocol, all transfer phases (including opcode) take DDR edge mode independent of the command under execution.

Data Sampling

The OSPI provides flexibility to configure the sampling point of read data with the SPI clock to meet setup and hold timings of the flash devices when operating at higher speed. The `OSPI_RDC` register provides an option to control the sampling point. In OSPI controller, data received on the OSPI pins is sampled by internal reference clock (SYSCLK). In STR mode, by default (when the `OSPI_RDC.DLYRD` field is set to 0), the incoming data is on the first falling edge of the SYSCLK in second half of SPI clock. In DTR mode, it is on the first falling edge of the SYSCLK in second quarter of SPI clock.

The `OSPI_RDC.SMPLEDG` bit selects the edge of the SYSCLK, in which data from flash memory are sampled. This increases the sampling resolution by two times. The `OSPI_RDC.DLYRD` field controls the additional number of SYSCLK cycles that must be applied to the internal read data capture circuit. Large clock-to-out delay of the flash

memory, trace delays, and other device delays may impose an upper limit on the flash clock frequency which is less for the flash memory to operate. To compensate this, software must set this register to a value that guarantees robust data captures.

For example, if baud divider (`OSPI_CTL.BAUD` field) is programmed to 7, it results in divider of 16. Therefore, `SPI_CLK: SYSCLK = 16:1` (every 1 `SPI_CLK` cycle has 16 `SYSCLK` cycles). Assuming that the `OSPI_RDC.DLYRD` bits are programmed to X,

In STR mode of operation, received data is captured on:

- $(16/2) + X^{\text{th}}$ falling edge of `SYSCLK` if `OSPI_RDC.SMPLEDG = 0`
- $(16/2) + X^{\text{th}}$ rising edge of `SYSCLK` if `OSPI_RDC.SMPLEDG = 1`

In DTR mode of operation, received data is captured on:

- $(16/4) + X^{\text{th}}$ falling edge of `SYSCLK` if `OSPI_RDC.SMPLEDG = 0`
- $(16/4) + X^{\text{th}}$ rising edge of `SYSCLK` if `OSPI_RDC.SMPLEDG = 1`

To improve the hold timing during transfers in DTR mode, the `OSPI_RDC.DDRDLYRD` delays the transmitted data by programmable number of `SYSCLK` cycles.

NOTE: The OSPI interface for Octal DTR mode may not work at higher frequencies for flash devices that require DQS.

PHY Module Architecture

The PHY Module is divided into the following four sub-blocks:

- Data Transmitter

The data transmitter serializes the transmit data to assign complaint signal values into the master output interface. The input data size is 2-bytes in order to cover the octal DDR scenario where two bytes are sent within a single reference clock cycle. The configuration interface covers selected SPI protocols (single, dual, quad, or octal) or command types (DDR, SDR). These values are necessary to calculate the number of bits that fit into a clock cycle and consequently what set value must be set by the hardware.

- Data Receiver

The data receiver block samples data from flash device.

- Delay Line Module

The delay line module block provides an appropriate delay for the input clock to ensure correct data transmitting and sampling. This block contains two separate delay paths for the OSPI clock, one feeding the external FLASH device and the other feeding the internal PHY sampling clock used for capturing data from the device when the PHY mode is enabled. Delay line values are configurable in software.

- Clock Arbiter

The clock arbiter handles gating the clock logic for clocks forwarded to the DLL inputs.

The PHY Module Block Diagram shows the sub-blocks in the PHY module. The sections following the diagram describe the architecture of the sub-blocks in more detail.

Figure 17-2: PHY Module Block Diagram

PHY Data Transmitter

The data transmitter latches queued data to transmit on both the negative and positive edges of the reference clock. Then data is chopped to fit into the output interface. With the PHY module, in the last stage of the TX data path data from both edges are connected, forwarded back to the low-level OSPI controller, and then put on the OSPI master outputs if the PHY enable bit is asserted. Otherwise, the master outputs generated by the low-level OSPI controller are selected.

PHY Data Receiver

In the data receiver module, data is sampled on both edges of the delayed reference clock (sampling clock) ensuring a wide range of the sampling window. Read data is gathered in shift registers and then merged into a byte-sized input FIFO. Data reception is programmable to work either with the delayed reference clock or with the DQS input signal from the flash device.

Delay Line Module

Due to the asynchronous nature of flash devices, it is important to address the timing requirements for capturing and receiving data between the controller and the flash. The PHY module contains logic to meet the timing requirements. The delay compensation circuit is designed with the following features:

- Programmable OSPI clock delay specified as a percentage of a clock cycle
- Programmable sampling clock delay specified as a percentage of a clock cycle
- Delay compensation circuit re-sync circuitry activated during refresh cycles to compensate for temperature and voltage drift

The delay compensation circuitry relies on a master/slave approach. The master delay line is used to determine how many delay elements constitute a complete cycle. This count, along with the programmable fractional delay settings, determines the actual number of delay elements to program into the slave delay lines. The master and slave delay lines are identical. This approach allows the memory controller to observe a clock and then delay other signals by a fixed percentage of that clock.

DLL Locking is controlled through the register interface. When the DLL is reset, the master DLL performs a locking procedure starting with the DLL start point value in the `OSPI_PHYMCTL.INITDLY` bit field and the current frequency of operation. The DLL start point value must not exceed a delay of 1 and 1/4 cycles of delay, when calculated by estimating the worst case timing through a delay element at the highest frequency the DLL will be operating at. For example, if the maximum operating frequency is 200 MHz (period of 5 ns) and the worst case delay element has a 85 ps delay, then program the DLL start point to $5 / 0.085 = 58.8 = 59$ elements = 0x3B.

With this setting, the master DLL is will correctly lock for all frequencies below 200 MHz and in any process corner. If the delay provided by the delay line is enough to cover a full clock cycle, the master DLL is in full clock mode. In this case, the DLL lock value in the `OSPI_DLLOB_LWR.LWRLOCK` bit field reports the number of delay element in one full clock cycle. The slave delay line fractional setting uses this number to determine the number of delay elements to add to the slave delay lines. For example, if the DLL lock value = 50 = 0x32, then the slave delay line percentage = 25% = 0x20, and the slave delay line delay value = $50 * 0.25 = 12.5$ elements. The DLL Module will round the calculated value into an integer number of delay elements.

If the frequency of operation is such that the delay line is not long enough to accommodate a full cycle of delay, the master DLL will automatically detect this and switch to half clock mode. In this mode, the master DLL attempts to lock when the delay in the delay line reaches a half-clock cycle. If lock is achieved in half clock mode, the slave delay lines are automatically adjusted to program a fractional delay of a full cycle. There is no need to change the slave delay settings based upon the lock mode of the master DLL. For example, if the DLL lock value = 50 = 0x32, then the slave delay line percentage = 25% = 0x20, and the slave delay line delay value = $(50 * 2) * 0.25 = 25$ elements. Do not work in half clock mode when using a loop-back sampling method or when the SPI clock is configured to SPI Mode 3 (CPHA = 1, CPOL = 1).

If the frequency of operation is such that the delay line is not long enough to capture a half-clock cycle of delay, the master DLL will indicate lock and set the number of delays to the maximum length of the delay line. This is called saturation mode. There is no need to change the slave delay settings in this mode. The slave delay settings will be fixed at the fractional delay based upon the maximum delay of the delay line times 2. For example, if the DLL lock

value = MAX = 128 = 0x80, and the slave delay line percentage = 25% = 0x20, then the slave delay line delay value = $(128 \times 2) \times 0.25 = 64$ elements.

PHY Clock Arbiter

The OSPI clock is generated only when the SPI control logic FSM indicates that an SPI transfer is ongoing. Conversely, the reference clock is continuously generated. This module generates a sampling clock that is ready to pass through the RX delay line. It is generated when read data phase of SPI transfer is detected based on information from the SPI control module. The sampling clock is optionally sourced from DQS or loop-back input.

PHY Pipeline Mode

The PHY pipeline mode is for a direct read mode of operation. The flash command generator pipelines and puts a few expected sequential accesses into the TX FIFO causing the CS to stay active since the low-level OSPI controller controls the internal TX FIFO fill level. To correctly trigger a direct read in pipeline mode, first poll the `OSPI_CTL.IDLE` bit to determine that the TX FIFO is empty. The sequential data transfer is interrupted when non-sequential access occur or too many wait states are introduced by the AHB master to keep the flash transaction continuous. Introducing wait states slows down the system data rate.

Enable this mode when following conditions are met:

- $\text{SYSCLK} > 1.1 \times \text{Reference clock}$

NOTE: In PHY mode the reference clock is taken from the CDU CLK010

- Accesses are only 32-bits in size

Programming Concepts

Software configures the OSPI controller before communicating with the flash device. The static configuration bits must be setup before the OSPI controller is enabled using the `OSPI_CTL.EN` field. To change the controller configuration, disable it before reconfiguring.

Configuring OSPI after Reset

The OSPI controller comes up with a state that is suitable to perform basic reads and writes using the DAC. Basic read (opcode 0x03) and write (opcode 0x02) instructions are supported by all target devices. The controller also wakes up with a baud rate divider setting of 32. Assuming that the SYSCLK (reference clock) operates at 500 MHz after reset, the effective SPI clock is 15.625 MHz. This must be slow enough to meet all timing requirements of all target devices without any further device programming.

If the target device does not use 3 address bytes, the `OSPI_DSCTL` register must be modified to the appropriate size. If software wants writes to the device and the number of bytes per device page is not equal to 256, the `OSPI_DSCTL` register must also be modified. The software must enable the write protect feature prior to enabling the OSPI controller. This blocks any AHB writes from taking effect. The `OSPI_WRPROT_LWR`, `OSPI_WRPROT_UP`, `OSPI_WRPROT_CTL`, and `OSPI_DSCTL.PGSZ` fields must be setup.

After reset, software can read from and write to the flash device. Enabling/disabling the controller and DAC is achieved by writing to the corresponding `OSPI_CTL` register fields. Maintain the default values of the baud rate divisor and default state of the `OSPI_CTL.CPOL/OSPI_CTL.CPHA` bits. A write data value of 0x00780081 is recommended.

Programming Dummy Cycles

When programming the dummy cycles for OSPI reads (DAC and STIG-initiated reads) from the flash device, mode data should be considered as it impacts the actual number of dummy cycles seen on the bus. If mode data is not enabled, then the number of dummy cycles is that same as those set in dummy cycles field, respectively, for STIG or DAC operation.

However, if mode data is enabled, then in addition to the programmed number of dummy cycles, a few extra cycles are needed to transmit out the mode data. The number of cycles added depends on the bus mode of the OSPI. For example, if the address phase of the command is configured to be sent on a single line in STR mode, then the mode bits consume eight cycles. If the address phase of the command is configured to be sent on four lines in DTR mode, then the mode bits consume one cycle. These extra cycles should be considered when configuring the dummy cycles for the controller so the overall dummy clock cycles match the dummy cycles provided in flash data sheet.

Configuring OSPI for Optimal Use

Software must accurately configure the controller to optimally access the flash.

To configure the controller:

1. Wait until pending STIG are completed or poll the `OSPI_CTL.IDLE` field.
2. Disable the `OSPI_CTL.DACEN` field. The OSPI controller can be completely disabled using the `OSPI_CTL.EN` field.
3. Update the `OSPI_DLY` register. This register allows the user to tweak how the chip select is driven after each flash access. This is required as each device may have different timing requirements. As the serial clock frequency is increased, these timing requirements become critical. The numbers programmed in this register are based on the period of reference clock (SYSCLK).

For example, an ATMEL device needs 50 ns minimum time before CS can be re-asserted after it has been de-asserted. By default, the controller provides a minimum of 1 SCLK period. When the device is operating at 50 MHz, the SCLK period is only 20 ns. Therefore, additional 30 ns are required. As the register defines the number of SYSCLK cycles to add, if SYCLK is running at 500 MHz (2 ns period), user must program a value of at least 15 to the `OSPI_DLY.DSRT` bits. This delay can be extended during auto-polling phase. Polling repetition delay can be defined in the `OSPI_WCCTL.REPDLY` field.

4. Update the `OSPI_DSCTL` register. The number of bytes per page is required to perform any write operation on flash. The number of bytes per device block is only required if the write protect feature is used.
5. Setup and enable the write protection registers (`OSPI_WRPROT_LWR`, `OSPI_WRPROT_UP`, and `OSPI_WRPROT_CTL`), if write protection features are required.

6. Enable the required interrupts using the `OSPI_IMSK` register.
7. Update the `OSPI_REMAPADDR` register to remap the DAC addresses to different address in flash.
8. Set the baud rate divisor in the `OSPI_CTL.BAUD` to define the required clock frequency of the target device.
9. Select the appropriate chip select signal to use through the `OSPI_CTL.BAUD` bits.
10. Update the `OSPI_RDC` register. This register delays when read data is captured and helps when read data path from the device to the controller is long and the device clock frequency is high.
11. Enable the OSPI controller and DAC using the `OSPI_CTL` register.

Configuring OSPI for DAC Read Operation

1. Configure the `OSPI_DRICTL` register:
 - a. Program the desired opcode for Read command (0xBB for Dual SPI read).
 - b. Configure the instruction type, address transfer type, and data transfer type as per the opcode.
 - c. Configure the dummy cycles for the selected command opcode depending on the flash device.
 - d. Set the Mode bit Enable if the mode data needs to be transferred during dummy cycles phase.
 - e. Set the DDR enable bit if the command works in DTR mode.
2. If the operation requires dual opcode, set the `OSPI_CTL.OPCODEEN` bit.
3. Update the second byte for read opcode in the `OSPI_OE_LWR.XRDBYT` field.
4. To operate in DTR protocol mode, set the `OSPI_CTL.DTREN` bit.

If this bit is set, the `OSPI_DRICTL.DDREN` bit has no effect and all phases of command including the opcode are done in DDR mode.

5. Update the `OSPI_DSCTL.ADDRSZ` field.
6. Update the `OSPI_MBCTL.MODE` field.
7. Enable the DAC mode using the `OSPI_CTL.DACEN` bit, if not enabled.
8. Start the read transfer by accessing the OSPI memory mapped space through core or MDMA accesses. Any access to address 0x60000000 will access the flash address 0x0 if address remapping is 0.
9. If using MDMA for the transfer, wait for the DMA to complete.

NOTE: For accesses through core, software need not check FIFO levels. All the FIFOs are internally maintained by DAC.

Configuring OSPI for DAC Write Operation

1. Configure the `OSPI_DWICTL` register:

- a. Program the desired opcode for write command like 0x02 for single SPI page program.
 - b. Configure the address transfer type and data transfer type as per the opcode.
 - c. Configure the dummy cycles for selected command opcode depending on the flash device.
2. Update the `OSPI_DRICtrl.INSTRTyp` field as per the selected opcode.
3. Clear the `OSPI_DWICtrl.WELDIS` bit to manually send the WEL (Write Enable) instruction to flash. Else, the controller automatically issues WEL to flash before sending any write command to flash.
If WEL command for flash under use is not 0x06, update the `OSPI_OE_Up.FSTBYTWEL` field.
4. If the operation requires dual opcode, set the `OSPI_Ctrl.OPCODEEN` bit.
5. Update the second byte for read opcode in the `OSPI_OE_Lwr.XWRBYT` field.
6. Update the number of address bytes the command expects in the `OSPI_DSCTL.ADDRSZ` field.
7. As the controller supports the automatic polling for write operation complete, update the `OSPI_WCCTL` register accordingly to enable the automatic polling for flash program operation complete.
 - a. Enable the automatic polling by clearing the `OSPI_WCCTL.DIS` bit.
 - b. Update Polling opcode and define polling bit index and polarity as per the flash device.
 - c. Update polling count and polling repetition delay.
 - d. Optionally, update the `OSPI_POLLEXP` register if polling expiration is enabled.
8. Enable the DAC mode using the `OSPI_Ctrl.DACEN`, if not enabled.
9. Start the read transfer by accessing the OSPI memory mapped space through core or MDMA accesses. Any access to address 0x60000000 will access the flash address 0x0 if address remapping is 0.
10. Wait for the DMA to complete, if using MDMA for the transfer.

NOTE: For accesses through core, software need not check FIFO levels. All FIFOs are internally maintained by DAC.

Issuing STIG Command

This is a typical method that software uses to access the flash device registers and perform erase operations. It can also be used to access the flash array (though only 8 data bytes can be read or written at a time), as defined in the `OSPI_FCRD_Lwr`, `OSPI_FCWD_Lwr`, `OSPI_FCRD_Up` and, `OSPI_FCWD_Up` registers.

To issue a STIG command:

1. Set the `OSPI_IMSK.STIGREQ_MSK` bit to enable the STIG command completion interrupt.
2. Update the `OSPI_FCCTL.OPCODE` and `OSPI_FCCTL.DMY` bits, as per the flash command that need to be executed via STIG.
3. Clear the `OSPI_FCCTL.STIGBNKEN` bit.

4. Set the `OSPI_FCCTL.ADDREN` bit, if the command requires the address to be driven.

If set:

- a. Update the `OSPI_FCCTL.ADDRSZ` field according to the number of address bytes expected by the command.
- b. Update the `OSPI_FCA` register with the desired flash address.

5. If command expects the data to be sent to flash, set the `OSPI_FCCTL.WREN` bit.

If set:

- a. Update the `OSPI_FCCTL.WRSZ` field according to the number of data bytes to be sent to flash.
- b. Update the `OSPI_FCWD_LWR` and `OSPI_FCWD_UP` registers with data to be sent to flash.

6. If command expects the data to be received from the flash, set the `OSPI_FCCTL.RDEN` bit.

If set, update the `OSPI_FCCTL.RDSZ` field according to the number of data bytes to expected from flash.

7. Update the `OSPI_FCCTL.MODEEN` bit, if the mode data are sent during dummy cycles.

If set, update the `OSPI_MBCTL.MODE` field with desired mode data.

8. Set the `OSPI_FCCTL.EXE` bit to execute the STIG command.
9. Set the `OSPI_ISTAT.STIGREQ` bit (or wait for interrupt if enabled) indicating that the STIG command execution is completed.
10. If command expects the data to be received from the flash, read the data from the `OSPI_FCWD_LWR` and `OSPI_FCWD_UP` registers.

NOTE: Do not set the `OSPI_FCCTL.WREN` and `OSPI_FCCTL.RDEN` bits simultaneously. A given command can either read data or send data to the flash, but not both at the same time.

With normal STIG command, only 8 bytes can be read at a time, but with support of STIG memory bank up to 16 bytes can be read in to STIG memory bank. This is controlled by the `OSPI_FCCTL.STIGBNKEN` bit and `OSPI_FCMCTL` register. Commands issued using this interface have a higher priority than all other read accesses coming from AHB, and interrupts any read commands being requested by the DAC.

To issue a STIG memory bank read command:

1. Set the `OSPI_IMSK.STIGREQ_MSK` bit to enable STIG command completion interrupt.
2. Update the `OSPI_FCCTL.OPCODE` and `OSPI_FCCTL.DMY` bits as per the flash command that need to be executed via STIG.
3. Set the `OSPI_FCCTL.STIGBNKEN` bit.
4. Set the `OSPI_FCCTL.ADDREN` bit, if the command requires the address to be driven.

If set:

- a. Update the `OSPI_FCCTL.ADDRSZ` field according to the number of address bytes expected by the command.
 - b. Update the `OSPI_FCA` register with the desired flash address.
5. Update the `OSPI_FCCTL.MODEEN` bit, if the mode data are sent during dummy cycles.
If set, update the `OSPI_MBCTL.MODE` field with the desired mode data.
6. Set the `OSPI_FCCTL.EXE` bit to execute the STIG command.
7. Set the `OSPI_ISTAT.STIGREQ` bit (or wait for interrupt if enabled) indicating that the STIG command execution is completed.

At this stage, 16 bytes of data read from the flash device are available in the STIG memory bank. To access this data, a STIG memory bank read has to be issued. Each read can read one byte from STIG memory bank at a time. To read all data, 16 reads must be issued.

To read a data byte from STIG memory bank:

1. Set the `OSPI_FCMCTL.BNKADDR` field. This can be any value from 0 to 16.
2. Set the `OSPI_FCMCTL.TRIGREQ` bit to trigger the STIG memory bank read.
3. Poll the `OSPI_FCMCTL.BNKREQ` bit to clear.
4. Read the requested data byte from the `OSPI_FCMCTL.BNKDATA`.

Entering XIP mode

The controller supports XIP operations to minimize the latency for back-to-back reads or code execution.

If the flash device comes in XIP on power up, software cannot discover the state of XIP from POR via the Flash Status Register reads. The only operation of a flash device when XIP mode is enabled, is an XIP read. In such cases, software must be aware that if flash enters XIP from POR, the `OSPI_MBCTL.MODE` and `OSPI_CTL.XIPIMM` fields must be set. This makes the controller to enter XIP mode immediately and start communicating with the flash device in XIP mode on next read issued. Therefore, it does not require the read opcode to be transferred. To exit XIP mode, this bit must be set to 0. This takes effect in the attached device only after the next read instruction is executed. Software must ensure that at least one read instruction is requested after resetting this bit before it can be sure XIP mode in the device is exited.

`OSPI_CTL.XIPRD`: If it is not known that the flash device enters XIP from POR, and XIP from POR may be supported by the attached flash device, software can attempt to exit the XIP mode by issuing an XIP exit command using a STIG command. For this, software must be aware of the mode bit requirements of that device, as XIP entry and exit changes per device.

XIP mode is supported in several flash devices. However, flash manufacturers do not have a consistent standard approach. Most of them use signature bits that are sent to the device immediately following the address bytes. Few of them (such as Micron devices) use signature bits and require a flash device configuration register write to enable XIP.

The following section describes how software ensures entry into XIP mode for the flash devices compliant with the OSPI controller.

Micron N25Q, MT25Q, and MT35X Devices

XIP mode must first be enabled by setting the corresponding field of VCR within the flash device. The VCR can be written to using the `OSPI_FCCTL` register to issue a VCR write command.

1. Disable the DAC using the `OSPI_CTL.DACEN` bit to ensure that no new AHB read accesses are sent to the flash device.
2. Use STIG mode to issue a VCR write to flash memory.
3. Set XIP mode bits in the `OSPI_MBCTL.MODE` field to `8'b00000000`.
4. Enable the OSPI controller XIP mode by setting the `OSPI_CTL.XIPRD` bit.
5. Re-enable the DAC.

Micron (Supporting Basic XIP Mode), Winbond, Spansion Devices

1. Disable the DAC using the `OSPI_CTL.DACEN` bit to ensure that no new AHB read accesses are sent to the flash device.
2. Set XIP mode bits in the `OSPI_MBCTL.MODE` to:
 - `8'b10000000`, for Micron devices supporting basic XIP mode
 - `8'b00100000`, for Winbond devices
 - `8'b10100000`, for Spansion devices
3. Enable XIP mode by setting the `OSPI_CTL.XIPRD` bit.
4. Re-enable the DAC.

Using PHY mode

The OSPI PHY mode extends the architecture of the OSPI flash controller to allow the interfacing of high-speed flash devices and ensure the reliable data transfers at high speed. For non-PHY operations, the controller assumes that OSPI transfer clock is at least 4 times lower than the reference clock to ensure correct data transactions in SDR Mode and 8 times lower for DDR transactions. This provides comfortable regulation of data synchronization but it is not effective from a dynamic power efficiency standpoint.

The PHY mode allows transfers at speeds that match the increasing reference clocks of emerging higher performance flash devices, including frequencies close to 200 MHz. The PHY module works with the OSPI Flash Controller to enable DDR or SDR transfers at the device frequencies. For example, if a given flash device operates at 200 MHz, the reference clock is also 200 MHz, eliminating the need for high speed peripheral clocks.

The reference clock for OSPI is `SYSCLK`, but to enable support for PHY mode the reference clock is selected from one of the options from CDU output clock 10 (Refer to CDU chapter). By default, it is connected to `SYSCLK`

which is suitable for non-PHY mode of operation. For PHY mode, the reference clock is either SCLK0_0 or SCLK1_1.

To configure PHY mode, first implement the procedure described in the “Configuring OSPI for Optional Use” section and then proceed with the following steps based on the DLL mode configuration:

DLL Bypass Mode

1. Enable the PHY mode by setting the `OSPI_CTL.PHYEN` bit and enable the DDR protocol with the `OSPI_CTL.DTREN` bit.

NOTE: Ensure that the device is configured to work in DDR Protocol (do not confuse with DDR commands).

2. Calibrate the software using the following sub steps:
 - a. Calculate how many delay elements are necessary to shift the reference clock period by 25% and program this value in the `OSPI_PHYCTL.TXDLY` bit field. This is the best case for DDR transfers from the set-up/hold timing standpoint. The delay may vary slightly in a real design.
 - b. Resynchronize the DLLs by setting the `OSPI_PHYCTL.RESYNC` bit. If this has already been set by a previous resynchronization, toggle the bit to 0 and then back to 1 to trigger the re-synchronization DLL logic.
 - c. Enable the PHY bypass mode by setting the `OSPI_PHYMCTL.BYPCTL` bit.
 - d. Trigger a read request from a location where the value is predictable. Depending on the device, this is the parameter page, ID, status, data from the OTP region, or data from the location of the flash array.
 - e. Check for data correctness by incrementing the value of the RX clock delay using the `OSPI_PHYCTL.RXDLY` bit field, resynchronizing the DLLs, triggering a valid read request, and then checking for the correct data and store information. Continue to check until the range boundary of the RX clock delay is achieved and then proceed to the next step.
3. Set the RX clock delay value with one from the middle of valid range based on the information in storage.
4. Resynchronize the DLLs
5. Set the device read instruction register for Octal Read DDR Configuration. Configure each transfer phase to work in Octal Mode and set the number of dummy cycles to a minimum of the number specified in the documentation of the device. More dummy cycles may be set to accommodate additional read path delays in actual systems data.
6. Enable pipeline mode by setting the `OSPI_CTL.PIPEPHYEN` bit.
7. Perform a sequential read of data consistent with the conditions indicated in the PHY Pipeline Mode section.
8. Poll for IDLE with the `OSPI_CTL.IDLE` bit and when it is asserted to high trigger the next transfer request.

DLL Master Mode

1. Enable the PHY mode by setting the `OSPI_CTL.PHYEN` bit and enable the DDR protocol with the `OSPI_CTL.DTREN` bit.

NOTE: Ensure that the device is configured to work in DDR Protocol (do not confuse with DDR commands).

2. Calibrate the software using the following sub steps:
 - a. Drive the `OSPI_CTL.RST` bit low to reset the DLL.
 - b. Calculate initial delay value for the Master DLL according to the PHY DLL Master Control Register bits[6:0] and write this value into the `OSPI_PHYMCTL.INITDLY` bit field.
 - c. Set DLL reset bit (`OSPI_CTL.RST`) back to high. The master delay Line automatically starts the locking procedure with the configuration given once the DLL module is in reset state.
 - d. Poll the `OSPI_DLLOB_LWR.LOCK` bit. When it is set, the lock is done.
 - e. Resynchronize the DLLs by setting the `OSPI_PHYCTL.RESYNC` bit. If this has already been set by a previous resynchronization, toggle the bit to 0 and then back to 1 to trigger the re-synchronization DLL logic.
 - f. Set the TX DLL delay bit field (`OSPI_PHYCTL.TXDLY`) and the RX DLL Delay bit field (`OSPI_PHYCTL.RXDLY`) to the current percentage clock offsets. Wait 20 reference clock cycles for the new configuration to propagate before triggering the next SPI transfer.
 - g. Trigger a read request from a location where the value is predictable. Depending on the device, this is the parameter page, ID, status, data from the OTP region, or data from the location of the flash array.
 - h. Check for data correctness by incrementing the value of the RX clock delay using the `OSPI_PHYCTL.RXDLY` bit field, resynchronizing the DLLs, triggering a valid read request, and then checking for the correct data and store information. Continue to check until the range boundary of the RX clock delay is achieved and then proceed to the next step.
3. Set the RX clock delay value with one from the middle of valid range based on the information in storage.
4. Resynchronize the DLLs
5. Set the device read instruction register for Octal Read DDR Configuration. Configure each transfer phase to work in Octal Mode and set the number of dummy cycles to a minimum of the number specified in the documentation of the device. More dummy cycles may be set to accommodate additional read path delays in actual systems data.
6. Enable pipeline mode by setting the `OSPI_CTL.PIPEPHYEN` bit.
7. Perform a sequential read of data consistent with the conditions indicated in the PHY Pipeline Mode section.
8. Poll for IDLE with the `OSPI_CTL.IDLE` bit and when it is asserted to high trigger the next transfer request.

ADSP-2159x OSPI Register Descriptions

Octal SPI (OSPI) contains the following registers.

Table 17-5: ADSP-2159x OSPI Register List

Name	Description
OSPI_CTL	Octal SPI Control Register
OSPI_DLY	Device Delay Register
OSPI_DRICTL	Device Read Instruction Control Register
OSPI_DWICTL	Device Write Instruction Control Register
OSPI_DSCTL	Device Size Control Register
OSPI_DLLOB_LWR	DLL Observable Register (Lower)
OSPI_DLLOB_UP	DLL Observable Register (Upper)
OSPI_FCA	Flash Command Address Register
OSPI_FCCTL	Flash Command Control Register
OSPI_FCMCTL	Flash Command Control Memory Register
OSPI_FCRD_LWR	Flash Command Read Data Register (Lower)
OSPI_FCRD_UP	Flash Command Read Data Register (Upper)
OSPI_FCWD_LWR	Flash Command Write Data Register (Lower)
OSPI_FCWD_UP	Flash Command Write Data Register (Upper)
OSPI_IMSK	Interrupt Mask Register
OSPI_ISTAT	Interrupt Status Register
OSPI_WRPROT_LWR	Lower Write Protection Register
OSPI_MBCTL	Mode Bit Control Register
OSPI_MODID	Module ID Register
OSPI_POLLEXP	Polling Expiration Register
OSPI_OE_LWR	Opcode Extension Register (Lower)
OSPI_OE_UP	Opcode Extension Register (Upper)
OSPI_PHYCTL	PHY Control Register
OSPI_PHYMCTL	PHY DLL Master Control Register
OSPI_POLSTAT	Polling Flash Status Register
OSPI_RDC	Read Data Capture Register
OSPI_REMAPADDR	Remap Address Register
OSPI_WRPROT_UP	Upper Write Protection Register
OSPI_WRPROT_CTL	Write Protection Control Register

Table 17-5: ADSP-2159x OSPI Register List (Continued)

Name	Description
OSPI_WCCTL	Write Completion Control Register

Octal SPI Control Register

Figure 17-3: OSPI_CTL Register Diagram

Table 17-6: OSPI_CTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/NW)	IDLE	Idle. Serial interface and low level SPI pipeline is idle. This is a status read-only bit. Note: This is a re-timed signal. There is an inherent delay in generating this signal.
30 (R/W)	OPCODEEN	Dual Byte Opcode Enable. The <code>OSPI_CTL.OPCODEEN</code> bit is set if the target Flash device supports dual byte opcode (Macronix MX25). It is applicable for Octal I/O mode or protocol only. It should be set back to low if the device is configured to work in another SPI Mode. If enabled, the supplementing bytes are taken from the <code>OSPI_OE_LWR</code> and <code>OSPI_OE_UP</code> registers.

Table 17-6: OSPI_CTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
25 (R/W)	PIPEPHYEN	Pipeline PHY Mode Enable. The <code>OSPI_CTL.PIPEPHYEN</code> bit is relevant only for configuration with PHY module. It is asserted to 1 between consecutive PHY pipeline reads transfers and deasserted to 0 otherwise.
24 (R/W)	DTREN	Enable DTR Protocol. The <code>OSPI_CTL.DTREN</code> bit enables the DTR protocol. It must be set if the device is configured to work in DTR protocol.
22:19 (R/W)	BAUD	Master Mode Baud Rate Divisor (2 to 32). The <code>OSPI_CTL.BAUD</code> bit field selects the baud rate divisor. SPI Baud Rate = (Master Reference Clock)/ Baud Rate Divisor where, Baud Rate Divisor is: 4'b0000 = /2 4'b0001 = /4 4'b0010 = /6 4'b0011 = /8 4'b0100 = /10 ... 4'b0100 = /32
18 (R/W)	XIPIMM	Enter XIP Mode Immediately. If XIP is enabled, setting to 0 causes the controller to exit XIP mode on the next read instruction. If set to 1, operate the device in XIP mode immediately. Use this register when the external device wakes up in XIP mode (as per the contents of its non-volatile configuration register). The controller assumes the next read instruction is passed to the device as an XIP instruction, and therefore does not require the read opcode to be transferred. Note: To exit XIP mode, this bit should be set to 0. This takes effect in the attached device only after the next read instruction is executed. Software must ensure that at least one read instruction is requested after resetting this bit (to ensure that XIP mode is exited).
		0 If XIP is enabled, it causes the controller to exit XIP mode on the next read instruction
		1 Operate the device in XIP mode immediately

Table 17-6: OSPI_CTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
17 (R/W)	XIPRD	Enter XIP Mode on Next Read. If XIP is enabled, setting to 0 causes the controller to exit XIP mode on the next read instruction. If XIP is disabled, setting to 1 informs the controller that the device is ready to enter XIP on the next read instruction. The controller sends the appropriate command sequence, including mode bits to cause the device to enter XIP mode. Use this register after the controller ensures that the Flash device is configured to enter XIP mode. Note: To exit XIP mode, this bit should be set to 0. This takes effect in the attached device only after the next read instruction is executed. Software must ensure that at least one read instruction is requested after resetting this bit (to ensure that XIP mode is exited).
		0 If XIP is enabled, it cause the controller to exit XIP mode on the next read instruction
		1 If XIP is disabled, this setting informs the controller that the device is ready to enter XIP on the next read instruction
16 (R/W)	AHBADDREN	Enable AHB Address Remapping. The <code>OSPI_CTL.AHBADDREN</code> bit enables AHB address remapping (Direct Access Mode only). When set to 1, the incoming AHB address will be adapted and sent to the Flash device as (address + N), where N is the value stored in the remap address register.
14 (R/W)	WRPROT	Write Protect Flash. The <code>OSPI_CTL.WRPROT</code> bit, when set (=1), drives the Write Protect pin of the Flash. This is resynchronized to the generated memory clock, as necessary.
13:10 (R/W)	SSEL	Peripheral Chip Select Lines. The <code>OSPI_CTL.SSEL</code> bit field indicates the peripheral chip select line. If <code>OSPI_CTL.SSELDPCODE = 0</code> , <code>ss[3:0]</code> is output: <code>ss[3:0] SSEL[3:0]</code> <code>4'bxxx0.....1110.....SSEL0 selected</code> <code>4'bxx01.....1101.....SSEL1 selected</code> <code>4'bx011.....1011.....SSEL2 selected</code> <code>4'b0111.....0111.....SSEL3 selected</code> <code>4'b1111.....1111.....No peripheral selected</code> If <code>OSPI_CTL.SSELDPCODE = 1</code> , <code>ss[3:0]</code> directly drives <code>SSEL[3:0]</code> .

Table 17-6: OSPI_CTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
9 (R/W)	SSELDPCODE	Peripheral Select Decode. The OSPI_CTL.SSELDPCODE bit indicates the peripheral select decode.
		0 Only one of the 4 selects n_ss_out [3:0] is active
		1 Allows external 4:16 decode (n_ss_out = ss)
7 (R/W)	DACEN	Direct Access Controller Enable. The OSPI_CTL.DACEN bit enables the Direct Access Controller. When the Direct Access Controller and Indirect Access Controller are disabled, all AHB requested are completed with an error response.
		0 Disable Direct Access Controller once current transfer of the data word is complete
		1 Enable Direct Access Controller
6 (R/W)	RSTCFG	Reset Configuration. The OSPI_CTL.RSTCFG bit indicates the reset pin configuration.
		0 Reset Feature on DQ3 Pin of the Device
		1 Reset Feature on Dedicated Pin of the Device (Controlling the 5th bit Influences the Output)
5 (R/W)	RST	Reset Pin. The OSPI_CTL.RST bit, when set (=1), drives the Reset pin of the Flash and is reset to deactivate the Reset pin.
4 (R/W)	HLD	Hold Pin. The OSPI_CTL.HLD bit, when set (=1), drives the Hold pin of the Flash and reset to deactivate the Hold pin.
3 (R/W)	PHYEN	PHY Mode Enable. When the OSPI_CTL.PHYEN bit is enabled, the controller is informed that PHY module is to be used for handling SPI transfers. This bit is relevant only for configuration with PHY module.
2 (R/W)	CPHA	Clock Phase. The OSPI_CTL.CPHA bit selects the clock phase.
		0 SPI clock is active outside the word
		1 SPI clock is inactive outside the word
1 (R/W)	CPOL	Clock Polarity. The OSPI_CTL.CPOL bit selects clock polarity outside SPI word.
		0 OSPI clock is quiescent low
		1 OSPI clock is quiescent high

Table 17-6: OSPI_CTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
0 (R/W)	EN	Enable. The OSPI_CTL.EN bit enables OSPI operation.
		0 Disable OSPI Module
		1 Enable OSPI Module

Device Delay Register

This register introduces relative delays in the generation of the master output signals. All timings are defined in cycles of the SPI REFERENCE CLOCK/ext_clk.

Figure 17-4: OSPI_DLY Register Diagram

Table 17-7: OSPI_DLY Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:24 (R/W)	DSRT	Clock Delay for Chip Select Deassert. Delay in master reference clocks for the length that the master mode chip select outputs are de-asserted between transactions. The minimum delay is always SCLK period to ensure the chip select is not asserted again within an SCLK period.
23:16 (R/W)	DACT	Clock Delay for Chip Select Deactivation. Delay in master reference clocks between one chip select being de-activated and the activation of another. This is used to ensure a quiet period between the selection of two different slaves and requires the transmit FIFO to be empty.
15:8 (R/W)	LSTTRAN	Clock Delay for Last Transaction. Delay in master reference clocks between last bit of current transaction and de-asserting the device chip select (n_ss_out). By default, the chip select is de-asserted on the cycle following the completion of the current transaction.
7:0 (R/W)	INIT	Clock Delay. Clock delay with n_ss_out. Delay in master reference clocks between setting n_ss_out low and first bit transfer.

Device Read Instruction Control Register

Figure 17-5: OSPI_DRICTL Register Diagram

Table 17-8: OSPI_DRICTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
28:24 (R/W)	DMYRD	Dummy Read Clock Cycles. Number of dummy clock cycles required by the device for a read instruction.
20 (R/W)	MODEEN	Mode Enable. This field is set to 1 to ensure that the <code>OSPI_MBCTL.MODE</code> bits are sent following the address bytes.
17:16 (R/W)	DATATRNSFR	Data Transfer Type. Data transfer type for standard SPI modes.
		0 SIO Mode. Data is shifted to the device on DQ0 only and from the device on DQ1 only.
		1 Used for Dual Input/Output instructions. For data transfers, DQ0 and DQ1 are used as both inputs and outputs.
		2 Used for Quad Input/Output instructions. For data transfers, DQ0, DQ1, DQ2, and DQ3 are used as both inputs and outputs.
		3 Used for Quad Input/Output instructions. For data transfers, DQ[7:0] are used as both inputs and outputs.

Table 17-8: OSPI_DRICTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
13:12 (R/W)	ADDRTRNSFR	Address Transfer Type. Address transfer type for standard SPI modes.
		0 Addresses can be shifted to the device on DQ0 only.
		1 Addresses can be shifted to the device on DQ0 and DQ1 only.
		2 Addresses can be shifted to the device on DQ0, DQ1, DQ2, and DQ3.
		3 Addresses can be shifted to the device on DQ [7:0]
10 (R/W)	DDREN	DDR Enable. It checks if the opcode from the OSPI_DRICTL.OPCODERD field is compliant with one of the DDR read commands. Set this field to 1 when opcode from bits 7 to 0 is compliant with DDR command. Master output data is issued by the controller in DDR fashion starting of the address SPI transfer phase. It is not applicable for STIG Mode.
9:8 (R/W)	INSTRTYP	Instruction Type. Instruction Type.
		0 Use standard SPI mode. Data is shifted to the device on DQ0 only and from the device on DQ1 only.
		1 Use DIO-SPI mode. Instruction sent on DQ0 and DQ1.
		2 Use QIO-SPI mode. Instruction sent on DQ0, DQ1, DQ2, and DQ3.
		3 Use OIO-SPI mode. Instruction sent on DQ[7:0].
7:0 (R/W)	OPCODERD	Read Opcode in Non-XIP Mode. Read Opcode to use when not in XIP mode.

Device Write Instruction Control Register

Figure 17-6: OSPI_DWICRTL Register Diagram

Table 17-9: OSPI_DWICRTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
28:24 (R/W)	DMYWR	Dummy Write Clock Cycles. Number of dummy clock cycles required by the device for write instruction.
17:16 (R/W)	DATATRNSFR	Data Transfer Type. Data transfer type for standard SPI modes.
		0 SIO Mode. Data is shifted to the device on DQ0 only and from the device on DQ1 only.
		1 Used for Dual Input/Output instructions. For data transfers, DQ0 and DQ1 are used as both inputs and outputs.
		2 Used for Octal Input/Output Instructions. For data transfers, DQ0, DQ1, DQ2, and DQ3 are used as both inputs and outputs.
		3 Used for Octal Input/Output instructions. For data transfers, DQ[7:0] are used as both inputs and outputs.

Table 17-9: OSPI_DWICTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
13:12 (R/W)	ADDRTRNSFR	Address Transfer Type. Address transfer type for standard SPI modes.
		0 Addresses can be shifted to the device on DQ0 only.
		1 Addresses can be shifted to the device on DQ0 and DQ1.
		2 Addresses can be shifted to the device on DQ0, DQ1, DQ2, and DQ3.
		3 Addresses can be shifted to the device on DQ [7:0].
8 (R/W)	WELDIS	WEL Disable. This is to turn off automatic issuing of WEL command before write operation for DAC or INDAC.
7:0 (R/W)	OPCODEWR	Write Opcode.

Device Size Control Register

Figure 17-7: OSPI_DSCTL Register Diagram

Table 17-10: OSPI_DSCTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
20:16 (R/W)	BLKSZ	Number of Bytes per Block. The controller uses this field to perform write protection logic. The number of bytes per block must be a power of 2. 0: 1 byte 1: 2 bytes 3: 8 bytes ... 16: 65535 bytes and so on
15:4 (R/W)	PGSZ	Number of Bytes per Device Page. The controller uses this field to perform flash writes up to and across page boundaries.
3:0 (R/W)	ADDRSZ	Number of Address Bytes. Defines the address size for DAC mode. A value of 0 indicates 1 byte.

DLL Observable Register (Lower)

Figure 17-8: OSPI_DLLOB_LWR Register Diagram

Table 17-11: OSPI_DLLOB_LWR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:24 (R/NW)	INCSTAT	State of Cumulative DLL Lock Inc Register. Holds the state of the cumulative dll_lock_inc register.
23:16 (R/NW)	DECSTAT	State of Cumulative DLL Lock Dec Register. Holds the state of the cumulative dll_lock_dec register.
15 (R/NW)	LOCK_LB	Loop Back Lock. This bit indicates that lock of loop back is done.
14:8 (R/NW)	LWRLOCK	DLL Observable Lower Lock Value. Reports the DLL encoder value from the master DLL to slave DLLs.
7:3 (R/NW)	UNLOCK	DLL Observable Lower Unlock Counter. Reports the number of increments or decrements required for the master DLL to complete the locking process.
2:1 (R/NW)	LOCK	Mode in Which DLL is Locked. Defines the mode in which the DLL has achieved the lock.
0 (R/NW)	STAT	Indicates DLL Status.

DLL Observable Register (Upper)

Figure 17-9: OSPI_DLLOB_UP Register Diagram

Table 17-12: OSPI_DLLOB_UP Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:23 (R/NW)	RSVRD2	Reserved. Unused.
22:16 (R/NW)	TXOP	DLL Observable Upper Transmit Decoder Output. Holds the encoded value for the TX delay line for this slice.
15:7 (R/NW)	RSVRD1	Reserved. Unused.
6:0 (R/NW)	RXOP	DLL Observable Upper Receive Decoder Output. Holds the encoded value for the RX delay line for this slice.

Flash Command Address Register

Figure 17-10: OSPI_FCA Register Diagram

Table 17-13: OSPI_FCA Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	ADDR	Command Address. It is the address used by the command specified in the <code>OSPI_FCCTL.OPCODE</code> field. This must be setup before triggering the STIG command using the <code>OSPI_FCCTL.EXE</code> field.

Flash Command Control Register

Figure 17-11: OSPI_FCCTL Register Diagram

Table 17-14: OSPI_FCCTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:24 (R/W)	OPCODE	Command Opcode. This field must be set before triggering the STIG command. For example, 0x20 maps to sub sector erase. Writing to the OSPI_FCCTL.EXE launches the command. Note: Using this approach, to issue commands to the device will make use of the instruction type of the OSPI_DRICTL and OSPI_DWICTL registers.
		0 Command opcode, command address, command dummy bytes, and command data are serially transferred.
		1 Command opcode, command address, command dummy bytes, and command data are transferred in parallel using DQ0 and DQ1 pins.
		2 Command opcode, command address, command dummy bytes, and command data are transferred in parallel using DQ0, DQ1, and DQ2 pins.
		3 Reserved
23 (R/W)	RDEN	Read Data Enable. Set to 1 if the command specified in the OSPI_FCCTL.OPCODE requires read data bytes to be received from the device.

Table 17-14: OSPI_FCCTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
22:20 (R/W)	RDSZ	Number of Read Data Bytes. Up to 8 data bytes can be read using this command. Set this field to 0 for 1 byte and 7 for 8 bytes.
19 (R/W)	ADDREN	Command Address Enable. Set to 1 if the command specified in the <code>OSPI_FCCTL.OPCODE</code> field requires an address. This must be set before triggering the command via writing a 1 to the execute field.
18 (R/W)	MODEEN	Mode Bit Enable. Set this field to 1 to ensure the <code>OSPI_MBCTL.MODE</code> field is sent following the address bytes.
17:16 (R/W)	ADDRSZ	Number of Address Bytes. Set to the number of address bytes required (the address itself is programmed in the <code>OSPI_FCA</code> register. This must be setup before triggering the command via bit 0 of this register.
		0 1 address byte
		1 2 address bytes
		2 3 address bytes
		3 4 address bytes
15 (R/W)	WREN	Write Data Enable. Set to 1 if the command specified in the <code>OSPI_FCCTL.OPCODE</code> field requires write data bytes to be sent to the device.
14:12 (R/W)	WRSZ	Number of Write Data Bytes. Up to 8 data bytes may be written using this command. Set to 0 for 1 byte, 7 for 8 bytes.
11:7 (R/W)	DMY	Number of Dummy Cycles. Set to the number of dummy cycles required. This should be setup before triggering the command via the <code>OSPI_FCCTL.EXE</code> field.
2 (R/W)	STIGBNKEN	STIG Memory Bank Enable. This bit must be asserted high before triggering the flash memory bank transfer. It must be de-asserted before triggering any other operation. This is set before triggering the command via <code>OSPI_FCCTL.EXE</code> field.
1 (R/NW)	STAT	Command Execution in Progress.
0 (RX/W)	EXE	Execute the STIG Command.

Flash Command Control Memory Register

Figure 17-12: OSPI_FCMCTL Register Diagram

Table 17-15: OSPI_FCMCTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
28:20 (R/W)	BNKADDR	Memory Bank Address. The address of the memory bank from which data is read.
18:16 (R/W)	RDSZ	Number of STIG Bytes. It defines the number of read bytes for the extended STIG.
15:8 (R/NW)	BNKDATA	Last Requested Data from STIG Memory Bank.
1 (R/NW)	BNKREQ	Memory Bank Data Request in Progress.
0 (RX/W)	TRIGREQ	Trigger Memory Bank Data Request.

Flash Command Read Data Register (Lower)

Figure 17-13: OSPI_FCRD_LWR Register Diagram

Table 17-16: OSPI_FCRD_LWR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	DATA	Data. This is the data that is returned by the flash device for any status or configuration read operation carried out by triggering the STIG event in the OSPI_FCCTL register. The register is valid when the <code>OSPI_FCCTL.STAT</code> bit is low.

Flash Command Read Data Register (Upper)

Figure 17-14: OSPI_FCRD_UP Register Diagram

Table 17-17: OSPI_FCRD_UP Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	DATA	Data. This is the data that is returned by the flash device for any status or configuration read operation carried out by triggering the STIG event in the OSPI_FCCTL register. The register is valid when the <code>OSPI_FCCTL.STAT</code> bit is low

Flash Command Write Data Register (Lower)

Figure 17-15: OSPI_FCWD_LWR Register Diagram

Table 17-18: OSPI_FCWD_LWR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	DATA	Command Write Data Lower Byte. It is the data written to the flash for any status or configuration write operation carried out by triggering the STIG event in the OSPI_FCCTL register. This must be setup before triggering the command using the OSPI_FCCTL.EXE field.

Flash Command Write Data Register (Upper)

Figure 17-16: OSPI_FCWD_UP Register Diagram

Table 17-19: OSPI_FCWD_UP Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	DATA	Command Write Data Upper Byte. It is the data written to the flash for any status or configuration write operation carried out by triggering the event in the OSPI_FCCTL register. This must be setup before triggering the command using the <code>OSPI_FCCTL.EXE</code> field.

Interrupt Mask Register

This register allows the user to mask/unmask particular interrupt sources. This register must be setup when the controller is idle.

Figure 17-17: OSPI_IMSK Register Diagram

Table 17-20: OSPI_IMSK Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
14 (R/W)	STIGREQ_MSK	STIG Request Completion Mask.
13 (R/W)	POLEXP_MSK	Polling Expiration Detected Mask.
5 (R/W)	ILLACCES_MSK	Illegal Access Detected Mask.
4 (R/W)	WRPROT_MSK	Protected Area Write Attempt Mask.
1 (R/W)	UNDRFLW_MSK	Underflow Detected Mask.
0 (R/W)	MODEFAIL_MSK	Mode M Failure Mask.

Interrupt Status Register

The status fields in this register are set when the described event occurs, and the interrupt is enabled in the `OSPI_IMSK` register. If any of these bit fields are set, the interrupt output is asserted high. The fields are each cleared by writing a 1 to the field.

Note: Bit fields [10:6] are valid only when legacy SPI mode is active.

Figure 17-18: OSPI_ISTAT Register Diagram

Table 17-21: OSPI_ISTAT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
14 (R/W)	STIGREQ	STIG Request Completion Interrupt. The controller is ready to get another STIG request.
13 (R/W)	POLEXP	Poll Expiration Cycles. The maximum number of programmed polls cycles is expired.
5 (R/W)	ILLACCES	Illegal AHB Access Detected. AHB wrapping bursts and the use of SPLIT/RETRY accesses cause this error interrupt to trigger.
4 (R/W)	WRPROT	Write to Protected Area is Attempted and Rejected.
1 (R/W)	UNDRFLW	Underflow Detection. Underflow is detected.
		0 No underflow is detected.
		1 underflow is detected and an attempt to transfer data is made when the small TX FIFO is empty. This may occur when AHB write data is slowly provided to keep up with the requested write operation.

Lower Write Protection Register

Figure 17-19: OSPI_WRPROT_LWR Register Diagram

Table 17-22: OSPI_WRPROT_LWR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	SUBSECT	Subsector. It defines the lower end of the address range to be protected. The address to be programmed must be OSPI memory map address (starting from 0x60000000) shifted by the value in the OSPI_DSCTL.BLKSZ. For example, if lower address of flash to be protected is 0x100 and the OSPI_DSCTL.BLKSZ= 4, the value to be programmed in this register must be 0x60000100 >> 4, which is 0x06000010.

Mode Bit Control Register

Figure 17-20: OSPI_MBCTL Register Diagram

Table 17-23: OSPI_MBCTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
7:0 (R/W)	MODE	Mode. These bits are sent to the device following the address bytes if mode bit transmission is enabled.

Module ID Register

Figure 17-21: OSPI_MODID Register Diagram

Table 17-24: OSPI_MODID Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:24 (R/NW)	PATCH	Fix/Patch Number. Fix/patch number related to the OSPI_MODID.REVID field.
23:8 (R/NW)	REVID	Module/Revision ID Number.
1:0 (R/NW)	CFGID	Configuration ID. Configuration ID number.
		0 Reserved
		1 Reserved
		2 Reserved
		3 Reserved

Polling Expiration Register

Figure 17-22: OSPI_POLLEXP Register Diagram

Table 17-25: OSPI_POLLEXP Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	PEC	Poll Expiration Cycles. It defines the number of polls cycles before expiration.

Opcode Extension Register (Lower)

Figure 17-23: OSPI_OE_LWR Register Diagram

Table 17-26: OSPI_OE_LWR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:24 (R/W)	XRDBYT	Supplement Byte of Any Read Opcode.
23:16 (R/W)	XWRBYT	Supplement Byte of Any Write Opcode.
15:8 (R/W)	XPOLBYT	Supplement Byte of Any Polling Opcode.
7:0 (R/W)	XSTIGBYT	Supplement Byte of Any STIG Opcode.

Opcode Extension Register (Upper)

Figure 17-24: OSPI_OE_UP Register Diagram

Table 17-27: OSPI_OE_UP Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:24 (R/W)	FSTBYTWEL	First Byte of Any WEL Opcode.
23:16 (R/W)	XBYTWEL	Supplement Byte of Any WEL Opcode.

PHY Control Register

Figure 17-25: OSPI_PHYCTL Register Diagram

Table 17-28: OSPI_PHYCTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (RX/W)	RESYNC	Re-synchronization Delay. This bit is used for re-synchronization delay lines to update them with values from the OSPI_PHYCTL.RXDLY and OSPI_PHYCTL.TXDLY fields.
30 (RX/W)	RST	DLL Reset. This bit is used for reset of Delay Lines by software.
29 (R/W)	RXBYP	Receive DLL Bypass. This field determines if RX DLL is bypassed.
28:23 (R/NW)	RSVRD2	Reserved. Unused.
22:16 (R/W)	TXDLY	Transmit DLL Delay. This field determines the number of delay elements to insert on data path between ref_clk and spi_clk.
15:7 (R/NW)	RSVRD1	Reserved. Unused.
6:0 (R/W)	RXDLY	Receive DLL Delay. This field determines the number of delay elements to insert on data path between ref_clk and rx_dll_clk.

PHY DLL Master Control Register

Figure 17-26: OSPI_PHYMCTL Register Diagram

Table 17-29: OSPI_PHYMCTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:25 (R/NW)	RSVRD3	Reserved. Unused.
24 (R/W)	LCK	PHY Master Lock Mode. Determines if the master delay line locks on a full cycle or half cycle of delay.
23 (R/W)	BYPCTL	Bypass Mode Control. Controls the bypass mode of the master and slave DLLs
22:20 (R/W)	PDSEL	PHY Master Phase Detect Selector. Selects the number of delay elements to be inserted between the phase detect flip-flops.
19 (R/NW)	RSVRD2	Reserved. Unused.
18:16 (R/W)	IND	Increment/Decrement Indication. Indicates the number of consecutive increment or decrement indications.
15:7 (R/NW)	RSVRD1	Reserved. Unused.
6:0 (R/W)	INITDLY	Initial Delay. This value is the initial delay value for the DLL.

Polling Flash Status Register

Figure 17-27: OSPI_POLSTAT Register Diagram

Table 17-30: OSPI_POLSTAT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
19:16 (R/W)	DMY	Number of Dummy Cycles for Auto Polling. This field enables the user to define additional dummy cycles for read status during the auto-polling state. It may be necessary to add some cycles if the external delay of read data path shifts it outside the defined clock cycle.
8 (R/NW)	STAT	Device Status Valid. This bit is set when value in bits from 7 to 0 is valid.
7:0 (R/NW)	DEVSTAT	Defines Actual Status Register of Device.

Read Data Capture Register

Figure 17-28: OSPI_RDC Register Diagram

Table 17-31: OSPI_RDC Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration	
19:16 (R/W)	DDRDLYRD	DDR Read Delay. Delay the transmitted data by the number of ref_clk cycles.This field is relevant only when DDR read Command is executed. Else, it can be ignored.	
8 (R/W)	DQSEN	DQS Enable. If this bit is enabled, the signal from DQS input is driven into RX DLL and is used for data capturing in PHY Mode instead of internally generated gated ref_clk.	
5 (R/W)	SMPLEDG	Sample Edge Selection. Select the edge on which data outputs from flash memory has to be sampled.	
		0	Data outputs from Flash are sampled on falling edge of the ref_clk.
		1	Data outputs from Flash are sampled on rising edge of the ref_clk.
4:1 (R/W)	DLYRD	Read Delay. Delay the read data capturing logic by the programmed number of SYSCLK cycles.	

Remap Address Register

Figure 17-29: OSPI_REMAPADDR Register Diagram

Table 17-32: OSPI_REMAPADDR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	OFFSET	Value. Used to remap an incoming AHB address to a different address used by the Flash.

Upper Write Protection Register

Figure 17-30: OSPI_WRPROT_UP Register Diagram

Table 17-33: OSPI_WRPROT_UP Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	SUBSECT	Subsector. It defines the upper end of the address range to be protected. The address to be programmed must be OSPI memory map address (starting from 0x60000000) shifted by the value in the OSPI_DSCTL.BLKSZ. For example, if upper address of flash to be protected is 0x100 and the OSPI_DSCTL.BLKSZ= 4, the value to be programmed in this register must be 0x60000100 >> 4, which is 0x06000010.

Write Protection Control Register

Figure 17-31: OSPI_WRPROT_CTL Register Diagram

Table 17-34: OSPI_WRPROT_CTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
1 (R/W)	EN	Write Protection Enable Bit. When set to 1, any AHB write access with an address within the protection region defined in the lower and upper write protection registers is rejected. An AHB error response is generated and an interrupt source triggered. When set to 0, the protection region is disabled.
0 (R/W)	INV	Write Protection Inversion Bit. When set to 1, the protection region defined in the lower and upper write protection registers is inverted meaning it is the region that the system is permitted to write to. When set to 0, the protection region defined in the lower and upper write protection registers is the region that the system is not permitted to write to.

Write Completion Control Register

This register defines how the controller polls the device following a write transfer.

Figure 17-32: OSPI_WCCTL Register Diagram

Table 17-35: OSPI_WCCTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:24 (R/W)	REPDLY	Polling Repetition Delay. Defines the additional delay required to ensure that the Chip Select is de-asserted during auto polling phase.
23:16 (R/W)	CNT	Poll Count. Defines the number of times the controller should expect to see a true result from polling in successive reads of the device register.
15 (R/W)	EXPEN	Enable Polling Expiration. It is set to 1 to enable auto polling expiration.
14 (R/W)	DIS	Disable Polling. It switches off automatic polling function.
13 (R/W)	POLRTY	Polling Polarity. Defines the polling polarity.
		0 Write transfer to the device will be complete if the polled bit is 0.
		1 Write transfer to the device will be complete if the polled bit is 1.

Table 17-35: OSPI_WCCTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
10:8 (R/W)	INDEX	Polling Index. Defines the bit index that must be polled. A value of 010 means that bit 2 of the returned data is polled for. A value of 111 means that bit 7 of the returned data is polled for.
7:0 (R/W)	OPCODE	Opcode. Defines the opcode that must be issued by the controller when it is automatically polling for device program completion. This command is issued followed all device write operations. By default, this polls the standard device status register using opcode 0x05.

18 Universal Asynchronous Receiver/Transmitter (UART)

The UART module is a full-duplex peripheral compatible with PC-style industry-standard UARTs. The UART converts data between serial and parallel formats. The serial communication follows an asynchronous protocol that supports various word lengths, stop bits, bit rates, and parity-generation options. Multiple events can generate interrupts.

The UART is logically compliant to EIA-232E, EIA-422, EIA-485 and LIN standards, but usually requires external transceiver devices to meet electrical requirements. In IrDA (Infrared Data Association) mode, the UART meets the half-duplex IrDA SIR (9.6/115.2 Kbps rate) protocol. In multi-drop bus mode, the UART meets the full-duplex MDB/ICP v2.0 protocol.

The UART module supports partial modem status and control functionality to allow for hardware flow control.

The UART is a DMA-capable peripheral with separate transmit and receive DMA master channels. The use of DMA requires minimal software intervention as the DMA engine moves the data. The UART can also use a programmed core mode of operation. The core mode requires software management of the data flow using either interrupts or polling.

The UART can use one of the peripheral timers for a hardware-assisted auto-baud detection mechanism. The timers are external to the UART.

NOTE: The UARTs (UART0, UART1 and UART2) operate in the SCLK0 domain.

UART Features

Each UART includes the following features.

- 5–8 data bits
- Programmable extra stop bit and programmable extra half-stop bit
- Even, odd, and sticky parity bit options
- Extra 8-stage receive FIFO with programmable threshold interrupt request
- Flexible transmit and receive interrupt request timing

- Three interrupt outputs for receive, transmit, and status
- Independent DMA operation for receive and transmit
- Programmable automatic request to send (RTS)/clear to send (CTS) hardware flow control
- False start bit detection
- SIR IrDA operation mode
- MDB/ICP v2.0 operation mode
- Internal loopback
- Improved bit rate granularity
- LIN break command/Inter-frame gap transmission support

Table 18-1: UART Specifications

Feature	Availability
<i>Protocol</i>	
Master-Capable	Yes
Slave-Capable	Yes
Transmission Simplex	Yes
Transmission Half-Duplex	Yes
Transmission Full-Duplex	Yes
<i>Access Type</i>	
Data Buffer	Yes
Core Data Access	Yes
DMA Data Access	Yes
DMA Channels	2 (per UART Port)
DMA Descriptor	Yes
Boot Capable	Yes (Slave Mode)
Local Memory	No
Clock Operation	SCLK0/16

UART Functional Description

The following sections provide details on the UARTs functionality.

ADSP-2159x UART Register List

The Universal Asynchronous Receiver/Transmitter module (UART) is a full-duplex peripheral compatible with PC-style industry-standard UARTs. The UART converts data between serial and parallel formats. The serial communication follows an asynchronous protocol that supports various word length, stop bit, parity, and interrupt generation options. A set of registers governs UART operations. For more information on UART functionality, see the UART register descriptions.

Table 18-2: ADSP-2159x UART Register List

Name	Description
UART_CLK	Clock Rate Register
UART_CTL	Control Register
UART_IMSK	Interrupt Mask Register
UART_IMSK_CLR	Interrupt Mask Clear Register

UART Block Diagram

The *UART Block Diagram* figure shows a simplified block diagram of one UART module and how it interconnects to the processor system.

Figure 18-1: UART Block Diagram

UART Architectural Concepts

The following sections provide information about the UART architecture.

Internal Interface

The UART is a DMA-capable peripheral with support for separate transmit and receive DMA master channels. It operates in either DMA or programmed core modes. The core mode requires software management of the data flow using either interrupts or polling. The DMA method requires minimal software intervention, as the DMA engine itself moves the data. The `UART_RBR` and `UART_THR` registers also connect to one of the peripheral DMA buses.

All UART registers are 32 bits wide and the registers connect to the peripheral MMR bus. Not all MMRs can be used and unused bits are zero-filled. The UART has three interrupt outputs described as follows.

- The transmit and receive request outputs can function as DMA requests and connect to the DMA controller. Therefore, if the DMA is not enabled, the DMA controller simply forwards the request to the system event controller (SEC).
- The status interrupt output connects directly to the SEC. On many processors, the alternative capture input (`(TIMER_ACI[nn])`) of one of the GP timers also senses the `UART_RX` pin. When configured in capture mode, the processor can then use the GP timer to detect the bit rate of the received signal.

External Interface

Each UART features a `UART_RX` (receive) pin and a `UART_TX` (transmit) pin available through the general-purpose ports. These two pins usually connect to an external transceiver device that meets the electrical requirements of full-duplex or half-duplex standards. For example, EIA-232, EIA-422, 4-wire EIA-485 for full-duplex or 2-wire EIA-485, LIN for half-duplex. Additionally, the UART features a pair of clear-to-send, input pins (`UART_CTS`),

and request-to-send, output pins (`UART_RTS`) for hardware flow control. UART signals are multiplexed with other functions at the pin level.

Hardware Flow Control

To prevent the UART transmitter from sending data while the receiving counterpart is not ready, the UART features a `UART_RTS/UART_CTS` hardware flow control mechanism. The `UART_RTS` signal is an output that connects to the `UART_CTS` input of the communication partner. If data transfer is bidirectional, the figure shows the *UART Hardware Flow Control* handshake.

Figure 18-2: UART Hardware Flow Control

In both DMA and core mode, the receiver can deassert the `UART_RTS` signal to indicate that its receive buffer is almost full. Continued data transfers can cause an overrun error. The transmitter pauses when the `UART_CTS` input is in a deasserted state. In this state, the transmitter completes transmission of the data currently held in the transmit shift register (`UART_TSR`) but it does not continue with the data in the transmit hold register (`UART_THR`). If the `UART_CTS` pin is asserted again, the transmitter resumes and loads the content of `UART_THR` register into the `UART_TSR` register.

Bit Rate Generation

The peripheral clock (`SCLK0`) and the 16-bit divisor in the `UART_CLK` register characterize the sample clock. The UART uses the `UART_CTL.EN` bit to enable the clock. By default, every serial bit is oversampled 16 times. The bit clock is 1/16th of the sample clock. If not in IrDA mode, the bit clock can equal the sample clock if the `UART_CLK.EDBO` bit is set, so that the following equation applies:

$$\text{Bit Rate} = \text{SCLK0} / 16^{(1-\text{EDBO})} \times \text{Divisor}$$

The *UART Bit Rate Examples with 100 MHz SCLK* table provides example divide factors required to support standard baud rates at an `SCLK0` of 100 MHz.

Table 18-7: UART Bit Rate Examples with 100 MHz SCLK0

Bit Rate (bits/sec)	EDBO = 0			EDBO = 1		
	DL	Actual	% Error	DL	Actual	% Error
2400	2604	2400.15	0.006	41667	2399.98	0.001
4800	1302	4800.31	0.006	20833	4800.08	0.002

Table 18-7: UART Bit Rate Examples with 100 MHz SCLK0 (Continued)

Bit Rate (bits/sec)	EDBO = 0			EDBO = 1		
	DL	Actual	% Error	DL	Actual	% Error
9600	651	9600.61	0.006	10417	9599.69	0.003
19200	326	19171.78	0.147	5208	19201.23	0.006
38400	163	38343.56	0.147	2604	38402.46	0.006
57600	109	57339.45	0.452	1736	57603.69	0.006
115200	54	115740.74	0.469	868	115207.37	0.006
921600	7	892857.14	3.119	109	917431.19	0.452
1500000	4	1562500	4.167	67	1492537.31	0.498
3000000	2	3125000	4.167	33	3030303.03	1.01
6250000	1	6250000	0	16	6250000	0

NOTE: Properly select the SCLK0 frequencies. Even multiples of bit rate decrease the error percentage.

Setting the bit clock equal to the sample clock (UART_CLK.EDBO =1) improves the bit rate granularity and the bit clock matches with the bit rate of the communication partner. The disadvantage is that the power dissipation is higher and sample points are not always accurate. Therefore, use UART_CLK.EDBO mode only when bit rate accuracy is not acceptable in the UART_CLK.EDBO=0 mode.

The UART_CLK.EDBO=1 mode is not intended to increase the speed of operation beyond the electrical limitations of the UART transfer protocol.

Autobaud Detection

At the chip level, the UART_RX pin is typically routed to an alternate capture input (TIMER_ACI [nn]) of a general-purpose timer. When working in width capture mode, the processor uses this general-purpose timer to detect the bit rate applied to the UART_RX pin automatically by an external device. It often uses the capture capabilities of the timer to supervise the bit rate at run time. If the UART communicates with any device supplied by a weak clock oscillator that drifts over time, the processor can then readjust its UART bit rate dynamically, as required.

Often, the processor uses autobaud detection for initial bit rate negotiations where it is most likely a slave device waiting for the host to send a predefined autobaud character. This situation is common for UART booting. Do not enable the UART_CTL.EN bit while autobaud detection is in-process, to prevent the UART from starting a receive operation with incorrect bit rate matching. Alternatively, set the UART_CTL.LOOP_EN bit to disconnect the UART from its UART_RX pin.

A software routine can detect the pulse widths of serial stream bit cells. The sample base of the timer is synchronous with the UART operation (all derived from the same SCLK0). The UART uses pulse widths to calculate the bit rate divider as follows:

$$\text{Divisor} = \text{TIMER_TMR}[n]_WID / (16^{(1-\text{EDBO})} \times \text{Number of captured UART bits})$$

To increase the number of timer counts and the resolution of the captured signal, do not measure just the pulse width of a single bit. Instead, enlarge the pulse of interest over more bits. Traditionally, a NULL character (ASCII 0x00) is used in autobaud detection, as shown in the *Autobaud Detection* figure.

Figure 18-3: Autobaud Detection

Because the example frame encloses 8 data bits and 1 start bit, apply the following formula:

$$\text{Divisor} = \text{TIMER_TMR}[n]_WID / (16^{(1-\text{EDBO})} \times 9)$$

NOTE: For processor-specific mapping of timer alternate capture inputs to the UARTs of the processor, see "Width Capture (WIDCAP) Mode" in the "*General-Purpose Timer (TIMER)*" chapter.

Real receive signals often have asymmetrical falling and rising edges, and the sampling logic level is not exactly in the middle of the signal voltage range. At higher bit rates, such pulse-width-based autobaud detection does not always return adequate results without extra conditioning of the analog signal. Measure signal periods to work around this issue.

For example, predefine the ASCII character "@" (0x40) as the autobaud detection character and measure the period between two subsequent falling edges. As shown in the *Autobaud Detection Character 0x40* figure, measure the period between the falling edge of the start bit and the falling edge after bit 6. Since this period encloses 8 bits, apply the following formula:

$$\text{Divisor} = \text{TIMER_TMR}[n]_PER / (16^{(1-\text{EDBO})} \times 8)$$

or:

- Divisor = $\text{TIMER_TMR}[n]_PER \gg 7$, if $\text{UART_CLK}.\text{EDBO}=0$
- Divisor = $\text{TIMER_TMR}[n]_PER \gg 3$, if $\text{UART_CLK}.\text{EDBO}=1$

The *Autobaud Detection Character 0x40* figure shows the ASCII "@" (0x40) detection character.

Figure 18-4: Autobaud Detection Character 0x40

UART Debug Features

The UART can automatically calculate and transmit a parity bit. The *UART Parity* table summarizes parity behavior assuming 8-bit data words (`UART_CTL.WLS=b#11`).

Table 18-8: UART Parity

PEN	STP	EPS	Data (hex)	Data (binary, LSB first)	Parity
0	x	x	x	x	None
1	0	0	0x60	0000 0110	1
1	0	0	0x57	1110 1010	0
1	0	1	0x60	0000 0110	0
1	0	1	0x57	1110 1010	1
1	1	0	x	x	1
1	1	1	x	x	0

The two force error bits, `UART_CTL.FPE` and `UART_CTL.FFE`, are intended for test purposes. They are useful for debugging software, especially in loopback mode.

The UART can be set to internal loopback mode (`UART_CTL.LOOP_EN=1`). Loopback mode disconnects the input of the receiver from the receive pin and internally redirects the transmit output to the receiver. The transmit pin remains active and continues to transmit data externally as well. Loopback mode also forces the `UART_RTS` pin to deassert, disconnects the `UART_STAT.CTS` bit from the `UART_CTS` input pin, and connects the internal version of `UART_RTS` to the `UART_STAT.CTS` bit.

Additionally, the `UART_TX` pin can be forced to zero asynchronously using the `UART_CTL.SB` bit.

UART Operating Modes

The following sections describe the main operating modes of the UART.

- [UART Mode](#)
- [IrDA SIR Mode](#)
- [Multi-Drop Bus Mode](#)

UART Mode

The UART mode follows an asynchronous serial communication protocol with these options:

- 1 start bit
- 5–8 data bits
- Address bit (available in MDB mode only)

- None, even, odd or sticky parity
- 1, 1½, or 2 stop bits (1½ stop bits valid only in 5-bit word length)

The `UART_CTL` register controls the format of received and transmitted character frames. Data is always transmitted and received with the least significant bit (LSB) first.

The *Bit Stream on a UART TX Pin Transmitting an “S” Character (0x53)* figure shows a typical physical bit stream measured on a `UART_TX` pin.

Figure 18-5: Bit Stream on a UART TX Pin Transmitting an “S” Character (0x53)

IrDA SIR Mode

The UART also supports serial data communication by way of infrared signals, according to the recommendations of the Infrared Data Association (IrDA). The physical layer known as IrDA SIR (9.6/115.2 Kbps rate) is based on return-to-zero-inverted (RZI) modulation. The UART does not support pulse position modulation.

Using the 16x data rate clock, RZI modulation is achieved by inverting and modulating the non-return-to-zero (NRZ) code normally transmitted by the UART. On the receive side, the UART uses a 16x clock to determine an IrDA pulse sample window, from which it recovers the RZI modulated NRZ code.

NOTE: The `UART_CLK.EDBO` bit is not valid in IrDA mode. Clear (=0) this bit in this mode.

Multi-Drop Bus Mode

The UART uses a protocol for point-to-point connections as well as in networks where the EIA-485 standard is representative of UART-based bus systems. The EIA-232 standard defines point-to-point connections. In such networks, node addressing is important.

In a multidrop bus (MDB) network, for example, an address bit enhances the UART frame. The address bit is inserted between the data bits and the optional parity bit. To configure the UART for MDB mode, set the mode of operation bits (`UART_CTL.MOD [5:4]`) to 01.

By convention, the address bit is transmitted low for regular data bytes. When set, it marks special address bytes that require the attention of all nodes on the network.

Figure 18-6: UART Frame with Address Bit

All transmit operations are processed through the transmit buffer register (`UART_THR`), so all DMA data transmissions clear the address bit. If data is written to the transmit address or insert pulse register (`UART_TAIP`) instead, the same transmit operation is initiated with the only exception that the address bit is sent high.

The UART uses the `UART_STAT.ADDR` bit of the receiver to signal whether the previously received frame had the address bit set or not. Hardware updates it every time a new frame is received. When the enable address word interrupt bit (`UART_IMSK.EAWI`) is set, the reception of an address byte triggers a special status interrupt request.

The address sticky bit (`UART_STAT.ASTKY`) is the sticky version of the `UART_STAT.ADDR` bit. Hardware sets it whenever the `UART_STAT.ADDR` bit is set. Software can clear the `UART_STAT.ASTKY` bit with a W1C operation.

In MDB mode, only address bytes progress to the receive FIFO by default. Data bytes are gated unless the `UART_STAT.ASTKY` bit is set. The receiver ignores all traffic on the UART bus. This way, the processor can go into low-power mode and interrupt activity does not load the processor every time a frame is transmitted on the UART bus. If, however, an address frame is transmitted, the receiver immediately samples all further traffic. A software routine can analyze the received data, decide whether it was of relevance for the local network node, and W1C the `UART_STAT.ASTKY` bit if it was not.

Software can overrule of the hardware address frame detection by setting the `UART_STAT.ADDR` bit and (indirectly) the `UART_STAT.ASTKY` bit with a W1S operation.

The MDB mode follows an asynchronous serial communication protocol with the following options.

- 1 start bit
- 5–8 data bits
- Address bit
- None, even, odd or sticky parity
- 1, 1½, or 2 stop bits (1½ stop bits are valid only in 5-bit word length)

NOTE: If the address bit and parity bit are both enabled, the parity check and generation includes the address bit in its parity calculation.

UART Data Transfer Modes

The UART can transfer data using both the core and DMA. Receive and transmit paths operate independently except that the bit rate and the frame format are identical for both transfer directions. Transmit and receive channels are both buffered. The `UART_THR` register buffers the transmit shift register (`UART_TSR`) and the `UART_RBR` register buffers the receive shift register (`UART_RSR`).

UART Mode Transmit Operation (Core)

In core mode, the processor core moves data to and from the UART. A write to the `UART_THR` register initiates the transmit operation. If no former operation is pending, the `UART_THR` register passes the data immediately to the `UART_TSR` register. There, it is shifted out at the bit rate characterized by the `UART_CLK` register, with start, stop, and parity bits appended as defined by the `UART_CTL` register.

The `UART_THR` register and the `UART_TSR` register can be modeled as a two-stage transmit buffer. The least significant bit (LSB) always transmits first. This bit is bit 0 of the value written to the `UART_THR` register.

UART Mode LIN Break Command

Some UART-based protocols demand synchronization methods that are not native to standard UART implementations. For example, the Local Interconnect Network (LIN) protocol requires a low-pulse of well-defined transmit length as a prologue to every multi-byte message. Its length must be at least 13 bit-times.

With previous UARTs, there were two options to implement this protocol:

- A null byte is transmitted with a temporarily lowered bit rate, or
- A software counter generates the period and the asynchronous set break (SB) mechanisms pull the transmit pin low

Since both methods have their disadvantages, the newer UART introduces a new inter-frame gap technique.

The feature is not available in MDB or IrDA operating modes. However, in standard UART mode (bits `UART_CTL.MOD[5:4] = 00`), a write to the `UART_TAIP` register initiates the transmission of an inter-frame pulse. If the transmit buffer is not empty, the UART first transmits all bytes in the queue. It only initiates with pulse generation after the last stop bit of the last byte has been shifted out.

The value written into the `UART_TAIP` register defines the nature and the duration of the transmitted pulse. Bits [6:0] control the duration in bit-times and bit [7] controls the value (duration = `UART_TAIP[6:0] / UART_CLK[15:0]`). If `UART_TAIP[7]` is set, and an active high pulse is issued, the number of stop bits is extended. If `UART_TAIP[7]` is cleared, a low pulse is generated. Invert the polarity using the `UART_CTL.FCPOL` bit. Writing a value of 13 into the `UART_TAIP` register generates the break command as required by the LIN protocol.

NOTE: If the `UART_CTL.TPOLC` bit is enabled, an inverted most-significant bit can be transmitted.

NOTE: If another transmission is pending (in the `UART_TSR` register), the `UART_TAIP` initiated pulse is queued until after all pending operations have finished and all stop bits are transmitted.

The transmission of break command/inter-frame gap precedes transmission of the number of stop bits as set in the `UART_CTL.STB` and `UART_CTL.STBH` bit fields.

The UART receiver can detect break commands through the break indicator (`UART_STAT.BI`) flag. This flag reports that an entire UART frame has been received in low state. It does not report whether the duration of the received low pulse was exact or at least 13 bit-times as LIN masters transmit. Typically, the break indicator meets LIN requirements. The processor can use GP timers to determine the pulse width more precisely, if necessary.

Each `UART_RX` pin is also routed to a GP timer through its alternate capture input (TACI). This functionality is not only useful for bit rate detection (*autobaud*) but also helps to measure the pulse widths precisely on the `UART_RX` input. Additionally, the GP timers can issue an interrupt request or a fault condition when the received pulse width is shorter than a bit time or longer than the worst-case break condition. The windowed watchdog width mode of the GP timers controls this functionality.

UART Mode Receive Operation (Core)

The receive operation uses the same data format as the transmit configuration except that one valid stop bit is always sufficient. The `UART_CTL.STB` and `UART_CTL.STBH` bits have no impact on the receiver.

The UART receiver senses the falling edges of the receive input. When it detects an edge, the receiver starts sampling the input according to settings in the `UART_CLK` register. The receiver samples the start bit (majority sampling) close to its midpoint. If sampled low, it assumes a valid start condition. Otherwise, it discards the detected falling edge.

After detection of the start bit, the received word is shifted into the `UART_RSR` register.

After the corresponding stop bit is received, the content of the `UART_RSR` register is transferred to the 8-deep receive FIFO and is accessible by reading the `UART_RBR` register.

The receive FIFOs and the `UART_RBR` register act as a 9-stage receive buffer. If the stop bit of the ninth word is received before software reads the `UART_RBR` register, an overrun error is reported. Overruns protect data in the `UART_RBR` register and the receive FIFO from being overwritten by further data until the software clears the `UART_STAT.OE` bit. However, the data in the `UART_RSR` register is immediately destroyed as soon as the overrun occurs.

The sampling clock is 16 times faster than the bit clock. The receiver oversamples every bit 16 times and makes a majority-decision based on the middle three samples. This functionality improves immunity against noise and hazards on the line. The receiver disregards spurious pulses of less than two times the sampling clock period.

Normally, the receiver samples every incoming bit at exactly the 7th, 8th and 9th sample clock. If, however, the `UART_CLK.EDBO` bit is set to 1, the receiver samples bits roughly at 7/16th, 8/16th, and 9/16th of their period. This configuration achieves better bit rate granularity and accuracy as required at high operation speeds. Hardware design must ensure that the incoming signal is stable between 6/16th and 10/16th of the nominal bit period.

Reception starts when the UART receiver detects a falling edge on the `UART_RX` input pin. The receiver attempts to see a start bit. The data is shifted into the `UART_RSR` register. After the ninth sample of the first, the receiver processes the stop bit and copies the received data to the 8-stage receive FIFO. The `UART_RSR` recovers for further data reception.

The receiver samples data bits close to their midpoint. Because the receiver clock is typically asynchronous to the data rate of the transmitter, the sampling point can drift relative to the center of the data bits. The sampling point is synchronized again with each start bit, so the error accumulates only over the length of a single word. The polarity of received data is selectable, using the `UART_CTL.RPOLC` bit.

NOTE: The receiver checks for only a single stop bit. After the third sample of the first stop bit has been received (at time 9/16th of the stop bit duration), the receiver immediately acts (status update). It then prepares for new falling edge detection (start detection).

IrDA Transmit Operation

To generate the IrDA pulse transmitted by the UART, the normal NRZ output of the transmitter is first inverted if the `UART_CTL.TPOLC` bit is configured for active-low operation. In this configuration, a zero is transmitted as a high pulse of 16 UART clock periods and a one is transmitted as a low pulse for 16 UART clock periods. Then, six UART clock periods delay the leading edge of the pulse. Similarly, eight UART clock periods truncate the trailing edge of the pulse. For a 16-cycle UART clock period, this operation results in the final representation of the original zero as a high pulse of only 3/16 clock periods. The *IrDA Transmit Pulse* figure shows how the pulse is centered around the middle of the bit time. The final IrDA pulse is fed to the off-chip infrared driver.

This modulation approach ensures a pulse width output from the UART of three cycles high out of every 16 UART clock cycles. As shown in the *IrDA Transmit Pulse* figure, the error terms associated with the bit rate generator are small and well within the tolerance of most infrared transceiver specifications.

NOTE: In IrDA mode, writes to the `UART_TAIP` register are equivalent to writes to the `UART_THR` register.

Figure 18-7: IrDA Transmit Pulse

IrDA Receive Operation

The IrDA receiver function is more complex than the transmit function. The receiver must discriminate the IrDA pulse and reject noise. The receiver looks for the IrDA pulse in a narrow window centered around the middle of the expected pulse.

Glitch filtering is accomplished by counting 16 system clocks from the time the receiver detects an initial pulse. If the pulse is absent when the counter expires, the receiver interprets it as a glitch. Otherwise, the receiver interprets it as a zero. This assessment is acceptable because glitches originating from on-chip capacitive cross-coupling typically

do not last for more than a fraction of the system clock (SCLK0) period. Appropriate shielding avoids sources outside of the chip and not part of the transmitter. The only other source of a glitch is the transmitter itself. The processor relies on the transmitter to perform within specification. If the transmitter violates the specification, unpredictable results can occur. The 4-bit counter adds an extra level of protection at a minimal cost.

NOTE: Because SCLK0 can change across systems, the longest glitch tolerated is inversely proportional to the SCLK0 frequency.

A counter that is clocked at the 16x bit-time sample clock determines the receive sampling window. The sampling window is resynchronized with each start bit by centering the sampling window around the start bit.

The polarity of receive data is selectable, using the `UART_CTL.RPOLC` bit. The *IrDA Receiver Pulse Detection* figure provides examples of each polarity type.

Figure 18-8: IrDA Receiver Pulse Detection

MDB Transmit Operation

In MDB mode, receive and transmit paths operate independently from each other, except for sharing bit rate and frame formats for both transfer directions.

Transmit operation is initiated by writing the `UART_THR` or `UART_TAIP` registers. A write to the `UART_THR` register transmits the written word with the appending address bit set low. A write to the `UART_TAIP` register transmits the written word with the appended address bit set high. The data is moved into the `UART_TSR` register, where it is shifted out at the bit rate programmed by the `UART_CLK` register, with start, stop, address, and parity bits appended, as required.

If DMA is enabled, the DMA engine always writes the data into the `UART_THR` register, and the written word is transmitted with the appending address bit set low.

The polarity of transmit data is selectable, using the `UART_CTL.TPOLC` bit.

MDB Receive Operation

Receive operations use the same data format as the transmit configuration, except that the number of stop bits is always assumed to be 1. After detection of the start bit, the received word is shifted into the `UART_RSR` register at the programmed bit.

Normally, the receiver samples every incoming bit at exactly the 7th, 8th and 9th sample clock. If, however, the `UART_CLK.EDBO` bit is set, the receiver samples the bits roughly at 7/16th, 8/16th, and 9/16th of their period. This configuration achieves better bit rate granularity and accuracy needed at high operation speeds. Hardware design must ensure that the incoming signal is stable between 6/16th and 10/16th of the nominal bit period.

After the appropriate number of bits (including address, parity, and stop bits) is received, the `UART_RSR` register is transferred to the receive FIFO and accessible through the `UART_RBR` register.

The polarity of receive data is selectable, using the `UART_CTL.RPOLC` bit.

DMA Mode

In DMA mode, separate receive and transmit DMA channels move data between the UART and memory. The software does not have to move data; it just has to set up the appropriate transfers either through the descriptor mechanism or through autobuffer mode.

DMA channels provide a 4-deep FIFO, resulting in total buffer capabilities of 6 words at the transmit side and 9 words at the receive side. In DMA mode, the bus activity and arbitration mechanism determine the latency. The processor loading and interrupt priorities do not determine the latency.

To enable UART DMA, first set up the system DMA control registers. Then, enable the `UART_IMSK.ERBFI` or `UART_IMSK.ETBEI` interrupts. This sequence is necessary because these interrupt request lines double as DMA request lines. With DMA enabled, once these requests are received, the DMA control unit generates a direct memory access. If DMA is not enabled, the UART interrupt is passed on to the system interrupt handling unit. The status interrupt for the UART goes directly to the system event controller (SEC), bypassing the DMA unit completely.

For transmit DMA, programs must set the `DMA_CFG.SYNC` bit. With this bit set, interrupt generation is delayed until the entire DMA FIFO is drained to the UART module. The UART transmit DMA interrupt service routine can disable the DMA or to clear the `UART_IMSK.ETBEI` control bit only when the `DMA_CFG.SYNC` bit is set. Otherwise, up to four data bytes can be lost.

When the `UART_IMSK.ETBEI` bit is set, an initial transmit DMA request is issued immediately. The program then clears the `UART_IMSK.ETBEI` bit through the DMA service routine.

In DMA transmit mode, the `UART_IMSK.ETBEI` bit enables the peripheral request to the DMA FIFO. The `DMA_CFG.EN` bit enables the strobe on the memory side. If the DMA count is less than the DMA FIFO depth, which is 4, then the DMA interrupt can be requested before the `UART_IMSK.ETBEI` bit is set. If this behavior is unwanted, set the `DMA_CFG.SYNC` bit.

Regardless of the `DMA_CFG.SYNC` setting, the DMA stream has not left the UART transmitter completely at the time the interrupt request is generated. Transmission can abort in the middle of the stream, causing data loss, when the UART clock was disabled without extra synchronization with the `UART_STAT.TEMT` bit.

The UART provides functionality to avoid resource-consuming polling of the `UART_STAT.TEMT` bit. The `UART_IMSK_SET.EDTPTI` bit enables the `UART_STAT.TEMT` bit to trigger a DMA interrupt. To delay the DMA completion interrupt until the last data word of a STOP DMA has left the UART, keep the `DMA_CFG.INT` bit cleared and set the `UART_IMSK_SET.EDTPTI` bit instead. Then, the normal DMA completion interrupt is suppressed. Later, the `UART_STAT.TEMT` event triggers a DMA interrupt after the last word of the DMA has left the UART transmit buffers. If `DMA_CFG.INT` and `UART_IMSK.EDTPTI` are set, when finishing STOP mode, the DMA requests two interrupts.

The DMA of the UART module supports 8-bit and 16-bit operation, but not 32-bit operation. It does not support sign-extension.

Mixing DMA and Core Modes

Switching from DMA mode to core operation dynamically requires some consideration, especially for transmit operations. By default, the interrupt timing of the DMA is synchronized with the memory side of the DMA FIFOs. Normally, the transmit DMA completion interrupt is generated after the last byte is copied from the memory into the DMA FIFO. The transmit DMA interrupt service routine is not yet permitted to disable the `DMA_CFG.EN` bit. The interrupt is requested when the `DMA_STAT.IRQDONE` bit is set. The `DMA_STAT.RUN` bit, however, remains set until the data has completely left the transmit DMA FIFO.

When planning to switch from a DMA to core mode, set the `DMA_CFG.SYNC` bit in the word of the last descriptor or work unit before handing over control. Then, after the interrupt request occurs, software can write new data into the `UART_THR` register as soon as the `UART_STAT.THRE` bit permits. If the `DMA_CFG.SYNC` bit cannot be set, software can poll the `DMA_STAT.RUN` bit instead. Alternatively, using the `UART_IMSK.EDTPTI` bit can avoid expensive status bit polling.

When switching from core to DMA operation, ensure that the first DMA request is issued properly. If the DMA is enabled while the UART is still transmitting, no precaution is required. If, however, the DMA is enabled after the `UART_STAT.TEMT` bit is high, pulse the `UART_IMSK.ETBEI` bit to initiate DMA transmission.

Setting Up Hardware Flow Control

The following steps show how to set up UART hardware flow control:

1. Configure automatic or manual hardware flow control for the receiver through the `UART_CTL.ARTS` bit, or the transmitter through the `UART_CTL.ACTS` bit.
2. Configure `UART_CTS` and `UART_RTS` polarity through the `UART_CTL.FCPOL` bit.

On reset, when the UART is not yet enabled and the port multiplexing has not been programmed, the `UART_RTS` pin is not driven. Some applications require a resistor to pull the `UART_RTS` signal to either state during reset.

UART Event Control

Status flags in the `UART_STAT` register are available to signal data reception, parity, and error conditions, if necessary.

DMA and Interrupt Multiplexing

See the *Direct Memory Access (DMA)* chapter for information on DMA multiplexing. Several interrupts and DMA channels in the UART can be multiplexed.

NOTE: To operate in interrupt mode without using DMA channels, set the `UART_IMSK.ELSI` bit. This configuration redirects receive and transmit requests to the status interrupt output. The status interrupt goes directly to the SEC without going through the DMA controller.

Interrupt Masks

Each UART features a set of interrupt mask registers: `UART_IMSK`, `UART_IMSK_SET`, and `UART_IMSK_CLR`. The `UART_IMSK` register supports read/write operations. Writing ones to the `UART_IMSK_SET` register enables interrupts, writing ones to the `UART_IMSK_CLR` register disables them. Reads from either register return the enabled bits. This way, different interrupt service routines can control transmit, receive, and status interrupt requests independently and easily.

The UART module uses the `UART_IMSK` registers to enable requests for system handling of empty or full states of data registers. Unless polling is used as a means of action, the `UART_IMSK.ERBFI` and `UART_IMSK.ETBEI` bits in this register are normally set.

Each UART module has three interrupt outputs. It uses one for transmission, one for reception, and one for reporting status events. The UART module routes transmit and receive requests through the DMA controller. The status request goes directly to the .

If the associated DMA channel is enabled, the request functions as a DMA request. If the DMA channel is disabled, it simply forwards the request to the SEC. A DMA channel must be associated with the UART module to enable transmit and receive interrupts. Otherwise, transmit and receive requests cannot be forwarded.

NOTE: To operate in interrupt mode without using DMA channels, set the `UART_IMSK.ELSI` bit. This configuration redirects receive and transmit requests to the status interrupt request output. The status interrupt goes directly to the SEC without going through the DMA controller.

Interrupt Servicing

Interrupt service routines (ISRs) perform UART writes and reads. Separate interrupt lines are provided for transmit, receive, and status. The `UART_IMSK` register group enables the independent interrupts individually. To enable UART transmit interrupts, set the `UART_CTL.EN` bit.

The ISRs evaluate the status bits in the `UART_STAT` register to determine the signaling interrupt source. The system event controller for the processor assigns and unmask interrupts. The ISRs must clear the interrupt latches explicitly. To reduce interrupt frequency on the receive side in core mode, use the `UART_IMSK.ERFCI` status interrupt as an alternative to the regular `UART_IMSK.ERBFI` receive interrupt. Hardware must ensure that at least two (if `UART_CTL.RFIT=0`) or four (if `UART_CTL.RFIT=1`) words are available in the receive buffer by the time the interrupt is requested.

Transmit Interrupts

The UART module uses the `UART_IMSK_SET.ETBEI` bit to enable transmit interrupt requests.

The `UART_THR` and `UART_TAIP` registers are the same physical register, and both affect the signaling of the `UART_STAT.TEMT`, `UART_STAT.TFI`, and `UART_STAT.THRE` bits similarly.

Figure 18-9: Transmit Interrupts

The UART module asserts the transmit request along with the `UART_STAT.THRE` bit, indicating that the transmit buffer is ready for new data. The `UART_STAT.THRE` bit resets to 1. When the `UART_IMSK_SET.ETBEI` bit is set, the UART module immediately issues an interrupt or DMA request. This way, no special handling of the first character is required when transmission of a string is initiated. Set the `UART_IMSK_SET.ETBEI` bit and let the interrupt service routine load the first character from memory and write it to the `UART_THR` register in the normal manner. ISRs can clear the `UART_IMSK.ETBEI` bit through the `UART_IMSK_CLR` register when the string transmission has completed.

Hardware clears the `UART_STAT.THRE` bit when new data is written to the `UART_THR` register. These write operations also clear the transmit interrupt request. However, they also initiate further transmission. If continued transmission is undesirable, the UART module can alternatively clear the transmit request through the `UART_IMSK_CLR.ETBEI` bit register. Transfers of data from the `UART_THR` register to the `UART_TSR` register reset this status flag in the `UART_STAT` register.

ISRs can interrogate the `UART_STAT.TEMT` bit to discover any ongoing transmission. The sticky counterpart of the `UART_STAT.TEMT` bit, `UART_STAT.TFI`, indicates when the transmit buffer has drained and can trigger a status interrupt. When data is pending in either one of these registers, the `UART_STAT.TEMT` flag is low. As soon as all data has left the `UART_TSR` register, the `UART_STAT.TEMT` bit goes high again and indicates that all pending transmit operations (including stop bits) have finished. Then, it is safe to disable the `UART_CTL.EN` bit or to three-state off-chip line drivers. Then, the UART module can generate an interrupt either through the status interrupt channel when the `UART_IMSK.ETFI` bit is set, or through the DMA controller when enabled by the `UART_IMSK.EDTPTI` bit.

When enabled by the `UART_IMSK.ETBEI` bit, the `UART_STAT.THRE` flag requests data along the peripheral command lines to the DMA controller (referred to as TXREQ). This signal is routed through the DMA controller. If the associated DMA channel is enabled, the TXREQ signal functions as a DMA request, otherwise the DMA

controller simply forwards it to the SEC. Alternatively the `UART_IMSK.ETXS` bit can redirect the transmit interrupts to the UART status interrupt.

With interrupts disabled, the UART module can poll the status flags to determine when data is ready to move. Because polling is processor intensive, it is not typically used in real-time signal processing environments. Since read operations from `UART_STAT` registers have no side effects, different software threads can interrogate these registers without mutual impacts.

Polling the `SEC_SSTAT[n]` register without enabling the interrupts by the `SEC_CCTL[n]` register is an alternate method of operation to consider. Software can write up to two words into the `UART_THR` register before enabling the UART clock. As soon as the `UART_CTL.EN` bit is set, the UART module sends those two words.

Receive Interrupts

The UART module uses the `UART_IMSK_SET.ERBFI` bit to enable receive interrupt requests. If set, the `UART_STAT.DR` flag requests an interrupt on the dedicated RXREQ output, indicating that new data is available in the `UART_RBR` register. This signal is routed through the DMA controller. If the associated DMA channel is enabled, the RXREQ signal functions as a DMA request; otherwise the DMA controller simply forwards it to the SEC. Alternatively, if no DMA channel is assigned to the UART, the `UART_IMSK.ERXS` bit can redirect the receive interrupts to the UART status interrupt. When software reads the `UART_RBR` register, hardware clears the `UART_STAT.DR` bit again, which, in turn, clears the receive interrupt request.

Figure 18-10: Receive Interrupts

Hardware updates the following:

- `UART_STAT.DR` bits
- `UART_STAT.ADDR` bits
- `UART_STAT.ASTKY` bits
- `UART_STAT.PE` bits
- `UART_STAT.FE` bits
- `UART_STAT.BI` bits

- [UART_RBR](#) register

The `UART_STAT.OE` bit is updated as soon as an overflow condition occurs (for example when a stop bit for a frame is received and the receive FIFO is full). When software does not read the [UART_RBR](#) register in time, the received data is protected from being overwritten by new data until software clears the `UART_STAT.OE` bit. Only the content of the [UART_RSR](#) register can be overwritten in the overrun case.

The UART module uses the `UART_STAT.RFCS` bit to monitor the state of the 8-deep receive FIFO. It uses the `UART_CTL.RFIT` bit to control the behavior of the buffer. If `UART_CTL.RFIT` is zero, the `UART_STAT.RFCS` bit is set when the receive buffer holds four or more words. If `UART_CTL.RFIT` is set, the `UART_STAT.RFCS` bit is set when the receive buffer holds seven or more words. Hardware clears the `UART_STAT.RFCS` bit when a core or DMA reads the [UART_RBR](#) register and when the buffer is flushed below the level of four (`UART_CTL.RFIT=0`) or seven (`UART_CTL.RFIT=1`). If the associated interrupt bit `UART_IMSK.ERFCI` is enabled, a status interrupt request is reported when the `UART_STAT.RFCS` bit is set.

If errors are detected during reception, an interrupt can be requested from the status interrupt output. This status interrupt request goes directly to the SEC. The bit enables status interrupt requests.

The controller detects the following error conditions, shown with their associated bits in the [UART_STAT](#) register.

- Overrun error (`UART_STAT.OE` bit)
- Parity error (`UART_STAT.PE` bit)
- Framing error or invalid stop bit (`UART_STAT.FE` bit)
- Break indicator (`UART_STAT.BI` bit)

Status Interrupts

The UART module uses status interrupt channels for the following purposes:

- Line status interrupt requests
- Flow control interrupt requests
- Receive FIFO threshold interrupt requests
- Transmission finished interrupt request

The UART module uses the `UART_IMSK.ELSI` bit to enable the line status interrupts. If set, the status interrupt request is asserted with one of the `UART_STAT.BI`, `UART_STAT.FE`, `UART_STAT.PE`, or `UART_STAT.OE` receive errors bits. A W1C operation to the [UART_STAT](#) register clears the error bits. Once all error conditions are cleared, the interrupt request deasserts.

The UART module uses the `UART_IMSK_SET.ERFCI` bit to enable the receive FIFO count interrupt. If set, a status interrupt request is generated when the `UART_STAT.RFCS` is active. The `UART_STAT.RFCS` bit indicates a receive buffer threshold level. If the `UART_CTL.RFIT` bit is cleared, software can safely read two words out of the [UART_RBR](#) register by the time the `UART_STAT.RFCS` interrupt occurs.

If the `UART_CTL.RFIT` bit is set, software can safely read four words. The interrupt request and the `UART_STAT.RFCS` bit are cleared when the `UART_RBR` is read enough of times, so that the receive buffer drains below the threshold of two (`UART_CTL.RFIT=0`) or four (`UART_CTL.RFIT=1`). Because in DMA mode a status service routine may not be permitted to read `UART_RBR`, this interrupt is only recommended in core mode. In DMA mode, use this functionality for error recovery only.

The UART module uses the `UART_IMSK_SET.EDSSI` bit to enable the flow control interrupts. If active, a status interrupt is generated when the sticky `UART_STAT.SCTS` bit register is set, indicating that the `UART_CTS` input of the transmitter been reasserted. A W1C operation to the `UART_STAT.SCTS` bit clears the interrupt request.

The UART module uses the `UART_IMSK_SET.ETFI` bit to enable the transmission finished interrupt. If active, a status interrupt request is asserted when the `UART_STAT.TFI` bit is set. The `UART_STAT.TFI` is the sticky version of the `UART_STAT.TEMT` bit, indicating that a byte that started transmission has finished. A W1C operation to the `UART_STAT.TFI` bit clears the interrupt request.

Multi-Drop Bus Events

Several status bits and interrupt features in the `UART_STAT` and `UART_IMSK` registers facilitate efficient data handling in multi-drop bus mode. These features include the address (`UART_STAT.ADDR`) bit, the address sticky (`UART_STAT.ASTKY`) bit and the enable address word interrupt (`UART_IMSK.EAWI`). One of the key features of the multi-drop bus protocol is its address bit. The address bit signifies to the slaves that the master is transmitting an address word (all read it) or a data word (only the addressed slave reads its). The UART hardware provides an efficient method of handling the situation described with the use of `UART_STAT.ASTKY` bit.

NOTE: The UART module uses the `UART_STAT.ASTKY` bit in multi-drop bus mode to indicate when an address operation for a peripheral is occurring. The `UART_STAT.ASTKY` bit is a sticky version of the `UART_STAT.ADDR` bit. Hardware sets the bit whenever the `UART_STAT.ADDR` bit is set. Only software clears it with a W1C operation. With the `UART_STAT.ASTKY` bit set, words are received irrespective of the mode bit or address bit setting. With the `UART_STAT.ASTKY` bit cleared, only address words (mode bit =1) are received and words with mode bit =0 are ignored in MDB mode. This bit does not affect reception in non-MDB modes. (Words with mode bit =0 are not moved from the `UART_RSR` register to the receive FIFO.)

UART Programming Model

The following sections provide basic procedures for configuring various UART operations.

Detecting Autobaud

To detect Autobaud:

1. Ensure that the timer is disabled.
2. Configure the following bits: `UART_CTL.MOD = 00`, `UART_CTL.LOOP_EN = 1`, `UART_CTL.WLS = 11` (8-bit data), and `UART_CTL.EN = 1`

3. Configure the following bits: `TIMER_TMR[n]_CFG.TMODE = 1101`, `TIMER_TMR[n]_CFG.OUTDIS = 1`, `TIMER_TMR[n]_CFG.IRQMODE = 10` and enable the timer.

4. Send test data through the host device and wait for the timer interrupt and disable the timer.

The bit rate can be derived from the timer period register value according to the formula provided in the [Auto-baud Detection](#) section.

Using Common Initialization Steps

When using the core or the DMA to execute transfers, the following steps are common to all UART modes.

1. All UART signals are multiplexed and compete with other functions at pin level. First, program the port registers according to the guidelines in the [PORT](#) chapter.
2. Program the [UART_CLK](#) register. Refer to [Bit Rate Generation](#) topic.
3. Program the [UART_CTL](#) register and enable the UART clock.

Using Core Transfers

Write data into the [UART_THR](#) register, when the `UART_STAT.THRE` bit is set, to initiate a core transmit operation. If the `UART_STAT.DR` bit is set, received data can be read from the [UART_RBR](#) register.

Using DMA Transfers

1. Make sure that the `UART_IMSK.ETBEI` or the `UART_IMSK.ERBFI` bits are cleared before configuring the DMA.
2. Configure the dedicated DMA channel.
3. Set the `UART_IMSK.ETBEI` or `UART_IMSK.ERBFI` bits to start the transfer.

Using Interrupts

Each UART features three interrupt signal outputs.

1. Enable individual interrupts in the system event controller (SEC).
2. Register IRQ handlers.
3. Use the interrupts mask registers to enable specific IRQ events.

Setting Up Hardware Flow Control

1. Configure automatic or manual hardware flow control for the receiver through the `UART_CTL.ARTS` bit, or the transmitter through the `UART_CTL.ACTS` bit.
2. Configure `UART_CTS` and `UART_RTS` polarity through the `UART_CTL.FCPOL` bit.

ADSP-2159x UART Register Descriptions

UART (UART) contains the following registers.

Table 18-9: ADSP-2159x UART Register List

Name	Description
UART_CLK	Clock Rate Register
UART_CTL	Control Register
UART_IMSK	Interrupt Mask Register
UART_IMSK_CLR	Interrupt Mask Clear Register
UART_IMSK_SET	Interrupt Mask Set Register
UART_RBR	Receive Buffer Register
UART_RSR	Receive Shift Register
UART_RXCNT	Receive Counter Register
UART_SCR	Scratch Register
UART_STAT	Status Register
UART_TAIP	Transmit Address/Insert Pulse Register
UART_THR	Transmit Hold Register
UART_TSR	Transmit Shift Register
UART_TXCNT	Transmit Counter Register

Clock Rate Register

The `UART_CLK` register divides the system clock (`SCLK0`) down to the bit clock.

Figure 18-11: `UART_CLK` Register Diagram

Table 18-10: `UART_CLK` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W)	EDBO	Enable Divide By One. The <code>UART_CLK.EDBO</code> bit enables the bypassing of the divide-by-16 prescaler in bit clock generation. This functionality improves bit rate granularity, especially at high bit rates. Do not set this bit in IrDA mode. Note: Properly select the <code>SCLK</code> frequencies. Even multiples of bit rate decrease the error percentage. Setting the bit clock equal to the sample clock (<code>UART_CLK.EDBO = 1</code>) improves the bit rate granularity and the bit clock matches with the bit rate of the communication partner. The disadvantage is that the power dissipation is higher and sample points are not always accurate. Therefore, use <code>UART_CLK.EDBO = 1</code> mode only when bit rate accuracy is not acceptable in the <code>UART_CLK.EDBO = 0</code> mode. The <code>UART_CLK.EDBO = 1</code> mode is not intended to increase the speed of operation beyond the electrical limitations of the UART transfer protocol.
		0 Bit clock prescaler = 16
		1 Bit clock prescaler = 1
15:0 (R/W)	DIV	Divisor. The <code>UART_CLK.DIV</code> provides the divisor for the UART's clock bit rate calculation. The bit rate is defined by: $\text{Bit Rate} = \text{SCLK0} / (16^{(1-\text{EDBo})} \times \text{UART_CLK.DIV})$

Control Register

The `UART_CTL` register provides enable and disable control for UART and IrDA mode of operation. It also provides UART line control, permitting selection of the format of received and transmitted character frames. Modem feature control also is available from this register, including partial modem functionality to allow for hardware flow control and loopback mode.

Figure 18-12: `UART_CTL` Register Diagram

Table 18-11: UART_CTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
30 (R/W)	RFRT	Receive FIFO RTS Threshold. The <code>UART_CTL.RFRT</code> bit controls <code>UART_RTS</code> pin assertion and deassertion timing. This bit is ignored if <code>UART_CTL.ARTS</code> is cleared. If set, the <code>UART_RTS</code> pin is deasserted when the receive buffer already holds seven words and an eighth start bit is detected. It is reasserted when the FIFO contains seven words or less. If cleared, the <code>UART_RTS</code> pin is deasserted when the RX buffer already holds four words and a fifth start bit is detected. The <code>UART_RTS</code> pin is reasserted when the RX buffer contains no more than 4 words.
		0 Deassert RTS if RX FIFO word count > 4; assert if <= 4
		1 Deassert RTS if RX FIFO word count > 7; assert if <= 7
29 (R/W)	RFIT	Receive FIFO IRQ Threshold. The <code>UART_CTL.RFIT</code> bit controls the timing of the <code>UART_STAT.RFCS</code> bit. If <code>UART_CTL.RFIT</code> is cleared, the receive threshold is two. If <code>UART_CTL.RFIT</code> is set, the threshold is four words in the receive buffer.
		0 Set RFCS=1 if RX FIFO count >= 4
		1 Set RFCS=1 if RX FIFO count >= 7
28 (R/W)	ACTS	Automatic CTS. The <code>UART_CTL.ACTS</code> bit must be set to enable the <code>UART_CTS</code> input pin for <code>UART_TX</code> handshaking. If enabled, the <code>UART_STAT.CTS</code> bit holds the value (if <code>UART_CTL.FCPOL</code> is set) or complement value (if <code>UART_CTL.FCPOL</code> is cleared) of the <code>UART_CTS</code> input pin. The <code>UART_STAT.CTS</code> bit can be used to determine whether the external device is ready to receive data (if <code>UART_STAT.CTS</code> is set) or whether it is busy (if <code>UART_STAT.CTS</code> is cleared). If <code>UART_CTL.ACTS</code> is cleared, the <code>UART_TX</code> handshaking protocol is disabled, and the <code>UART_TX</code> line transmits data whenever there is data to send, regardless of the value of <code>UART_CTS</code> . Software can pause ongoing transmission by setting the <code>UART_CTL.XOFF</code> bit.
		0 Disable TX handshaking protocol
		1 Enable TX handshaking protocol
27 (R/W)	ARTS	Automatic RTS. The <code>UART_CTL.ARTS</code> bit must be set to enable the <code>UART_RTS</code> input pin for <code>UART_TX</code> handshaking. If set, the hardware guarantees a minimal <code>UART_RTS</code> pin deassertion pulse width of at least the number of data bits defined by the <code>UART_CTL.WLS</code> bit field. If cleared, the <code>UART_RTS</code> pin is not generated automatically by hardware. The <code>UART_RTS</code> pin can still be manually controlled by the <code>UART_CTL.MRTS</code> bit, and software is responsible for <code>UART_RTS</code> pulse width control (if needed).
		0 Disable RX handshaking protocol.
		1 Enable RX handshaking protocol.

Table 18-11: UART_CTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
26 (R/W)	XOFF	Transmitter off. The <code>UART_CTL.XOFF</code> bit (if set) turns off transmission (XOFF) by preventing the content of <code>THR</code> from being continued to <code>TSR</code> . When set, this bit turns on transmission (XON). The state of the <code>UART_CTL.XOFF</code> bit is ignored if the <code>UART_CTL.ACTS</code> bit is set.
		0 Transmission ON, if <code>ACTS</code> =0
		1 Transmission OFF, if <code>ACTS</code> =0
25 (R/W)	MRTS	Manual Request to Send. The <code>UART_CTL.MRTS</code> bit controls the state of the <code>UART_RTS</code> output pin when the <code>UART_CTL.ARTS</code> bit is cleared. When <code>UART_CTL.MRTS</code> is cleared, the UART deasserts the <code>UART_RTS</code> pin, signaling to the external device that the UART is not ready to receive. When <code>UART_CTL.MRTS</code> is set, the UART asserts the <code>UART_RTS</code> pin, signaling to the external device that the UART is ready to receive.
		0 Deassert RTS pin when <code>ARTS</code> =0
		1 Assert RTS pin when <code>ARTS</code> =0
24 (R/W)	TPOLC	IrDA TX Polarity Change. The <code>UART_CTL.TPOLC</code> bit selects the active low or high polarity for IrDA communications. This bit is effective only in IrDA mode. If set, in IrDA mode, the <code>UART_TX</code> pin idles high. In UART or MDB mode, it is inverted-NRZ. If cleared, in IrDA mode, the <code>UART_TX</code> pin idles low. In UART or MDB mode, it is NRZ.
		0 Active-low TX polarity setting
		1 Active-high TX polarity setting
23 (R/W)	RPOLC	IrDA RX Polarity Change. The <code>UART_CTL.RPOLC</code> bit selects the active low or high polarity for IrDA communications. This bit is effective only in IrDA mode. If set, in IrDA mode, the <code>UART_RX</code> pin idles high. In UART or MDB mode, it is inverted-NRZ. If cleared, in IrDA mode, the <code>UART_RX</code> pin idles low. In UART or MDB mode, it is NRZ.
		0 Active-low RX polarity setting
		1 Active-high RX polarity setting

Table 18-11: UART_CTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
22 (R/W)	FCPOL	Flow Control Pin Polarity. The <code>UART_CTL.FCPOL</code> bit selects the polarities of the <code>UART_CTS</code> and <code>UART_RTS</code> pins. When the <code>UART_CTL.FCPOL</code> bit is cleared, the <code>UART_RTS</code> and <code>UART_CTS</code> pins are active low, and the UART is halted when the <code>UART_RTS</code> and <code>UART_CTS</code> pin state is high. When <code>UART_CTL.FCPOL</code> bit is set, the <code>UART_RTS</code> and <code>UART_CTS</code> pins are active high, and the UART is halted when the <code>UART_RTS</code> and <code>UART_CTS</code> pin state is low.
		0 Active low CTS/RTS
		1 Active high CTS/RTS
19 (R/W)	SB	Set Break. If set, the <code>UART_CTL.SB</code> bit forces the <code>UART_TX</code> pin to low asynchronously, regardless of whether or not data is currently transmitted. This bit functions even when the UART clock is disabled. Because the <code>UART_TX</code> pin normally drives high, it can be used as a flag output pin, if the UART is not used. (For example, if <code>UART_CTL.TPOLC</code> is cleared, drive <code>UART_TX</code> pin low; or if <code>UART_CTL.TPOLC</code> is set, drive <code>UART_TX</code> pin high.)
		0 No force
		1 Force TX pin to 0
18 (R/W)	FFE	Force Framing Error on Transmit. The <code>UART_CTL.FFE</code> bit is intended for test purposes. This bit is useful for debugging software, especially in loopback mode.
		0 Normal operation
		1 Force error
17 (R/W)	FPE	Force Parity Error on Transmit. The <code>UART_CTL.FPE</code> bit is intended for test purposes. This bit is useful for debugging software, especially in loopback mode.
		0 Normal operation
		1 Force parity error

Table 18-11: UART_CTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
16 (R/W)	STP	Sticky Parity. The <code>UART_CTL.STP</code> bit controls whether the parity is generated by hardware based on the data bits or whether it is set to a fixed value. If this bit is cleared, the hardware calculates the parity bit value based on the data bits. Then, the <code>EPS</code> bit determines whether odd or even parity mode is chosen. If this bit is set, odd parity is used. That means that the total count of logical-1 data bits including the parity bit must be an odd value. Even parity is chosen by <code>UART_CTL.STP</code> cleared and <code>UART_CTL.EPS</code> set. Then, the count of logical-1 bits must be an even value. If the <code>UART_CTL.STP</code> bit is set, hardware parity calculation is disabled. In this case, the sent and received parity equals the inverted <code>UART_CTL.EPS</code> bit.
		0 No forced parity
		1 Force (Stick) parity to defined value (if <code>PEN=1</code>)
15 (R/W)	EPS	Even Parity Select.
		0 Odd parity
		1 Even parity
14 (R/W)	PEN	Parity Enable. The <code>UART_CTL.PEN</code> bit enables parity transmission and parity check. The <code>UART_CTL.PEN</code> bit inserts one additional bit between the most significant data bit and the first stop bit. The polarity of this so-called parity bit depends on data and the <code>UART_CTL.STP</code> and <code>UART_CTL.EPS</code> control bits. Both transmitter and receiver calculate the parity value. The receiver compares the received parity bit with the expected value and issues a parity error if they do not match. If the <code>UART_CTL.PEN</code> bit is cleared, the <code>UART_CTL.STP</code> and the <code>UART_CTL.EPS</code> bits are ignored.
		0 Disable
		1 Enable parity transmit and check
13 (R/W)	STBH	Stop Bits (Half Bit Time).
		0 0 half-bit-time stop bit
		1 1 half-bit-time stop bit
12 (R/W)	STB	Stop Bits. The <code>UART_CTL.STB</code> bit controls how many stop bits are appended to transmitted data.
		0 1 stop bit
		1 2 stop bits

Table 18-11: UART_CTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
9:8 (R/W)	WLS	Word Length Select. The <code>UART_CTL.WLS</code> field determines whether the transmitted and received UART word consists of 5, 6, 7, or 8 data bits.
		0 5-bit word
		1 6-bit word
		2 7-bit word
		3 8-bit word
5:4 (R/W)	MOD	Mode of Operation. The <code>UART_CTL.MOD</code> selects the UART operation mode (UMOD).
		0 UART mode
		1 MDB mode
		2 IrDA SIR mode
1 (R/W)	LOOP_EN	Loopback Enable. The <code>UART_CTL.LOOP_EN</code> bit enables UART loopback mode. When set, this bit disconnects the input of the receiver from the <code>UART_RX</code> pin, and internally redirects the transmit output to the receiver. The <code>UART_TX</code> pin remains active and continues to transmit data externally as well. Loopback mode also forces the <code>UART_RTS</code> pin to its deassertive state, disconnects the <code>UART_CTS</code> bit from the <code>UART_CTS</code> input pin, and directly connects the <code>UART_CTL.MRTS</code> bit to the <code>UART_STAT.CTS</code> bit. In loopback mode, setting the <code>UART_CTL.MRTS</code> bit sets the <code>UART_STAT.CTS</code> bit and enables the transmitter of the UART. Clearing the <code>UART_CTL.MRTS</code> bit clears the <code>UART_STAT.CTS</code> bit and disables the transmitter of the UART.
		0 Disable
		1 Enable
0 (R/W)	EN	Enable UART. The <code>UART_CTL.EN</code> enables the UART clocks. This bit also resets the state machine and control registers when cleared. Using this bit to disable the UART -- when not used -- reduces power consumption.
		0 Disable
		1 Enable

Interrupt Mask Register

The `UART_IMSK` register indicates the interrupt mask status (unmasked, if set, or masked, if cleared) of the UART status interrupt requests. This register is not a data register. Instead, it is controlled by the `UART_IMSK_SET` and `UART_IMSK_CLR` register pair. Writing ones to the `UART_IMSK_SET` register enables (unmasks) interrupt requests, and writing ones to the `UART_IMSK_CLR` register disables (masks) them. Reads from either register return the enabled bits.

The `UART_IMSK` register is used to enable requests for system handling of empty or full states of UART data registers. Unless polling is used as a means of action, the `UART_IMSK.ERBFI` and `UART_IMSK.ETBEI` bits are normally set. Setting this register without enabling system DMA causes the UART to notify the processor of the data inventory state using interrupts. For proper operation in this mode, system interrupts must be enabled, and appropriate interrupt handling routines must be present.

Each UART features three separate interrupt channels to handle the data transmit, data receive, and line status events independently, regardless of whether DMA is enabled or not. If no DMA channels are assigned to the UART, set the `UART_IMSK.ELSI` bit to reroute the transmit and receive interrupts to the status interrupt request output.

With system DMA enabled, the UART uses DMA to transfer data to or from the processor. Dedicated DMA channels are available for receive and transmit operations. Line error handling can be configured independently from the receive or transmit setup.

The DMA of the UART is enabled by first setting up the system DMA control registers and then enabling the `UART_IMSK.ERBFI` and `UART_IMSK.ETBEI` interrupts. This configuration is because the interrupt request lines double as DMA request lines. Depending on whether DMA is enabled or not, upon receiving these requests, the DMA control unit either generates a direct memory access or passes the UART interrupt on to the system interrupt handling unit(s). However, the error interrupt for the UART goes directly to the system interrupt handling unit(s), bypassing the DMA unit completely.

Figure 18-13: UART_IMSK Register Diagram

Table 18-12: UART_IMSK Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
9 (R/W)	ETXS	Enable TX to Status Interrupt Mask Status. If set (interrupt unmasked), the <code>UART_IMSK.ETXS</code> bit indicates re-direction of the TX interrupt requests to status interrupt output. If cleared, TX interrupt requests are routed to normal interrupt outputs.
		0 Interrupt is masked
		1 Interrupt is unmasked
8 (R/W)	ERXS	Enable RX to Status Interrupt Mask Status. If set (interrupt unmasked), the <code>UART_IMSK.ERXS</code> bit indicates re-direction of RX interrupt requests to status interrupt output. If cleared, RX interrupt requests are routed to normal interrupt outputs.
		0 Interrupt is masked
		1 Interrupt is unmasked

Table 18-12: UART_IMSK Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
7 (R/W)	EAWI	Enable Address Word Interrupt Mask Status. If set (interrupt unmasked), the <code>UART_IMSK.EAWI</code> bit indicates generation of a status interrupt request when an Address word in MDB-mode is present in the <code>UART_RBR</code> . A received word is an address word if the <code>UART_STAT.ADDR</code> bit is set.
		0 Interrupt is masked
		1 Interrupt is unmasked
6 (R/W)	ERFCI	Enable Receive FIFO Count Interrupt Mask Status. If set (interrupt unmasked), the <code>UART_IMSK.ERFCI</code> bit indicates enabling of the receive buffer threshold interrupt request if signaled by the <code>UART_STAT.RFCS</code> bit. Read the <code>UART_RBR</code> register sufficient times to clear the interrupt request.
		0 Interrupt is masked
		1 Interrupt is unmasked
5 (R/W)	ETFI	Enable Transmission Finished Interrupt Mask Status. If set (interrupt unmasked) the <code>UART_IMSK.ETFI</code> bit indicates enabling of interrupt generation on the status interrupt channel when the transmit buffer register, the transmit address register, and the transmit shift register are all empty as indicated by the <code>UART_STAT.TFI</code> . The <code>UART_IMSK.ETFI</code> interrupt can be used to avoid expensive polling of the <code>UART_STAT.TEMT</code> bit, when the UART clock or line drivers should be disabled after transmission has completed. With the <code>UART_STAT.TFI</code> bit to clear the interrupt request. In DMA operation, the <code>UART_IMSK.ETFI</code> bits functionality might be preferred.
		0 Interrupt is masked
		1 Interrupt is unmasked
4 (R/W)	EDTPTI	Enable DMA TX Peripheral Triggered Interrupt Mask Status. If set (interrupt unmasked), the <code>UART_IMSK.EDTPTI</code> bit indicates enabling of the DMA completion interrupt request to be delayed until the data has left the UART completely. This bit is required for DMA transmit operation only. If set, the UART can generate a DMA interrupt request by the time the <code>UART_STAT.TEMT</code> bit goes high after the last DMA data word is transmitted. When <code>UART_IMSK.EDTPTI</code> is set, usually the <code>DMA_CFG.INT</code> field is cleared to 00 in a STOP mode DMA. This set up suppresses the normal completion interrupt request, and the <code>UART_STAT.TEMT</code> event is signaled through the DMA controller and triggers the DMA interrupt. If both (<code>DMA_CFG.INT</code> not 00 and <code>UART_IMSK.EDTPTI</code> set), two interrupts are requested at the end of a STOP mode DMA.
		0 Interrupt is masked
		1 Interrupt is unmasked

Table 18-12: UART_IMSK Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
3 (R/W)	EDSSI	Enable Modem Status Interrupt Mask Status. If set (interrupt unmasked), the <code>UART_IMSK.EDSSI</code> bit indicates enabling of a modem status interrupt request on the same status interrupt channel when the <code>UART_STAT.SCTS</code> bit is set. This indicates <code>UART_CTS</code> pin re-assertion. Write-1-to-clear (W1C) the <code>UART_STAT.SCTS</code> bit to clear the interrupt request.
		0 Interrupt is masked
		1 Interrupt is unmasked
2 (R/W)	ELSI	Enable Line Status Interrupt Mask Status. If set (interrupt unmasked), the <code>UART_IMSK.ELSI</code> bit indicates that redirection of TX and RX interrupt requests to the status interrupt output of the UART by OR'ing them with the <code>UART_STAT.OE</code> , <code>UART_STAT.PE</code> , <code>UART_STAT.FE</code> , and <code>UART_STAT.BI</code> interrupt requests. Set this bit when no DMA channel is associated with the UART. Enabling <code>UART_IMSK.ELSI</code> disables the RX/TX interrupt channels and negates the <code>UART_IMSK.EDTPTI</code> bit.
		0 Interrupt is masked
		1 Interrupt is unmasked
1 (R/W)	ETBEI	Enable Transmit Buffer Empty Interrupt Mask Status. If set (interrupt unmasked), the <code>UART_IMSK.ETBEI</code> bit indicates generation of a TX interrupt request if the <code>UART_STAT.THRE</code> bit is set.
		0 Interrupt is masked
		1 Interrupt is unmasked
0 (R/W)	ERBFI	Enable Receive Buffer Full Interrupt Mask Status. If set (interrupt unmasked), the <code>UART_IMSK.ERBFI</code> indicates generation of an RX interrupt request if the <code>UART_STAT.DR</code> bit is set.
		0 Interrupt is masked
		1 Interrupt is unmasked

Interrupt Mask Clear Register

The `UART_IMSK` indicates interrupt mask status (unmasked if set, masked if cleared) of UART status interrupts. This register is not a data register. Instead it is controlled by the `UART_IMSK_SET` and `UART_IMSK_CLR` register pair. Writing ones to `UART_IMSK_SET` enables (unmasks) interrupt requests, and writing ones to `UART_IMSK_CLR` disables (masks) them. Reads from either register return the enabled bits. For more information, see the `UART_IMSK` register description.

Figure 18-14: UART_IMSK_CLR Register Diagram

Table 18-13: UART_IMSK_CLR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
9 (R/W1C)	ETXS	Enable TX to Status Interrupt Mask Clear.
		0 No action
		1 Mask interrupt
8 (R/W1C)	ERXS	Enable RX to Status Interrupt Mask Clear.
		0 No action
		1 Mask interrupt
7 (R/W1C)	EAWI	Enable Address Word Interrupt Mask Clear.
		0 No action
		1 Mask interrupt

Table 18-13: UART_IMSK_CLR Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration	
6 (R/W1C)	ERFCI	Enable Receive FIFO Count Interrupt Mask Clear.	
		0	No action
		1	Mask interrupt
5 (R/W1C)	ETFI	Enable Transmission Finished Interrupt Mask Clear.	
		0	No action
		1	Mask interrupt
4 (R/W1C)	EDTPTI	Enable DMA TX Peripheral Triggered Interrupt Mask Clear.	
		0	No action
		1	Mask interrupt
3 (R/W1C)	EDSSI	Enable Modem Status Interrupt Mask Clear.	
		0	No action
		1	Mask interrupt
2 (R/W1C)	ELSI	Enable Line Status Interrupt Mask Clear.	
		0	No action
		1	Mask interrupt
1 (R/W1C)	ETBEI	Enable Transmit Buffer Empty Interrupt Mask Clear.	
		0	No action
		1	Mask interrupt
0 (R/W1C)	ERBFI	Enable Receive Buffer Full Interrupt Mask Clear.	
		0	No action
		1	Mask interrupt

Interrupt Mask Set Register

The `UART_IMSK` indicates interrupt request mask status (unmasked if set, masked if cleared) of UART status interrupts. This register is not a data register. Instead it is controlled by the `UART_IMSK_SET` and `UART_IMSK_CLR` register pair. Writing ones to `UART_IMSK_SET` enables (unmasks) interrupt requests, and writing ones to `UART_IMSK_CLR` disables (masks) them. Reads from either register return the enabled bits. For more information, see the `UART_IMSK` register description.

Figure 18-15: UART_IMSK_SET Register Diagram

Table 18-14: UART_IMSK_SET Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
9 (R/W1S)	ETXS	Enable TX to Status Interrupt Mask Set.
		0 No action
		1 Unmask interrupt
8 (R/W1S)	ERXS	Enable RX to Status Interrupt Mask Set.
		0 No action
		1 Unmask interrupt
7 (R/W1S)	EAWI	Enable Address Word Interrupt Mask Set.
		0 No action
		1 Unmask interrupt

		0	No action
		1	Unmask interrupt

Receive Buffer Register

The read-only `UART_RBR` register is the UART’s receive buffer. It is updated when there is pending data in the receive FIFO. Newly available data is signaled by the `UART_STAT.DR` bit.

Figure 18-16: UART_RBR Register Diagram

Table 18-15: UART_RBR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
7:0 (R/NW)	VALUE	8-bit data.

Receive Shift Register

The read only `UART_RSR` register which returns the content of the UART’s receive shift register.

The frame data is moved into this shift register after polarity inversion, if any (including the native polarity inversion in the IrDA case).

In the case of the longest frame (MDB, with parity mode, and 8 bit data word-length), the start bit may be shifted out and not available for reading at the end of the frame reception. This register is NOT reset at the start of frame. If read, in the middle of a frame reception, data corresponding the previous frame may not have entirely shifted out (for example, the read data that have been read may NOT correspond entirely to the frame being received).

Because the UART is receiving only 1 stop bit, the `UART_RSR` contains only 1 stop bit even if more than one stop bit is present in the actual transfer. This register may be considered as storing the 10 most recently received bits (taking into consideration the stop bit receive limitation above).

Figure 18-17: UART_RSR Register Diagram

Table 18-16: UART_RSR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
9:0 (R/NW)	VALUE	Contents of RSR.

Receive Counter Register

The `UART_RXCNT` register returns the content of 16-bit counter in the UART receiver. This count is used for baud rate clock generation (the lower [15:0] is the count data).

Figure 18-18: UART_RXCNT Register Diagram

Table 18-17: UART_RXCNT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15:0 (R/NW)	VALUE	16-bit Counter Value.

Scratch Register

The `UART_SCR` registers contain 8-bit scratch pad data. These registers are used for general purpose data storage and do not control the UART hardware in any way.

Figure 18-19: UART_SCR Register Diagram

Table 18-18: UART_SCR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
7:0 (R/W)	VALUE	Stored 8-bit Data.

Status Register

The `UART_STAT` register contains the UART line status and UART modem status, as indicated by the current states of the UART's `UART_CTS` pin and internal receive buffers. Writes to this register can perform write-one-to-clear (W1C) operations on most status bits. Reading this register has no side effects.

Figure 18-20: UART_STAT Register Diagram

Table 18-19: UART_STAT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
17 (R/NW)	RFCS	Receive FIFO Count Status.
		The <code>UART_STAT.RFCS</code> bit is set when the receive buffer holds more or equal entries than a certain threshold. The threshold is controlled by the <code>UART_CTL.RFIT</code> bit. If <code>UART_CTL.RFIT</code> is cleared, the threshold is four entries. If <code>UART_CTL.RFIT</code> is set, the threshold is seven entries. The <code>UART_STAT.RFCS</code> bit is cleared when the <code>UART_RBR</code> register is read sufficient times until the buffer is drained below the threshold. The <code>UART_STAT.RFCS</code> bit can trigger a status interrupt request if enabled by the <code>UART_IMSK_SET.ERFCI</code> bit.
		0 RX FIFO has less than 4 (7) entries when <code>RFIT=0</code> (1)
		1 RX FIFO has at least 4 (7) entries when <code>RFIT=0</code> (1)

Table 18-19: UART_STAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
16 (R/NW)	CTS	Clear to Send. The <code>UART_STAT.CTS</code> bit holds the value (if <code>UART_CTL.FCPOL</code> set) or the complement value (if <code>UART_CTL.FCPOL</code> cleared) of the <code>UART_CTS</code> input pin. The <code>UART_CTL.ACTS</code> bit must be set to enable this feature. The core can read the value of the <code>UART_STAT.CTS</code> bit to determine whether the external device is ready to receive (<code>UART_STAT.CTS</code> set) or if it is busy (<code>UART_STAT.CTS</code> cleared). If <code>UART_CTL.ACTS</code> is cleared, the <code>UART_TX</code> handshaking protocol is disabled, and the UART transmits data as long as there is data to transmit, regardless of the value of <code>UART_STAT.CTS</code> . When <code>UART_CTL.ACTS</code> is cleared, the software can pause transmission temporarily by setting the <code>XOFF</code> bit. Note that in loopback mode (<code>UART_CTL.LOOP_EN</code> set), the <code>UART_STAT.CTS</code> bit is disconnected from the <code>UART_CTS</code> input pin. Instead, the bit is directly connected to the <code>UART_CTL.MRTS</code> bit.
		0 Not clear to send (External device not ready to receive)
		1 Clear to send (External device ready to receive)
12 (R/W1C)	SCTS	Sticky CTS. The <code>UART_STAT.SCTS</code> bit is a sticky bit that is set when <code>UART_STAT.CTS</code> transitions from 0 to 1. The <code>UART_STAT.SCTS</code> bit is cleared by software with a W1C operation. This bit can trigger a line status interrupt request if enabled by the <code>UART_IMSK_SET.EDSSI</code> bit.
		0 CTS has not transitioned from low to high
		1 CTS has transitioned from low to high
11 (R/NW)	RO	Reception On-going.
		0 No data reception in progress
		1 Data reception in progress
10 (R/W1S)	ADDR	Address Bit Status. The <code>UART_STAT.ADDR</code> bit is used to mirror the address bit of the word in <code>UART_RBR</code> in multi-drop bus protocol, and is enabled only in MDB mode. The <code>UART_STAT.ADDR</code> bit is updated by hardware upon detecting a received word with the address bit in <code>UART_RBR</code> set or cleared. Additionally, software can set the <code>ADDR</code> bit with a write-1-to-set (W1S) operation.
		0 Address bit is low
		1 Address bit is high

Table 18-19: UART_STAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
9 (R/W1C)	ASTKY	Address Sticky. The <code>UART_STAT.ASTKY</code> bit is used in multi-drop bus mode to indicate whether a peripheral is currently being addressed. This bit is a sticky version of the <code>UART_STAT.ADDR</code> bit and is set by hardware when setting the <code>UART_STAT.ADDR</code> bit. The <code>UART_STAT.ASTKY</code> bit can only be cleared by software with a write-one-to-clear (W1C) operation. With the <code>UART_STAT.ASTKY</code> bit set, words will be received irrespective of the <code>UART_CTL.MOD</code> bit or <code>UART_STAT.ADDR</code> bit selection. With the <code>UART_STAT.ASTKY</code> bit cleared, only address words (<code>UART_CTL.MOD</code> bit set) will be received and words with <code>UART_CTL.MOD</code> bit cleared are ignored (not moved from the RSR to the RX FIFO) in MDB mode. The <code>UART_STAT.ASTKY</code> bit does not affect reception in non-MDB modes.
		0 ADDR bit has not been set
		1 ADDR bit has been set
8 (R/W1C)	TFI	Transmission Finished Indicator. The <code>UART_STAT.TFI</code> bit is a sticky version of the <code>UART_STAT.TEMT</code> bit. While <code>UART_STAT.TEMT</code> is automatically cleared by hardware when new data is written to the <code>UART_THR</code> register, the sticky <code>UART_STAT.TFI</code> bit remains set, until it is cleared by software (W1C). The <code>UART_STAT.TFI</code> bit enables more flexible transmit interrupt request timing.
		0 TEMT did not transition from 0 to 1
		1 TEMT transition from 0 to 1
7 (R/NW)	TEMT	TSR and THR Empty. The <code>UART_STAT.TEMT</code> bit indicates that the <code>UART_THR</code> and <code>UART_TAIP</code> registers and the <code>UART_TSR</code> register are empty. In this case, the program is permitted to write to the <code>UART_THR</code> and <code>UART_TAIP</code> registers twice without losing data. The <code>UART_STAT.TEMT</code> bit can also be used as indicator that pending UART transmission is completed. At that time, it is safe to disable the <code>UART_CTL.EN</code> bit or to three-state the off-chip line driver.
		0 Not empty TSR/THR
		1 TSR/THR Empty

Table 18-19: UART_STAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
5 (R/NW)	THRE	Transmit Hold Register Empty. The <code>UART_STAT.THRE</code> bit indicates that the UART transmit channel is ready for new data and software can write to the <code>UART_THR</code> and <code>UART_TAIP</code> registers. Writes to the <code>UART_THR</code> and <code>UART_TAIP</code> registers clear the <code>UART_STAT.THRE</code> . The bit is set again when the <code>UART_THR</code> and <code>UART_TAIP</code> registers are empty and ready to accept data.
		0 Not empty THR/TAIP
		1 Empty THR/TAIP
4 (R/W1C)	BI	Break Indicator. The <code>UART_STAT.BI</code> bit indicates that the first stop bit is sampled low and the entire <u>data word</u> , including parity bit, consists of low bits only. (This condition indicates that <code>UART_RX</code> was held low for more than the maximum word length.) The <code>UART_STAT.BI</code> bit is updated simultaneously with the <code>UART_STAT.DR</code> bit, that is, by the time the first stop bit is received or when data is loaded from the receive FIFO to the <code>UART_RBR</code> register. The bit is sticky and can be cleared by W1C operations.
		0 No break interrupt
		1 Break interrupt this indicates UARTxRX was held low(RPOLC=0) / high (RPOLC=1) for more than the maximum word length
3 (R/W1C)	FE	Framing Error. The <code>UART_STAT.FE</code> bit indicates that the first stop bit is sampled. This bit is updated simultaneously with the <code>UART_STAT.DR</code> bit, that is, by the time the first stop bit is received or when data is loaded from the receive FIFO to the <code>UART_RBR</code> register. The <code>UART_STAT.FE</code> bit is sticky and can be cleared by W1C operations. Note that invalid stop bits can be simulated by setting the <code>UART_CTL.FFE</code> bit.
		0 No error
		1 Invalid stop bit error
2 (R/W1C)	PE	Parity Error. The <code>UART_STAT.PE</code> bit indicates that the received parity bit does not match the expected value. This bit is updated simultaneously with the <code>UART_STAT.DR</code> bit, that is, by the time the first stop bit is received or when data is loaded from the receive FIFO to the <code>UART_RBR</code> register. The <code>UART_STAT.PE</code> bit is sticky and can be cleared by W1C operations. Note that invalid parity bits can be simulated by setting the <code>UART_CTL.FPE</code> bit.
		0 No parity error
		1 Parity error

Table 18-19: UART_STAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
1 (R/W1C)	OE	Overrun Error. The <code>UART_STAT.OE</code> bit indicates that further data is received while the internal receive buffer was full. This bit is set when sampling the stop bit of the sixth data word. To avoid overruns, read the <code>UART_RBR</code> register in time. In DMA receive mode, overruns are very unlikely to happen ever. After an overrun occurs, the <code>UART_RBR</code> and receive FIFO are protected from being overwritten by new data until the <code>UART_STAT.OE</code> bit is cleared by software. The content of the <code>UART_RSR</code> register is lost as soon as the overrun occurs. The <code>UART_STAT.OE</code> bit is sticky and can be cleared by W1C operations.
		0 No overrun
		1 Overrun error
0 (R/NW)	DR	Data Ready. The <code>UART_STAT.DR</code> bit indicates that data is available in the receiver and can be read from the <code>UART_RBR</code> register. The bit is set by hardware when the receiver detects the first valid stop bit. The bit is cleared by hardware when the <code>UART_RBR</code> register is read.
		0 No new data
		1 New data in RBR

Transmit Address/Insert Pulse Register

The `UART_TAIP` register and the `UART_THR` register share the same physical register, but `UART_TAIP` has different effect than the `UART_THR` register when `UART_TAIP` is written to in MDB and UART modes.

In MDB mode, data written to the `UART_TAIP` register is transmitted as an address frame (as with the `UART_CTL.MOD` bit set).

In UART mode, a write to `UART_TAIP` causes a pulse of value `UART_TAIP` [7] for a duration of `UART_TAIP` [6:0] x bit time. (There is additional inversion if the `UART_CTL.TPOLC` bit is set).

Bit time is defined by the `UART_CLK` register. The transmission of the pulse is followed by stop bit transmission as specified by the `UART_CTL.STB` and `UART_CTL.STBH` bits. This could be used for supporting line break command and inter-frame gap.

In IrDA mode, writes to `UART_TAIP` is treated the same as writes to `UART_THR`.

Accesses to the `UART_TAIP` register have the same affects as the `UART_THR` register with respect to the `UART_STAT.THRE`, `UART_STAT.TEMT`, and `UART_STAT.TFI` flags.

Figure 18-21: UART_TAIP Register Diagram

Table 18-20: UART_TAIP Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
7:0 (R/W)	VALUE	8-bit data.

Transmit Hold Register

The write-only `UART_THR` register is the UART’s transmit buffer. The `UART_STAT.THRE` bit indicates whether data can be written to `UART_THR`. Writes to this register automatically propagate to the internal `UART_TSR` register as soon as `UART_TSR` is ready. Then, transmit operation is initiated immediately.

Figure 18-22: UART_THR Register Diagram

Table 18-21: UART_THR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
7:0 (R/W)	VALUE	8 bit data.

Transmit Shift Register

The read only `UART_TSR` register which returns the content of the UART’s transmit shift register.

Bit No. (Access)	Bit Name	Description/Enumeration
15:0 (R/NW)	VALUE	16-bit Counter Value.

19 Enhanced Parallel Peripheral Interface (EPPI)

The Enhanced Parallel Peripheral Interface (EPPI) is a half-duplex, bidirectional port with a dedicated clock pin and three frame sync (FS) pins. It can support direct connections to active TFT LCDs, parallel A/D and D/A converters, video encoders and decoders, image sensor modules and other general-purpose peripherals. Each EPPI has two DMA channels associated with it. Moreover, in some modes, an EPPI can use an extra DMA channel.

EPPI Features

The EPPI module supports the following features.

- Programmable data length from 8 bits to up to 24 bits per clock cycle (depending on the product model)
- Bidirectional and half-duplex port
- Internal or external clock source
- Clock gating by an external device asserting the clock gating control signal
- Various framed and non-framed operating modes, as well as internal or external frame syncs
- Various general-purpose modes with 0, 1, 2, and 3 frame sync modes for both receive and transmit
- Ignores premature external frame syncs for data consistency
- SMPTE274M and SMPTE 296M high definition format support
- ITU-656, SMPTE 296M and SMPTE 274M status word error detection and correction for ITU-656 receive modes
- ITU-656, SMPTE 296M and SMPTE 274M receive modes – active video only, vertical blanking only, and entire field
- ITU-656, SMPTE 296M and SMPTE 274M preamble and status word decode
- Optional packing and unpacking of data to or from 32 bits from or to 8, 16 bits and 24 bits. If packing or unpacking is enabled, endianness can be altered to change the order of packing or unpacking of bytes/words
- Optional sign extension or zero-fill and alternate even or odd data sample filter for receive modes

- RGB888 to RGB666 or RGB565 conversion for transmit modes
- 4:2:2 YCrCb data Tx/Rx interleaving or de-interleaving modes
- Configurable LCD data enable (DEN) output available on frame sync 3
- Delayed start of PPI frame syncs
- Data clipping and mirroring
- Horizontal and vertical windowing for general purpose 2 and 3 frame sync modes
- Preamble, blanking and stripping support
- Multiplexing dual input

EPPI Functional Description

The EPPI has the following functionality.

RGB data formats

For transmit modes, the EPPI can convert RGB888 data in memory to either RGB565 or RGB666 at the output using bits in the Control register.

Data clipping

The EPPI contains two registers to define the lower and upper limits for the Luma and Chroma components. This functionality is used for clipping data values during 8-bit, 10-bit, 12-bit or 16-bit transmit modes.

Data mirroring

A data mirroring feature is available which mirrors the EPPI data bits 15–0. This functionality is available in both transmit and receive modes.

Windowing

The EPPI supports windowing for general-purpose input modes.

Preamble, blanking and stripping support

The EPPI can embed blanking information and clip active data to be transmitted. This functionality is available for single channel data, interleaved data, and parallel data and supports data lengths equal to 16 bits, 20 bits or 24 bits.

ADSP-2159x EPPI Register List

The EPPI is a half-duplex, bidirectional parallel port. It comprises a clock pin, 3 frame sync pins, and a set of data pins. For more information on EPPI functionality, see the EPPI register descriptions.

Table 19-1: ADSP-2159x EPPI Register List

Name	Description
EPPI_CLKDIV	Clock Divide Register
EPPI_CTL	Control Register
EPPI_CTL2	Control Register 2 Register
EPPI_EVENCLIP	Clipping Register for EVEN (Luma) Data Register
EPPI_FRAME	Lines Per Frame Register
EPPI_FS1_DLY	Frame Sync 1 Delay Value Register
EPPI_FS1_PASPL	FS1 Period Register / EPPI Active Samples Per Line Register
EPPI_FS1_WLHB	FS1 Width Register / EPPI Horizontal Blanking Samples Per Line Register
EPPI_FS2_DLY	Frame Sync 2 Delay Value Register
EPPI_FS2_PALPF	FS2 Period Register / EPPI Active Lines Per Field Register
EPPI_FS2_WLVB	FS2 Width Register / EPPI Lines Of Vertical Blanking Register
EPPI_HCNT	Horizontal Transfer Count Register
EPPI_HDLY	Horizontal Delay Count Register
EPPI_IMSK	Interrupt Mask Register
EPPI_LINE	Samples Per Line Register
EPPI_ODDCLIP	Clipping Register for ODD (Chroma) Data Register
EPPI_STAT	Status Register
EPPI_VCNT	Vertical Transfer Count Register
EPPI_VDLY	Vertical Delay Count Register

Trigger ID	Name	Description	Sensitivity
19	EPPI0_CH0_DMA	EPPI0 Channel 0 DMA	Pulse
20	EPPI0_CH1_DMA	EPPI0 Channel 1 DMA	Pulse

RGB Data Formats

For transmit modes, the EPPI can convert RGB888 data in memory to RGB666 at the output when the `EPPI_CTL.RGBFMTEN` bit is set and the `EPPI_CTL.DLEN` value is equal to 18 bits. Similarly, the EPPI can convert RGB888 data in memory to RGB565 at the output when the `EPPI_CTL.RGBFMTEN` bit is set and `EPPI_CTL.DLEN` is equal to 16 bits.

This conversion is performed as follows:

- If `EPPI_CTL.PACKEN = 1`, the EPPI first unpacks according to the `EPPI_CTL.SWAPEN` bit setting, and the three 32-bit data words from the DMA are broken into four 24-bit data words to be transmitted out, as described earlier.
- If `EPPI_CTL.PACKEN = 0`, the EPPI takes the lower 24 bits of the 32-bit DMA as the data to be transmitted. Then, the EPPI truncates this 24-bit data word to the required data width. It removes the lower 2 bits of G and the lower 2 bits or 3 bits of R and B.

Data Clipping

The EPPI contains two registers to define the lower and upper limits for the Luma and Chroma components. It uses these registers for clipping data values during 8-bit, 10-bit, 12-bit or 16-bit transmit modes. All data values for odd samples which are less than the value in the `EPPI_ODDCLIP.LOWODD` bit field are replaced with the value in the `EPPI_ODDCLIP.LOWODD` field. All data values for even samples which are less than the value in the `EPPI_EVENCLIP.LOWEVEN` field are replaced with the value in the `EPPI_EVENCLIP.LOWEVEN` field.

In the same manner, all data values for odd samples which are more than the value in the `EPPI_ODDCLIP.HIGHODD` bit field are replaced with the value in the `EPPI_ODDCLIP.HIGHODD` field. All data values for even samples which are more than the values in the `EPPI_EVENCLIP.HIGHEVEN` field are replaced with the values in the `EPPI_EVENCLIP.HIGHEVEN` field.

Depending on the programmed EPPI length, only the corresponding bits (least aligned) are considered for clipping. For example, if the EPPI is programmed in 10-bit mode, bits 9:0 and bits 25:16 constitute the clipping thresholds. The higher bits are ignored. The EPPI supports 8-bit, 10-bit, 12-bit, and 16-bit clipping thresholds.

For the 4:2:2 YCrCb color space, Luma and Chroma typically have different lower and upper thresholds. Separate thresholds can be required for even and odd data samples. For monochrome (Y only) or some non-video clipping applications, the value in the `EPPI_ODDCLIP.LOWODD` field can be the same as the value in the `EPPI_EVENCLIP.LOWEVEN` field. The value in the `EPPI_ODDCLIP.HIGHODD` field can be the same as the value in the `EPPI_EVENCLIP.HIGHEVEN` field.

In GP 0 FS mode with internal blanking generation, clipping is valid only for the active video part of the transmitted data. ITU-R 656 preambles, status words, and blanking data bypass the clipping logic.

If the EPPI is programmed in 16, 20-bit or 24-bit mode with the `EPPI_CTL.SPLTWRD` bit set, the YDATA (luma data) gets the clipping threshold levels of the `EPPI_EVENCLIP` register. The CDATA (chroma data) gets the clipping threshold levels of the `EPPI_ODDCLIP` register.

The clipping registers are ignored when the `EPPI_CTL.RGBFMTEN` bit is set.

Data Mirroring

To increase the pin multiplexing options for the EPPI data pins, a data mirroring feature is available which mirrors the EPPI data bits 15:0. This feature is available in both transmit and receive modes. It is enabled by setting the `EPPI_CTL.DMIRR` bit.

Figure 19-1: Data Mirroring Receive

Figure 19-2: Data Mirroring Transmit

Windowing

The EPPI supports windowing for general-purpose input modes. The module can be configured to bring in a region of interest instead of the entire frame of data, which helps reduce bandwidth requirements.

Preamble, Blanking and Stripping Support

The EPPI supports embedding blanking information and clipping of active data for transmission. This functionality is available for single-channel data, interleaved data, and parallel data and supports a data length (EPPI_CTL.DLEN) of 16, 20 bits or 24 bits.

Support of preamble generation or detection and stripping of blanking information is also provided for ITU656 mode and the SMPTE 274M and 296M HD formats. The *Video Mode Comparison* table shows the SMPTE standards in comparison with the ITU656 modes. Preambles for SMPTE and ITU656 modes are identical. Extension of preamble to 12 bits is also supported.

Table 19-5: Video Mode Comparison

Video Mode	Frame Rate	Frame Resolution	Active Video Resolution	Sampling Frequency (MHz)	Remarks
ITU656 (NTSC)	30	1716x525	720x480	27.02	Y-C interleaved
ITU656 (PAL)	25	1728x625	720x576	27.00	Y-C interleaved
SMPTE 296M	30	3300x750	1280x720	74.25	Y,C separate
	60	1650x750	1280x720	74.25	Y,C separate

Table 19-5: Video Mode Comparison (Continued)

Video Mode	Frame Rate	Frame Resolution	Active Video Resolution	Sampling Frequency (MHz)	Remarks
SMPTE 274M	30	2200x1125	1920x1080	74.25	Y,C separate
	60	2200x1125	1920x1080	148.50	Y,C separate
	25	2640x1125	1920x1080	74.25	Y,C separate
	50	2640x1125	1920x1080	148.50	Y,C separate
	24	2750x1125	1920x1080	74.25	Y,C separate

See the clock operating conditions section of the data sheet for the maximum sampling frequency for this product.

EPPI Definitions

The following definitions are helpful when using the EPPI module.

ITU-R BT.-656

Description of a digital video protocol for interfaces and data stream format required to send uncompressed PAL or NTSC standard definition TV (525 or 625 lines) signals.

YUV422

YUV is a color space where luminance (Y) and chrominance (UV) components define the pixels. The suffix signifies how the chrominance components have been decimated and provide formatting information. In this case, the YUV422 format has the chrominance decimated by two, meaning only half of each chrominance component is available. Typical YUV422 formatting interleaves the luminance and chrominance (for example, U1Y1V1Y2U2Y3V2Y4).

RGB888

RGB is a color space where three color values, one red (R), one green (G) and one blue (B), define the pixels. The suffix signifies the bit widths for these color components. In this case, RGB888 means that each red, green, and blue value is 8 bits.

RGB565

RGB is a color space where three color values, one red (R), one green (G) and one blue (B) define the pixels. The suffix signifies the bit widths for these color components. In this case, RGB565 means that the red (R) and blue (B) are 5 bits each while the green (G) is 6 bits. When packed together, each RGB565 pixel can be represented in a 16-bit data word. LCD display panels commonly use this format.

SMPTE 274M

An HD standard defining the spatial resolution (image sample structure) and frame rates for 1920x1080.

SMPTE 296M

An HD standard for defining the spatial resolution (image sample structure) and frame rates for 1280x720.

EPPI Block Diagram

The *EPPI Block Diagram* figure shows the functional blocks within the EPPI.

Figure 19-3: EPPI Block Diagram

EPPI Architectural Concepts

The following sections describe the architectural concepts.

- [Reset Operation](#)
- [Frame Sync Polarity and Sampling Edge](#)
- [Direct Memory Access \(DMA\)](#)
- [EPPI Clock](#)

Reset Operation

On a hardware reset, the entire EPPI is reset. All MMRs return to their default values. EPPI interrupt and DMA requests become inactive and internally generated **EPPI_CLK** and frame syncs are aborted.

In software, write 0 to the **EPPI_CTL.EN** bit to reset and reconfigure the EPPI. When disabled in this manner, only the **EPPI_STAT** register is cleared to its reset value. Interrupts and DMA requests become inactive and internally generated clock and frame syncs are aborted.

Frame Sync Polarity and Sampling Edge

The `EPPI_CTL.POLS` and `EPPI_CTL.POLC` bits provide a mechanism to select the active level of the frame syncs and the sampling or driving edge of the EPPI clock, respectively. This functionality allows the EPPI to connect to data sources and receivers with a wide array of control signal polarities. Often, the remote data source or receiver also offer configurable signal polarities. In these cases, the `EPPI_CTL.POLS` and `EPPI_CTL.POLC` bits add flexibility.

Table 19-6: Frame Sync Polarity Selections and Frame Sync Pin States

Bit Setting	Frame Sync 2	Frame Sync 1
POLS = b#00	Active high	Active high
POLS = b#01	Active high	Active low
POLS = b#10	Active low	Active high
POLS = b#11	Active low	Active low

Table 19-7: Clock Polarity Selections and Receive/Transmit Pin States

Bit Setting	Receive		Transmit	
	Sample Data	Sample/Drive Syncs	Drive Data	Sample/Drive Syncs
POLC = b#00	Falling edge	Falling edge	Rising edge	Rising edge
POLC = b#01	Falling edge	Rising edge	Rising edge	Falling edge
POLC = b#10	Rising edge	Falling edge	Falling edge	Rising edge
POLC = b#11	Rising edge	Rising edge	Falling edge	Falling edge

Direct Memory Access (DMA)

The EPPI has a native DMA controller with two channels. A local arbiter arbitrates between these channels and requests are forwarded to the system crossbar. The EPPI has one connection to the fabric.

Figure 19-4: EPPI DMA Interface

The EPPI must be used with DMA. Configuring the EPPI DMA channels is a necessary step toward using the EPPI interface. The channels can be configured for either transmit or receive operation, and have a maximum throughput of $(EPPI_CLK) \times (32 \text{ bits/transfer})$. In modes where data lengths permit, packing can increase transfer bandwidth.

The DMA engine generates interrupts at the completion of a row, frame, or partial-frame transfer. The DMA engine also coordinates the source or destination point for the data that is transferred through the EPPI.

The 2D DMA capability allows the processor to be interrupted at the end of a line or after a frame of video is transferred, or if a DMA error occurs. The `DMA_XCNT` and `DMA_YCNT` registers allow for flexible data interrupt points. For example, assume the `DMA_XMOD = DMA_YMOD = 1`. If a data frame contains 320×240 bytes (240 rows of 320 bytes each), the following conditions hold.

- Setting `DMA_XCNT = 320`, `DMA_YCNT = 240`, and `DMA_CFG.INT = 1` interrupts on every row transferred, for the entire frame.
- Setting `DMA_XCNT = 320`, `DMA_YCNT = 240`, and `DMA_CFG.INT = 2` interrupts only on the completion of the frame (when 240 rows of 320 bytes have been transferred).
- Setting `DMA_XCNT = 38,400 ( $320 \times 120$ ), DMA_YCNT = 2, and DMA_CFG.INT = 1 causes an interrupt when half of the frame is transferred, and again when the whole frame is transferred.`

The following is the general procedure for setting up DMA operation with the EPPI.

1. Configure the DMA registers as appropriate for the desired DMA operating mode.
2. Enable the DMA channel for operation.
3. Configure appropriate EPPI registers.
4. Enable the EPPI by writing 1 to the `EPPI_CTL.EN` bit.

EPPI Clock

The EPPI can be supplied with an external clock, or the clock can be generated internally and supplied to external devices. For information on the maximum `PPI_CLK` specification in internal and external clock modes, see the product-specific data sheet.

When using an external `EPPI_CLK`, there can be up to two cycles latency before valid data is received or transmitted.

The internal clock can be generated from `SCLK0` when the `EPPI_CTL.ICLKGEN` bit is set. The value in the `EPPI_CLKDIV` register determines the generated clock frequency. The internally generated EPPI clock frequency is:

$$f_{PCLK} = f_{SCLK0} / (EPPI_CLKDIV + 1)$$

where:

f_{PCLK} – frequency of internally generated EPPI clock

f_{SCLK} – frequency of `SCLK0`

[EPPI_CLKDIV](#) – Clock division value programmed in the [EPPI_CLKDIV](#) register.

The *Relationship Between CLKDIV and the Ratio of SCLK0 to EPPI Clock* table gives a few examples.

Table 19-8: Relationship Between CLKDIV and the Ratio of SCLK0 to EPPI Clock

CLKDIV15–0	EPPI/SCLK0 Clock Ratio
0x0002	1:3
0x0003	1:4
0x0004	1:5
0x0005	1:6
...	...

EPPI Operating Modes

The EPPI supports various receive and transmit modes of operation which include the detection and generation of preamble data. Specifically, the EPPI supports data formats described in the specifications ITU656, SMPTE 274M and SMPTE 296M. In addition to these modes, the EPPI also supports general-purpose receive and transmit using up to three frame syncs (FS).

The control register ([EPPI_CTL](#)) includes most of the bits used for configuring operating modes. The “Register Descriptions” section of this chapter provides complete descriptions of these bits.

ITU-R 656 Modes

The EPPI supports three input modes and one output mode for ITU-R 656 framed data. This section describes these modes.

ITU-R 656 Background

In ITU-R 656 mode, the horizontal (H), vertical (V), and field (F) signals are sent as an embedded part of the video data stream. The signals are sent in a series of bytes that form a control word. ITU-R 656 was formerly known as CCIR-656.

The letter H is used to distinguish between the *start of active video* (SAV) and *end of active video* (EAV) signals. These signals indicate the beginning and end of active video data in each line. The SAV occurs on a 1-to-0 transition of H, and EAV occurs on a 0-to-1 transition of H. The space between EAV and SAV is filled with horizontal blanking data. Therefore, H = 1 during the horizontal blanking portion of the data stream, and H = 0 during the active video portion of the data stream.

The letter V is used to denote the vertical blanking portion of the data stream. A transition in V can occur only in the EAV sequence. When V = 1, the data stream contains vertical blanking data, and when V = 0, the data stream contains active video data.

The letter F is used to distinguish Field 1 from Field 2. Interlaced video has two fields in a frame of data. It requires each field to be handled uniquely, and alternate rows of each field combined to create the actual video image.

For interlaced video, $F = 0$ represents Field 1 (*Odd Field*) and $F = 1$ represents Field 2 (*Even Field*). Progressive video makes no distinction between Field 1 and Field 2, and F is always 0 for progressive video. Interlaced video requires each field to be handled uniquely because alternate rows of each field combine to create the actual video image.

An entire field of video is comprised of active video plus horizontal blanking (the space between an EAV and SAV code) and vertical blanking (the space where $V = 1$). A field of video commences on a transition of the F bit.

Figure 19-5: Typical Video Frame Partitioning for NTSC/PAL Systems in Interlaced and Progressive ITU-R BT.656 Systems

Figure 19-6: ITU-R 656 8-Bit Parallel Data Stream from NTSC (PAL) Systems

NOTE: Refer to the *Control Sequences for 8-Bit and 10-Bit ITU-R 656 Video* table. There is a defined preamble of three data elements (for example, in the case of 8-bit video: 0xFF, 0x00, 0x00), followed by the XY status word. The status word contains four protection bits for error detection and correction excluding the

F (field), V (vertical blanking), and H (horizontal blanking) bits. F and V are only allowed to change as part of EAV sequences (that is, transition from H = 0 to H = 1).

The bit definitions are as follows:

- F = 0 for field 1
- F = 1 for field 2
- V = 1 during vertical blanking
- V = 0 when not in vertical blanking
- H = 0 at SAV
- H = 1 at EAV
- $P3 = V \text{ XOR } H$
- $P2 = F \text{ XOR } H$
- $P1 = F \text{ XOR } V$
- $P0 = F \text{ XOR } V \text{ XOR } H$

P3–P0 are protection bits that enable 1-bit and 2-bit error detection, and 1-bit error correction at the receiver. The EPPI corrects the error if it detects 1-bit errors in F, V, or H. Errors in the protection bits themselves are detected but not corrected.

Table 19-9: Control Sequences for 8-Bit and 10-Bit ITU-R 656 Video

	8-Bit Data								10-Bit Data	
	D9 (MSB)	D8	D7	D6	D5	D4	D3	D2	D1	D0
Preamble	1	1	1	1	1	1	1	1	1	1
	0	0	0	0	0	0	0	0	0	0
	0	0	0	0	0	0	0	0	0	0
Control Byte	1	F	V	H	P3	P2	P1	P0	0	0

The `EPPI_STAT` register contains 2 bits, `EPPI_STAT.ERRDET` and `EPPI_STAT.ERRNCOR`, that are used to report the status of error detected and error not corrected, respectively.

The `EPPI_STAT.ERRDET` bit is set whenever an error is detected in the status word. However, this bit does not generate an interrupt. The `EPPI_STAT.ERRNCOR` bit is set when more than a 1-bit error is detected in the status word. An interrupt is generated when the `EPPI_STAT.ERRNCOR` bit is set. It can be cleared by clearing the `EPPI_STAT.ERRNCOR` and `EPPI_STAT.ERRDET` bits. Both bits are sticky and W1C.

In many applications, video streams other than the standard NTSC/PAL formats (for example, CIF, QCIF) can be employed. The processor interface is flexible enough to accommodate different row and field lengths. In general, as

long as the incoming video has the proper EAV/SAV codes, the EPPI can read it in. A CIF image could be formatted to be 656-compliant, where EAV and SAV values define the range of the image for each line. The V and F codes are used to delimit fields and frames.

The following sections provide descriptions of EPPI operations.

Table 19-10: Operating Modes and Generic EPPI Operation

		How to configure	Useful for	How to configure in ITU R 656 Tx Mode

ITU-R 656 Input Modes

In the ITU-R 656 input modes, the video source provides the clock or the system supplies it externally.

As shown in the *ITU-R 656 Input Submodes* figure and described in the following sections, there are three submodes supported for ITU-R 656 inputs: entire field, active video only, and vertical blanking interval only.

Figure 19-7: ITU-R 656 Input Submodes

Entire Field

In this mode, the EPPI reads the entire incoming bit stream. This stream includes active video as well as control byte sequences and ancillary data that can be embedded in horizontal and vertical blanking intervals.

Data transfer starts immediately after Field 1 synchronization occurs. The transfer does not include the first EAV code that contains the $F = 0$ assignment for interlaced video or the $V = 0$ assignment for progressive video.

Active Video

The EPPI uses this mode when only the active video portion of a field is of interest. The EPPI ignores (does not read in) all data between EAV and SAV, as well as all data present when $V = 1$. Furthermore, the control byte sequences are not stored to memory. The EPPI filters the sequences. After the start of Field 1 synchronizes, the EPPI ignores incoming samples until it sees an SAV.

In active video mode, programs must specify the number of total (active plus vertical blanking) lines per frame in the `EPPI_FRAME` register. Programs must specify the number of total (active plus horizontal blanking plus 8) samples per line in the `EPPI_LINE` register.

In this mode, any input data sequence that is considered part of the preamble is not sent to memory such as in 8-bit ITU mode. If `0xFF` or `0x00` appear in the input data stream, these values are considered part of the preamble. The part of the preamble can appear individually and not be tagged along with the preamble sequence `FE, 00, 00`. This functionality also applies to vertical blanking interval mode.

Vertical Blanking Interval (VBI)

In this mode, data transfer is only active while $V = 1$ is in the control byte sequence. This functionality indicates that the video source is in the midst of the vertical blanking interval (VBI), which is sometimes used for ancillary data transmission. The ITU-R 656 recommendation specifies the format for these ancillary data packets, but the EPPI is not equipped to decode the packets themselves. Software must handle this task. Horizontal blanking data is logged where it coincides with the rows of the VBI.

The VBI is split into two regions within each field. The EPPI considers these two separate regions as one contiguous space. However, frame synchronization begins at the start of Field 1, which does not necessarily correspond to the

start of vertical blanking. For instance, in 525/60 systems, the start of Field 1 ($F = 0$) corresponds to line 4 of the VBI.

In VBI mode, the program must specify the number of total (active plus vertical blanking) lines per frame in the `EPPI_FRAME` register. The program must specify the number of total (active plus horizontal blanking plus 8) samples per line in the `EPPI_LINE` register.

In this mode, any input data sequence that is considered as part of the preamble is not sent to memory such as in 8-bit ITU mode. If 0xFF or 0x00 appears in the input data stream, these values are considered part of the preamble. The part of the preamble can appear individually, and not be tagged along with the preamble sequence FF, 00, 00. This functionality applies to active video mode too.

ITU-R 656 Output in General-Purpose Transmit Modes

In GP transmit mode, the EPPI frames an ITU-R 656 output stream with the proper preambles and blanking intervals by setting the `EPPI_CTL.BLANKGEN` bit. The EPPI fetches active data from memory through the DMA channel, saving DMA bandwidth. The EPPI generates and embeds the proper preamble, status word (EAV and SAV sequences), and blanking data along with the active video from memory. Program the `EPPI_FS1_PASPL`, `EPPI_FS2_WLVB`, `EPPI_FS2_PALPF`, and `EPPI_FS1_WLHB` registers to perform the desired functions. The EPPI can also drive out the frame syncs using the `EPPI_CTL.FSCFG` bit setting.

The *16-Bit Transmit with Internal Blanking Generation* figure shows the bit stream format in 16-bit transmit modes with blanking generation (EPPI_CTL.BLANKGEN enabled). Each 16-bit data sample consists of 8-bit luma (Y) and 8-bit chroma (Cr or Cb) components. During transmission, the chroma data and blanking bytes of value 0x80 are placed on the upper half (MSBs) of the data lines. The luma data and blanking bytes of value 0x10 are placed on the lower half (LSBs) of the data lines.

Figure 19-8: 16-Bit Transmit with Internal Blanking Generation

The *Generated Blanking Preamble Sequence* figure shows the data transmitted by the EPPI in this mode. After the EPPI is enabled, and if the EPPI FIFO is not empty, the transmission starts by sending out an EAV sequence for a vertical blanking line. For interlaced video, F starts at 1. For progressive video, F is always 0.

NOTE: Internal blanking generation functionality is valid only when the data length is 8, 10, or 16 bits and when the EPPI is in GP transmit modes. The EPPI_CTL.BLANKGEN bit generates preambles even in GP 2FS mode.

The internal blanking generation functionality of the ITU-R 656 output mode can also be bypassed by clearing the `EPPI_CTL.BLANKGEN` bit. (For example, if sending ancillary data in the blanking interval). The `EPPI_CTL.BLANKGEN` bit generates preambles even in GP 2FS mode.

Figure 19-9: Generated Blanking Preamble Sequence

Frame Synchronization in ITU-R 656 Modes

For interlaced video, the start of frame synchronization occurs when a high-to-low transition is detected in F, the field indicator. For progressive video, the start of frame synchronization occurs when a high-to-low transition is detected in V, the vertical blanking indicator. These transitions in F and V can occur only in the EAV sequence. A start of line is detected on a low-to-high transition in H, the horizontal blanking indicator, which occurs in the EAV sequence as well.

For interlaced video, the start of frame corresponds to the start of field 1. Therefore, up to two fields can be ignored before the EPPI receives data. (For example, if field 1 started before the EPPI-to-camera channel was established). For progressive video, the start of frame corresponds to the start of active video.

Because all H and V signaling is embedded in the data stream in ITU-R 656 modes, the EPPI ignores the count registers ([EPPI_HCNT](#), [EPPI_VCNT](#)). However, the EPPI still uses the [EPPI_FRAME](#) register to check for synchronization errors. Therefore, program this MMR with the number of lines expected in each frame of video.

The EPPI monitors the number of EAV-to-SAV transitions that occur from the start of a frame until it decodes the end of frame condition. (For example, a transition from F = 1 to F = 0 for interlaced video and a transition from V = 1 to V = 0 for progressive video).

At the end of frame condition, the actual number of lines processed is compared against the value in [EPPI_FRAME](#). If there is a mismatch, a frame track error is asserted in the [EPPI_STAT](#) register. For example, if an SAV transition was missed, the current field only has NUM_ROWS – 1 rows. But, resynchronization occurs at the start of the next frame. When the EPPI receives the entire field, the field status bit is toggled in the [EPPI_STAT](#) register. This way, an interrupt service routine (ISR) can discern which field was previously read in.

General-Purpose EPPI Modes

The general-purpose (GP) EPPI modes accommodate a wide variety of data capture and transmission applications.

Each EPPI has three bidirectional frame sync pins. The EPPI internally generates frame syncs, or an external device communicating with the EPPI generates them.

GP modes differ based on the number of frame syncs used and the EPPI supports GP 0 FS—GP 3 FS modes.

All the GP modes, except 0 FS mode, support horizontal windowing. GP modes with 2 and 3 frame syncs also support vertical windowing.

For GP transmit modes with internal clock or frame syncs, the EPPI starts generating the clock or frame syncs only when the EPPI FIFO is full for the first time. For GP 0 FS transmit mode, the EPPI only starts transmitting when the EPPI FIFO is full for the first time.

General-Purpose 0 Frame Sync Mode

This mode is useful for applications where periodic frame syncs are not used to frame the data.

After the initial trigger, the EPPI receives or transmits data samples on every clock cycle. However, if the `EPPI_CTL.SKIPEN` bit is set for receive mode, the EPPI receives only alternate data samples.

The `EPPI_LINE`, `EPPI_FRAME`, `EPPI_HCNT`, `EPPI_HDLY`, `EPPI_VCNT`, and `EPPI_VDLY` registers are not valid for GP 0 FS mode. Therefore, windowing is not possible in this mode. Also, line and frame track errors are not applicable in this mode.

GP 0 FS receive mode is further divided into two submodes; internal trigger (`EPPI_CTL.FLDSEL` bit =0) and external trigger (`EPPI_CTL.FLDSEL` bit =1). The submodes are based on how the processor initiates data transmission or reception. GP 0 FS transmit mode is always internally triggered. DMA handles all subsequent data manipulation.

- *Frame synchronization in GP 0 FS external trigger mode.* When the EPPI is programmed in external trigger mode, it does not generate the `EPPI_FS1` signal and the external device must provide a trigger. The EPPI starts receiving the data as soon as an `EPPI_FS1` signal assertion is detected. After that, the DMA handles all subsequent data manipulation and any activity on `EPPI_FS1` is ignored.
- *Frame synchronization in GP 0 FS internal trigger mode.* When the EPPI is programmed in internal trigger mode, it starts receiving or transmitting data as soon as the EPPI clock is enabled and synchronized. There can be up to four PPI clock cycles of latency before valid data is received or transmitted.

General-Purpose 1 Frame Sync Mode

This mode is useful for interfacing the EPPI with analog-to-digital converters (ADCs), digital-to-analog converters (DACs), and other general-purpose devices. This mode works for both transmit and receive.

The `EPPI_FRAME`, `EPPI_VDLY`, and `EPPI_VCNT` registers have no effect in GP 1 FS mode. As a result, frame track errors and vertical windowing are not available.

General-Purpose 2 Frame Sync Mode

This mode is useful for video applications that use two hardware synchronization signals, HSYNC and VSYNC. The HSYNC signal can be connected to EPPI_FS1 and the VSYNC signal can be connected to EPPI_FS2.

Data Enable in General-Purpose 2 Frame Sync Transmit Mode

The EPPI_FS3 pin functions as a data enable (DEN) pin, when EPPI is configured in GP 2 FS transmit mode and generating the frame sync internally. The bits EPPI_CTL.MUXSEL and EPPI_CTL.CLKGATEN are not enabled. The functionality of the DEN pin is described in the following two cases.

Case 1

Blanking generation is configured using the EPPI_CTL.BLANKGEN bit. EPPI data length (EPPI_CTL.DLEN bit) is configured for 8, 10, or 16-bit transfers. The EPPI_FS3 pin asserts during the *active data* regions, aligned with EPPI_CLK according to the clock polarity (EPPI_CTL.POLC bit) settings. For this mode, the pin EPPI_FS3 is driven based on the EPPI_CTL.POLC setting. The pin EPPI_FS3 is driven out on the same EPPI clock edge that drives out data. The frame sync polarity (EPPI_CTL.POLS) setting does not apply here—EPPI_FS3 is always active high in this mode.

Case 2

Blanking generation (EPPI_CTL.BLANKGEN = 0) is disabled. Or blanking generation is enabled, but the EPPI data length (EPPI_CTL.DLEN bit) is configured for a transfer size other than 8, 10, or 16 bits. The EPPI_FS3 pin asserts at the start of the active data region on each line, aligned with EPPI_CLK according to the EPPI_CTL.POLC bit settings. For this mode, the pin EPPI_FS3 is driven based on the EPPI_CTL.POLC setting. The EPPI_FS3 signal is driven out on the same EPPI clock edge that drives out data.

The EPPI_CTL.POLS bit setting does not apply for case 2. The EPPI_FS3 signal is always active high in this mode. Once asserted, EPPI_FS3 stays asserted for the number of clock cycles per line configured in the EPPI_HCNT register, then it deasserts. This behavior on each line continues for the total number of lines programmed in the EPPI_VCNT register per frame. The behavior repeats at the start of subsequent video frames.

In case 2, if transmission of valid data is held off due to delays programmed in the EPPI_HDLY or EPPI_VDLY registers, the assertion of EPPI_FS3 is also held off. The delay is on a per-line or per-frame basis.

General-Purpose 3 Frame Sync Mode

This mode is useful for video applications that use three synchronization signals for hardware: HSYNC, VSYNC, and FIELD. The HSYNC connects to the EPPI_FS1 pin, VSYNC connects to the EPPI_FS2 pin, and FIELD connects to the EPPI_FS3 pin.

GP 3 FS mode is similar in operation to GP 2 FS mode. However, the start of frame synchronization in GP 3 FS also considers the state of the EPPI_FS3 pin. All the windowing register settings ([EPPI_FRAME](#), [EPPI_LINE](#), [EPPI_HDLY](#), [EPPI_HCNT](#), [EPPI_VDLY](#), and [EPPI_VCNT](#) registers), as well as data reception or transmission and error generation are the same as for GP 2 FS mode. In addition, for GP 3 FS mode with internal frame syncs, the EPPI_CTL.FLDSEL bit setting specifies the condition under which the transfer begins.

The EPPI generates the EPPI_FS3 signal and toggles during every assertion of EPPI_FS2 or a combination of EPPI_FS2 and EPPI_FS1. The toggle depends on the EPPI_CTL.FLDSEL bit setting. The EPPI skips an EPPI_FS2 signal when the EPPI_FS3 value is high. Because of this condition, program the EPPI_FS2 period value to half of the total number of pixels in the frame as in GP 3 FS mode. When in GP 2 FS mode, program the EPPI_FS2 period with the value equal to the number of pixels per frame.

Supported Data Formats

The following sections describe EPPI receive and transmit data formats.

Receive Data Formats

The *EPPI Receive Data Formats* table provides information about EPPI configuration for specific use models for receive data.

Table 19-11: EPPI Receive Data Formats

Input Data Width	Use Model	Splitting/Packing Options
8	NTSC/PAL data	EPPI_CTL.SPLTEO =1 EPPI_CTL.SUBSPLTODD =1 if necessary to separate chroma components
	RGB sensor	No splitting possible. EPPI_CTL.PACKEN =1 – Four EPPI words are packed to 32-bit DMA data. EPPI_CTL.PACKEN =0 – Each EPPI word is sent as 8-bit data on the 32-bit DMA bus. This transfer consumes 4 times the DMA bandwidth of the 8-bit case with EPPI_CTL.PACKEN =1;
	ADCs	Gives I (in phase) and Q (quadrature) components. EPPI_CTL.SPLTEO =1 EPPI_CTL.SUBSPLTODD =0 since there are only two components.

Table 19-11: EPPI Receive Data Formats (Continued)

Input Data Width	Use Model	Splitting/Packing Options
10	NTSC/PAL data	Each EPPI word is zero filled or sign extended to 16 bits. EPPI_CTL.SPLTEO =1. EPPI_CTL.SUBSPLTODD =1 if necessary to separate chroma components.
	RGB sensor	No splitting possible. EPPI_CTL.PACKEN =1. Two EPPI words are zero filled or sign extended to 16 bits and packed to 32-bit DMA data. EPPI_CTL.PACKEN =0. Each EPPI word can be zero filled or sign extended to 16 bits and sent as a 16-bit data on the 32-bit DMA bus. This transfer consumes double the bandwidth of the 10-bit case with EPPI_CTL.PACKEN =1;
	ADCs	Each EPPI word is zero filled or sign extended to 16 bits. EPPI_CTL.SPLTEO =1 SEPPI_CTL.SUBSPLTODD = 0 since there are only two components.
12	RGB sensor	No splitting possible. EPPI_CTL.PACKEN =1. Two EPPI words are zero filled or sign extended to 16 bits and packed to 32-bit DMA data. EPPI_CTL.PACKEN =0. Each EPPI word can be zero filled or sign extended to 16 bits and sent as a 16-bit data on the 32-bit DMA bus. This transfer consumes double the bandwidth of the 12-bit case with EPPI_CTL.PACKEN =1;
	ADCs	Each EPPI word is zero filled or sign extended to 16 bits. EPPI_CTL.SPLTEO =1 EPPI_CTL.SUBSPLTODD =0 since there are only two components.
14	ADCs	Each EPPI word is zero filled or sign extended to 16 bits. EPPI_CTL.SPLTEO =1 EPPI_CTL.SUBSPLTODD =0 since there are only two components.

Table 19-11: EPPI Receive Data Formats (Continued)

Input Data Width	Use Model	Splitting/Packing Options
16	8-bit luma/chroma pair for NTSC or HD	EPPI_CTL.SPLTEO =1, EPPI_CTL.SPLTWRD =1, EPPI_CTL.SUBSPLTODD =1 if necessary to separate chroma components.
	16-bit luma/chroma pair for NTSC or HD	EPPI_CTL.SPLTEO =1, EPPI_CTL.SPLTWRD =0, EPPI_CTL.SUBSPLTODD =1 if necessary to separate chroma components.
	RGB565 sensor	No splitting possible. EPPI_CTL.PACKEN =1. Two EPPI words are packed to a 32-bit DMA data. EPPI_CTL.RGBFMTEN is valid only in transmit modes. So, RGB565 cannot be byte aligned in memory. EPPI_CTL.PACKEN =0. Each EPPI word is sent as a 16-bit data on the 32-bit DMA bus. This transfer consumes double the bandwidth of the 16-bit case with EPPI_CTL.PACKEN =1
	8-bit ADCs I/Q pair	EPPI_CTL.SPLTEO =1, EPPI_CTL.SPLTWRD =1, EPPI_CTL.SUBSPLTODD =0.
	16-bit ADCs I/Q pair	EPPI_CTL.SPLTEO =1, EPPI_CTL.SPLTWRD =0, EPPI_CTL.SUBSPLTODD =0.

Transmit Data Formats

The *EPPI Transmit Data Formats* table provides information about EPPI configuration for specific use models for transmit data.

Table 19-12: EPPI Transmit Data Formats

Output Data Width	Use Model	Splitting/Packing Options
8	NTSC/PAL data	EPPI_CTL.SPLTEO =1 EPPI_CTL.SUBSPLTODD =1 if the chroma components (U and V) come in separate DMA words.
	Serial RGB for lower-resolution LCDs	No splitting possible. EPPI_CTL.PACKEN =1. The 32-bit DMA data is unpacked to drive four EPPI words. EPPI_CTL.PACKEN =0. The lowest 8 bits of the DMA data is driven on the EPPI data and the rest of the 24 bits are discarded. This transfer consumes 4 times the DMA bandwidth of the 8-bit case with EPPI_CTL.PACKEN =1.
10	NTSC/PAL data	EPPI_CTL.SPLTEO =1 EPPI_CTL.SUBSPLTODD =1 if the chroma components (U and V) come in separate DMA words.
	DACs	EPPI_CTL.SPLTEO =1, EPPI_CTL.SUBSPLTODD =0.

Table 19-12: EPPI Transmit Data Formats (Continued)

Output Data Width	Use Model	Splitting/Packing Options
12	DACs	EPPI_CTL.SPLTEO =1, EPPI_CTL.SUBSPLTODD =0.
14	DACs	EPPI_CTL.SPLTEO =1, EPPI_CTL.SUBSPLTODD =0.
16	8-bit luma/chroma pair for NTSC or HD	EPPI_CTL.SPLTEO =1, EPPI_CTL.SPLTWDRD =1, EPPI_CTL.SUBSPLTODD =1 if the chroma components (U and V) come in separate DMA words.
	16-bit luma/chroma pair for NTSC or HD	EPPI_CTL.SPLTEO =1, EPPI_CTL.SPLTWDRD =0, EPPI_CTL.SUBSPLTODD =1 if the chroma components (U and V) come in separate DMA words.
	RGB565 LCD	No splitting possible. EPPI_CTL.RGBFMTEN =1. Takes RGB888 data from the memory and drops the LSBs from each component to drive out RGB565 data.
	8-bit ADCs I/Q pair	EPPI_CTL.SPLTEO =1, EPPI_CTL.SPLTWDRD =1, EPPI_CTL.SUBSPLTODD = 0
	16-bit ADCs I/Q pair	EPPI_CTL.SPLTEO =1, EPPI_CTL.SPLTWDRD =0, EPPI_CTL.SUBSPLTODD =1
18	RGB666 LCD	No splitting possible. EPPI_CTL.RGBFMTEN =1. Takes RGB888 data from the memory and drops the 2 LSBs from each component to drive out RGB666 data.

Data Transfer Modes

The following sections describe EPPI data transfer modes, including receive or transmit data packing, sign extension, zero fill, receive or transmit split modes, clock gating, delayed start, and data consistency management.

Data Packing for Receive Modes

For receive modes, if the EPPI_CTL.PACKEN bit =1 and the DMA is 32 bits, the EPPI packs the incoming data into 32-bit words based on the EPPI_CTL.DLEN and EPPI_CTL.SWAPEN bit settings. When EPPI_CTL.SWAPEN =0, the EPPI puts the first data in the least significant bits and when EPPI_CTL.SWAPEN =1, the EPPI puts the first data in the most significant bits. The packing options for the EPPI_CTL.DLEN bits are as follows.

- When EPPI_CTL.DLEN =8, four 8-bit words can be packed into one 32-bit word.
- When EPPI_CTL.DLEN =16, two 16-bit words can be packed into one 32-bit word.
- For EPPI_CTL.DLEN values that are more than 8 bits but less than 16 bits, two such words are either sign-extended or zero-filled to 16 bits, and packed into one 32-bit word.
- When EPPI_CTL.DLEN =18, the EPPI sign-extends or zero-fills the 18-bit data to 24 bits and packs four 24-bit words into three 32-bit words.

- When `EPPI_CTL.DLEN = 24`, the EPPI packs four 24-bit words into three 32-bit words.

When `EPPI_CTL.PACKEN = 0`, the EPPI receives the incoming data and sends it on the bus as-is. If `EPPI_CTL.DLEN` is less than or equal to 16 bits, the DMA is a 16-bit DMA; otherwise it is a 32-bit DMA.

Data Packing for Transmit Modes

For transmit modes, if the `EPPI_CTL.DLEN` bit = 1 and the DMA is a 32-bit DMA, the EPPI unpacks the 32-bit word according to the `EPPI_CTL.DLEN` and `EPPI_CTL.SWAPEN` bit settings.

If `EPPI_CTL.SWAPEN = 1`, the EPPI transmits the most significant bits as the first data, and if `EPPI_CTL.SWAPEN = 0`, the EPPI transmits the least significant bits as the first data. The unpacking options for the `EPPI_CTL.DLEN` bits are as follows.

- When `EPPI_CTL.DLEN = 8`, the EPPI transmits one 32-bit word from memory as four 8-bit data words.
- For `EPPI_CTL.DLEN` values greater than 8 bits but less than or equal to 16 bits, the EPPI transmits one 32-bit word from memory as two 16-bit data words.
- When `EPPI_CTL.DLEN = 18` or `24`, the EPPI transmits three 32-bit words from memory as four data words.

Sign-Extended and Zero-Filled Data

The following list describes the bit settings and functionality for sign-extending and zero-filling data.

- For `EPPI_CTL.DLEN` equal to 10, 12 or 14, data is zero-filled or sign-extended to 16 bits.
- For `EPPI_CTL.DLEN` equal to 18 bits, data is zero-filled or sign-extended to 24 bits if packing is enabled, and zero-filled or sign-extended to 32 bits if packing is disabled.
- For `EPPI_CTL.DLEN` equal to 24 bits, data is zero-filled or sign-extended to 32 bits if packing is disabled.
- For `EPPI_CTL.DLEN` equal to 8 bits, data is zero-filled or sign-extended to 16 bits if packing is disabled.
- If `EPPI_CTL.SIGNEXT = 1`, then the data is sign-extended, otherwise it is zero-filled.

Split Receive Modes

The control register has three control bits for split receive modes: `EPPI_CTL.SPLTEO`, `EPPI_CTL.SUBSPLTODD`, and `EPPI_CTL.DMACFG`. Packing is not valid in split modes.

- If `EPPI_CTL.SPLTEO = 1`, the EPPI splits the incoming data stream into two substreams, an even stream, and an odd stream, and packs them separately.
- The `EPPI_CTL.SUBSPLTODD` bit is available only when `EPPI_CTL.SPLTEO = 1`. When `EPPI_CTL.SUBSPLTODD = 1`, the EPPI subsplits the odd substream, and packs the streams separately.
- The `EPPI_CTL.DMACFG` bit is also available only if `EPPI_CTL.SPLTEO = 1`. If `EPPI_CTL.DMACFG = 1`, the EPPI uses two DMA channels and if `EPPI_CTL.DMACFG = 0`, the EPPI uses only one DMA channel.

Split Transmit Modes

The EPPI_CTL register has three control bits for split transmit modes: EPPI_CTL.SPLTEO, EPPI_CTL.SUBSPLTODD, and EPPI_CTL.DMACFG. The DMA is always a 32-bit DMA. Packing is not valid in split modes.

- If EPPI_CTL.SPLTEO = 1, the EPPI receives the Luma (Y3Y2Y1Y0) and interleaved Chroma (Cr1Cb1Cr0Cb0) data as 32 bits from the DMA channel. The EPPI interleaves the data to form a 4:2:2 YCrCb data stream to transmit.
- The EPPI_CTL.SUBSPLTODD bit is available only when EPPI_CTL.SPLTEO = 1. In this case, if EPPI_CTL.SUBSPLTODD = 1, the EPPI receives the Luma (Y3Y2Y1Y0) and deinterleaved Chroma (Cb3Cb2Cb1Cb0 and Cr3Cr2Cr1Cr0). The EPPI interleaves the data to form a 4:2:2 YCrCb data stream to transmit. (The EPPI does not decimate the chroma data when formatting it into 4:2:2.)
- The EPPI_CTL.DMACFG bit is also valid only if EPPI_CTL.SPLTEO = 1. If EPPI_CTL.DMACFG = 1, the EPPI uses two DMA channels and if EPPI_CTL.DMACFG = 0, the EPPI uses only one DMA channel.

Clock Gating

In ITU-R BT.656 and GP 0/1/2 FS modes, EPPI_FS3 becomes a clock-gating input. This functionality is valid for both internally and externally sourced EPPI_CLK, in both receive and transmit modes. This clock gating signal must be synchronous with EPPI_CLK. The external device on the rising edge of EPPI_CLK must drive the clock gating signal. Its function is to hold the sync and data lines in their current state until EPPI_FS3 is driven low. There are no additional latency cycles upon coming out of clock gating mode.

If clock gating is not required, the EPPI_FS3 pin must either be tied to ground, or configured to operate as another of its multiplexed functions.

In GP 2 FS transmit mode with internally generated frame syncs, the EPPI_FS3 pin functions as a data enable signal.

Support for Delayed Start of EPPI Frame Syncs

The EPPI supports a delayed start of the EPPI_FS1 and EPPI_FS2 frame syncs. The EPPI_FS1_DLY and EPPI_FS2_DLY registers are programmable registers corresponding to EPPI_FS1 (HSYNC) and EPPI_FS2 (VSYNC).

The delay programmed in these registers applies to the first active edge of the internally generated frame sync. The delay starts from the first EPPI_CLK edge. The delay counter runs only for the first time and then shuts off until the EPPI is reenabled. (The delay counter is the period counter itself, since they do not run together.) Program the delay registers prior to the first EPPI_CLK edge (similar to the width and period registers). The *EPPI Delayed Frame Sync Generation* figure shows the functioning of EPPI_FS1 and EPPI_FS2.

Figure 19-10: EPPI Delayed Frame Sync Generation

Ignoring Premature External Frame Syncs for Data Consistency

Once a frame has started with a VSYNC followed by an HSYNC (or both coming together), a line is tracked. When the count expires, the state machine waits at the end of line for an HSYNC to come. With the arrival of the HSYNC, the state machine starts tracking the next line, and so on.

The number of lines tracked is counted separately. Once the end of a frame is reached, the state machine waits there for the next VSYNC/HSYNC combination. The next frame starts once they are sampled. Unfortunately, every incoming FS (VSYNC or HSYNC) resets the respective counters and the tracking starts all over (even if the FS signals are premature). The result is incomplete data (or frames) to enter into memory through the PxP interface.

To correct this problem, the EPPI waits for a frame or line completion before considering any incoming FS as valid.

- Single FS mode and line tracking in dual FS mode – When a line is in progress, when HSYNC is detected prematurely, it is ignored. A line track underflow event is generated.
- Dual FS mode – If a VSYNC is received when a frame is in progress, it is ignored. A frame track underflow error (EPPI_STAT.FTERRUNDR) is generated.

Ignoring the FS ensures that once a frame starts, the amount of data that goes into the memory/PxP interface corresponds exactly to the programmed data size in a frame.

NOTE: Even if the premature FS is a valid FS, the state machine loses at most one frame and it recovers in the subsequent FS. The FS to number of data going into the memory relationship is always maintained as programmed.

When data underflow errors occur at the DMA interface, the EPPI does the following.

- If a premature line sync is detected, an LT underflow error is generated (EPPI_STAT.LTERRUNDR =1). All further line track errors are ignored until the EPPI detects the next valid line sync.
- If a premature frame sync is detected, an FT underflow error is generated (EPPI_STAT.FTERRUNDR =1). All further frame track and line track errors are ignored until the EPPI detects the next valid frame sync.

EPPI Event Control

The following sections describe how EPPI manages events.

EPPI Status, Error, and Interrupt Signals

The EPPI generates error interrupts (flagged in the `EPPI_STAT` register) when any one of the following error conditions occur.

- `EPPI_STAT.YFIFOERR` (YFIFO underflow or overflow)
- `EPPI_STAT.CFIFOERR` (CFIFO underflow or overflow)
- `EPPI_STAT.LTERROVR` (line track overflow error)
- `EPPI_STAT.LTERRUNDR` (line track underflow error)
- `EPPI_STAT.FTERROVR` (frame track overflow error)
- `EPPI_STAT.FTERRUNDR` (frame track underflow error)
- `EPPI_STAT.ERRNCOR` (ITU preamble error not corrected)

A W1C (write-1-to-clear) operation clears the error conditions. Each of the individual conditions which cause an EPPI error interrupt can be masked. The interrupt mask register (`EPPI_IMSK`) allows the masking of individual conditions which cause error interrupts.

There is only one interrupt line from each EPPI so all interrupts are internally OR'ed and sent as a single interrupt to the core. The `EPPI_STAT` register must then be read to discover specific errors. The following sections describe these errors in detail.

Frame and Line Track Errors

In external frame sync mode, the EPPI uses line track error (`EPPI_STAT.LTERROVR` and `EPPI_STAT.LTERRUNDR`) and frame track error (`EPPI_STAT.FTERROVR` and `EPPI_STAT.FTERRUNDR`) status bits to monitor the line and frame synchronization errors. The EPPI updates the bits when there is a mismatch detected in the HSYNC and VSYNC as compared to the programmed values in `EPPI_LINE` and `EPPI_FRAME` count registers.

Line Track Errors

The line track overflow (`EPPI_STAT.LTERROVR`) and underflow errors (`EPPI_STAT.LTERRUNDR`) generate a maskable interrupt as soon as the EPPI identifies them and not at the next frame sync.

- If the frame sync has not arrived when the `EPPI_LINE` counter expires, then the `EPPI_STAT.LTERROVR` error is generated.
- When the `EPPI_LINE` counter is running and a frame sync is detected, the `EPPI_STAT.LTERRUNDR` error is generated. A W1C operation clears both interrupts.

Frame Track Errors

The frame track overflow (`EPPI_STAT.FTERROVR`) and underflow errors (`EPPI_STAT.FTERRUNDR`) generate a maskable interrupt as soon as the EPPI identifies them. When the `EPPI_FRAME.VALUE` counter expires, the `EPPI_STAT.FTERROVR` error is reported before the next frame sync arrives.

When the `EPPI_FRAME` counter is running and a frame sync is detected, then an `EPPI_STAT.FTERRUNDR` is reported.

Both errors generate an error interrupt. Perform a W1C operation to clear the interrupts at their respective locations in the status register.

A premature frame sync results in a frame track under run error. But, the error is logged (register bit set) only after the subsequent blanking period (if any) elapses.

Preamble Error Not Corrected Error

The EPPI supports data embedded frame syncs in ITU and SMPTE formats. In these formats, the module can receive an erroneous preamble which is not correctable. The `EPPI_STAT.ERRNCOR` error signals when this event occurs.

EPPI Programming Model

The following sections describe programming techniques, including receiving or transmitting ITU-R 656 frames; configuring transfers in GP0, GP1, GP2, and GP3 modes; and managing EPPI mode configurations.

Receiving ITU-R 656 Frames

The EPPI supports the reception of ITU-R 656 compliant frames.

1. Configure the EPPI to receive either full ITU-R 656 frame, active video, or blanking information by configuring the `EPPI_CTL.XFRTYPE` bits.
2. In both active video mode and in VBI (vertical blanking information) mode, specify the number of total (active plus vertical blanking) lines per frame in the `EPPI_FRAME` register. Specify the number of total (active plus horizontal blanking plus 8) samples per line in the `EPPI_LINE` register.
3. Configure DMA descriptors to move the data to memory.
4. Enable DMA.
5. Enable the EPPI.
6. To program the EPPI in internal clock mode, follow the procedure above with the `EPPI_CTL.ICLKGEN` bit =0. After enabling the EPPI, add a delay of 200 SCLK0 cycles (worst case) to ensure the EPPI FIFO becomes full. Then switch to internal clock mode by setting the `EPPI_CTL.ICLKGEN` bit =1.

Depending on the EPPI configuration, either the full ITU-R 656 frame is moved to memory or only the active video or only the blanking information.

Transmitting ITU-R 656 Frames in GP Transmit Modes

The EPPI can take active video from memory and generate the proper preambles and blanking information to produce valid ITU-R 656 video frames for transmission.

1. Provide active data frame in memory.
2. Set the `EPPI_CTL.BLANKGEN` bit so the EPPI generates blanking information.
3. Configure the `EPPI_FS1_WLHB`, `EPPI_FS1_PASPL`, `EPPI_FS2_WLVB`, `EPPI_FS2_PALPF` registers accordingly.
4. Configure the rest of the EPPI settings.
5. Configure DMA to fetch active frame data from memory buffers.
6. Enable DMA.
7. Enable the EPPI.
8. To program the EPPI in internal clock mode, follow the procedure above with the `EPPI_CTL.ICLKGEN` bit =0. After enabling the EPPI, add a delay of 200 SCLK0 cycles (worst case) to ensure the EPPI FIFO becomes full. Then switch to internal clock mode by setting the `EPPI_CTL.ICLKGEN` bit =1.

The EPPI takes the active data from memory, generates the blanking information, and transmits an ITU-R 656 frame

Configuring Transfers in GP 0 FS Mode

The EPPI can be configured to not use periodic frame syncs to frame the data.

1. Configure the EPPI to operate in GP 0 FS mode by setting `EPPI_CTL.XFRTYPE = b#11` and `EPPI_CTL.FSCFG = b#00`.
2. When receiving, configure the EPPI to trigger on internally or externally by setting the `EPPI_CTL.FLDSEL` field appropriately. When transmitting, the EPPI always generates a trigger internally.
3. Configure DMA to move the data to or from memory.
4. Enable DMA.
5. Enable EPPI.
6. To program the EPPI in internal clock mode, follow the procedure above with the `EPPI_CTL.ICLKGEN` bit =0. After enabling the EPPI, add a delay of 200 SCLK0 cycles (worst case) to ensure the EPPI FIFO becomes full. Then switch to internal clock mode by setting the `EPPI_CTL.ICLKGEN` bit =1.

The DMA descriptions control the amount of data transferred. The frame syncs from the EPPI do not control the amount.

Configuring Transfers in GP 1 FS Mode

The GP 1 FS mode is useful for interfacing the EPPI with analog-to-digital converters (ADCs), digital-to-analog converters (DACs), and other general-purpose devices. This mode works for both transmit and receive.

NOTE: The `EPPI_FRAME`, `EPPI_VDLY`, and `EPPI_VCNT` registers have no effect in GP 1 FS mode. As a result, frame track errors and vertical windowing are not possible in this mode.

1. Configure GP 1 FS mode by setting the `EPPI_CTL.XFRTYPE` bit =b#11 and the `EPPI_CTL.FSCFG` bit =b#01. An external device can provide the frame syncs or the EPPI can source the frame syncs.
2. Program the `EPPI_LINE` register to contain the number clock cycles expected between two assertions of the `EPPI_FS1` signal to monitor the line track errors. Program the `EPPI_LINE` register before the `EPPI_HCNT` register.
3. Program the `EPPI_HDLY` register to contain the number of clock cycles to wait after the assertion of `EPPI_FS1`. For example, the start of frame.
4. Program the `EPPI_HCNT` register to contain the number of data samples to receive or transmit for each frame.
5. Configure DMA to move the data to or from memory.
6. Enable DMA.
7. Enable the EPPI.
8. To program the EPPI in internal clock mode, follow the procedure above with the `EPPI_CTL.ICLKGEN` bit =0. After enabling the EPPI, add a delay of 200 SCLK0 cycles (worst case) to ensure the EPPI FIFO becomes full. Then, switch to internal clock mode by setting the `EPPI_CTL.ICLKGEN` bit =1.

Data moves in or out of memory. A frame sync frames the data for every line.

Configuring Transfers in GP 2 FS Mode

GP 2 FS mode is useful for video applications that use two hardware synchronization signals, HSYNC and VSYNC. The HSYNC connects to the `EPPI_FS1` signal and VSYNC connects to the `EPPI_FS2` signal.

1. Configure the EPPI to operate in GP 2 FS mode by setting the `EPPI_CTL.XFRTYPE` bit =b#11 and the `EPPI_CTL.FSCFG` bit =b#10. An external device can provide the frame syncs or the EPPI can source the frame syncs.
2. Program the `EPPI_FRAME` register to contain the number of expected lines per frame. The value can be equal to the number of `EPPI_FS1` signal assertions expected between the start of each frame sync. The EPPI uses the value to monitor frame track errors. Program the `EPPI_FRAME` register before the `EPPI_VCNT` register.
3. Program the `EPPI_LINE` register to contain the number of clock cycles expected between two assertions of the `EPPI_FS1` signal to monitor line track errors. Program the `EPPI_LINE` register before the `EPPI_HCNT` register.
4. Program the `EPPI_HDLY` register to configure the number of clock cycles to wait after the assertion of the `EPPI_FS1` signal. (For example, the start of the line).
5. Program the `EPPI_HCNT` register to contain the number of data samples to receive or transmit for each line.

6. Program the `EPPI_VDLY` register to contain the number of lines to wait after the start of frame is detected.
7. Program the `EPPI_VCNT` register to contain the number of lines to receive or transmit.
8. If setting up the EPPI for transmit, the data enable (DEN) pin behaves according to the enabling of the blanking generation and the data length setting (DLEN). See [Data Enable in General-Purpose 2 Frame Sync Transmit Mode](#) for more details.
9. Enable DMA.
10. Enable the EPPI.
11. To program the EPPI in internal clock mode, follow the procedure above with the `EPPI_CTL.ICLKGEN` bit =0. After enabling the EPPI, add a delay of 200 SCLK0 cycles (worst case) to ensure the EPPI FIFO becomes full. Then switch to internal clock mode by setting the `EPPI_CTL.ICLKGEN` bit =1.

Data moves in or out of memory. A frame sync frames the data for every line and frame.

Configuring Transfers in GP 3 FS Mode

GP 3 FS mode is useful for video applications that use three synchronization signals for hardware: HSYNC, VSYNC, and FIELD. The HSYNC connects to `EPPI_FS1`, VSYNC connects to `EPPI_FS2`, and FIELD connects to `EPPI_FS3`.

1. Configure the EPPI to operate in GP 3 FS mode by setting the `EPPI_CTL.XFRTYPE` bit =b#11 and the `EPPI_CTL.FSCFG` bit =b#11. An external device can provide the frame syncs or the EPPI can source the frame syncs.
2. Configure the windowing registers according to steps in GP 2 FS mode.
3. Enable DMA.
4. Enable the EPPI.
5. To program the EPPI in internal clock mode, follow the procedure above with the `EPPI_CTL.ICLKGEN` bit =0. After enabling the EPPI, add a delay of 200 SCLK0 cycles (worst case) to ensure the EPPI FIFO becomes full. Then switch to internal clock mode by setting the `EPPI_CTL.ICLKGEN` bit =1.

Data moves in or out of memory. A frame sync frames the data for every line and frame. Operation and result are similar to operation in GP 2 FS mode but the EPPI also uses the `EPPI_FS3` signal.

Configuring the EPPI to Use the Windowing Feature

Windowing is a useful feature for applications where the region of interest is smaller than the active video stream (for example, sensor calibration, auto-focusing, and others). It can result in significant DMA bandwidth reduction. The EPPI supports windowing for GP input modes.

1. Program the `EPPI_FRAME` register with the number of lines the frame contains.

2. Program the `EPPI_LINE` register with the number of samples per line in the frame.
3. Program the `EPPI_VDLY` register with the number of lines to wait after the start of a new frame before starting to read or transmit data.
4. Program the `EPPI_VCNT` register with the number of lines to read in or write out after `EPPI_VDLY` number of lines from the start of the frame.
5. Program the `EPPI_HDLY` register with the number of clock cycles to delay after the assertion of `EPPI_FS1` is detected for the start of a new line.
6. Program the `EPPI_HCNT` register with the number of samples to read in or write out after `EPPI_HDLY` number of cycles have expired since the assertion of `EPPI_FS1`.

EPPI Mode Configuration

This section describes EPPI mode configurations, including support for all EPPI transmit and receive modes.

Configuring 8-Bit Receive Mode

For 8-bit non-split receive mode and if `EPPI_CTL.PACKEN = 1`, the EPPI packs 4 bytes of incoming data into a 32-bit word. Alternate even or odd samples can be skipped based on the `EPPI_CTL.SKIPEN` and `EPPI_CTL.SKIPEO` bits. The first incoming data can be placed either in the least significant bit positions or in the most significant bit positions, based on the `EPPI_CTL.SWAPEN` bit setting.

Table 19-13: 8-Bit Receive Mode with Packing Enabled

Pin Data (8 bits)	DMA DATA SKIPEN=0 SKIPEO=X SWAPEN=0 SIGNEXT=X	DMA DATA SKIPEN=0 SKIPEO=X SWAPEN=1 SIGNEXT=X	DMA DATA SKIPEN=1 SKIPEO=1 SWAPEN=0 SIGNEXT=X	DMA DATA SKIPEN=1 SKIPEO=0 SWAPEN=0 SIGNEXT=X	DMA DATA SKIPEN=1 SKIPEO=1 SWAPEN=1 SIGNEXT=X	DMA DATA SKIPEN=1 SKIPEO=0 SWAPEN=1 SIGNEXT=X
0x11						
0x22						
0x33						
0x44	0x4433 2211	0x1122 3344

0xFF			0xFFDD BB99		0x99BB DDFF	
0x00	0x00FF EEDD	0xDDE EFF00		0x00EE CCAA		0xAACC EE00

If `EPPI_CTL.PACKEN=0`, the DMA is a 16-bit DMA and the EPPI either sign-extends or zero-fills the bytes of incoming data into a 16-bit word. The `EPPI_CTL.SWAPEN` bit has no effect if `EPPI_CTL.PACKEN=0`.

Table 19-14: 8-Bit Receive Mode with Packing Disabled

Pin Data (8 bits)	DMA DATA SKIPEN=0 SKIPEO=X SWAPEN=X SIGNEXT=0	DMA DATA SKIPEN=0 SKIPEO=X SWAPEN=X SIGNEXT=1	DMA DATA SKIPEN=1 SKIPEO=1 SWAPEN=X SIGNEXT=0	DMA DATA SKIPEN=1 SKIPEO=0 SWAPEN=X SIGNEXT=1

0xBB	0x00BB	0xFFBB		0xFFBB

Configuring 10/12/14-Bit Receive Modes

For 10, 12, or 14-bit non-split receive modes, the EPPI first either zero-fills or sign-extends the incoming data into a 16-bit word. The action depends on the setting of the `EPPI_CTL.SIGNEXT` bit. If `EPPI_CTL.PACKEN=1`, the EPPI then packs two of these words into one 32-bit word. Alternate even or odd samples can be skipped based on the `EPPI_CTL.SKIPEN` and `EPPI_CTL.SKIPEO` bits. The first incoming data can be placed either in the least significant bit positions or in the most significant bit positions, based on the `EPPI_CTL.SWAPEN` bit setting.

Configuring 16-Bit Receive Mode

For 16-bit non-split receive mode, if `EPPI_CTL.PACKEN = 1`, the EPPI packs two 16-bit incoming data into one 32-bit word. Alternate even or odd samples can be skipped based on the `EPPI_CTL.SKIPEN` and

EPPI_CTL.SKIPED bits. The first incoming data can be placed either in the least significant bit positions or in the most significant bit positions, based on the EPPI_CTL.SWAPEN bit setting.

Configuring 18-Bit Receive Mode

For 18-bit non-split receive mode, if EPPI_CTL.PACKEN =0, the EPPI zero-fills or sign-extends the incoming data into a 32-bit word. If EPPI_CTL.PACKEN =1, the EPPI first zero-fills or sign-extends the incoming data to 24 bits, and then packs four such 24-bit data words into three 32-bit words. Alternate even or odd samples can be

skipped based on the `EPPI_CTL.SKIPEN` and `EPPI_CTL.SKIPEO` bits. The `EPPI_CTL.SWAPEN` bit has no effect.

Table 19-21: 18-bit Receive Mode with Packing Disabled

Configuring 8-Bit Split Receive Mode

For 8-bit split receive mode, the `EPPI_CTL.PACKEN` and `EPPI_CTL.SIGNEXT` bits are not valid. The EPPI always packs 4 bytes of data into one 32-bit word.

Table 19-23: 8-bit Split Receive Mode with SKIPEN = 0 and SWAPEN = 0

When the bits settings are EPPI_CTL.SPLTEO = 1, EPPI_CTL.SUBSPLTODD = 1 and EPPI_CTL.DMACFG = 0, the EPPI packs the second Chroma component sent over the DMA bus completely before the Luma component. However, it is intentionally held until that previous word is moved out. This functionality allows the separation of Luma and Chroma values into individual buffers when using 2D-DMA. The second Chroma component is U₀U₁U₂U₃ in the *8-bit Split Receive Mode with SKIPEN = 0 and SWAPEN = 0* and *8-bit Split Receive Mode with SKIPEN = 0 and SWAPEN = 1* tables. The Luma component is Y₄Y₅Y₆Y₇ in the *8-bit Split Receive Mode with SKIPEN = 0 and SWAPEN = 1* table.

Configuring 10/12/14/16-Bit Split Receive Mode with SPLTWRD=0

For 16-bit split receive mode, the `EPPI_CTL.PACKEN` bit is not valid. The EPPI always packs two 16-bit words into one 32-bit word. For 10, 12, or 14-bit split receive modes, the EPPI first either sign-extends or zero-fills the incoming data into a 16-bit word. The EPPI then packs two of these words into one 32-bit word to send to the DMA.

Configuring 16-Bit Split Receive Mode with SPLITWRD=1

For 16-bit split receive mode, the EPPI_CTL.PACKEN bit is not valid. The EPPI always packs two 16-bit words into one 32-bit word. The EPPI_CTL.SPLITWRD bit is only valid when the EPPI_CTL.DLEN bit =16 bits.

Configuring 8-Bit Transmit Mode

For 8-bit non-split transmit mode, if the EPPI_CTL.PACKEN bit =1, the DMA is a 32-bit DMA and the EPPI unpacks the 32-bit word from memory into 4 bytes to transmit. The EPPI transmits either the MSBs or the LSBs as the first data, depending on the EPPI_CTL.SWAPEN bit setting. If EPPI_CTL.PACKEN =0, the DMA is a 16-bit DMA and the EPPI transmits the lower 8 bits. The EPPI_CTL.SWAPEN bit has no effect when EPPI_CTL.PACKEN =0.

Table 19-28: 8-bit Transmit Mode with Packing Enabled

DMA Data (32 bits)	Pin Data when SWAPEN=0	Pin Data when SWAPEN=1
0x11223344	0x44	0x11
0x55667788	0x33	0x22
	0x22	0x33
	0x11	0x44
	0x88	0x55
	0x77	0x66
	0x66	0x77

Table 19-28: 8-bit Transmit Mode with Packing Enabled (Continued)

DMA Data (16 bits)	Pin Data SWAPEN=X
0x1234	0x34
0x2345	0x45
0x3456	0x56

Configuring 10/12/14-Bit Transmit Modes

For 10, 12, or 14-bit non-split transmit modes, if the `EPPI_CTL.PACKEN` bit =1, the DMA is a 32-bit DMA. The EPPI unpacks the 32-bit word from memory into two 16-bit data words. The EPPI then transmits the required LSBs from each data word. The EPPI transmits either the most significant word or the least significant word as the first data, depending on the `EPPI_CTL.SWAPEN` bit setting. If `EPPI_CTL.PACKEN` =0, the DMA is a 16-bit DMA and the EPPI transmits the required LSBs. The `EPPI_CTL.SWAPEN` bit has no effect when the `EPPI_CTL.PACKEN` bit =0.

Table 19-30: 10-bit Transmit Mode with Packing Enabled

DMA Data (32 bits)	Pin Data when SWAPEN=0	Pin Data when SWAPEN=1
0x1111 2222	0x222	0x111
0x3333 4444	0x111	0x222
	0x044	0x333
	0x333	0x044

Table 19-31: 10-bit Transmit Mode with Packing Disabled

DMA Data (16 bits)	Pin Data SWAPEN=X
0x1234	0x234
0x2345	0x345
0x3456	0x056
0x4567	0x167

Configuring 16-Bit Transmit Mode

For 16-bit non-split transmit mode, if the `EPPI_CTL.PACKEN` bit =1, the DMA is a 32-bit DMA. The EPPI unpacks the 32-bit word from memory into two 16-bit data words to transmit. The EPPI transmits either the MSBs or the LSBs as the first data, depending on the `EPPI_CTL.SWAPEN` bit setting. If the `EPPI_CTL.PACKEN` bit =0, the DMA is a 16-bit DMA and the EPPI transmits the data as is. The `EPPI_CTL.SWAPEN` has no effect when `EPPI_CTL.PACKEN` bit =0.

Table 19-32: 16-bit Transmit Mode with Packing Enabled

DMA Data (32 bits)	Pin Data when SWAPEN=0	Pin Data when SWAPEN=1
0x1111 2222	0x2222	0x1111
0x3333 4444	0x1111	0x2222
	0x4444	0x3333
	0x3333	0x4444

Table 19-33: 16-bit Transmit Mode with Packing Disabled

DMA Data (16 bits)	Pin Data SWAPEN=X
0x1234	0x1234
0x2345	0x2345
0x3456	0x3456

Configuring 18-Bit Transmit Mode

For 18-bit transmit mode, if the `EPPI_CTL.PACKEN` bit =1, the DMA is a 32-bit DMA and the EPPI unpacks the 32-bit word from memory. In this mode, when `EPPI_CTL.RGBFMTEN` is set, the least significant 2 bits of R, G, and B are dropped.

Table 19-34: 18-bit Transmit Mode with Packing Enabled

DMA Data	Pin Data (18-bits)	
	RGBFMTEN=0	RGBFMTEN=1
0x0123 4567	0x3 4567	0x0 8459
0x89AB CDEF	0x1 EF01	0x3 3EC0
0x0123 4567	0x3 89AB	0x1 98AA
	0x1 2345	0x0 0211

Table 19-35: 18-bit Transmit Mode with Packing Disabled

Configuring 10/12/14/16-Bit Transmit Mode with SPLTWRD=0

For 16-bit split transmit mode, the EPPI_CTL.PACKEN bit is not valid. The EPPI always unpacks the 32-bit DMA data into two 16-bit words to transmit. For 10, 12, or 14-bit split transmit modes, the EPPI first unpacks the data in the same way as for 16-bit transmit mode. But, the EPPI transmits only the required number of LSBs.

Table 19-40: 16-bit Split Transmit Mode with SPLTEO = 1, SUBSPLTODD = 0, and SWAPEN = 0

EPPI Programming Concepts

This section provides information on SMPTE programming.

SMPTE Modes Programming

The programming model of SMPTE modes is similar to ITU Modes. All programming modes pertaining to ITU modes like XFRTYPE, FSCFG, FLDSEL, and BLANKGEN hold true for SMPTE modes as well. The only difference is that since ITU modes use Y-Cr/Cb interleaved data and SMPTE use parallel Y-Cr/Cb data, SPLTWDR could be set while operating in SMPTE modes. The *Programming Modes for SMPTE Formats* table describes the programming modes for different SMPTE formats.

Table 19-46: Programming Modes for SMPTE Formats

SMPTE Format	SMPTE Channel Width	EPPI Input Bit Width	EPPI Mode	Remarks
296M	8	16 Cr/Cb - [15:8] Y - [7:0]	DLEN = 16 bits SPLTWDR = 1	SIGNEXT not supported
	8	16 Cr/Cb - [15:8] Y - [7:0]	DLEN = 16 bits SPLTWDR = 1	SIGNEXT not supported

ADSP-2159x EPPI Register Descriptions

Enhanced Parallel Peripheral Interface (EPPI) contains the following registers.

Table 19-47: ADSP-2159x EPPI Register List

Name	Description
EPPI_CLKDIV	Clock Divide Register
EPPI_CTL	Control Register
EPPI_CTL2	Control Register 2 Register
EPPI_EVENCLIP	Clipping Register for EVEN (Luma) Data Register
EPPI_FRAME	Lines Per Frame Register
EPPI_FS1_DLY	Frame Sync 1 Delay Value Register
EPPI_FS1_PASPL	FS1 Period Register / EPPI Active Samples Per Line Register
EPPI_FS1_WLHB	FS1 Width Register / EPPI Horizontal Blanking Samples Per Line Register
EPPI_FS2_DLY	Frame Sync 2 Delay Value Register
EPPI_FS2_PALPF	FS2 Period Register / EPPI Active Lines Per Field Register
EPPI_FS2_WLVB	FS2 Width Register / EPPI Lines Of Vertical Blanking Register
EPPI_HCNT	Horizontal Transfer Count Register
EPPI_HDLY	Horizontal Delay Count Register
EPPI_IMSK	Interrupt Mask Register
EPPI_LINE	Samples Per Line Register
EPPI_ODDCLIP	Clipping Register for ODD (Chroma) Data Register
EPPI_STAT	Status Register
EPPI_VCNT	Vertical Transfer Count Register
EPPI_VDLY	Vertical Delay Count Register

Clock Divide Register

The `EPPI_CLKDIV` register provides the divisor for EPPI internal clock generation. The generated clock frequency is given by following formula:

$$\text{EPPI_CLK} = (\text{SCLK0}) / (\text{EPPI_CLKDIV} + 1)$$

Note that a value of 0xFFFF is invalid for the `EPPI_CLKDIV` register.

Figure 19-11: EPPI_CLKDIV Register Diagram

Table 19-48: EPPI_CLKDIV Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15:0 (R/W)	VALUE	Internal Clock Divider.

Control Register

The `EPPI_CTL` register configures the EPPI for operating mode, control signal polarities, and data width of the port.

Figure 19-12: EPPI_CTL Register Diagram

Table 19-49: EPPI_CTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W)	CLKGATEN	Clock Gating Enable. The EPPI_CTL.CLKGATEN bit enables using the EPPI_FS3 pin as a clock gating pin. When EPPI_CTL.CLKGATEN is set, the EPPI_FS3 pin acts as a clock gating signal, and both the internal and external clock are gated. Note that the EPPI_FS3 pin gating signal is active low, and the EPPI_CTL.CLKGATEN selection is ignored if EPPI_CTL.MUXSEL is set or EPPI_CTL.FSCFG equals 0x3.
		0 Disable
		1 Enable
30 (R/W)	MUXSEL	MUX Select. The EPPI_CTL.MUXSEL bit enables multiplexing of a primary and alternate camera using the EPPI main data and clock lines. For more information on this feature, see the EPPI functional description.
		0 Normal Operation
		1 Multiplexed Operation
29 (R/W)	DMAFINEN	DMA Finish Enable. The EPPI_CTL.DMAFINEN bit selects whether or not the EPPI sends a finish command (010) through the DDE COMMAND line soon after a frame/line is received completely.
		0 No Finish Command
		1 Enable Send Finish Command
28 (R/W)	DMACFG	One or Two DMA Channels Mode. The EPPI_CTL.DMACFG bit is valid only if EPPI_CTL.SPLTEO is set. If EPPI_CTL.DMACFG is set, the EPPI uses two DMA channels. And, if EPPI_CTL.DMACFG is cleared, the EPPI uses only one DMA channel.
		0 PPI Uses One DMA Channel
		1 PPI Uses Two DMA Channels
27 (R/W)	RGBFMTEN	RGB Formatting Enable. For 16- or 18-bit transmit modes only, the EPPI_CTL.RGBFMTEN bit enables conversion of RGB888 from memory into RGB666 output data (18-bit transmit) or enables conversion of RGB888 from memory into RGB565 output data (16-bit transmit). Note that EPPI_CTL.SPLTEO and EPPI_CTL.RGBFMTEN should never be set simultaneously.
		0 Disable RGB Formatted Output
		1 Enable RGB Formatted Output

Table 19-49: EPPI_CTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration												
26 (R/W)	SPLTWRD	Split Word. The EPPI_CTL.SPLTWRD bit selects split word data placement when the data length (EPPI_CTL.DLEN) selects 16-, 20-, or 24-bit data words. For all other EPPI_CTL.SPLTWRD values, the set or clear selections for EPPI_CTL.SPLTWRD produce the same result (act as though EPPI_CTL.SPLTWRD is cleared). For EPPI_CTL.SPLTWRD set, the EPPI_CTL.DLEN values below result in the following combinations of split words: <table><tr><td>DLEN</td><td>Cr/Cb data</td><td>Y data</td></tr><tr><td>16</td><td>PPI_DATA[15:8]</td><td>PPI_DATA[7:0]</td></tr><tr><td>20</td><td>PPI_DATA[19:10]</td><td>PPI_DATA[9:0]</td></tr><tr><td>24</td><td>PPI_DATA[23:12]</td><td>PPI_DATA[11:0]</td></tr></table>	DLEN	Cr/Cb data	Y data	16	PPI_DATA[15:8]	PPI_DATA[7:0]	20	PPI_DATA[19:10]	PPI_DATA[9:0]	24	PPI_DATA[23:12]	PPI_DATA[11:0]
		DLEN	Cr/Cb data	Y data										
		16	PPI_DATA[15:8]	PPI_DATA[7:0]										
		20	PPI_DATA[19:10]	PPI_DATA[9:0]										
24	PPI_DATA[23:12]	PPI_DATA[11:0]												
0	PPI_DATA has (DLEN-1) bits of Y or Cr or Cb													
1	PPI_DATA Contains 2 Elements per Word													
25 (R/W)	SUBSPLTODD	Sub-Split Odd Samples. The EPPI_CTL.SUBSPLTODD bit is valid only if EPPI_CTL.SPLTEO is set. If EPPI_CTL.SUBSPLTODD is set, the EPPI sub-splits the odd sub-stream, and packs them separately.												
		0	Disable											
		1	Enable											
24 (R/W)	SPLTEO	Split Even and Odd Data Samples. If EPPI_CTL.SPLTEO is set, the EPPI splits the incoming data stream into two sub-streams, an even stream and an odd stream, and packs them separately.												
		0	Do Not Split Samples											
		1	Split Even/Odd Samples											
23 (R/W)	SWAPEN	Swap Enable. The EPPI_CTL.SWAPEN selects whether or not to swap the order of the first data (most-significant bits versus least-significant bits) of the DMA word. For receive modes, the EPPI puts the first data in the most significant bits (if set) or puts the first data in the least significant bits (if cleared) of the DMA word. For transmit modes, the EPPI transmits the most significant bits in the DMA word as the first data (if set) or transmits the least significant bits in the DMA word as the first data (if cleared).												
		0	Disable											
		1	Enable											

Table 19-49: EPPI_CTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration																								
22 (R/W)	PACKEN	Pack/Unpack Enable. The EPPI_CTL . PACKEN select whether or not packing is enabled (for receive modes) and unpacking is enabled (for transmit modes). When this bit is set, EPPI transfer DMA is 32-bits wide. When this bit is cleared and the EPPI_CTL . DLEN is less than or equal to 16 bits, EPPI transfer DMA is 16-bits wide. For receive modes, if this bit is set, then the EPPI packs the incoming data into 32-bit words. If this bit is cleared, then the EPPI does not do any packing. For transmit modes, if this bit is set, then the EPPI always unpacks the 32-bit data from DMA. If this bit is not set, the EPPI does not do any unpacking.																								
		0 Disable																								
		1 Enable																								
21 (R/W)	SKIPEO	Skip Even or Odd. The EPPI_CTL . SKIPEO bit selects whether even (if set) or odd (if cleared) samples are skipped if sample skipping is enabled (EPPI_CTL . SKIPEN is set). This feature only is useful for receive modes.																								
		0 Skip Odd Samples																								
		1 Skip Even Samples																								
20 (R/W)	SKIPEN	Skip Enable. The EPPI_CTL . SKIPEN bit enables skipping alternate samples. This feature only is useful for receive modes.																								
		0 No Samples Skipping																								
		1 Skip Alternate Samples																								
19 (R/W)	DMIRR	Data Mirroring. The EPPI_CTL . DMIRR field enables mirroring (bit reversing) of the data coming in or going out on the EPPI data pins. <table><tr><td>Pin</td><td>PPI Data</td><td>PPI Data</td></tr><tr><td>Data</td><td>(DAT_MRR=0)</td><td>(DAT_MRR=1)</td></tr><tr><td colspan="3">-----</td></tr><tr><td>15</td><td>15</td><td>0</td></tr><tr><td>14</td><td>14</td><td>1</td></tr><tr><td>....</td><td>....</td><td>....</td></tr><tr><td>1</td><td>1</td><td>14</td></tr><tr><td>0</td><td>0</td><td>15</td></tr></table>	Pin	PPI Data	PPI Data	Data	(DAT_MRR=0)	(DAT_MRR=1)	-----			15	15	0	14	14	1				1	1	14	0	0	15
		Pin	PPI Data	PPI Data																						
		Data	(DAT_MRR=0)	(DAT_MRR=1)																						

15	15	0																								
14	14	1																								
....																										
1	1	14																								
0	0	15																								
0 No Data Mirroring																										
1 Data Mirroring																										
18:16 (R/W)	DLEN	Data Length. The EPPI_CTL . DLEN bits select the data length for the EPPI. Note that the 20 bits data length selection is valid only for SMPTE modes (EPPI_CTL . SPLTWRD set).																								

Table 19-49: EPPI_CTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration	
		0	8 bits
		1	10 bits
		2	12 bits
		3	14 bits
		4	16 bits
		5	18 bits
		6	20 bits
		7	24 bits
15:14 (R/W)	POLS	Frame Sync Polarity. The EPPI_CTL.POLS selects whether the frame syncs' polarity is active low versus active high.	
		0	FS1 and FS2 are active high
		1	FS1 is active low. FS2 is active high
		2	FS1 is active high. FS2 is active low
		3	FS1 and FS2 are active low
13:12 (R/W)	POLC	Clock Polarity. The EPPI_CTL.POLC selects the rising versus falling edge for sampling data and sampling/driving syncs.	
		0	Clock/Sync Polarity Mode 0. For receive mode: Sample data on falling edge and sample/drive syncs on falling edge. For transmit mode: Drive data on rising edge and sample/drive syncs on rising edge.
		1	Clock/Sync Polarity Mode 1. For receive mode: Sample data on falling edge and sample/drive syncs on rising edge. For transmit mode: Drive data on rising edge and sample/drive syncs on falling edge.
		2	Clock/Sync Polarity Mode 2. For receive mode: Sample data on rising edge and sample/drive syncs on falling edge. For transmit mode: Drive data on falling edge and sample/drive syncs on rising edge.
		3	Clock/Sync Polarity Mode 3. For receive mode: Sample data on rising edge and sample/drive syncs on rising edge. For transmit mode: Drive data on falling edge and sample/drive syncs on falling edge.

Table 19-49: EPPI_CTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
11 (R/W)	SIGNEXT	Sign Extension. The EPPI_CTL.SIGNEXT select whether (for receive modes when EPPI_CTL.DLEN selecting 16 bit data length) the data is sign extended or zero filled. Not that EPPI_CTL.SPLTWRD is removed from this shared bit.
		0 Zero Filled
		1 Sign Extended
10 (R/W)	IFSGEN	Internal Frame Sync Generation. The EPPI_CTL.IFSGEN bit selects whether the frame syncs are generated internally or are supplied by an external device.
		0 External Frame Sync
		1 Internal Frame Sync
9 (R/W)	ICLKGEN	Internal Clock Generation. The EPPI_CTL.ICLKGEN bit selects whether the EPPI_CLK is generated internally or is supplied by an external device.
		0 External Clock
		1 Internal Clock
8 (R/W)	BLANKGEN	Blanking Generation (ITU Output Mode). The EPPI_CTL.BLANKGEN enables ITU output with internal blanking. In GP 8, 10 transmit bit modes (when EPPI_CTL.SPLTWRD is cleared) and 16-, 20-, and 24-bit transmit modes (when EPPI_CTL.SPLTWRD is set), EPPI_CTL.BLANKGEN selects whether or not the EPPI generates blanking and generates preamble and insertion with active data from memory.
		0 Disable
		1 Enable
7 (R/W)	ITUTYPE	ITU Interlace or Progressive. The EPPI_CTL.ITUTYPE selects interlaced or progressive operation for ITU656 mode. This selection is valid for both TX and RX modes.
		0 Interlaced
		1 Progressive

Table 19-49: EPPI_CTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
6 (R/W)	FLDSEL	Field Select/Trigger. The EPPI_CTL.FLDSEL bits configure the EPPI field and trigger selection. These are valid for GP modes (EPPI_CTL.XFRTYPE = 0x3) and ITU656 active video mode (EPPI_CTL.XFRTYPE cleared).
		0 Field Mode 0. Read field 1 (for ITU656 active video mode). Set internal trigger (for GP RX mode). FS3 is toggled on FS2 assertion followed by FS1 assertion (when the EPPI_CTL.FSCFG bit selects sync mode 3 and the EPPI_CTL.IFSGEN bit selects internal frame sync).
		1 Field Mode 1 Read field 1 and field 2 (ITU656 active video mode). Set external trigger (GP RX mode). FS3 is toggled on FS2 assertion (when the EPPI_CTL.FSCFG bit selects sync mode 3 and the EPPI_CTL.IFSGEN bit selects internal frame sync).
5:4 (R/W)	FSCFG	Frame Sync Configuration. The EPPI_CTL.FSCFG bits configure the EPPI frame syncs. These are valid only for GP modes (EPPI_CTL.XFRTYPE = 0x3). The output of the frames syncs also depends on whether the EPPI transfer direction is transmit and the EPPI is in ITU output mode (EPPI_CTL.BLANKGEN is set).
		0 Sync Mode 0. FS0 driven in GP mode. FS0 not driven in ITU output mode.
		1 Sync Mode 1. FS1 driven in GP mode. HSYNC driven on FS1 in ITU output mode.
		2 Sync Mode 2. FS2 driven in GP mode. HSYNC driven on FS1 and VSYNC driven on FS1 in ITU output mode.
		3 Sync Mode 3. FS3 driven in GP mode. HSYNC driven on FS1, VSYNC driven on FS2, and FIELD driven on FS3 in ITU output mode.

Table 19-49: EPPI_CTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
3:2 (R/W)	XFRTYPE	Transfer Type (Operating Mode). The EPPI_CTL.XFRTYPE bits select the EPPI operating mode. In receive mode (EPPI_CTL.DIR cleared), the EPPI modes include ITU656 active video only mode, ITU656 entire field mode, ITU656 vertical blanking only mode, and non-ITU656 mode (GP mode). For transmit mode (EPPI_CTL.DIR set), the EPPI_CTL.XFRTYPE bits have no effect, and the EPPI (in transmit mode) is always in GP mode.
		0 ITU656 Active Video Only Mode
		1 ITU656 Entire Field Mode
		2 ITU656 Vertical Blanking Only Mode
		3 Non-ITU656 Mode (GP Mode)
1 (R/W)	DIR	PPI Direction. The EPPI_CTL.DIR bit selects whether the EPPI is in receive mode (if cleared) or in transmit mode (if set).
		0 Receive Mode
		1 Transmit Mode
0 (R/W)	EN	PPI Enable. The EPPI_CTL.EN bit enables or disables the EPPI.
		0 Disable
		1 Enable

Control Register 2 Register

The `EPPI_CTL2` register controls HSYNC finish signal generation.

Figure 19-13: EPPI_CTL2 Register Diagram

Table 19-50: EPPI_CTL2 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
1 (R/W)	FS1FINEN	HSYNC Finish Enable. The <code>EPPI_CTL2.FS1FINEN</code> bit selects whether (if set) the EPPI sends a finish command (010) through the DDE COMMAND line soon after a LINE is received completely or (if cleared) the EPPI sends a finish command (010) through the DDE COMMAND line soon after a FRAME is received completely. Note that the <code>EPPI_CTL.DMAFINEN</code> bit must be set for the EPPI to generate either of the finish commands.
		0 Finish sent after frame RX done. PPI sends a finish command (010) through the DDE COMMAND line soon after a FRAME is received completely
		1 Finish sent after frame/line RX done. PPI sends a finish command (010) through the DDE COMMAND line soon after a frame/line is received completely.

Clipping Register for EVEN (Luma) Data Register

The `EPPI_EVENCLIP` register selects the clipping threshold for luma data, which provides clipping of individual video components.

The high even and low even spaces in `EPPI_EVENCLIP` are 16-bits wide and (depending on the `EPPI_CTL.DLEN` bit selection) only the corresponding video component bits are considered for clipping.

For example, if the EPPI is programmed in 10-bit mode, bits [9:0] and bits [25:16] constitute the clipping thresholds. The higher bits are (in this case) ignored.

Using this method, 8-, 10-, 12- and 16-bit clipping thresholds can be set.

Note that when the EPPI is programmed in 16-, 20-, or 24-bit mode with the `EPPI_CTL.SPLTWRD` bit set, the luma data gets the clipping threshold levels of the `EPPI_EVENCLIP` register, and the chroma data gets the clipping threshold levels of the `EPPI_ODDCLIP` register.

Also, note that the `EPPI_EVENCLIP` and `EPPI_ODDCLIP` registers are ignored when the `EPPI_CTL.RGBFMTEN` bit is set.

Figure 19-14: EPPI_EVENCLIP Register Diagram

Table 19-51: EPPI_EVENCLIP Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:16 (R/W)	HIGHEVEN	High Even Clipping Threshold (Luma Data). The <code>EPPI_EVENCLIP.HIGHEVEN</code> bit field selects the clipping threshold for luma data. The high even spaces are 16-bits wide and (depending on the <code>EPPI_CTL.DLEN</code> selection) only the corresponding video component bits are considered for clipping.
15:0 (R/W)	LOWEVEN	Low Even Clipping Threshold (Luma Data). The <code>EPPI_EVENCLIP.LOWEVEN</code> bit field selects the clipping threshold for luma data. The low even spaces are 16-bits wide and (depending on the <code>EPPI_CTL.DLEN</code> selection) only the corresponding video component bits are considered for clipping.

Lines Per Frame Register

The EPPI_FRAME register tracks the frame track overflow and underflow errors. This register should be programmed with the number of lines expected per frame. Any write to the EPPI_FRAME register will also write the same value to the EPPI_VCNT register. But, any write to the EPPI_VCNT register does not affect the EPPI_FRAME register value. So the EPPI_FRAME register should be programmed before the EPPI_VCNT register.

Figure 19-15: EPPI_FRAME Register Diagram

Table 19-52: EPPI_FRAME Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15:0 (R/W)	VALUE	Lines Per Frame. The EPPI_FRAME.VALUE holds the number of lines expected per frame of data.

Frame Sync 1 Delay Value Register

The `EPPI_FS1_DLY` register selects the delay count (based on the period of the `EPPI_CLK` clock) between the first rising edge of `EPPI_CLK` after the EPPI is enabled and the first active edge of the associated frame sync when the internal frame sync is used.

Note that if the `EPPI_FS1_DLY` or `EPPI_FS2_DLY` registers are programmed with value 0, the EPPI operates as though 0 value is 1, and the first frame sync transition occurs after the completion of one period value of the respective counters.

Figure 19-16: EPPI_FS1_DLY Register Diagram

Table 19-53: EPPI_FS1_DLY Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	FS1_DLY	Frame Sync 1 Delay Count. The <code>EPPI_FS1_DLY.FS1_DLY</code> bit field selects the delay count.

FS1 Period Register / EPPI Active Samples Per Line Register

The `EPPI_FS1_PASPL` register content varies depending on whether the EPPI is in GP1/2/3 FS modes or in GP transmit mode.

In GP 1, 2, or 3 FS modes, the `EPPI_FS1_PASPL` register is used for the generation of frame sync 1. The register contains the period required for `EPPI_FS1` based on the `EPPI_CLK` clock.

In GP transmit mode with the `EPPI_CTL.BLANKGEN` bit set, this register contains the number of samples of active video or vertical blanking samples per line. When used for blanking generation, only the lower 16 bits are valid.

Note that a value of 0 for this register is illegal. If programmed as 0, the EPPI regards the `EPPI_FS1_PASPL` register as containing 1.

Figure 19-17: `EPPI_FS1_PASPL` Register Diagram

Table 19-54: `EPPI_FS1_PASPL` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	Frame Sync Period or Samples Number. In GP 1, 2, or 3 FS modes, the <code>EPPI_FS1_PASPL.VALUE</code> bit field is used for the generation of frame sync 1 and contains the period required for <code>EPPI_FS1</code> based on the <code>EPPI_CLK</code> clock. In GP transmit mode with the <code>EPPI_CTL.BLANKGEN</code> bit set, this bit field contains the number of samples of active video or vertical blanking samples per line.

FS1 Width Register / EPPI Horizontal Blanking Samples Per Line Register

The `EPPI_FS1_WLHB` register's content varies depending on whether the EPPI is in GP1/2/3 FS modes or in GP transmit mode.

In GP 1, 2 or 3 FS modes, `EPPI_FS1_WLHB` is used for the generation of frame sync 1. The register contains the width required for `EPPI_FS1` based on the `EPPI_CLK` clock.

In GP transmit mode with the `EPPI_CTL.BLANKGEN` bit set, this register contains the number of samples of horizontal blanking per line. When used for blanking generation, only the lower 16 bits are valid.

Note that a value of 0 for the `EPPI_FS1_WLHB` register is illegal. If programmed as 0, the EPPI regards the `EPPI_FS1_WLHB` register as containing 1.

Figure 19-18: EPPI_FS1_WLHB Register Diagram

Table 19-55: EPPI_FS1_WLHB Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	Frame Sync Width or Blanking Samples Number. The <code>EPPI_FS1_WLHB.VALUE</code> bit field content varies depending on whether the EPPI is in GP1/2/3 FS modes or in GP transmit mode. In GP 1, 2 or 3 FS modes, the <code>EPPI_FS1_WLHB.VALUE</code> bit field is used for the generation of frame sync 1. The register contains the width required for <code>EPPI_FS1</code> based on the <code>EPPI_CLK</code> clock. In GP transmit mode with <code>EPPI_CTL.BLANKGEN</code> set, this bit field contains the number of samples of horizontal blanking per line.

Frame Sync 2 Delay Value Register

The `EPPI_FS2_DLY` register selects the delay count (based on the period of the `EPPI_CLK` clock) between the first rising edge of `EPPI_CLK` after EPPI enabled and the first active edge of the associated frame sync when the internal frame sync is used.

Note that if the `EPPI_FS1_DLY` or `EPPI_FS2_DLY` registers are programmed with the value 0, the EPPI operates as though 0 value is 1, and the first frame sync transition occurs after the completion of one period value of the respective counters.

Figure 19-19: EPPI_FS2_DLY Register Diagram

Table 19-56: EPPI_FS2_DLY Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	FS2_DLY	Frame Sync 2 Delay Count. The <code>EPPI_FS2_DLY.FS2_DLY</code> bit field selects the delay count.

FS2 Period Register / EPPI Active Lines Per Field Register

The `EPPI_FS2_PALPF` register content varies depending on whether the EPPI is in GP2/3 FS modes or in GP transmit mode.

In GP 2 or 3 FS modes, `EPPI_FS2_PALPF` is used for the generation of frame sync 2. This register contains the period required for `EPPI_FS2` based on the `EPPI_CLK` clock.

In GP transmit mode with the `EPPI_CTL.BLANKGEN` bit set, this register contains the number of lines of active video per field.

Note that a value of 0 for the `EPPI_FS2_PALPF.F1ACT` or `EPPI_FS2_PALPF.F2ACT` bits is illegal. If either is programmed as 0, the EPPI regards the 0 value fields as containing 1.

Also, note that for progressive video, the `EPPI_FS2_PALPF.F2ACT` bit is ignored.

Figure 19-20: `EPPI_FS2_PALPF` Register Diagram

Table 19-57: `EPPI_FS2_PALPF` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:16 (R/W)	F2ACT	Field 2 Active. The <code>EPPI_FS2_PALPF.F2ACT</code> bit field contains the number of lines of active data in field 2.
15:0 (R/W)	F1ACT	Field 1 Active. The <code>EPPI_FS2_PALPF.F1ACT</code> bit field contains the number of lines of active data in field 1.

FS2 Width Register / EPPI Lines Of Vertical Blanking Register

The `EPPI_FS2_WLVB` register content varies depending on whether the EPPI is in GP2/3 FS modes or in GP transmit mode.

In GP 2 or 3 FS modes, the `EPPI_FS2_WLVB` register is used for the generation of frame sync 2. The register contains the width required for `EPPI_FS2` based on the `EPPI_CLK` clock.

In GP transmit mode with the `EPPI_CTL.BLANKGEN` bit set, this register contains the number or lines of vertical blanking.

Note that for progressive video, the `EPPI_FS2_WLVB.F2VBBD` and `EPPI_FS2_WLVB.F2VBAD` bits are ignored.

Figure 19-21: `EPPI_FS2_WLVB` Register Diagram

Table 19-58: `EPPI_FS2_WLVB` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:24 (R/W)	F2VBAD	Field 2 Vertical Blanking After Data. The <code>EPPI_FS2_WLVB.F2VBAD</code> bit field contains the number of lines of vertical blanking after field 2.
23:16 (R/W)	F2VBBD	Field 2 Vertical Blanking Before Data. The <code>EPPI_FS2_WLVB.F2VBBD</code> bit field contains the number of lines of vertical blanking before field 2.
15:8 (R/W)	F1VBAD	Field 1 Vertical Blanking After Data. The <code>EPPI_FS2_WLVB.F1VBAD</code> bit field contains the number of lines of vertical blanking after field 1.
7:0 (R/W)	F1VBBD	Field 1 Vertical Blanking Before Data. The <code>EPPI_FS2_WLVB.F1VBBD</code> bit field contains the number of lines of vertical blanking before field 1.

Horizontal Transfer Count Register

The `EPPI_HCNT` register holds the number of samples to read in or write out per line, after `EPPI_HDLY` number of cycles have expired since the assertion of `EPPI_FS1`. Any write to the `EPPI_LINE` register modifies the `EPPI_HCNT` register. But, any write to the `EPPI_HCNT` register does not affect the `EPPI_LINE` register value. So the `EPPI_HCNT` register should be programmed after the `EPPI_LINE` register.

Figure 19-22: EPPI_HCNT Register Diagram

Table 19-59: EPPI_HCNT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15:0 (R/W)	VALUE	Horizontal Transfer Count. The <code>EPPI_HCNT.VALUE</code> holds the number of samples to read in or write out per line, after <code>EPPI_HDLY</code> number of cycles have expired since the last assertion of <code>EPPI_FS1</code> .

Horizontal Delay Count Register

The `EPPI_HDLY` register contains the number of clock cycles to delay after the assertion of `EPPI_FS1` is detected before starting to read or write data.

Figure 19-23: EPPI_HDLY Register Diagram

Table 19-60: EPPI_HDLY Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15:0 (R/W)	VALUE	Horizontal Delay Count. The <code>EPPI_HDLY.VALUE</code> holds the number of <code>EPPI_CLK</code> cycles to delay after as- sertion of <code>EPPI_FS1</code> before starting to read or write data.

Interrupt Mask Register

The **EPPI_IMSK** register permits the masking (if associated bit is set) of EPPI error interrupts for YFIFO underflow or overflow, CFIFO underflow or overflow, line track overflow error, line track underflow error, frame track overflow error, frame track underflow error, and ERR_NCOR (ITU preamble error not corrected). These conditions are flagged in the **EPPI_STAT** register and cleared by write-1-to-clear.

Figure 19-24: EPPI_IMSK Register Diagram

Table 19-61: EPPI_IMSK Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
7 (R/W)	PXPERR	PxP Ready Error Interrupt Mask.
		0 Unmask Interrupt
		1 Mask Interrupt
6 (R/W)	ERRNCOR	ITU Preamble Error Not Corrected Interrupt Mask.
		0 Unmask Interrupt
		1 Mask Interrupt
5 (R/W)	FTERRUNDR	Frame Track Underflow Error Interrupt Mask.
		0 Unmask Interrupt
		1 Mask Interrupt
4 (R/W)	FTERROVR	Frame Track Overflow Error Interrupt Mask.
		0 Unmask Interrupt
		1 Mask Interrupt

Table 19-61: EPPI_IMSK Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration	
3 (R/W)	LTERRUNDR	Line Track Underflow Error Interrupt Mask.	
		0	Unmask Interrupt
		1	Mask Interrupt
2 (R/W)	LTERROVR	Line Track Overflow Error Interrupt Mask.	
		0	Unmask Interrupt
		1	Mask Interrupt
1 (R/W)	YFIFOERR	YFIFO Underflow or Overflow Error Interrupt Mask.	
		0	Unmask Interrupt
		1	Mask Interrupt
0 (R/W)	CFIFOERR	CFIFO Underflow or Overflow Error Interrupt Mask.	
		0	Unmask Interrupt
		1	Mask Interrupt

Samples Per Line Register

The `EPPI_LINE` register tracks the line track overflow and underflow errors. This register should be programmed with the number of samples expected per line. Any write to the `EPPI_LINE` register will also write the same value to the `EPPI_HCNT` register. However, any write to the `EPPI_HCNT` register does not affect the `EPPI_LINE` register value. So the `EPPI_LINE` register should be programmed before the `EPPI_HCNT` register.

Figure 19-25: EPPI_LINE Register Diagram

Table 19-62: EPPI_LINE Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15:0 (R/W)	VALUE	Samples Per Line. The <code>EPPI_LINE.VALUE</code> holds the number of samples expected per line.

Clipping Register for ODD (Chroma) Data Register

The `EPPI_ODDCLIP` register selects the clipping threshold for chroma data, which provides clipping of individual video components.

The high odd and low odd spaces in `EPPI_ODDCLIP` are 16-bits wide and (depending on the `EPPI_CTL.DLEN` bit selection) only the corresponding video component bits are considered for clipping.

For example, if the EPPI is programmed in 10-bit mode, bits [9:0] and bits [25:16] constitute the clipping thresholds. The higher bits are (in this case) ignored.

Using the this method, 8-, 10-, 12- and 16-bit clipping thresholds can be set.

Note that when the EPPI is programmed in 16-, 20-, or 24-bit mode with the `EPPI_CTL.SPLTWRD` bit set, the luma data gets the clipping threshold levels of the `EPPI_EVENCLIP` register, and the chroma data gets the clipping threshold levels of the `EPPI_ODDCLIP` register.

Also, note that the `EPPI_EVENCLIP` and `EPPI_ODDCLIP` registers are ignored when the `EPPI_CTL.RGBFMTEN` bit is set.

Figure 19-26: EPPI_ODDCLIP Register Diagram

Table 19-63: EPPI_ODDCLIP Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:16 (R/W)	HIGHODD	High Odd Clipping Threshold (Chroma Data). The <code>EPPI_ODDCLIP.HIGHODD</code> bit field selects the clipping threshold for luma data. The high odd spaces are 16-bits wide and (depending on the <code>EPPI_CTL.DLEN</code> selection) only the corresponding video component bits are considered for clipping.
15:0 (R/W)	LOWODD	Low Odd Clipping Threshold (Chroma Data). The <code>EPPI_ODDCLIP.LOWODD</code> bit field selects the clipping threshold for luma data. The low add spaces are 16-bits wide and (depending on the <code>EPPI_CTL.DLEN</code> selection) only the corresponding video component bits are considered for clipping.

Status Register

The `EPPI_STAT` register contains bits that provide information about the current operating state of the EPPI.

Figure 19-27: EPPI_STAT Register Diagram

Table 19-64: EPPI_STAT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15 (R/NW)	FLD	Current Field Received by EPPI. The <code>EPPI_STAT.FLD</code> bit indicates whether the current field being received by the PPI is field 1 (if clear) or field 2 (if set).
		0 Field 1
		1 Field 2
14 (R/W1C)	ERRDET	Preamble Error Detected. The <code>EPPI_STAT.ERRDET</code> bit is useful only in ITU receive modes and indicates if an error has been detected in the status word of EAV or SAV sequences (if set) or not (if clear).
		0 No Preamble Error Detected
		1 Preamble Error Detected
7 (R/W1C)	PXPERR	PxP Ready Error. The <code>EPPI_STAT.PXPERR</code> bit is valid only in the RX mode. This bit indicates whether the incoming PPI data overflows the PxP interface (if set) or not (if clear). This bit is sticky and must be cleared by software by writing 1 to it.

Table 19-64: EPPI_STAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
6 (R/W1C)	ERRNCOR	Preamble Error Not Corrected. The <code>EPPI_STAT.ERRNCOR</code> bit is useful only in the ITU receive modes and indicates if an error in the status word of EAV or SAV sequences can not be cleared (if set) or not (if clear). This bit is sticky and must be cleared by software by writing 1 to it.
		0 No uncorrected preamble error has occurred
		1 Preamble error detected but not corrected
5 (R/W1C)	FTERRUNDR	Frame Track Underflow. The <code>EPPI_STAT.FTERRUNDR</code> bit indicates whether a frame track underflow error has occurred (if set) or not (if clear). This bit is sticky and must be cleared by software by writing 1 to it.
		0 No Error Detected
		1 Error Occurred
4 (R/W1C)	FTERROVR	Frame Track Overflow. The <code>EPPI_STAT.FTERROVR</code> bit indicates whether a frame track overflow error has occurred (if set) or not (if clear). This bit is sticky and must be cleared by software by writing 1 to it.
		0 No Error Detected
		1 Error Occurred
3 (R/W1C)	LTERRUNDR	Line Track Underflow. The <code>EPPI_STAT.LTERRUNDR</code> bit indicates whether a line track underflow error has occurred (if set) or not (if clear). This bit is sticky and must be cleared by software by writing 1 to it.
		0 No Error Detected
		1 Error Occurred
2 (R/W1C)	LTERROVR	Line Track Overflow. The <code>EPPI_STAT.LTERROVR</code> bit indicates whether a line track overflow error has occurred (if set) or not (if clear). This bit is sticky and must be cleared by software by writing 1 to it.
		0 No Error Detected
		1 Error Occurred

Table 19-64: EPPI_STAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
1 (R/W1C)	YFIFOERR	Luma FIFO Error. For RX modes, the EPPI_STAT.YFIFOERR bit indicates whether the Luma FIFO has overflowed (if set) or not (if clear). For TX modes, this bit indicates whether the Luma FIFO has underflowed (if set) or not (if clear). This bit is sticky and must be cleared by software by writing 1 to it.
		0 No Error Detected
		1 Error Occurred
0 (R/W1C)	CFIFOERR	Chroma FIFO Error. For RX modes, the EPPI_STAT.CFIFOERR bit indicates whether the chroma FIFO has overflowed (if set) or not (if clear). For TX modes, this bit indicates whether the chroma FIFO has underflowed (if set) or not (if clear). This bit is sticky and must be cleared by software by writing 1 to it.
		0 No Error Detected
		1 Error Occurred

Vertical Transfer Count Register

The `EPPI_VCNT` register holds the number of lines to read in or write out, after `EPPI_VDLY` number of lines from the start of frame. Any write to the `EPPI_FRAME` register modifies the `EPPI_VCNT` register. However, any write to the `EPPI_VCNT` register does not affect the `EPPI_FRAME` register value. So the `EPPI_VCNT` register should be programmed after the `EPPI_FRAME` register.

Figure 19-28: EPPI_VCNT Register Diagram

Table 19-65: EPPI_VCNT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15:0 (R/W)	VALUE	Vertical Transfer Count. The <code>EPPI_VCNT.VALUE</code> holds the number of lines to read in or write out, after <code>EPPI_VDLY</code> number of lines from the start of frame.

Vertical Delay Count Register

The `EPPI_VDLY` register contains the number of lines to wait after the start of a new frame before starting to read/transmit data.

Figure 19-29: EPPI_VDLY Register Diagram

Table 19-66: EPPI_VDLY Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15:0 (R/W)	VALUE	Vertical Delay Count. The <code>EPPI_VDLY.VALUE</code> holds the number of lines to wait after the start of a new frame before starting to read/transmit data.

20 General-Purpose Timer (TIMER)

The general-purpose timer (GP Timer) module serves as a collection of system timers that support various system-level functions. These functions include:

- Synchronized PWM waveform output capability
- External signal capture
- External event count
- General time-base functionality

Additionally, interrupt requests can be generated upon completion of timer events. Moreover, GP timers can act both as trigger masters and trigger slaves.

GP Timer Features

Each timer can be individually configured in any of these modes:

- Pin interrupt capture mode
- Windowed watchdog mode
- Pulse-width count and capture (WDTH_CAP) mode
- External Event (EXT_CLK) mode
- Pulse-width modulation (PWM_OUT) mode

Other features include:

- Synchronous operation
- Consistent management of period and pulse width values
- Autobaud detection for UART module (where available)
- Graceful bit pattern termination when stopping
- Support for center-aligned PWM patterns
- Error detection on implausible pattern values

- All read and write accesses to 32-bit registers are atomic
- Every timer has its dedicated interrupt request output

ADSP-2159x TIMER Register List

The General-Purpose Timer block (TIMER) provides timers that may be used for external event capture and measurement, system timing, and PWM waveform generation. A set of registers governs TIMER operations. For more information on TIMER functionality, see the TIMER register descriptions.

Table 20-1: ADSP-2159x TIMER Register List

Name	Description
TIMER_BCAST_DLY	Broadcast Delay Register
TIMER_BCAST_PER	Broadcast Period Register
TIMER_BCAST_WID	Broadcast Width Register
TIMER_DATA_ILAT	Data Interrupt Latch Register
TIMER_DATA_IMSK	Data Interrupt Mask Register
TIMER_ERR_TYPE	Error Type Status Register
TIMER_RUN	Run Register
TIMER_RUN_CLR	Run Clear Register
TIMER_RUN_SET	Run Set Register
TIMER_STAT_ILAT	Status Interrupt Latch Register
TIMER_STAT_IMSK	Status Interrupt Mask Register
TIMER_STOP_CFG	Stop Configuration Register
TIMER_STOP_CFG_CLR	Stop Configuration Clear Register
TIMER_STOP_CFG_SET	Stop Configuration Set Register
TIMER_TMR[n]_CFG	Timer n Configuration Register
TIMER_TMR[n]_CNT	Timer n Counter Register

Timer Block Diagram

The Timer block diagram figure shows all of the possible clock sources.

Figure 20-1: Timer Block Diagram

Internal Interface

The processor core always accesses the timer registers through the MMR access bus. Hardware ensures that all read and write operations from and to 32-bit timer registers are atomic. Every timer has a dedicated data interrupt request. There is also one common timer status and error interrupt request output that connects to the system event controller. Whenever a data interrupt request is generated, a data trigger master pulse is also driven out, if enabled. Each timer has an individual trigger input line, and each timer can be either started or stopped as a trigger slave.

In total, the GP timer module can have up to $(N + 1)$ interrupt request output lines and N data trigger lines.

Internal Timer Connections

The Timers support alternate inputs for the clock/capture (see [External Interface](#)). Some signals have internal default alternate connections according to the *Timer Signal Routing* table.

Table 20-5: Timer Signal Routing

Timer Signal	Connection
TM0_ACLK0	SYS_CLKIN0
TM0_ACI5	DAI0_PB04
TM0_ACLK5	DAI0_PB03
TM0_ACI6	DAI1_PB04
TM0_ACLK6	DAI1_PB03
TM0_ACI07	CNT0_TO
TM0_ACLK7	SYS_CLKIN1
TM0_ACI8	DAI0_PB06
TM0_ACLK8	DAI0_PB05
TM0_ACI9	DAI1_PB06
TM0_ACLK9	DAI1_PB05
TM0_ACI14	DAI0 Group C
TM0_ACI15	DAI1 Group C

External Interface

Each GP timer module can support up to 16 individual timers. However, most processors have less than this number. The exact number of timers available on a given processor is available in the data sheet for the processor.

Every timer has one main input/output signal ($TIMER_TMR[nn]$) and, usually, one auxiliary input pin, used as an alternate capture input ($TIMER_ACI[nn]$). Each timer can either run with a time base of SCLK0 or can reference an external clock on one of two ($TIMER_ACLK[nn]$) pins. The TMR_ALT_CLK0 signal maps to individual alternate clock ($TIMER_ACLK[nn]$) pins for one or more timers. For instance, a TM_ACLK3 pin would provide an alternate site to supply an external signal that would serve as reference clock for TMR3. Likewise, the TMR_ALT_CLK1 signal from each timer unit connects together internally to provide a single global timer clock pin ($TIMER_CLK$) for the GP timer module. It is used as an additional time base.

GP Timer Operating Modes

The following sections provide information on the various operating modes of the GP timer.

General Operation

The core of every timer is a 32-bit counter that can be interrogated through the read-only `TIMER_TMR[n]_CNT` register. Once the module enables a timer, it loads the timer `TIMER_TMR[n]_CNT` register with a starting value.

A timer can operate in one of several different modes, configured through the `TIMER_TMR[n]_CFG` register for that timer. These modes are: PWMOUT, EXTCLK, WIDCAP, WATCHDOG, PININT, and IDLE. The *Timer Mode Descriptions* table summarizes the modes.

Table 20-6: Timer Mode Descriptions

Timer Mode	Description
PWMOUT	Generates single or continuous PWM waveforms with programmable pulse width, period, and delay
EXTCLK	Counts edges of an externally applied waveform
WIDCAP	Captures pulse width or period of an externally applied waveform
WATCHDOG	Monitors pulse width or period of an external signal and compares against a window of acceptable values, optionally generating an interrupt when it falls inside or outside of that window
PININT	Can generate an interrupt request on an active edge applied to a timer pin
IDLE	Idle; no activity

Period, Width and Delay Register Interaction

When the timer is started, writes to the buffer registers are immediately copied through to the double-buffered period, pulse width, and delay registers. These values are then ready for use in the first timer period. When a timer is already running, software can write new values to the `TIMER_TMR[n]_PER`, `TIMER_TMR[n]_WID`, and `TIMER_TMR[n]_DLY` registers. The written values are buffered and do not update into the registers until the end of the current period. (The update occurs when the value in the `TIMER_TMR[n]_CNT` register equals the value in the `TIMER_TMR[n]_PER` register.)

If new values are not written to these registers, the value from the previous period is reused. Writes to these registers are atomic; it is not possible for the high word to be written without the low word also being written. Values written to the period, pulse width, and delay registers are always stored in the buffer registers. Reads from the same register always return the current, active value of period, pulse width, or delay value. Written values are not readback until they become active.

The usage of the `TIMER_TMR[n]_PER`, `TIMER_TMR[n]_WID`, and `TIMER_TMR[n]_DLY` registers varies, depending on the mode of the timer specified by the `TIMER_TMR[n]_CFG.TMODE` bits. See the *Usage of the Period, Width, and Delay Registers in Different Timer Modes* table for more information.

Table 20-7: Usage of the Period, Width, and Delay Registers in Different Timer Modes

Timer Mode	<code>TIMER_TMR[n]_PER</code>	<code>TIMER_TMR[n]_WID</code>	<code>TIMER_TMR[n]_DLY</code>
IDLE	Not writable	Not writable	Not writable

Table 20-7: Usage of the Period, Width, and Delay Registers in Different Timer Modes (Continued)

Timer Mode	<code>TIMER_TMR[n]_PER</code>	<code>TIMER_TMR[n]_WID</code>	<code>TIMER_TMR[n]_DLY</code>
WATCHDOG	Update on-the-fly. New value takes effect either at timer start or when an asserting edge on the input signal is sensed.	Read-only. Retains value of last measured width or period of the input signal.	Update on-the-fly. New value takes effect either at timer start or when an asserting edge on the input signal is sensed.
WIDCAP	Read-only. Period value captured at the appropriate time and updated from its buffer register simultaneously with the Width register.	Read-only. Width value captured at the appropriate time and updated from its buffer register simultaneously with the Period register.	Not used
PWMOUT	Update on-the-fly. New value takes effect either at timer start or at the end of the current period. A write followed by immediate read returns the current operating values.	Update on-the-fly. New value takes effect either at timer start or at the end of the current period. A write followed by immediate read returns the current operating values.	Update on-the-fly. New value takes effect either at timer start or at the end of the current period. A write followed by immediate read returns the current operating values.
EXTCLK	Can be updated on-the-fly.	Not used	Not used
PININT	Not used	Not used	Not used

If any of the period, pulse width, and delay registers are not used, then programs cannot write into that register. For example, in WIDCAP mode, the delay registers are not used. So, the program is not allowed to write any value to the `TIMER_TMR[n]_DLY` register. To prevent undesired operation, program the `TIMER_TMR[n]_CFG.TMODE` bits before programming the period, width, or delay registers.

If a program changes the `TIMER_TMR[n]_CFG.TMODE` bits from a status register to writable register (for example in PWMOUT mode), hardware does not clear these registers. These values are automatically overwritten by new values specified by software.

In PWMOUT mode with small periods, there may not be enough time between updates from the buffer registers to write these registers. The next period can use one old value and one new value. To prevent (width + pulse delay) > period errors, write the width and delay registers before the period register when decreasing the values. Write the period register before the width and delay registers when increasing the value.

Single-Pulse PWMOUT Mode

In single-pulse PWMOUT mode, the timer generates a single pulse on the `TIMER_TMR[nn]` pin. This mode is frequently used to implement a precise delay, often with generating an output trigger. The timer module uses the value in the `TIMER_TMR[n]_DLY` register to control the assertion of a pulse. The value in the `TIMER_TMR[n]_WID` register defines the pulse width. The `TIMER_TMR[n]_PER` is not used and cannot be written in this mode. After completion of the pulse, the timer is automatically stopped, and optionally generates an interrupt. The timer uses the `TIMER_TMR[n]_CFG.PULSEHI` bit to control pulse polarity.

The timer can be configured to generate a data interrupt request after satisfying various conditions specified by the `TIMER_TMR[n]_CFG.IRQMODE` bits.

It is not necessary to clear the relevant `TIMER_RUN` bit to stop the timer cleanly. At the end of the pulse, the timer stops automatically and the corresponding `TIMER_RUN` bit is cleared. To generate multiple discrete pulses (as opposed to a continuous PWM waveform), write a 1 to the appropriate `TIMER_RUN` bit, and wait for the timer to stop. Then, write another 1 to the same `TIMER_RUN` bit.

Continuous PWMOUT Mode

In continuous PWMOUT mode, the timer generates a repetitive pulse with a well-defined period, duty cycle, and pulse position. The `TIMER_TMR[n]_DLY`, `TIMER_TMR[n]_PER`, and `TIMER_TMR[n]_WID` registers are programmed with the values of the required PWM pulse. After the timer is started, the counter counts towards the value programmed in the `TIMER_TMR[n]_PER` register. Initially, the `TIMER_TMR[nn]` pin remains in a deasserted state. The pin toggles to an asserted state when the value in the `TIMER_TMR[n]_CNT` register equals the value in the `TIMER_TMR[n]_DLY` register.

The timer can control the assertion sense of the `TIMER_TMR[nn]` pin with the `TIMER_TMR[n]_CFG.PULSEHI` bit. The `TIMER_TMR[nn]` pin holds this value for the number of clock cycles specified in the `TIMER_TMR[n]_WID` register. Then, the pin deasserts and holds this value until the completion of the programmed period. The same waveform is generated repeatedly until the timer is disabled.

The timer can be configured to generate a data interrupt request after satisfying any of various conditions specified by the `TIMER_TMR[n]_CFG.IRQMODE` bits.

It is important to guarantee that the programmed period is greater than or equal to the sum of width and delay. Similarly, delay must be less than period. Violating either of these criteria results in an unpredictable waveform on the `TIMER_TMR[nn]` pin until the situation is rectified by writing proper values to these registers.

The maximum frequency possible to generate on the `TIMER_TMR[nn]` pin is achieved by setting `TIMER_TMR[n]_PER` to 2 and `TIMER_TMR[n]_WID` to 1. This operation makes the `TIMER_TMR[nn]` pin toggle each `SCLK0` clock cycle (assuming the timer is configured to clock internally), producing a duty cycle of 50%.

When the `TIMER_STOP_CFG.TMR[nn]` bit of a timer is 0, the timer treats a stop operation as a stop-is-pending condition. When terminated with this setting, the timer automatically completes the current waveform and then stops cleanly, remaining in a deasserted state. This functionality prevents truncation of the current pulse and unwanted PWM patterns at the `TIMER_TMR[nn]` pin. The processor can determine when the timer stops running by polling the corresponding `TIMER_RUN.TMR[nn]` bit until it reads 0 or by waiting for the last interrupt (if enabled).

Figure 20-2: Signal Generation in Continuous PWMOUT Mode

The `TIMER_TMR[n]_CFG` register cannot be reconfigured until after the timer stops and the `TIMER_RUN` register reads 0.

Programs can force a timer to stop immediately in PWMOUT mode by writing a 1 to the `TIMER_STOP_CFG` register followed by writing a 1 to the `TIMER_RUN_CLR` register. (Or, a program can stop a timer by writing a 0 to the appropriate `TIMER_RUN.TMR[nn]` bit.) This operation stops the timer whether the pending stop is waiting for the end of the current period or the end of the current pulse width. The timer can use this feature to regain immediate control of a timer during an error recovery sequence.

Use this feature carefully, as it can corrupt the PWM pattern generated at the `TIMER_TMR[nn]` pin, though after such a stop the pin deasserts automatically. Each timer samples its `TIMER_RUN.TMR[nn]` bit at the end of each period. It stops cleanly at the end of the first period after the `TIMER_RUN.TMR[nn]` bit is low. A timer that is disabled and then restarted (before the end of the current period), continues to run as if nothing happened. Typically, the program disables a PWMOUT timer and then waits for it to stop itself.

Width Capture (WIDCAP) Mode

The timer uses WIDCAP mode, often called capture mode, to measure pulse widths on the `TIMER_TMR[nn]` or (`TIMER_ACI[nn]`) inputs. The polarity (active high or low) of the input signal can be selected with the `TIMER_TMR[n]_CFG.PULSEHI` bit. The *Timer Signal Flow in Width Capture Mode* figure shows the control signal flow for WIDCAP_CAP mode.

Figure 20-3: Timer Signal Flow in Width Capture Mode

NOTE: SCLK in the *Timer Signal Flow in Width Capture Mode* figure is SCLK0.

In this mode, the timer uses the `TIMER_TMR[n]_CFG.TINSEL` bit to select between the `TIMER_TMR[nn]` or (`TIMER_ACI[nn]`) input. The internally clocked timer is used to determine the period and pulse width of the externally applied rectangular waveforms.

When a timer is enabled in this mode, the timer resets the count in its `TIMER_TMR[n]_CNT` register to 0x0000 0001. It does not start counting until it detects a leading edge on the selected input pin.

When the timer detects the first leading edge, it starts incrementing. When it detects a trailing edge of a waveform, it captures the current 32-bit value of its `TIMER_TMR[n]_CNT` register into its width buffer register. At the next leading edge, the timer transfers the current 32-bit value of its `TIMER_TMR[n]_CNT` register into its period buffer register. The `TIMER_TMR[n]_CNT` register is reset to 0x0000 0001 again, and the timer continues counting and capturing until it is disabled.

In this mode, programs can measure both the pulse width and the pulse period of a waveform. The timer does not use the `TIMER_TMR[n]_DLY` register in this mode. The timer uses the `TIMER_TMR[n]_CFG.PULSEHI` bit to control the definition of leading edge and trailing edge of the `TIMER_TMR[nn] / (TIMER_ACI[nn])` pin.

In WIDCAP mode, the following events always occur at the same time as one unit:

1. The `TIMER_TMR[n]_PER` register is updated from the period buffer register.
2. The `TIMER_TMR[n]_WID` register is updated from the width buffer register.
3. The `TIMER_DATA_ILAT.TMR[nn]` bit is set (if enabled).
4. A timer data trigger pulse is generated (if enabled).

The `TIMER_TMR[n]_CFG.TMODE` bit 0 controls the point in time at which this set of events is executed. Taken together, these four events are called a measurement report. The `TIMER_STAT_ILAT` register is not set at a

measurement report. A measurement report occurs, at most, once per input signal period. The current `TIMER_TMR[n]_CNT` value is always copied to the width buffer and period buffer registers at the trailing and leading edges of the input signal, respectively. But, these values are not visible to software. A measurement report event samples the captured values into visible registers and sets the timer interrupt request to signal that the `TIMER_TMR[n]_PER` and the `TIMER_TMR[n]_WID` registers are ready to be read.

When the `TIMER_TMR[n]_CFG.TMODE` bit = `b#1011`, the measurement report occurs just after the width buffer register captures its value at a falling edge. Then, the `TIMER_TMR[n]_WID` register reports the pulse width measured in the pulse that has ended, but the `TIMER_TMR[n]_PER` register reports the pulse period measured at the end of the previous period. If only the first trailing edge has occurred, then the first period value has not yet been measured at the first measurement report. So, the period value is not valid. A read of the `TIMER_TMR[n]_PER` value in this case returns 0. See the *Example of Width Capture Deasserted Mode (TMODE=b#1011)* figure for more information.

Figure 20-4: Example of Width Capture Deasserted Mode (TMODE=b#1011)

NOTE: SCLK in the *Example of Width Capture Deasserted Mode (TMODE=b#1011)* figure is SCLK0.

When the `TIMER_TMR[n]_CFG.TMODE` bit = `b#1010`, the measurement report occurs just after the period buffer register captures its value at a leading edge. Then, the `TIMER_TMR[n]_PER` and `TIMER_TMR[n]_WID` registers report the pulse period and pulse width measured in the period that has ended. Refer to the *Example of Width Capture Asserted Mode (TMODE=b#1010)* figure for more information.

Figure 20-5: Example of Width Capture Asserted Mode (TMODE=b#1010)

NOTE: SCLK in the *Example of Width Capture Asserted Mode (TMODE=b#1010)* figure is SCLK0.

To measure the pulse width of a waveform that has only one leading edge and one trailing edge, set `TIMER_TMR[n]_CFG.TMODE = b#1011`. If `TIMER_TMR[n]_CFG.TMODE = b#1010` for this case, no period value is captured in the period buffer register. Instead, the timer generates an error report interrupt request (if enabled) when the `TIMER_TMR[n]_CNT` range is exceeded and the counter wraps around. In this case, both the `TIMER_TMR[n]_PER` and `TIMER_TMR[n]_WID` registers read 0 (because no measurement report occurred to copy the value captured in the width buffer register to the `TIMER_TMR[n]_WID` register).

If using the `TIMER_TMR[n]_CFG.TMODE` bit =b#1010 mode to measure the width of a single pulse, programs can disable the timer after taking the interrupt that ends the measurement interval. If desired, restart the timer as appropriate in preparation for another measurement. This procedure prevents the timer from free-running after the width measurement and logging errors generated by the timer count overflowing.

Width Capture Mode Overflow

A timer status interrupt request (when enabled) is generated when the `TIMER_TMR[n]_CNT` register wraps around from 0xFFFF FFFF to 0 in the absence of a leading edge. At that point, the `TIMER_STAT_ILAT` bit is set and the `TIMER_ERR_TYPE` bits change to indicate a count overflow due to a period greater than the range of the counter. This indication is referred to as an error report. A data interrupt request in WIDCAP mode indicates that a new measurement is ready to be read (a measurement report). Similarly, an interrupt request on the timer status interrupt line (shared interrupt request for all timers) indicates an overflow error when generated in this mode.

The `TIMER_TMR[n]_PER` and `TIMER_TMR[n]_WID` registers are never updated at the time an overflow error is signaled. If the timer overflows and the `TIMER_TMR[n]_CFG.TMODE` bit =b#1010, the `TIMER_TMR[n]_PER` and `TIMER_TMR[n]_WID` registers are not updated. If the timer overflows and the

`TIMER_TMR[n]_CFG.TMODE` bit = `b#1011`, the `TIMER_TMR[n]_PER` and `TIMER_TMR[n]_WID` registers are updated only if a trailing edge is detected at a previous measurement report.

Software can count the number of error reports between measurement report interrupt requests to measure input signal periods longer than `0xFFFF FFFF`. Each error report interrupt request adds a full 2^{32} SCLK0 counts to the total for the period, but the width is ambiguous. Ensure that if software monitors only the status interrupt request, then status interrupt requests from all other timers are masked.

Refer to the *Example Timing for Width Capture Followed by Period Overflow (TMR_CFG.TMODE=b#1010)* figure. The period is `0x1 0000 0004`, but the pulse width could be either `0x0 0000 0002` or `0x1 0000 0002`.

Figure 20-6: Example Timing for Width Capture Followed by Period Overflow (TMR_CFG.TMODE=b#1010)

NOTE: SCLK in the *Example Timing for Width Capture Followed by Period Overflow* figure is SCLK0.

The waveform applied to the `TIMER_TMR[nn]` (or `(TIMER_ACI[nn])`) pin is not required to have a 50% duty cycle. The minimum input low time is little more than one SCLK0 period. The minimum input high time is a little more than one SCLK0 period. (Refer to the product data sheet for details.) The maximum `TIMER_TMR[nn]` input frequency is less than $SCLK0/2$, with a 50% duty cycle. Under these conditions, the WIDCAP mode timer measures: period = 2 and pulse width = 1.

Figure 20-7: Example Timing for Width Capture Followed by Period Overflow (TMR_CFG.TMODE=b#1011)

NOTE: SCLK in the *Example Timing for Width Capture Followed by Period Overflow* figure is SCLK0.

Windowed Watchdog (WATCHDOG) Modes

In windowed watchdog (WATCHDOG) modes, a timer can take inputs from one of the `TIMER_TMR[nn]` pins or the `TIMER_ACI[nn]` pins. With this mode, the timer can monitor pulse width (width watchdog mode) or pulse period (period watchdog mode) on the input line. It also compares the measured value against a minimum required value and maximum allowed value and generates an interrupt request appropriately. The timer uses the `TIMER_TMR[n]_CFG.PULSEHI` bit to select polarity of the input signal.

The waveform applied to the input pin in watchdog mode is not required to have a 50% duty cycle. The minimum input pulse low time, high time, and total period specifications are available in the product data sheet.

Windowed Watchdog Width Mode

In windowed watchdog width mode, the timer counter monitors the pulse width of an input signal on one of the `TIMER_TMR[nn]` pins or one of the alternate clock pins (`TIMER_ACLK[nn]`). Program the minimum pulse width (p_{MIN}) in the `TIMER_TMR[n]_DLY` register and the maximum pulse width (p_{MAX}) in the `TIMER_TMR[n]_PER` register. Both values are programmed in terms of number of clock cycles (SCLK0 or alternate clock). The timer can generate an interrupt if the deasserting pulse edge occurs:

- Inside the window ($p_{MIN} < \text{pulse width} \leq p_{MAX}$), or
- Outside the window ($\text{pulse width} \leq p_{MIN}$ or $\text{pulse width} > p_{MAX}$)

After enabling the timer in this mode, it always starts counting at the asserting edge of the input signal. Any pulse that is already active when the timer is enabled is ignored.

With the `TIMER_TMR[n]_CFG.IRQMODE` bit =b#11, the timer generates an interrupt if the timed pulse width exceeds p_{MAX} , or if the pulse width is less than p_{MIN} . After attaining p_{MAX} , the pulse stays at an active level, and the counter keeps on counting until it sees a deasserting edge. When the input pulse is not active, the counter holds its current value until it again sees an asserting edge, or it restarts. An interrupt can also be generated for when the pulse occurs within the specified window condition, by setting `TIMER_TMR[n]_CFG.IRQMODE` =b#10.

In this mode, a trailing edge on the input pin triggers capturing of pulse width into the `TIMER_TMR[n]_WID` register. During the inactive portion of the input signal, the internal counter does not increment. The *Watchdog Width Mode Timing* figure shows the signal flow in this mode.

Figure 20-8: Watchdog Width Mode Timing

NOTE: SCLK in the *Watchdog Width Mode Timing* figure is SCLK0.

To check only the upper limit on pulse width (p_{MAX} but not p_{MIN}), then program p_{MIN} as 0 or 1. In such a case, it is better to use `TIMER_TMR[n]_CFG.IRQMODE` =b#11. With `TIMER_TMR[n]_CFG.IRQMODE` = b#10, a pulse width of 1 clock cycle results in an interrupt. For details, see the *Windowed Watchdog Width Mode Interpretation* table.

Table 20-8: Windowed Watchdog Width Mode Interpretation

Timer Delay	Timer Period	Incoming Pulse Width	IRQMODE= b#10	IRQMODE= b#11	Error Interrupt?
0 or 1	Anything ≥ 1	PW = 1	Interrupt at deasserting edge of input signal	No Interrupt	No Error Interrupt
		$PW \leq TMR_PER$	Interrupt at deasserting edge of input signal	No Interrupt	No Error Interrupt
		$PW > TMR_PER$	No Interrupt	Interrupt when pulse width exceeds Pmax (Period Register) Value	No Error Interrupt
> 1 but $\leq$ (Period -1)	Anything > 1	$PW \leq TMR_DLY$	No Interrupt	Interrupt at deasserting edge of input signal	No Error Interrupt
		$TMR_DLY < PW \leq TMR_PER$	Interrupt at deasserting edge of input signal	No Interrupt	No Error Interrupt
		$PW > TMR_PER$	No Interrupt	Interrupt when pulse width exceeds Pmax (Period Register) Value	No Error Interrupt
$\geq$ Period	-	$PW \leq TMR_PER$	Undefined	Undefined	No Error Interrupt
-	-	$PW > TMR_PER$	Undefined	Undefined	b#11 Error Type
-	0	-	Undefined	Undefined	b#10 Error Type

Windowed Watchdog Period Mode

In this mode, the timer monitors the number of clock cycles between two consecutive rising or falling edges of an input signal on one of the `TIMER_TMR[nn]` or `TIMER_ACI[nn]` pins. Program the required minimum number of clock cycles (t_{MIN}) in the `TIMER_TMR[n]_DLY` register and the required maximum allowed number of clock cycles (t_{MAX}) in the `TIMER_TMR[n]_PER` register. Both values are programmed in terms of number of clock cycles (SCLK0) or alternate time clock (`TIMER_ACLK[nn]`). The timer can generate an interrupt when two consecutive occurrences of an active edge are:

- Within a specified window ($t_{MIN} < \text{Pulse Period} \leq t_{MAX}$), or
- Outside a specified window ($\text{pulse width} \leq t_{MIN}$ or $t_{MAX} < \text{pulse width}$)

When the `TIMER_TMR[n]_CFG.IRQMODE` bit = b#11 and the pulse period $> t_{MAX}$ or is $\leq t_{MIN}$, the timer generates an interrupt (if unmasked). After attaining the t_{MAX} value, the counter keeps on counting until it sees an active edge on the input line. An interrupt can also be generated for when the pulse occurs within the specified

window condition, by setting `TIMER_TMR[n]_CFG.IRQMODE = b#10`. Refer to the *Watchdog Period Mode Timing* figure for timer functionality in period watchdog mode.

Figure 20-9: Watchdog Period Mode Timing

NOTE: SCLK in the *Watchdog Period Mode Timing* figure is SCLK0.

To check only the upper limit on period (the t_{MAX} value, not the t_{MIN} value), program t_{MIN} as 0 or 1. For details, refer to the *Windowed Watchdog Period Mode Interpretation* table.

Table 20-9: Windowed Watchdog Period Mode Interpretation

Timer Delay	Timer Period	Incoming Pulse Width	IRQMODE=b#10	IRQMODE =b#11	Error Interrupt?
0 or 1	Anything ≥ 2	Pulse Period $\leq$ TMR_PER	Interrupt at deasserting edge of input signal	No Interrupt	No Error Interrupt
		Pulse Period $>$ TMR_PER	No Interrupt	Interrupt when pulse period crosses Pmax (Period Register) value	No Error Interrupt
> 1 but $\leq$ Period -1	Anything ≥ 2	Pulse Period $\leq$ TMR_DLY	No Interrupt	Interrupt at deasserting edge of input signal	No Error Interrupt
		TMR_DLY $<$ Pulse Period $\leq$ TMR_PER	Interrupt at deasserting edge of input signal	No Interrupt	No Error Interrupt
		Pulse Period $>$ TMR_PER	No Interrupt	Interrupt when pulse width exceeds Pmax (Period Register) value	No Error Interrupt

Table 20-9: Windowed Watchdog Period Mode Interpretation (Continued)

Timer Delay	Timer Period	Incoming Pulse Width	IRQMODE=b#10	IRQMODE =b#11	Error Interrupt?
$\geq$ Period	-	Pulse Period < TMR_PER	Undefined	Undefined	No Error Interrupt
		Pulse Period $\geq$ TMR_PER	Undefined	Undefined	b#11 Error Type
-	0 or 1	-	Undefined	Undefined	b#10 Error Type

Pin Interrupt (PININT) Mode

In PININT mode, any active edges on either the `TIMER_TMR[n]` pin or the `(TIMER_ACI[nn])` pin can cause an edge-based interrupt, if enabled. (The timer uses the `TIMER_TMR[n]_CFG.TINSEL` register to select the pin). The event on the input pin can set the `TIMER_DATA_ILAT.TMR[nn]` bit and issue a system interrupt request. Program the `TIMER_TMR[n]_CFG.PULSEHI` bit to change active edge polarity.

Since the interrupt request is generated in the SCLK0 clock domain, the width of the input signal must be more than one SCLK0 period. Along with generating the interrupt request, the timer also generates a trigger pulse (configured using the `TIMER_TRG_MSK` register). Due to the configuration of polarity, glitches can cause the generation of an undesired interrupt request at the input. To avoid this problem, programs must ensure that interrupt requests are unmasked only after configuring the desired polarity.

External Clock (EXTCLK) Mode

The timer uses EXTCLK mode, sometimes referred to as the counter mode, to count external events (signal edges), on either the `TIMER_TMR[n]` or `(TIMER_ACI[nn])` input pin. The timer works as a counter clocked by an external source (the signal at the pin), which can be asynchronous to SCLK0. The current count in the `TIMER_TMR[n]_CNT` register represents the number of leading-edge events detected. The `TIMER_TMR[n]_PER` register is programmed with the value of the maximum timer external count before stopping or issuing an interrupt request or trigger.

The `TIMER_TMR[n]_CFG.PULSEHI` bit determines the polarity of the leading edge on the input pin. The timer uses the `TIMER_TMR[n]_CFG.TINSEL` bit to select whether the event is counted on the `TIMER_TMR[nn]` or on the `(TIMER_ACI[nn])` pin. The `TIMER_STAT_ILAT.TMR[nn]` and `TIMER_ERR_TYPE` bits are set if *one* of these conditions is met:

- `TIMER_TMR[n]_CNT` wraps around from 0xFFFF FFFF to 0
- The period = 0 at startup
- `TIMER_TMR[n]_CNT` register rolls over (from count = period to count = 0x1)

The `TIMER_TMR[n]_WID` and `TIMER_TMR[n]_DLY` registers are unused in this mode and must not be written.

The *EXTCLK Mode Control Flow* figure shows a flow diagram for EXTCLK mode.

Figure 20-10: EXTCLK Mode Control Flow

The waveform applied to the input pin is not required to have a 50% duty cycle. The minimum input pulse low time, high time, and total period specifications are available in the product data sheet. Program the period to any value from 1 to $(2^{32} - 1)$, inclusive.

After the timer has started, it resets the `TIMER_TMR[n]_CNT` register to 0x0 and then waits for the first leading edge on the input pin. This edge causes `TIMER_TMR[n]_CNT` to be incremented to the value 0x1, and every subsequent leading edge increments it by one. After the `TIMER_TMR[n]_CNT` register reaches the value programmed in the `TIMER_TMR[n]_PER` register, the corresponding `TIMER_DATA_ILAT` bit is set, and an interrupt and trigger are both generated (if enabled). The next leading-edge reloads the `TIMER_TMR[n]_CNT` register with 0x1, and the timer continues counting until it is disabled.

GP Timer Programming Concepts

Using the features, operating modes, and event control for the GP timer to their greatest potential requires an understanding of some GP timer-related concepts.

Setting Up Constantly Changing Timer Conditions

This task shows how to use different period, pulse width, and delay settings for each of the first three timer periods after the timer starts.

1. Program the first set of `TIMER_TMR[n]_PER`, `TIMER_TMR[n]_WID`, and `TIMER_TMR[n]_DLY` register values.
2. Enable the timer using the `TIMER_RUN` register.
3. Immediately program the second set of `TIMER_TMR[n]_PER`, `TIMER_TMR[n]_WID`, and `TIMER_TMR[n]_DLY` register values, as needed.
4. Wait for the first timer interrupt request.
5. Program the third set of `TIMER_TMR[n]_PER`, `TIMER_TMR[n]_WID`, and `TIMER_TMR[n]_DLY` register values.

Each new setting is then programmed when the preceding timer interrupt request is received.

Configuring, Enabling, and Disabling One or More Timers

1. Configure the relevant timers for the operating mode and other properties using the `TIMER_TMR[n]_CFG` register.
2. Write a 1 to the representative `TIMER_RUN.TMR[nn]` bit. Or, use the `TIMER_RUN_SET` register to avoid disturbing the settings of other timers that are not going through configuration.

The timer is enabled and operating.

3. To stop one or more timers, first program the `TIMER_STOP_CFG` register to determine whether to stop immediately or gracefully upon receiving a stop command.

ADDITIONAL INFORMATION: PWMOUT modes are the only modes where a timer can be configured for graceful termination.

4. Write a 0 to the representative `TIMER_RUN.TMR[nn]` bits to stop the timer according to their `TIMER_STOP_CFG` settings. Alternately, write a 1 to the appropriate `TIMER_RUN_CLR.TMR[nn]` bits to avoid disturbing the settings of other timers that are not terminating.

The timers stop.

Configuring Timer Data and Status Interrupts

1. Configure the `TIMER_TMR[n]_CFG.IRQMODE` bit field with the desired interrupt properties.
2. Unmask the interrupt source.
3. Set the `TIMER_TMR[n]_CFG.IRQMODE` field but leave the interrupt masked at the system level to poll the `TIMER_DATA_ILAT.TMR[nn]` bit of the timer without generating an interrupt.
4. Use the `TIMER_STAT_IMSK` register to generate interrupt requests by overflow or error conditions (incorrect programming values). The timer uses the `TIMER_STAT_ILAT.TMR[nn]` bits to report interrupt errors, when the timer status interrupt source is unmasked.
5. To poll the `TIMER_STAT_ILAT.TMR[nn]` bit of the timer without generating an interrupt, unmask the corresponding bit in the `TIMER_STAT_IMSK` register, but leave the interrupt masked at the system level.

Configuring the Timer as a Trigger Slave

The timer can be configured to either start or stop or toggle between these two states on the input trigger pulse depending on the configuration of the `TIMER_TMR[n]_CFG.TGLTRIG` and `TIMER_TMR[n]_CFG.SLAVETRIG` bits.

- If `TIMER_TMR[n]_CFG.TGLTRIG` bit =0 and `TIMER_TMR[n]_CFG.SLAVETRIG` bit =1 then the trigger pulse starts timer, if it is stopped.

- If `TIMER_TMR[n]_CFG.TGLTRIG` bit =0 and `TIMER_TMR[n]_CFG.SLAVETRIG` bit =0 then the trigger pulse stops timer, if it is running.
- When `TIMER_TMR[n]_CFG.TGLTRIG` bit =0, the trigger pulse has no effect when the timer is already in the requested state.

If `TIMER_TMR[n]_CFG.TGLTRIG` bit is 1, the trigger pulse starts the timer if it is stopped, or stops the timer if it is running. The `TIMER_TMR[n]_CFG.SLAVETRIG` bit has no effect on trigger mechanism. In continuous PWMOUT mode, the timer stops gracefully or abruptly depending on the stop mechanism programmed in the `TIMER_STOP_CFG_CLR` register. In other modes, the timer stops immediately.

Ordered Trigger Toggle Mode

The timer can be configured to either start or stop the timer on the input trigger pulse depending on the configuration of the `TIMER_TMR[n]_CFG.TGLTRIG` and `TIMER_TMR[n]_CFG.ORDTGLTRIG` bits.

- If `TIMER_TMR[n]_CFG.TGLTRIG` bit is 1 and `TIMER_TMR[n]_CFG.ORDTGLTRIG` bit is 0, then the input trigger pulse on trigger slave 0 or trigger slave 1 starts the timer if it is stopped, or stops the timer if it is running.
- If `TIMER_TMR[n]_CFG.TGLTRIG` bit is 1 and `TIMER_TMR[n]_CFG.ORDTGLTRIG` bit is 1, then the input trigger pulse on trigger slave 0 starts timer if it is stopped. If the timer is running, it stops when the input trigger pulse on trigger slave 1 is detected.

Trigger slave 0 cannot toggle the timer from the run to halt state. Trigger slave 1 cannot toggle the timer from the halt to run state.

NOTE: The timer state is not toggled by writes to the `TIMER_RUN`, `TIMER_RUN_SET`, and `TIMER_RUN_CLR` registers in this mode.

Using the Timer Broadcast Feature

The broadcast feature provides a means to update period, width, and delay registers simultaneously across more than one timer.

1. Enable the appropriate broadcast bits (`TIMER_TMR[n]_CFG.BPEREN`, `TIMER_TMR[n]_CFG.BWIDEN` are `TIMER_TMR[n]_CFG.BDLYEN`) for the timers involved in the broadcast. The use of these bits depends on which broadcast registers the timer uses (`TIMER_BCAST_PER`, `TIMER_BCAST_WID`, or `TIMER_BCAST_DLY`).
2. Program the `TIMER_BCAST_PER` register (for example), to broadcast the period setting across the multiple timers enabled.

The enabled timers load their `TIMER_TMR[n]_PER` registers with the value specified in the `TIMER_BCAST_PER` register.

3. Repeat Step 2 as needed for the `TIMER_BCAST_WID` and `TIMER_BCAST_DLY` register settings.

Timer Illegal States

The following sections use these definitions:

- **Startup.** The first clock period during which the timer counter is running after the timer is started by writing the `TIMER_RUN` register.
- **Rollover.** The time when the current count in `TIMER_TMR[n]_CNT` matches the value in `TIMER_TMR[n]_PER` and the counter is reloaded with the value 1.
- **Overflow.** The timer counter was incremented instead of doing a rollover when it was holding the maximum count value of 0xFFFF FFFF. The counter does not have a large enough range to express the next greater value and so it erroneously loads a new value of 0x0000 0000.
- **Unchanged.** No new error.

When the `TIMER_ERR_TYPE` register is designated unchanged, it displays the previously reported error code orb# 00 when there has been no error since this timer was enabled.

When the `TIMER_STAT_ILAT` register is unchanged, it reads 0 when there has been no error or overflow since this timer was enabled. Or, it reads 0 if software has performed a W1C to clear any previous error. If software has not acknowledged a previous error, the `TIMER_STAT_ILAT` register reads 1. Software can read the `TIMER_STAT_ILAT` register to check for errors. If a particular bit of a timer is set in this register, software can then read the `TIMER_ERR_TYPE` register for more information. Once detected, software can W1C the appropriate `TIMER_STAT_ILAT` bit to acknowledge the error.

Read the following tables as:

- In mode ___ at event __,
- if `TIMER_TMR[n]_PER` is ___ and `TIMER_TMR[n]_WID` is ___ and `TIMER_TMR[n]_DLY` is __,
- then `TIMER_ERR_TYPE` is ___ and `TIMER_STAT_ILAT` is ___.

Startup error conditions do not prevent the timer from starting. Similarly, overflow and rollover error conditions do not stop the timer. Illegal cases can cause unwanted behavior of the `TIMER_TMR[nn]` pins.

NOTE: For PININT mode, the timer does not use error functionality.

ADSP-2159x TIMER Register Descriptions

General-Purpose Timer Block (TIMER) contains the following registers.

Table 20-22: ADSP-2159x TIMER Register List

Name	Description
TIMER_BCAST_DLY	Broadcast Delay Register
TIMER_BCAST_PER	Broadcast Period Register
TIMER_BCAST_WID	Broadcast Width Register
TIMER_DATA_ILAT	Data Interrupt Latch Register
TIMER_DATA_IMSK	Data Interrupt Mask Register
TIMER_ERR_TYPE	Error Type Status Register
TIMER_RUN	Run Register
TIMER_RUN_CLR	Run Clear Register
TIMER_RUN_SET	Run Set Register
TIMER_STAT_ILAT	Status Interrupt Latch Register
TIMER_STAT_IMSK	Status Interrupt Mask Register
TIMER_STOP_CFG	Stop Configuration Register
TIMER_STOP_CFG_CLR	Stop Configuration Clear Register
TIMER_STOP_CFG_SET	Stop Configuration Set Register
TIMER_TMR[n]_CFG	Timer n Configuration Register
TIMER_TMR[n]_CNT	Timer n Counter Register
TIMER_TMR[n]_DLY	Timer n Delay Register
TIMER_TMR[n]_PER	Timer n Period Register
TIMER_TMR[n]_WID	Timer n Width Register
TIMER_TRG_IE	Trigger Slave Enable Register
TIMER_TRG_MSK	Trigger Master Mask Register

Broadcast Delay Register

For timers with `TIMER_TMR[n]_CFG.BDLYEN` enabled, a write to the `TIMER_BCAST_DLY` register concurrently updates the delay (`TIMER_TMR[n]_DLY`) registers of only those timers. A read of the `TIMER_BCAST_DLY` register returns `0x00000000`, and no bus error is generated. To read back a written value, read that TMR's `TIMER_TMR[n]_DLY` register.

Figure 20-11: TIMER_BCAST_DLY Register Diagram

Table 20-23: TIMER_BCAST_DLY Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R0/W)	VALUE	Broadcast Delay Value. A write to the <code>TIMER_BCAST_DLY.VALUE</code> bit field concurrently updates the delay (<code>TIMER_TMR[n]_DLY</code>) registers of only those timers. A read of the <code>TIMER_BCAST_DLY.VALUE</code> bit field returns <code>0x0000 0000</code> , and no bus error is generated.

Broadcast Period Register

For timers with `TIMER_TMR[n]_CFG.BPEREN` enabled, a write to the `TIMER_BCAST_PER` register concurrently updates the period (`TIMER_TMR[n]_PER`) registers of only those timers. A read of `TIMER_BCAST_PER` returns 0x00000000, and no bus error is generated. To read back a written value, read that TMR's `TIMER_TMR[n]_PER` register.

Figure 20-12: TIMER_BCAST_PER Register Diagram

Table 20-24: TIMER_BCAST_PER Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R0/W)	VALUE	Broadcast Period Value. A write to the <code>TIMER_BCAST_PER.VALUE</code> bit field concurrently updates the period (<code>TIMER_TMR[n]_PER</code>) registers of only those timers. A read of the <code>TIMER_BCAST_PER.VALUE</code> bit fields returns 0x0000 0000, and no bus error is generated.

Broadcast Width Register

For timers with `TIMER_TMR[n]_CFG.BWIDEN` enabled, a write to the `TIMER_BCAST_WID` register concurrently updates the width (`TIMER_TMR[n]_WID`) registers of only those timers. A read of the `TIMER_BCAST_WID` register returns `0x00000000`, and no bus error is generated. To read back a written value, read that TMR's `TIMER_TMR[n]_WID` register.

Figure 20-13: `TIMER_BCAST_WID` Register Diagram

Table 20-25: `TIMER_BCAST_WID` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R0/W)	VALUE	Broadcast Width Value. A write to the <code>TIMER_BCAST_WID.VALUE</code> bit field concurrently updates the width (<code>TIMER_TMR[n]_WID</code>) registers of only those timers. A read of the <code>TIMER_BCAST_WID.VALUE</code> bit field returns <code>0x0000 0000</code> , and no bus error is generated.

Data Interrupt Latch Register

The `TIMER_DATA_ILAT` holds the latched interrupt status for interrupt requests that have been unmasked (enabled) by the `TIMER_DATA_IMSK` register and generated according to the conditions selected by the `TIMER_TMR[n]_CFG.IRQMODE` bits. If a bit in `TIMER_DATA_ILAT` is already set and the corresponding interrupt is masked in `TIMER_DATA_IMSK`, the latch holds its old value, leaving the interrupt request asserted until it is reset by software with a W1C operation.

Note that interrupt service routines (ISRs) should clear the appropriate bits in `TIMER_DATA_ILAT` before returning from the ISR, to ensure that the interrupt is not re-issued. To make sure that no timer event is missed, the latch should be reset at the very beginning of the ISR when in EXTCLK mode.

Figure 20-14: `TIMER_DATA_ILAT` Register Diagram

Table 20-26: `TIMER_DATA_ILAT` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15:0 (R/W1C)	<code>TMR[nn]</code>	Data Interrupt Latch. For all <code>TIMER_DATA_ILAT.TMR[nn]</code> bits, status of =0 indicates no interrupt is latched, and status of =1 indicates a latched interrupt (indicating an unmasked interrupt request from a timer with a condition matching the one selected with corresponding <code>TIMER_TMR[n]_CFG.IRQMODE</code> bit has occurred).

Data Interrupt Mask Register

Each timer may generate a unique processor data interrupt request signal. The `TIMER_DATA_IMSK` register contains an interrupt mask for these requests, masking (disabling) or unmasking (enabling) the interrupts as programmed. The reset value of the `TIMER_DATA_IMSK` register is 0xFFFF, masking these interrupts after reset.

Figure 20-15: `TIMER_DATA_IMSK` Register Diagram

Table 20-27: `TIMER_DATA_IMSK` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15:0 (R/W)	TMR[nn]	Data Interrupt Mask. For all <code>TIMER_DATA_IMSK.TMR[nn]</code> bits, write =0 unmask (enables) the corresponding data interrupt request, and write =1 masks (disables) the corresponding data interrupt request.

Error Type Status Register

The `TIMER_ERR_TYPE` register contains error type status bits for each timer. These bits indicate the type of error (if any) in a running timer. This register is read-only. These status bits are cleared at reset and when a particular timer is enabled.

Each time an error request interrupt is latched in the `TIMER_STAT_ILAT` register, the corresponding `TERRx` bits in the `TIMER_ERR_TYPE` register are loaded with a code that identifies the type of error that was detected. This status value is held until the next error or until a particular timer is restarted. No bus error is generated if a write is performed on the `TIMER_ERR_TYPE` register.

Run Register

The `TIMER_RUN` allows all timers to be enabled simultaneously, permitting them to run synchronously. For each timer, there is a single start/stop control bit. Writing a 1 to this bit starts the corresponding timer; writing a 0 stops the timer with mechanism specified in the timer stop configuration `TIMER_STOP_CFG` register.

The start/stop control bits can be set/reset individually or in any combination. While starting or stopping one particular timer directly with this register, software must perform a read-modify write, so the bits corresponding to other timers remain unchanged. To avoid this need, software can use the `TIMER_RUN_CLR` register.

Reading the `TIMER_RUN` register shows the start status for the corresponding timer. A 1 indicates that the timer is running.

If a timer is in run state (corresponding run bit is =1), a software write of 1 in this bit does not have any effect on the timer state. The write does not result in restarting the timer.

Note that the `TIMER_RUN` register is not used in PININT mode. PININT mode starts as soon as the `TIMER_TMR[n]_CFG.TMODE` bits are set to 111.

Figure 20-17: `TIMER_RUN` Register Diagram

Table 20-29: `TIMER_RUN` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15:0 (R/W)	<code>TMR[nn]</code>	Start/Stop Timer n. For all <code>TIMER_RUN.TMR[nn]</code> bits, write =0 for stop, and write =1 for start. Read =1 when timer is running.

Run Clear Register

The `TIMER_RUN_CLR` register is an alias register, providing a mechanism to clear a specific start/stop bit in the `TIMER_RUN` register without affecting other bits in `TIMER_RUN`. To stop a particular timer, software must write a 1 into the corresponding `TIMER_RUN_CLR` bit. Writing a 0 has no effect. Because `TIMER_RUN_CLR` is a write-only register, the result of any write to this register must be checked by reading the `TIMER_RUN` register. A read of the `TIMER_RUN_CLR` returns 0x0000.

Note that the stopping mechanism of a timer may be abrupt or graceful (after completion of current waveform period) depending on the selection in the `TIMER_STOP_CFG` register.

Figure 20-18: `TIMER_RUN_CLR` Register Diagram

Table 20-30: `TIMER_RUN_CLR` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15:0 (R0/W1C)	TMR[nn]	RUN Clear Alias. For all <code>TIMER_RUN_CLR.TMR[nn]</code> bits, write =0 has no effect, and write =1 for stop (clearing the corresponding in start/stop bit in the <code>TIMER_RUN</code> register). Using <code>TIMER_RUN_CLR</code> to clear start/stop bits permits stopping specific timers without influencing run status of other timers.

Run Set Register

The `TIMER_RUN_SET` register is an alias register, providing a mechanism to set a specific start/stop bit in the `TIMER_RUN` register without affecting other bits in `TIMER_RUN`. To start a particular timer, software must write a 1 into the corresponding `TIMER_RUN_SET` bit. Writing a zero has no effect. For an example, to start timer 3 without affecting any other timer, write 0x0008 into `TIMER_RUN_SET`. Because `TIMER_RUN_SET` is a write-only register, the result of any write to this register must be checked by reading the `TIMER_RUN` register. A read of the `TIMER_RUN_SET` returns 0x0000.

Figure 20-19: `TIMER_RUN_SET` Register Diagram

Table 20-31: `TIMER_RUN_SET` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15:0 (R0/W1S)	<code>TMR[nn]</code>	RUN Set Alias. For all <code>TIMER_RUN_SET.TMR[nn]</code> bits, write =0 has no effect, and write =1 for start (setting the corresponding start/stop bit in the <code>TIMER_RUN</code> register). Using <code>TIMER_RUN_SET</code> to set start/stop bits permits starting specific timers without influencing the run status of other timers.

Status Interrupt Latch Register

The `TIMER_STAT_ILAT` holds the latched interrupt status for error interrupt requests, indicating a timer overflow condition or indicating that prohibited programming has occurred for a timer. These interrupt status bits are sticky and are W1C. The bits in the `TIMER_STAT_ILAT` register provide information regarding each timer interrupt request source.

Figure 20-20: `TIMER_STAT_ILAT` Register Diagram

Table 20-32: `TIMER_STAT_ILAT` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15:0 (R/W1C)	TMR[nn]	Status Interrupt Latch. For all <code>TIMER_STAT_ILAT.TMR[nn]</code> bits, status of 0 indicates no error interrupt request is latched, and status of 1 indicates a timer counter overflow or programming error interrupt request is latched.

Status Interrupt Mask Register

While each timer may generate a status interrupt request, these requests are OR'ed to generate a single status interrupt signal to the system event controller. The `TIMER_STAT_IMSK` register contains an interrupt mask for these requests, masking (disabling) or unmasking (enabling) the interrupts as programmed. The reset value of the `TIMER_STAT_IMSK` register is 0xFFFF, masking these interrupts after reset.

Figure 20-21: `TIMER_STAT_IMSK` Register Diagram

Table 20-33: `TIMER_STAT_IMSK` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15:0 (R/W)	TMR[nn]	Status Interrupt Mask. For all <code>TIMER_STAT_IMSK.TMR[nn]</code> bits, write =0 unmask (enables) the corresponding status interrupt request, and write =1 masks (disables) the corresponding status interrupt request.

Stop Configuration Register

The `TIMER_STOP_CFG` register selects the stop mode for each timer. Timers may be stopped abruptly (immediate halt - all modes) or gracefully in PWMOUT modes (single pulse and continuous). The halt is achieved through either a write =0 to the corresponding bit in `TIMER_RUN` or a write =1 to the corresponding bit in `TIMER_RUN_CLR`. A read of `TIMER_STOP_CFG` returns the last value written.

Figure 20-22: TIMER_STOP_CFG Register Diagram

Table 20-34: TIMER_STOP_CFG Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15:0 (R/W)	TMR[nn]	Stop Mode Select. For all <code>TIMER_STOP_CFG.TMR[nn]</code> bits, write =0 for graceful termination (PWMOUT modes only), and write =1 for abrupt (immediate halt) on stop.

Stop Configuration Clear Register

This is an alias register, providing a mechanism to clear a specific bit in the `TIMER_STOP_CFG` register without affecting other bits in `TIMER_STOP_CFG`. To clear a bit in `TIMER_STOP_CFG`, software must write a 1 to the corresponding bit of `TIMER_STOP_CFG_CLR` register. Writing a zero has no effect. Because the `TIMER_STOP_CFG_CLR` register is a write-only register, the result of any write to this register must be checked by reading the `TIMER_STOP_CFG` register. A read of the `TIMER_STOP_CFG_CLR` register returns 0x0000.

Figure 20-23: TIMER_STOP_CFG_CLR Register Diagram

Table 20-35: TIMER_STOP_CFG_CLR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15:0 (R0/W1C)	TMR[nn]	STOP_CFG Clear Alias. For all <code>TIMER_STOP_CFG_CLR.TMR[nn]</code> bits, write =0 has no effect, and write =1 for graceful stop in PWMOUT modes (clearing the corresponding stop mode select bit in the <code>TIMER_STOP_CFG</code> register). Using <code>TIMER_STOP_CFG_CLR</code> to clear stop mode bits permits configuring specific timers without influencing the stop mode configuration of other timers.

Stop Configuration Set Register

This is an alias register, providing a mechanism to set a specific bit in the `TIMER_STOP_CFG` register without affecting other bits in `TIMER_STOP_CFG`. To set a bit in the `TIMER_STOP_CFG` register, software must write a 1 to the corresponding bit of the `TIMER_STOP_CFG_SET` register. Writing a zero has no effect. Because the `TIMER_STOP_CFG_SET` register is a write-only register, the result of any write to this register must be checked by reading the `TIMER_STOP_CFG` register. A read of the `TIMER_STOP_CFG_SET` register returns 0x0000.

Figure 20-24: TIMER_STOP_CFG_SET Register Diagram

Table 20-36: TIMER_STOP_CFG_SET Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15:0 (R0/W1S)	TMR[nn]	STOP_CFG Set Alias. For all <code>TIMER_STOP_CFG_SET.TMR[nn]</code> bits, write =0 has no effect, and write =1 for abrupt stop (setting the corresponding stop mode select bit in the <code>TIMER_STOP_CFG</code> register). Using <code>TIMER_STOP_CFG_SET</code> to set stop mode bits permits configuring specific timers without influencing the stop mode configuration of other timers.

Timer n Configuration Register

Each timer has a `TIMER_TMR[n]_CFG` register that specifies its operating mode. Only write to a `TIMER_TMR[n]_CFG` register when the corresponding timer is not running.

After disabling a timer operating in PWMOUT mode, verify that the timer has stopped running by checking the start/stop status of the timer in the `TIMER_RUN` register before writing to the timer's `TIMER_TMR[n]_CFG` register.

Note that a timer's `TIMER_TMR[n]_CFG` register may be read at any time.

Figure 20-25: `TIMER_TMR[n]_CFG` Register Diagram

Table 20-37: TIMER_TMR[n]_CFG Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
17 (R/W)	ORDTGLTRIG	Ordered Slave Trigger Toggle Enable. The <code>TIMER_TMR[n]_CFG.ORDTGLTRIG</code> bit controls ordered slave trigger toggle mode. The timer(slave) state is not toggled by writes to the <code>TIMER_RUN</code> , <code>TIMER_RUN_SET</code> and <code>TIMER_RUN_CLR</code> registers when this bit is enabled.
		0 No effect
		1 Trigger pulse on Trigger Slave 0 starts the timer if it in halt state and trigger pulse in Trigger Slave 1 stops the timer if it is running
16 (R/W)	TGLTRIG	Slave Trigger Toggle Enable. The <code>TIMER_TMR[n]_CFG.TGLTRIG</code> bit stops the timer if it is running and starts the timer if it is halted (in the stop state). If the <code>TIMER_TMR[n]_CFG.TGLTRIG</code> bit is set, then the setting of the <code>TIMER_TMR[n]_CFG.SLAVETRIG</code> bit is ignored.
		0 Slave Trigger Response Depends on SLAVETRIG Bit Setting
		1 Slave Trigger Toggles Timer State
15 (R/W)	EMURUN	Emulation Run. The <code>TIMER_TMR[n]_CFG.EMURUN</code> bit causes the timer to run (count) during emulation.
		0 Stop Timer During Emulation
		1 Run Timer During Emulation
14 (R/W)	BPEREN	Broadcast Period Enable. The <code>TIMER_TMR[n]_CFG.BPEREN</code> bit enables updates to the <code>TIMER_TMR[n]_PER</code> register simultaneously across more than one timer.
		0 Disable Broadcast to PER Register
		1 Enable Broadcast to PER Register
13 (R/W)	BWIDEN	Broadcast Width Enable. The <code>TIMER_TMR[n]_CFG.BWIDEN</code> bit enables updates to the <code>TIMER_TMR[n]_WID</code> register simultaneously across more than one timer.
		0 Disable Broadcast to WID Register
		1 Enable Broadcast to WID Register

Table 20-37: TIMER_TMR[n]_CFG Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
12 (R/W)	BDLYEN	Broadcast Delay Enable. The <code>TIMER_TMR[n]_CFG.BDLYEN</code> bit enables updates to the <code>TIMER_TMR[n]_DLY</code> register simultaneously across more than one timer.
		0 Disable Broadcast to DLY Register
		1 Enable Broadcast to DLY Register
11 (R/W)	OUTDIS	Output Disable. The <code>TIMER_TMR[n]_CFG.OUTDIS</code> bit enables or disables the timer pin output buffer.
		0 Enable TMR Pin Output Buffer
		1 Disable TMR Pin Output Buffer
10 (R/W)	TINSEL	Timer Input Select (for WIDCAP, WATCHDOG, PININT modes).
		0 Use TMR Pin Input
		1 Use TMR Alternate Capture Input
9:8 (R/W)	CLKSEL	Clock Select. The <code>TIMER_TMR[n]_CFG.CLKSEL</code> bit field selects the TIMER clock to use.
		0 Use SCLK0
		1 Use TMR_ALT_CLK0 as TMR Clock
		3 Use TMR_ALT_CLK1 as TMR Clock
7 (R/W)	PULSEHI	Polarity Response Select. The <code>TIMER_TMR[n]_CFG.PULSEHI</code> bit defines specific behaviors of the timer based on the operating mode. For more information, see the specific operating mode in the Programming Concepts section.
		0 Negative Response or Pulse. A Negative Edge Response or Negative Action Pulse on the TMR pin.
		1 Positive Response or Pulse. A Positive Edge Response or Positive Action Pulse on the TMR pin.
6 (R/W)	SLAVETRIG	Slave Trigger Response.. The <code>TIMER_TMR[n]_CFG.SLAVETRIG</code> bit controls the trigger response. The trigger pulse has no effect (to stop or start the timer) if the timer is already in the requested state.
		0 Pulse Stops Timer if it is Running
		1 Pulse Starts Timer if it is Stopped

Table 20-37: TIMER_TMR[n]_CFG Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
5:4 (R/W)	IRQMODE	Interrupt Modes. The <code>TIMER_TMR[n]_CFG.IRQMODE</code> bit field selects the interrupt request mode. Note that any mismatched combination of the <code>TIMER_TMR[n]_CFG.IRQMODE</code> and the <code>TIMER_TMR[n]_CFG.TMODE</code> bits results in no interrupt being generated. In WIDCAP modes, the position of the interrupt is controlled with the <code>TIMER_TMR[n]_CFG.TMODE</code> bit, and the <code>TIMER_TMR[n]_CFG.IRQMODE</code> bit is ignored. Whenever an interrupt is generated, a trigger master pulse is also generated, if enabled in the <code>TIMER_TRG_MSK</code> register.
		0 Active Edge Mode. The timer generates an interrupt at every active edge. The active edge polarity depends on the state of the <code>TIMER_TMR[n]_CFG.PULSEHI</code> bit. Valid for PININT mode only.
		1 Delay Expired Mode. The timer generates an interrupt when the <code>TIMER_TMR[n]_CNT</code> value reaches the value in the <code>TIMER_TMR[n]_DLY</code> register. This mode is valid for all PWMOUT modes.
		2 Width Plus Delay Expired Mode. The timer generates an interrupt when the <code>TIMER_TMR[n]_CNT</code> value reaches the value in the <code>TIMER_TMR[n]_WID</code> register plus the value in the <code>TIMER_TMR[n]_DLY</code> register. (PWMOUT modes only)
		3 Period Expired Mode. The timer generates an interrupt when the <code>TIMER_TMR[n]_CNT</code> value reaches the value in the <code>TIMER_TMR[n]_PER</code> register. (Continuous PWMOUT and EXTCLK modes only)
3:0 (R/W)	TMODE	Timer Mode Select. The <code>TIMER_TMR[n]_CFG.TMODE</code> bit field selects the operating mode of each timer.
		0-7 Idle Mode
		8 Period Watchdog Mode
		9 Width Watchdog Mode

Table 20-37: TIMER_TMR[n]_CFG Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration	
		10	Measurement Report at Asserting Edge of Waveform
		11	Measurement Report at Deasserting Edge of Waveform
		12	Continuous PWMOUT Mode
		13	Single Pulse PWMOUT Mode
		14	EXTCLK Mode
		15	PININT (pin interrupt) Mode

Timer n Counter Register

The `TIMER_TMR[n]_CNT` register holds the current timer count. After enabling, the count is re-initialized to either 0x0 or 0x1, depending on the configuration and mode. The `TIMER_TMR[n]_CNT` register is read-only and may be read at any time (whether the timer is running or stopped). Reading the `TIMER_TMR[n]_CNT` register returns an atomic 32-bit value.

Depending on the timer operation mode, the counter increment can be clocked by a number of sources, including SCLK0, the TMR or alternate capture input pins, ACLK[n]. The counter retains its value after the timer is disabled.

Figure 20-26: TIMER_TMR[n]_CNT Register Diagram

Table 20-38: TIMER_TMR[n]_CNT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	VALUE	Counter Value. The <code>TIMER_TMR[n]_CNT.VALUE</code> bit field holds the current timer count.

Timer n Delay Register

The `TIMER_TMR[n]_DLY` register holds the delay value for the corresponding timer. This register's use is based on the selected timer mode.

Figure 20-27: `TIMER_TMR[n]_DLY` Register Diagram

Table 20-39: `TIMER_TMR[n]_DLY` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	Delay Value. The <code>TIMER_TMR[n]_DLY.VALUE</code> bit field holds the delay value for the corresponding timer.

Timer n Period Register

The `TIMER_TMR[n]_PER` register holds the period value for the corresponding timer. This register's use is based on the selected timer mode.

Figure 20-28: `TIMER_TMR[n]_PER` Register Diagram

Table 20-40: `TIMER_TMR[n]_PER` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	Period Value. The <code>TIMER_TMR[n]_PER.VALUE</code> bit field holds the period value for the corresponding timer.

Timer n Width Register

The `TIMER_TMR[n]_WID` register holds the width value for the corresponding timer. This register's use is based on the selected timer mode.

Figure 20-29: `TIMER_TMR[n]_WID` Register Diagram

Table 20-41: `TIMER_TMR[n]_WID` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	Width Value. The <code>TIMER_TMR[n]_WID.VALUE</code> bit field holds the width value for the corresponding timer.

Trigger Slave Enable Register

As a trigger slave, each timer can generate a unique data trigger pulse signal. The `TIMER_TRG_IE` contains trigger input enable bits for these signals, disabling or enabling the triggers as programmed. The reset value of the `TIMER_TRG_IE` register is 0xFFFF, masking these triggers after reset.

Figure 20-30: `TIMER_TRG_IE` Register Diagram

Table 20-42: `TIMER_TRG_IE` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15:0 (R/W)	TMR[nn]	Trigger Input Enable. For all <code>TIMER_TRG_IE.TMR[nn]</code> bits, write =0 disables the corresponding trigger input, and write =1 enables the corresponding trigger input.

Trigger Master Mask Register

As a trigger master, each timer can generate a unique data trigger pulse signal. The `TIMER_TRG_MSK` register contains a trigger mask for these outputs, masking (disabling) or unmasking (enabling) the triggers as programmed. The reset value of the `TIMER_TRG_MSK` register is 0xFFFF, masking these triggers after reset.

Figure 20-31: TIMER_TRG_MSK Register Diagram

Table 20-43: TIMER_TRG_MSK Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15:0 (R/W)	TMR[nn]	Trigger Output Mask. For all <code>TIMER_TRG_MSK.TMR[nn]</code> bits, write =0 unmask (enables) the corresponding data trigger output, and write =1 masks (disables) the corresponding data trigger output.

21 General-Purpose Counter (CNT)

The GP counter converts pulses from incremental position encoders into data that is representative of the actual position of the pulse. This conversion is done by integrating (counting) pulses on one or two inputs. Since integration provides relative position, some devices also feature a zero-position input (zero marker). The GP counter can use the zero position input feature to establish a reference point for verifying that the acquired position does not drift over time. In addition, the GP counter can use the incremental position information to determine speed, if the time intervals are measured.

The GP counter provides flexible ways to establish position information. When used with the GP timer block, the GP counter can allow for the acquisition of coherent position or time stamp information that enables speed calculation.

GP Counter Features

The GP counter includes the following features:

- 32-bit up or down counter
- Quadrature encode mode (Gray code)
- Binary encoder mode
- Alternative frequency-direction mode
- Timed direction and up or down counting modes
- Zero marker or push-button support
- Capture event timing in association with GP Timer
- Boundary comparison and boundary setting features

GP Counter Functional Description

The *GP Counter Block Diagram* shows a block diagram of the GP counter. The CNT_UD and CNT_DG pins accept various forms of incremental inputs. The 32-bit counter processes the inputs. The GP counter uses the CNT_ZM pin to sense the pressing of a push button.

NOTE: When enabled, the GP counter requires 3 SCLK0 cycles of initialization before recognizing valid toggles on its input pins.

The three input pins can be filtered (debounced) before the GP counter evaluates them.

The GP counter features a flexible boundary comparison. In all of the operating modes, the counter can be compared to an upper and lower limit. It takes various actions when reaching these limits.

The GP counter has a flexible input selection. Apart from accepting inputs from the CNT0_UD and CNT0_DG and PORT pins, the counter can be configured to accept trigger inputs by setting PADS_PCFG0.CNT0UDSEL and PADS_PCFG0.CNT0DGSEL bits. Refer to the [PADS_PCFG0](#) register description in General-Purpose Ports (PORT) chapter for details.

The module can optionally generate an interrupt request to the system through its IRQ line. On many processors, a GP timer module can use an output to generate time stamps on certain events.

ADSP-2159x CNT Register List

The GP Counter (CNT) provides support for manually controlled rotary controllers, such as the volume wheel on a radio device. This unit also supports industrial encoders.

The CNT converts pulses from incremental position encoders into data that is representative of the actual position. To complete this task, the CNT integrates (counts) pulses on one or two inputs. Because integration provides relative position, a zero position input (zero marker) is usually provided that establishes a reference point, verifying that the acquired position does not drift over time. The incremental position information may also be used to determine speed, if the relevant time intervals are measured. The CNT provides flexible ways to establish position information. When used in conjunction with the General-purpose Timer (TIMER), the CNT allows acquisition of coherent position/time stamp information, enabling speed calculation.

A set of registers govern CNT operations. For more information on CNT functionality, see the CNT register descriptions.

Table 21-1: ADSP-2159x CNT Register List

GP Counter Operating Modes

The GP counter has the following five modes of operation.

1. Quadrature Encoder
2. Binary Encoder
3. Up/Down Counter
4. Direction Counter
5. Timed Direction

With the exception of the timed direction mode, the GP counter can operate with the GP timer block to capture additional timing information (time stamps) associated with events detected by this block.

Quadrature Encoder Mode

In this mode, the CNT_UD and CNT_DG inputs expect a quadrature-encoded signal that is interpreted as a two-bit Gray code. The order of transitions of the CNT_UD and CNT_DG inputs determines whether the counter increments or decrements. The CNT_CNTR register contains the number of transitions that have occurred as shown in the *Quadrature Events and Counting Mechanism* table. Optionally, an interrupt is generated when both inputs

change within one SCLK0 cycle. Gray coding prohibits such transitions. Therefore, the `CNT_CNTR` register remains unchanged, and an error condition is signaled.

Table 21-5: Quadrature Events and Counting Mechanism

CNT_COUNTER Register Value	-4	-3	-2	-1	0	+1	+2	+3	+4
CDG, CUD Inputs	00	01	11	10	00	01	11	10	00

It is possible to reverse the count direction of the Gray-coded signal by enabling the polarity inverter of either the `CNT_UD` pin or the `CNT_DG` pin. Inverting both pins does not alter the behavior. The GP counter can enable this feature with the `CNT_CFG.CDGINV` and `CNT_CFG.CUDINV` bits.

As an example, the `CNT_DG` and `CNT_UD` inputs are 00 and the next transition is to 01. These inputs normally change the counter in increments as shown in the table. If the `CNT_UD` polarity is inverted, this condition generates a received input of 01 followed by 00. The results is a decrement of the counter, altering the behavior of the connected hardware.

Binary Encoder Mode

This mode is almost identical to quadrature encoder mode, with the exception that the `CNT_UD`: `CNT_DG` inputs expect a binary-encoded signal. The order of transitions of the `CNT_UD` and `CNT_DG` inputs determines whether the counter increments or decrements. The `CNT_CNTR` register contains the number of transitions that have occurred as shown in the *Binary Events and Counting Mechanism* table. Optionally, an interrupt is generated when the detected code steps by more than 1 (in binary arithmetic) within one SCLK0 cycle. Such transitions are erroneous. Therefore, the `CNT_CNTR` register remains unchanged, and an error condition is signaled.

Table 21-6: Binary Events and Counting Mechanism

CNT_COUNTER Register Value	-4	-3	-2	-1	0	+1	+2	+3	+4
CDG:CUD Inputs	00	01	10	11	00	01	10	11	00

Reversing the `CNT_UD` and `CNT_DG` pin polarity has a different effect in binary encoder mode than for the quadrature encoder mode. Inverting the polarity of the `CNT_UD` pin only, or inverting both the `CNT_UD` and `CNT_DG` pins, results in reversing the count direction.

Up/Down Counter Mode

In this mode, the counter increments or decrements at every active edge of the input pins. The GP counter uses the `CNT_CFG.CUDINV` bit to select an active edge and has the following results.

- If the GP counter module detects an active edge at the `CNT_UD` input, the counter increments.
- If the GP counter module detects an active edge at the `CNT_DG` input, the counter decrements.
- If simultaneous edges occur on the `CNT_DG` and `CNT_UD` pins, the counter remains unchanged, and both up-count and down-count events are signaled in the `CNT_STAT` register.

Direction Counter Mode

In this mode, the counter is incremented or decremented at every active edge of the `CNT_DG` input pin. The state of the `CNT_UD` input determines whether the counter increments or decrements. The GP counter uses the `CNT_CFG.CUDINV` bit to select the polarity.

If the GP counter detects an active edge at the `CNT_DG` input, the counter value changes by one in the selected direction.

Timed Direction Mode

In this mode, the counter is incremented or decremented at each `SCLK0` cycle. The state of the `CNT_UD` input determines whether the counter increments or decrements. The GP counter uses the `CNT_CFG.CUDINV` bit to select the polarity. The `CNT_DG` pin can be used to gate the clock. The GP counter uses the `CNT_CFG.CDGINV` bit to select the polarity.

GP Counter Programming Model

The following sections provide information for programming the interface.

GP Counter General Programming Flow

The following are general guidelines for configuring and enabling the GP counter.

1. Initialize (but do not enable) the GP counter for the desired mode and settings through the `CNT_CFG` register.
2. Usually, events of interest are processed using interrupts rather than by polling status bits. In this case, clear all status bits and activate the interrupt generation requests with the `CNT_IMSK` register.
3. Configure interrupts at the system level to insure desired interrupt signaling to the system.
4. If timing information is required, set up the relevant GP Timer in width capture mode.
5. Finally, enable interrupt requests and the GP Counter itself using the `CNT_IMSK` and `CNT_CFG` registers, respectively.

GP Counter Mode Configuration

The GP counter can use the `CNT_ZM` input pin to sense the zero marker output of a rotary device or to detect the pressing of a push button. There are four programming schemes, which are functional in all counter modes:

- Push-button mode
- Zero-marker-zeros-counter mode
- Zero-marker-error mode
- Zero-once mode

Configuring GP Counter Push-Button Operation

Use the following procedure to configure push-button operation:

1. Set `CNT_IMSK.CZM` to enable (unmask) the zero marker interrupt.
2. Select the active edge polarity through the `CNT_CFG.CZMINV` bit.
3. Proceed with any other desired configuration steps and enable the peripheral.

An active edge at the `CNT_ZM` input sets the `CNT_IMSK.CZM` bit.

Configuring Zero-Marker-Zeros-Counter Mode

The following provides information on configuring zero-marker-zeros-counter mode for the GP counter.

1. Set `CNT_IMSK.CZMZ` to enable `CNT_CNTR`. The zero marker interrupt zeroes the counter.
2. Set `CNT_CFG.ZMZC` to enable ZMZC mode.
3. Select the active edge polarity through the `CNT_CFG.CZMINV` bit.
4. Proceed with any other desired configuration steps and enable the peripheral.

This configuration causes an active level at the `CNT_ZM` pin to clear the `CNT_CNTR` register and keep it cleared until the `CNT_ZM` pin is deactivated. In addition, the `CNT_STAT.CZMZ` bit is set.

Configuring Zero-Marker-Error Mode

The GP counter uses this mode to detect discrepancies between counter-value and the zero marker output of certain rotary encoder devices.

1. Set the `CNT_STAT.CZME` bit to enable this mode.
2. Select the active edge of the `CNT_ZM` pin through the `CNT_CFG.CZMINV` bit.
3. Proceed with any other desired configuration steps and enable the peripheral.

When the GP counter detects an active edge at the `CNT_ZM` input pin, it compares the four LSBs of the `CNT_CNTR` register to zero. If they are not zero, the GP counter uses `CNT_STAT.CZME` bit to signal a mismatch.

Configuring Zero-Once Mode

The GP counter uses this mode to perform an initial reset of the counter-value when it detects an active zero marker. After that, the zero marker is ignored (the counter is no longer reset).

1. Set the `CNT_CMD.W1ZMONCE` bit to enable this mode.
2. Select the active edge of the `CNT_ZM` pin through the `CNT_CFG.CZMINV` bit.
3. Ensure that at least one of the following bits is enabled: `CNT_IMSK.CZM`, `CNT_IMSK.CZME`, `CNT_IMSK.CZMZ`.

4. Proceed with any other desired configuration steps and enable the peripheral.

The `CNT_CNTR` register and the `CNT_CMD.W1ZMONCE` bit are cleared on the next active edge of the `CNT_ZM` pin. Now the `CNT_CMD.W1ZMONCE` bit can be read to check whether the event has already occurred.

Configuring Boundary Auto-Extend Mode

In this mode, hardware modifies the boundary registers (`CNT_MIN` and `CNT_MAX`) whenever the `CNT_CNTR` value reaches either of them. The GP counter uses this mode to monitor the widest angle a thumb wheel even if the software did not generate interrupts.

1. Initialize `CNT_CNTR` with the desired value.
2. Set both `CNT_MIN` and `CNT_MAX` to this same value.
3. Configure the `CNT_CFG.BNDMODE` field for auto extend mode.
4. Proceed with any other desired configuration steps and enable the peripheral.

The `CNT_MAX` register is loaded with the current `CNT_CNTR` value when the latter increments beyond the `CNT_MAX` value. Similarly, the `CNT_MIN` register is loaded with the `CNT_CNTR` value when the latter decrements below the `CNT_MIN` value. The `CNT_STAT.MAXC` and `CNT_STAT.MINC` status bits are set when the `CNT_CNTR` value matches the respective boundary register value.

Configuring Boundary Capture Mode

In this mode, the `CNT_CNTR` value is latched into the `CNT_MIN` register at one detected edge of the `CNT_ZM` input pin, and latched into the `CNT_MAX` boundary register at the opposite edge.

1. To capture the `CNT_ZM` pin rising edge into `CNT_MIN` and the falling edge into `CNT_MAX`, program `CNT_CFG.CZMINV` for active high polarity. Conversely, to capture the `CNT_ZM` pin falling edge into `CNT_MIN` and the rising edge into `CNT_MAX`, program `CNT_CFG.CZMINV` for active low polarity.
2. Program the `CNT_IMSK.MAXC` and `CNT_IMSK.MINC` interrupt mask bits according to interrupt generation requirements.
3. Configure the `CNT_CFG.BNDMODE` field for boundary capture mode.
4. Proceed with any other desired configuration steps and enable the peripheral.

The `CNT_STAT.MAXC` and `CNT_STAT.MINC` status bits report the capture event, depending on how interrupt masks are configured.

Configuring Boundary Compare and Boundary Zero Modes

In these modes, the two boundary registers (`CNT_MAX` and `CNT_MIN`) are compared to the value in the `CNT_CNTR` register.

1. Program `CNT_MAX` and `CNT_MIN` registers with appropriate upper and lower range values.

2. Program the `CNT_IMSK.MAXC` and `CNT_IMSK.MINC` interrupt mask bits according to interrupt generation requirements.
3. Configure the `CNT_CFG.BNDMODE` field for boundary compare mode.
4. Proceed with any other desired configuration steps and enable the peripheral.

If after incrementing, `CNT_CNTR = CNT_MAX`, then the `CNT_STAT.MAXC` bit is set. Similarly if after decrementing, `CNT_CNTR = CNT_MIN`, then the `CNT_STAT.MINC` bit is set.

Additionally, for boundary zero mode, the counter-value in `CNT_CNTR` is set to zero. The `CNT_STAT.MAXC` and `CNT_STAT.MINC` bits are not set when software updates the `CNT_MAX` or `CNT_MIN` registers.

Configuring GP Counter Push-Button Operation

Use the following procedure to configure push-button operation:

1. Set `CNT_IMSK.CZM` to enable (unmask) the zero marker interrupt.
2. Select the active edge polarity through the `CNT_CFG.CZMINV` bit.
3. Proceed with any other desired configuration steps and enable the peripheral.

An active edge at the `CNT_ZM` input sets the `CNT_IMSK.CZM` bit.

GP Counter Programming Concepts

Using the features, operating modes, and event control for the GP counter to their greatest potential requires an understanding of some GP counter-related concepts. Some key aspects to consider are input noise filtering and capturing timing information.

CNT Input Noise Filtering

In all modes, the three input pins can be filtered to present clean signals to the GP counter logic. The GP counter uses the `CNT_CFG.DEBEN` bit to enable or disable this filtering. The *Programmable Noise Filtering* figure shows the filtering operation for the `CNT_UD` pin.

Figure 21-1: Programmable Noise Filtering

The CNT module implements the filtering mechanism using counters for each GP counter pin, where each counter is initialized from the `CNT_DEBNCE.DPRESCALE` field. When a transition is detected on a pin, the corresponding counter starts counting up to the programmed number of `SCLK0` cycles. The state of the pin is latched after time t_{filter} and passed on to the GP counter logic.

The following formula determines the time t_{filter} , given SCLK0 and the CNT_DEBNCE.DPRESCALE value, where lower values of CNT_DEBNCE.DPRESCALE result in shorter debounce delays:

$$t_{\text{filter}} = 128 \times (2^{\text{DPRESCALE}} \times \text{SCLK0})$$

Capturing Counter Interval and CNT_CNTR Read Timing

When the count speed is low, it is often useful to capture the time elapsed since the last count event. Program the `TIMER TMR[n] CFG` register of the associated GP timer in a width capture mode with the following bit settings.

- `TIMER_TMR[n]_CFG.PULSEHI = 0`
- `TIMER_TMR[n]_CFG.TMODE = b#1011`
- `TIMER_TMR[n]_CFG.TINSEL = 1`

The *Capture Intervals* figure shows and the following list describe the operation of the GP counter and the GP timer in this mode.

Figure 21-2: Capture Intervals

NOTE: SCLK in the *Capture Intervals* figure is SCLK0.

1. The CNT_TO signal generates a pulse every time a count event occurs. In addition, when the processor reads the CNT_CNTR register, the CNT_TO signal presents a pulse which is extended (high) until the next count event.
2. The GP timer updates its TIMER_TMR[n]_PER register with the period (measured from falling edge to falling edge, because TIMER_TMR[n]_CFG.PULSEHI = 0) of the CNT_TO signal.

3. The `TIMER_TMR[n]_WID` register is updated with the pulse width (the portion where `CNT_TO` is low, again because `TIMER_TMR[n]_CFG.PULSEHI = 0`).
4. Both registers are updated at every rising edge of the `CNT_TO` signal (because `TIMER_TMR[n]_CFG.TMODE = b#011`).

The `TIMER_TMR[n]_PER` register contains the period between the last two count events. The `TIMER_TMR[n]_WID` register contains the time since the last count event and the read of the `CNT_CNTR` register, both measured in `SCLK0` cycles.

Read the `CNT_CNTR` register to latch the two time measurements, providing a coherent triplet of information to calculate speed and position.

NOTE: Speed restrictions apply to the use of the `CNT_TO` signal. Therefore, programs must not operate at count event rates that are high. For instance, if `CNT_CNTR` is incremented or decremented every `SCLK0` cycle (timed direction mode), the `CNT_TO` signal is not valid.

Capturing Time Interval Between Successive Counter Events

When the required timing information is the interval between successive count events, program the associated timer in a width capture mode. Set the `TIMER_TMR[n]_CFG` bit of `TIMER_TMR[n]_CFG.PULSEHI = 1`, `TIMER_TMR[n]_CFG.TMODE = b#1010` and `TIMER_TMR[n]_CFG.TINSEL = 1`. Typically, this information is sufficient if the speed of GP counter events does not to reach low values.

The *Period Register Timing* figure shows the operation of the GP counter and the GP timer in this mode.

Figure 21-3: Period Register Timing

NOTE: SCLK in the *Period Register Timing* figure is `SCLK0`.

The `CNT_TO` signal generates a pulse every time a count event occurs. The GP timer updates its `TIMER_TMR[n]_PER` register with the period (measured from rising edge to rising edge) of the `CNT_TO` signal. The `TIMER_TMR[n]_PER` register is updated at every rising edge of the `CNT_TO` signal and contains the number of `SCLK0` cycles that have elapsed since the previous rising edge.

Incidentally, the `TIMER_TMR[n]_WID` register is also updated at the same time, but is generally of no interest in this mode of operation. If no reads of the `CNT_CNTR` register occur between counter events, the `TIMER_TMR[n]_WID` register only contains the width of the `CNT_TO` pulse. If a read of `CNT_CNTR` has occurred between events, the `TIMER_TMR[n]_WID` register contains the time between the read of `CNT_CNTR` and the next event.

This mode can also be used with `TIMER_TMR[n]_CFG.PULSEHI = 0`. In this case, the period of `CNT_TO` is measured between falling edges. It results in the same values as in the previous case, only the latching occurs one `SCLK0` cycle later.

GP Counter Event Control

Eleven events can be signaled to the processor using status information and optional interrupt requests. The GP counter uses the respective bits in the `CNT_IMSK` register to enable the interrupt requests. It uses dedicated bits in the `CNT_STAT` register to report events. When an interrupt request from the GP counter is serviced, the application software is responsible for correct interpretation of the events. It is recommended to logically AND the content of the `CNT_IMSK` and `CNT_STAT` registers to identify pending interrupt requests.

Perform a write-one-to-clear (W1C) operation to the `CNT_STAT` register to clear the interrupt requests. Hardware does not clear the status bits automatically, unless the counter module is disabled.

The following sections describe the events associated with the GP counter.

Illegal Gray and Binary Code Events

When illegal transitions occur in quadrature encoder or binary encoder modes, the `CNT_STAT.IC` bit is set. If enabled by the `CNT_STAT.IC` bit, the counter module generates an interrupt request. Set the `CNT_STAT.IC` bit only in the quadrature encoder or binary encoder modes.

Up/Down Count Events

The GP counter uses the `CNT_STAT.UC` bit to indicate whether the counter has been incremented. Similarly, the `CNT_STAT.DC` bit reports decrements. The two events are independent. For instance, if the counter increments by one and then decrements by two, both bits remain set, even though the resulting counter-value shows a decrement by one.

In up/down counter mode, hardware can detect simultaneous active edges on the `CNT_UD` and `CNT_DG` inputs. In that case, the `CNT_CNTR` remains unchanged, but both the `CNT_STAT.UC` and `CNT_STAT.DC` bits are set. Interrupt requests for these events can be enabled through the `CNT_IMSK.UC` and `CNT_IMSK.DC` bits. Use this feature carefully when the counter is clocked at high rates. This suggestion is especially critical when the counter operates in `DIR_TMR` mode, as interrupts are generated every `SCLK0` cycle.

These events can also be used for more push buttons, when GP counter features are unnecessary. When up/down counter mode is enabled, the GP counter can use these count events to report interrupts from push buttons that connect to the CNT_UD and CNT_DG inputs.

Zero-Count Events

The CNT_STAT.CZERO status bit indicates that the CNT_CNTR has reached a value equal to 0x0000 0000 after an increment or decrement. This bit is not set when the counter value is set to zero by a write to CNT_CNTR or by setting the CNT_CMD.W1LCNTZERO bit. If enabled by the CNT_IMSK.CZERO bit, the GP counter module generates an interrupt request.

Overflow Events

There are two status bits that indicate whether the signed counter-register has overflowed from a positive to a negative value or conversely. The CNT_STAT.COV31 bit reports that the 32-bit CNT_CNTR register has either incremented from 0x7FFF FFFF to 0x8000 0000, or decremented from 0x8000 0000 to 0x7FFF FFFF.

If enabled by the CNT_IMSK.COV31 bit, an interrupt request is generated. Similarly, in applications where only the lower 16 bits of the counter are of interest, the CNT_STAT.COV15 status bit reports counter transitions from 0xFFFF 7FFF to 0xFFFF 8000, or from 0xFFFF 8000 to 0xFFFF 7FFF. If enabled by the CNT_IMSK.COV15 bit, an interrupt request is generated.

Boundary Match Events

The CNT_STAT.MINC and CNT_STAT.MAXC status bits report boundary events as described in [Configuring Boundary Capture Mode](#). These bits are not set if the software updates the CNT_CNTR, CNT_MAX, or CNT_MIN registers or writes to the CNT_CMD register. The CNT_IMSK.MINC and CNT_IMSK.MAXC bits enable interrupt request generation on boundary events.

Zero Marker Events

The CNT_STAT.CZM, CNT_STAT.CZME, and CNT_STAT.CZMZ bits are associated with zero marker events, as described in [Configuring GP Counter Push-Button Operation](#). Each of these events can optionally generate an interrupt request, when enabled by the corresponding CNT_IMSK.CZM, CNT_IMSK.CZME and CNT_IMSK.CZMZ bits.

ADSP-2159x CNT Register Descriptions

CNT (CNT) contains the following registers.

Table 21-7: ADSP-2159x CNT Register List

Name	Description
CNT_CFG	Configuration Register
CNT_CMD	Command Register

Table 21-7: ADSP-2159x CNT Register List (Continued)

Name	Description
CNT_CNTR	Counter Register
CNT_DEBNCE	Debounce Register
CNT_IMSK	Interrupt Mask Register
CNT_MAX	Maximum Count Register
CNT_MIN	Minimum Count Register
CNT_STAT	Status Register

Configuration Register

The `CNT_CFG` register configures counter modes, configures input pins, and enables the CNT.

Figure 21-4: CNT_CFG Register Diagram

Table 21-8: CNT_CFG Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15 (R/W)	INPDIS	CUD and CDG Pin Input Disable. The <code>CNT_CFG</code> . <code>INPDIS</code> disables or enables the <code>CNT_UD</code> input pin and the <code>CNT_DG</code> pin.
		0 Enable
		1 Pin Input Disable
13:12 (R/W)	BNDMODE	Boundary Register Mode. The <code>CNT_CFG</code> . <code>BNDMODE</code> bit field selects the mode for the <code>CNT_MIN</code> and <code>CNT_MAX</code> boundary registers.
		0 BND_COMP. Boundary Compare Mode
		1 BND_ZERO. Boundary Zero Mode
		2 BND_CAPT. Boundary Capture Mode
		3 BND_AEXT. Boundary Auto-extend Mode

Table 21-8: CNT_CFG Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
11 (R/W)	ZMZC	CZM Zeros Counter Enable. The CNT_CFG . ZMZC bit enables or disables level sensitive - active CNT_ZM pin operation to zero the CNT_CNTR register.
		0 Disable
		1 Enable
10:8 (R/W)	CNTMODE	Counter Operating Mode. The CNT_CFG . CNTMODE bit field selects the operating mode for the CNT_UD input pin and the CNT_DG pin.
		0 QUAD_ENC. Quadrature Encoder Mode
		1 BIN_ENC. Binary Encoder Mode
		2 UD_CNT. Rotary Counter Mode
		4 DIR_CNT. Direction Counter Mode
		5 DIR_TMR. Direction Timer Mode
6 (R/W)	CZMINV	CZM Pin Polarity Invert. The CNT_CFG . CZMINV bit selects the polarity for the CNT_ZM pin. This polarity must be configured before the counter is enabled. It must not change on-the-fly while the counter is enabled.
		0 Active High, Rising Edge
		1 Active Low, Falling Edge
5 (R/W)	CUDINV	CUD Pin Polarity Invert. The CNT_CFG . CUDINV bit selects the polarity for the CNT_UD pin. This polarity must be configured before the counter is enabled. It must not change on-the-fly while the counter is enabled.
		0 Active High, Rising Edge
		1 Active Low, Falling Edge
4 (R/W)	CDGINV	CDG Pin Polarity Invert. The CNT_CFG . CDGINV bit selects the polarity for the CNT_DG pin. This polarity must be configured before the counter is enabled. It must not change on-the-fly while the counter is enabled.
		0 Active High, Rising Edge
		1 Active Low, Falling Edge

Table 21-8: CNT_CFG Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
1 (R/W)	DEBEN	Debounce Enable. The CNT_CFG.DEBEN bit enables or disables CNT input debounce filtering operation selected with the CNT_DEBNCE register.
		0 Disable
		1 Enable
0 (R/W)	EN	Counter Enable. The CNT_CFG.EN bit enables or disables CNT operation.
		0 Counter Disable
		1 Counter Enable

Command Register

The `CNT_CMD` register configures the CNT, enabling operations such as zeroing a counter register and copying or swapping boundary registers. These actions are taken by setting the appropriate bit.

Read operations from this register do not return meaningful values, with the exception of the `CNT_CMD.W1ZMONCE` bit, where a set bit indicates that the bit has been set by software before, but a zero marker event has not yet been detected on the `CNT_ZM` pin yet. For more information, see the CNT functional description.

The `CNT_CNTR`, `CNT_MIN`, and `CNT_MAX` registers can be initialized to zero by setting the `CNT_CMD.W1LCNTZERO`, `CNT_CMD.W1LMINZERO`, and `CNT_CMD.W1LMAXZERO` bits. In addition to clearing registers, the `CNT_CMD` register permits modifying the `CNT_MIN` and `CNT_MAX` boundary registers in a number of ways. The current counter value in the `CNT_CNTR` register can be captured and loaded into either of the two boundary registers to create new boundary limits. This operation is performed by setting the `CNT_CMD.W1LMAXCNT` and `CNT_CMD.W1LMINCNT` bits. Alternatively, the counter can be loaded from `CNT_MAX` or `CNT_MIN` using the `CNT_CMD.W1LCNTMAX` and `CNT_CMD.W1LCNTMIN` bits. It is also possible to transfer the current `CNT_MAX` value into `CNT_MIN` (or conversely) through the `CNT_CMD.W1LMINMAX` and `CNT_CMD.W1LMAXMIN` bits.

Another counter operation is the ability to only have the zero marker clear the `CNT_CNTR` register once. For more information, see the CNT functional description.

It is possible for multiple actions to be performed simultaneously by setting multiple bits in the `CNT_CMD` register. However, there are restrictions. The bits associated with each command have been grouped together such that all bits that involve a write to the `CNT_CNTR`, `CNT_MAX`, or `CNT_MIN` registers are located within bits 4-bit groups of the `CNT_CMD` register.

Note that a maximum of three commands can be issued at any one time, excluding the `CNT_CMD.W1ZMONCE` command. Also, note that `CNT_CMD.W1LCNTMIN`, `CNT_CMD.W1LCNTMAX`, and `CNT_CMD.W1LCNTZERO` bits have to be used exclusively. Never set more than one of them at the same time.

Figure 21-5: CNT_CMD Register Diagram

Table 21-9: CNT_CMD Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
12 (R/W)	W1ZMONCE	Write 1 Zero Marker Clear Once Enable. The CNT_CMD.W1ZMONCE enables a single zero marker clear of the CNT_CNTR register. Reading a 1 in this bit indicates that the bit has been set by software before, but no zero marker event has been detected on the CNT_ZM pin yet.
10 (R0/W)	W1LMAXMIN	Write 1 MAX Copy from MIN. The CNT_CMD.W1LMAXMIN bit transfers the current CNT_MIN register value into CNT_MAX register.
9 (R0/W)	W1LMAXCNT	Write 1 MAX Capture from CNTR. The CNT_CMD.W1LMAXCNT bit loads the current value in the CNT_CNTR register into the CNT_MAX register to create a new boundary limit.
8 (R0/W)	W1LMAXZERO	Write 1 MAX to Zero. Writing a 1 to the CNT_CMD.W1LMAXZERO bit clears the CNT_MAX register.
7 (R0/W)	W1LMINMAX	Write 1 MIN Copy from MAX. The CNT_CMD.W1LMINMAX bit transfers the current CNT_MAX register value into CNT_MIN register.
5 (R0/W)	W1LMINCNT	Write 1 MIN Capture from CNTR. The CNT_CMD.W1LMINCNT bit loads the current value in the CNT_CNTR register into the CNT_MIN register to create a new boundary limit.
4 (R0/W)	W1LMINZERO	Write 1 MIN to Zero. Writing a 1 to the CNT_CMD.W1LMINZERO bit clears the CNT_MIN register.

Table 21-9: CNT_CMD Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
3 (R0/W)	W1LCNTMAX	Write 1 CNTR Load from MAX. The CNT_CMD.W1LCNTMAX bit loads the current value in the CNT_MAX register into the CNT_CNTR register to create a new boundary limit.
2 (R0/W)	W1LCNTMIN	Write 1 CNTR Load from MIN. The CNT_CMD.W1LCNTMIN bit loads the current value in the CNT_MIN register into the CNT_CNTR register to create a new boundary limit.
0 (R0/W)	W1LCNTZERO	Write 1 CNTR to Zero. Writing a 1 to the CNT_CMD.W1LCNTZERO bit clears the CNT_CNTR register.

Counter Register

The `CNT_CNTR` register holds the 32-bit, two's-complement count value. It can be read and written at any time. Hardware ensures that reads and write are atomic, by providing respective shadow registers. This register can be accessed with either 32-bit or 16-bit operations. This allows use of the CNT as a 16-bit counter if sufficient for the application.

Figure 21-6: CNT_CNTR Register Diagram

Table 21-10: CNT_CNTR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	CNTR Value. The <code>CNT_CNTR.VALUE</code> bit field holds the 32-bit, two's-complement count value.

Debounce Register

The `CNT_DEBNCE` register selects the noise filtering characteristic of the three input pins according to the formula:

$$t_{\text{filter}} = 128 \times (2^{\text{DPRESCALE}} / \text{SCLK0})$$

Figure 21-7: CNT_DEBNCE Register Diagram

Table 21-11: CNT_DEBNCE Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
4:0 (R/W)	DPRESCALE	Debounce Prescale. The <code>CNT_DEBNCE.DPRESCALE</code> selects the desired number of input filtering cycles (and resulting input debounce time) in multiples of <code>SCLK0</code> .
		0 1x cycles = 128 <code>SCLK0</code> cycles
		1 2x cycles
		2 4x cycles
		3 8x cycles
		4 16x cycles
		5 32x cycles
		6 64x cycles
		7 128x cycles
		8 256x cycles
		9 512x cycles
		10 1024x cycles
		11 2048x cycles
		12 4096x cycles
		13 8192x cycles
		14 16384x cycles
		15 32768x cycles
		16 65536x cycles

Table 21-11: CNT_DEBNCE Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration	
		17	131072x cycles
		18	Reserved from this value. The values 10010 - 11111 are reserved.
		31	Reserved until this value

Interrupt Mask Register

The `CNT_IMSK` register supports enabling (unmasking) interrupt request generation from each of the CNT events.

All bits in `CNT_IMSK` either disable/mask an interrupt request (if bit cleared) or enable/unmask an interrupt request (if bit set).

Figure 21-8: CNT_IMSK Register Diagram

Table 21-12: CNT_IMSK Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
10 (R/W)	CZMZ	Counter Zeroed by Zero Marker Interrupt Enable. The <code>CNT_IMSK.CZMZ</code> bit enables (unmasks) the counter zeroed by zero marker interrupt request.
		0 Mask Interrupt
		1 Unmask Interrupt
9 (R/W)	CZME	Zero Marker Error Interrupt Enable. The <code>CNT_IMSK.CZME</code> bit enables (unmasks) the zero marker error interrupt request.
		0 Mask Interrupt
		1 Unmask Interrupt

Table 21-12: CNT_IMSK Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
8 (R/W)	CZM	CZM Pin/Pushbutton Interrupt Enable. The CNT_IMSK.CZM bit enables (unmasks) the CZM pin/pushbutton interrupt request.
		0 Mask Interrupt
		1 Unmask Interrupt
7 (R/W)	CZERO	CNT_CNTR Counts To Zero Interrupt Enable. The CNT_IMSK.CZERO bit enables (unmasks) the counts to zero interrupt request.
		0 Mask Interrupt
		1 Unmask Interrupt
6 (R/W)	COV15	Bit 15 Overflow Interrupt Enable. The CNT_IMSK.COV15 bit enables (unmasks) the bit 15 overflow interrupt request.
		0 Mask Interrupt
		1 Unmask Interrupt
5 (R/W)	COV31	Bit 31 Overflow Interrupt Enable. The CNT_IMSK.COV31 bit enables (unmasks) the bit 31 overflow interrupt request.
		0 Mask Interrupt
		1 Unmask Interrupt
4 (R/W)	MAXC	Max Count Interrupt Enable. The CNT_IMSK.MAXC bit enables (unmasks) the max count interrupt request.
		0 Mask Interrupt
		1 Unmask Interrupt
3 (R/W)	MINC	Min Count Interrupt Enable. The CNT_IMSK.MINC bit enables (unmasks) the min count interrupt request.
		0 Mask Interrupt
		1 Unmask Interrupt
2 (R/W)	DC	Downcount Interrupt Enable. The CNT_IMSK.DC bit enables (unmasks) the down count interrupt request.
		0 Mask Interrupt
		1 Unmask Interrupt

Table 21-12: CNT_IMSK Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
1 (R/W)	UC	Upcount Interrupt Enable. The CNT_IMSK. UC bit enables (unmasks) the up count interrupt request.
		0 Mask Interrupt
		1 Unmask Interrupt
0 (R/W)	IC	Illegal Gray/Binary Code Interrupt Enable. The CNT_IMSK. IC bit enables (unmasks) the illegal Gray/Binary Code interrupt request and should only be used in these modes.
		0 Mask Interrupt
		1 Unmask Interrupt

Maximum Count Register

The `CNT_MAX` register holds the 32-bit, two's-complement, higher boundary value. It can be read and written at any time. Hardware ensures that reads and write are atomic, by providing respective shadow registers. This register can be accessed with either 32-bit or 16-bit operations. This allows for using the CNT as a 16-bit counter if sufficient for the application.

Figure 21-9: CNT_MAX Register Diagram

Table 21-13: CNT_MAX Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	MAX Value. The <code>CNT_MAX.VALUE</code> bit field holds the 32-bit, two's-complement, higher boundary value.

Minimum Count Register

The `CNT_MIN` register holds the 32-bit, two's-complement, lower boundary value. It can be read and written at any time. Hardware ensures that reads and write are atomic, by providing respective shadow registers. This register can be accessed with either 32-bit or 16-bit operations. This allows for using the CNT as a 16-bit counter if sufficient for the application.

Figure 21-10: CNT_MIN Register Diagram

Table 21-14: CNT_MIN Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	MIN Value. The <code>CNT_MIN.VALUE</code> bit field holds the 32-bit, two's-complement, lower boundary value.

Status Register

The **CNT_STAT** register provides status information for each of the CNT events as configured in the **CNT_IMSK** register. When a CNT event is detected, the corresponding bit in this register is set. It remains set until either software writes a 1 to the bit (write-1-to-clear) or the CNT is disabled.

All bits in the **CNT_STAT** register indicate either no interrupt request pending (if bit cleared) or an interrupt request pending (if bit set).

Figure 21-11: CNT_STAT Register Diagram

Table 21-15: CNT_STAT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
10 (R/W1C)	CZMZ	Counter Zeroed By Zero Marker Interrupt. The CNT_STAT.CZMZ bit indicates a zero marker error. If the CNT_CFG.ZMZC bit =1, this interrupt request is generated when the CZMII latch reports a significant edge on the CZM input. Once cleared by software the CNT_STAT.CZM bit is not set again when the CZM input remains active without pulsing.
		0 No error
		1 Error occurred

Table 21-15: CNT_STAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
9 (R/W1C)	CZME	Zero Marker Error Interrupt. The CNT_STAT.CZME bit behaves similarly to the CNT_STAT.CZM bit, with the exception that CNT_STAT.CZME is not set on the CZM edge when the lower four bits of the CNT_CNTR are not zero. In many applications this indicates an error condition, as the zero marker might be out of sync with the counter.
		0 No error
		1 Error occurred
8 (R/W1C)	CZM	CZM Pin/Pushbutton Interrupt. The CNT_STAT.CZM bit indicates a CZM pin/pushbutton error. This interrupt request is generated when a significant edge is seen on the CZM pin, regardless what mode the counter is operating in. This is often used to sense push buttons (especially with the debouncing circuit enabled).
		0 No error
		1 Error occurred
7 (R/W1C)	CZERO	CNT_CNTR Counts To Zero Interrupt. The CNT_STAT.CZERO bit indicates a counts to zero error. This error is generated when the CNT_CNTR register has incremented or decremented toward 0x0000.0000. The latch is not set when software writes to the CNT_CNTR register directly or when the counter is zeroed by writes to the CNT_CMD register.
		0 No error
		1 Error occurred
6 (R/W1C)	COV15	Bit 15 Overflow Interrupt. The CNT_STAT.COV15 bit indicates a bit 15 overflow error. This error is generated when the 16-bit twos-complement CNT_CNTR register has incremented from 0xxxxx.7FFF to 0xxxxx.8000 or decremented from 0xxxxx.8000 to 0xxxxx.7FFE.
		0 No error
		1 Error occurred
5 (R/W1C)	COV31	Bit 31 Overflow Interrupt. The CNT_STAT.COV31 bit indicates a bit 31 overflow error. This error is generated when the 32-bit twos-complement CNT_CNTR register has incremented from 0x7FFF.FFFF to 0x8000.0000 or decremented from 0x8000.0000 to 0x7FFF.FFFF.
		0 No error
		1 Error occurred

Table 21-15: CNT_STAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
4 (R/W1C)	MAXC	Max Count Interrupt. The CNT_STAT.MAXC bit indicates a max count error. This interrupt is used in boundary compare (BND_COMP) mode. If after incrementing the CNT_CNTR register equals CNT_MAX, the CNT_STAT.MAXC bit is set.
		0 No error
		1 Error occurred
3 (R/W1C)	MINC	Min Count Interrupt. The CNT_STAT.MINC bit indicates a minimum count error. This interrupt is used in boundary compare (BND_COMP) mode. If, after decrementing, the CNT_CNTR register equals CNT_MIN, the CNT_STAT.MINC bit is set.
		0 No error
		1 Error occurred
2 (R/W1C)	DC	Down Count Interrupt. The CNT_STAT.DC bit indicates a down count error. This interrupt is generated when the CNT_CNTR register decrements.
		0 No error
		1 Error occurred
1 (R/W1C)	UC	Up Count Interrupt. The CNT_STAT.UC bit indicates an up count interrupt. This interrupt is generated when the CNT_CNTR register increments.
0 (R/W1C)	IC	Illegal Gray/Binary Code Interrupt. The CNT_STAT.IC bit indicates a illegal Gray/Binary Code interrupt and should only be used in these modes. In normal operation those codes can increment or decrement the CNT_CNTR register by one at a time. If the sensed inputs instruct the counter to increment or decrement by two, the CNT_STAT.IC bit is set. Hardware sets the CNT_STAT.IC bit in QUAD_ENC and BIN_ENC encoder modes only.
		0 No error
		1 Error occurred

22 Media Local Bus (MLB)

Media Local Bus (MediaLB[®]) is an on-PCB or inter-chip communication bus, which allows an application to access the MOST network data. Media Local Bus supports all the MOST network data transport methods including synchronous stream data, asynchronous packet data, control message data and isochronous data. The MLB topology supports communication among the MLB controller and MLB devices, where the MLB controller is the interface between the MLB devices and the MOST network.

The MLB module serves as an interface between the MediaLB and the processor, implementing the requirements of the physical layer and the link layer outlined in the MediaLB specification. It supports up to 64 logical channels with up to 468 bytes of data per MediaLB frame. Transmit and receive data can be transferred between MediaLB and on-chip memory with DMA block transfers.

The MLB supports the MOST25, MOST50 and MOST150 standards and this document assumes familiarity with these standards. For more information, refer to the Media Local Bus specification version 4.2.

- Copyright 1998-2016 Microchip Technology Inc. All rights reserved. Portions of this chapter are included with permission from Microchip Technology, Inc.

Features

The objective of MLB is to map all the MOST Network data types (transport methods) into a single low-cost, scalable, and standardized hardware interface between a MediaLB controller and at least one other MediaLB Device. The adoption of MediaLB simplifies the hardware interface, reduces the pin count, and facilitates the design of modular reusable hardware. From a software development perspective, the use of MediaLB relieves the system developer from the complexity of the MOST network, which simplifies software development and enables the design of reusable software for different applications. This simplified, standardized interface shortens time to market and makes software maintenance effortless.

- Compliant to Media Local Bus specification version 4.2
- Support MOST25, MOST50, MOST150 standards
- Support 3-pin and 6-pin mode
 - 6-pin mode supports a data rate of $2048 \times \text{FS}$
 - 3-pin mode support various data rates of $256 \times \text{FS}$, $512 \times \text{FS}$, $1024 \times \text{FS}$

- Support 64 logic channels
- Dedicated PLL for clock recovery and phase alignment
- Dedicated pins for 6-pin mode (LVDS)
- Shared pins for 3-pin mode
- Dedicated internal RAM for data buffering and channel table
- Recovered clock (after division) available out on a shared pin for DAI

NOTE: Only one MLB interface (3-pin mode or 6-pin mode) is active at any given time.

MLB Definitions

The following are standard MLB and MOST terms that are used in this chapter.

AGU

Address Generation Units. To access a particular HBI channel the HC must first configure one of two HBI address generation units. AGUs can be configured by writing the HBI command registers, HCMD0 and HCMD1.

CAT

Channel Allocation Table. The Channel Allocation Table (CAT) is comprised of 16 CTR entries. Each 16-bit CAT entry represents a logical connection to or from a transmit/receive device (for example MediaLB or HBI channel).

CDT

Channel Descriptor Table.

FCE

Flow Control Enable bit. The FCE bit is used by MediaLB isochronous Rx channels only.

HBI

Host Bus Interface. The HBI block provides 16-bit parallel slave access to all MOST channels and data types for the external Host Controller (HC). The HBI supports up to 64 independent channels.

HC

Host Controller (external).

HCMDx

HBI Command registers.

HSTSx

HBI status registers.

MFE

Multi-Frame per sub-buffer enable bit. The MFE bit is used by MediaLB synchronous channels only.

PML

Packet Message Length.

Clocking

The MLB controller provides an external clock pin—the media local bus clock. The MLB controller generates the clock. It is synchronized to the MOST network and provides the timing for the entire MLB interface at $FS = 48$ kHz.

Functional Description

The *MediaLB Block Diagram* figure shows the MLB high-level architecture. The MLB core serves as an interface between the MediaLB and the processor, implementing the requirements of the physical layer and the link layer outlined in the MediaLB specification. The MLB core has the following responsibilities.

- Transmit commands and data when functioning as the transmitting device associated with a *Channel Address*
- Receive data and transmit Rx status responses when functioning as the receiving device associated *Channel Address*
- MLB lock detection
- System channel command handling

The MediaLB device can function as either a MediaLB 3-pin interface (single-ended) or MediaLB 6-pin interface (differential) but only one interface can be active at a time. The MediaLB interfaces are capable of exchanging data at speeds up to $1024 \times Fs$ in 3-pin mode or $2048 \times Fs$ in 6-pin mode.

A set of physical channels for exchanging data over the MediaLB bus is supported. These physical channels (4 bytes in length, or a quadlet) can be grouped into logical channels, where each logical channel is referenced using a channel address and represents a uni-directional datapath between a specific MediaLB device transmitting the data and the MediaLB device(s) receiving the data. The MediaLB 6-pin interface provides support for up to 468 bytes of data per frame. The logical channels, configured by system software, can be any combination of channel types (synchronous, asynchronous, isochronous, or control) and direction (transmit or receive).

ADSP-2159x MLB Register List

The MediaLB Device Interface Macro 2 (MediaLB DIM 2), also referred to as OS62420, implements the required functionality of a Media Local Bus (MediaLB) device. This logic serves as an interface between the inter-chip MediaLB bus and a customer IC, implementing the physical- and link-layer requirements outlined in the MediaLB Specification.

MediaLB Protocol

The MediaLB topology supports communication among all MediaLB devices, including the MediaLB controller. The bus interface consists of a uni-directional line for clock (MLBC), a bidirectional line for signal information (MLBS), and a bidirectional line for data transfer (MLBD). The MediaLB topology supports one controller connected to one or more devices, where the controller is the interface between the MediaLB devices and the MOST network.

The MediaLB controller includes MediaLB device functionality, and also generates the MediaLB clock (MLBC) that is synchronized to the MOST Network. This generated clock provides the timing for the entire MediaLB interface. The MLBS line is a multiplexed signal which carries channel addresses generated by the MediaLB controller, as well as command and RxStatus bytes from MediaLB devices. The MLBD line is driven by the transmitting MediaLB device and is received by all other MediaLB devices, including the MediaLB controller. The MLBD line carries the actual data (synchronous, asynchronous, control, or isochronous).

Once per MOST network frame, the MLB controller generates a unique frame sync pattern on the MLB_SIG line. The end of the frame sync pattern defines the byte boundary and the channel boundary for the MLB_SIG and MLB_DAT lines of all MLB devices.

The MLB controller manages the arbitration for all the channels on the MLB and grants bandwidth for all the MLB devices. An MLB *physical channel* is defined as four bytes wide, or a quadlet. Physical channels can be grouped into multiple quadlets (which do not have to be consecutive) to form an MLB *logical channel*, which is defined by a unique channel address.

As shown in *MLB Data Structure*, the MLB controller initiates communication by sending out a channel address on the MLB_SIG line for each physical channel. The channel address indicates which MLB device is transmitting and which MLB devices are receiving in the following physical channel. Therefore, four bytes after the controller outputs the channel address on the MLB_SIG line, the transmitting device outputs a command byte command on the MLB_SIG line and outputs the respective data on the MLB_DAT line, concurrently. The MLB command byte contains the type of data currently being transmitted (for example synchronous, asynchronous or control).

The MLB device receiving the channel data outputs a status byte, RxStatus, on the MLB_SIG line immediately after the transmitting device outputs the command byte. The status response can indicate that the receiving device is busy and cannot receive the data at present, or the device is ready to receive the data. Since synchronous stream data is sent in a broadcast fashion, receiving devices cannot return a busy status and should not drive RxStatus onto the MLB_SIG line.

Figure 22-1: MLB Data Structure

MLB Architectural Concepts

The following sections provide information about the MLB architecture.

MediaLB Block Diagram

The *MediaLB Block Diagram* shows the various blocks within the interface its connections to the processor.

Figure 22-2: MediaLB Block Diagram

MediaLB Interface

The Media Local Bus (MediaLB) block supports both a MediaLB 3-pin interface and MediaLB 6-pin interface; however, only one MediaLB interface can be active at any given time. Both MediaLB interfaces provide real-time access to all network data types - synchronous, asynchronous, control, and isochronous data.

- MediaLB 3-pin interface – Supports the MediaLB protocol for single-ended 3-pin mode, with a maximum data rate of 1024 FS (49.152 MHz at FS = 48 kHz).
- MediaLB 6-pin interface – Supports the MediaLB protocol for high-speed differential 6-pin mode, with a maximum data

maximum data rate of 2048 FS (98.304 MHz at FS = 48 kHz).

MediaLB Channel Address to Logical Channel Mapping

The MediaLB channel addresses are mapped to the logical channels as shown in the *MediaLB Channel Address to Logical Channel Mapping* table.

Table 22-3: MediaLB Channel Address to Logical Channel Mapping

Channel Address	Logical Address
0x0002	1
0x0004	2
0x0006	3
...	...
0x007C	62
0x007E	63

Table 22-3: MediaLB Channel Address to Logical Channel Mapping (Continued)

Channel Address	Logical Address
0x01FE	0 (Logical channel 0 is the system channel and is reserved)

Routing Fabric

The Routing Fabric (RF) block manages the flow of data between the MediaLB port and the HBI port. It manages accessing the Channel Table RAM (CTR) and Data Buffer RAM (DBR), which are explained in the following sub-sections. The routing fabric uses channel descriptors (stored in the CTR) to manage access to dynamic buffers in the DBR.

Data Buffer RAM

The Data Buffer RAM (DBR) is an 8-bit x 16k entries deep, single-port synchronous SRAM and provides dynamic circular buffering between the transmit and receive devices. The size and location of each data buffer is defined by software in the Channel Descriptor Table (CDT), which is located in the Channel Table RAM (CTR), described in following sections.

Channel Table RAM

The Channel Table RAM (CTR) is a 128-bit x 144-entry table that allows system software to dynamically configure channel routing and allocate data buffers in the DBR. The CTR is logically divided into three tables:

- [Channel Descriptor Tables](#)
- [AHB Descriptor Table \(ADT\)](#)
- [Channel Allocation Table](#)

Address Mapping

The *CTR Address Mapping* table shows the address mapping for the CTR.

Table 22-4: CTR Address Mapping

Label	Address	Bits [127:96]	Bits [95:64]	Bits [63:32]	Bits [31:0]
Channel Descriptor Table (CDT)					
CDT	0x00	CDT0[127:0], CL = 0			
	0x01	CDT1[127:0], CL = 1			
	0x02	CDT2[127:0], CL = 2			
	...				
	0x3D	CDT61[127:0], CL = 61			
	0x3E	CDT62[127:0], CL = 62			
	0x3F	CDT63[127:0], CL = 63

^{*1} A fixed relationship exists between ADT entries and HBI CAT entries. When using HBI channel 0 (CAT64), program ADT0. When using HBI channel 1 (CAT65), program ADT1, and so on.

Channel Allocation Table

The *Channel Allocation Table (CAT)* table is comprised of 16 CTR entries (addresses 0x80 0x8F) as shown in the *CTR Entry Map* table. Each 16-bit CAT entry represents a logical connection to or from a transmit or receive device. (for example, MediaLB channel). All entries are indexed according to a fixed physical address assigned to every RX/TX channel as shown in the *CAT Entry Formats* table. The value stored in a CAT entry includes a 6-bit connection label, which provides a pointer to the CDT. To complete a logical channel and form a routing connection, system software must assign the same connection label to both the RX and TX channels.

Table 22-5: CAT Entry Map

Peripheral	TX Channels	RX Channels	CAT Start Index	CAT End Index	Entries
MediaLB	0 to 64	64 TX Channels	0	63	64
HBI	0 to 64	64 TX Channels	64	127	64

The format of a full CAT entry is shown in the *CAT Entry Formats* table, with field descriptions described in the *CAT Field Definitions* table. All reserved bits of a CAT entry field should be written as zero.

Table 22-6: CAT Entry Formats

Channel Type	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Isochronous	rsvd	FCE	rsvd	RNW	CE	CT[2:0] = 011			rsvd	CL[5:0]

Table 22-7: CAT Field Definitions

Field	Description
CL[5:0]	Connection Label (offset into CDT)
CT[2:0]	Channel Type (others) 111 = Reserved 110 = Reserved 101 = Reserved 100 = Reserved 011 = Isochronous 010 = Asynchronous 001 = Control 000 = Synchronous
CE	Channel Enable. 0 = Disabled, 1 = Enabled
RNW	Read Not Write. 0 = Write, 1 = Read
MT	Mute Enable. 0 = Disabled When set for synchronous channels, the MT bit forces RX channels to write zeros into the channel data buffer, and TX channels to output zeros on the physical interface. When set for asynchronous and control channels, the MT bit causes DMA to halt at a packet boundary. Not valid for isochronous channels.
FCE	Flow Control Enable. 0 = Disabled, 1 = Enabled The FCE bit is used by MediaLB isochronous RX channels only.
MFE	Multi-Frame per sub-buffer enable. 0 = Disabled, 1 = Enabled The MFE bit is used by MediaLB synchronous channels only.
rsvd	Reserved. Software writes a 0 to all reserved bits when the entry is initialized. These bits are read-only after initialization.

Channel Set Up

Data direction is in reference to the DBR. The data direction of CAT entries corresponding to the same channel is reversed for the HBI CAT and the MediaLB CAT.

- For a Tx channel (from the HC to the MediaLB interface):
 - HBI CAT entry: RNW = 0 (write)

- MediaLB CAT entry: RNW = 1 (read)
- Conversely, for an Rx channel (data from MediaLB to HC):
 - HBI CAT entry: RNW = 1 (read)
 - MediaLB CAT entry: RNW = 0 (write)

Figure 22-3: DBR Directional Relationship

Channel Descriptor Tables

The Channel Descriptor Table (CDT) is comprised of 64 CTR entries (addresses 0x00 - 0x3F), as shown in the [Table 22-4 CTR Address Mapping](#) table. Each 128-bit CDT entry (also referred to as a channel descriptor) is referenced by a connection label and contains information about a data buffer in the DBR (for example buffer size, address pointers). The format of each CDT entry is dependent on the channel type (synchronous, isochronous, asynchronous, or control).

NOTE: All reserved channel descriptor bits must be written to 0 by software when initialized.

Synchronous Channel Descriptors

The format and field definitions for a synchronous CDT entry are shown in the *Synchronous CDT Entry Format* and *Synchronous CDT Entry Field Definitions* tables.

Table 22-8: Synchronous CDT Entry Format

Bit Offset	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

WSTS	Write Status	Software initializes to 0, hardware updates. Status States (only valid for DMA pointers associated with the MLB block, not HBI block pointers): xxx0 = idle xxx1 = command protocol error detected xx0x = <i>AsyncBreak/ControlBreak</i> command received from TX device	RWU
Reserved. Software writes a 0 to all these bits when the entry is initialized. Reserved bits are RO after initialization.			RWU

AHB Descriptor Table (ADT)

The AHB block manages data exchange between local channel data buffers within MLB module and the system memory buffer. To support system memory buffering, a ping-pong memory structure is implemented on a per channel basis using 128-bit descriptors for AHB Descriptor Table (ADT) entries. The [Table 22-4 CTR Address Mapping](#) table provides a complete address map of the CTR, including the location of the ADT.

Each logical channel is assigned a separate 128-bit descriptor, defining the data buffers in the system memory used by the DMA interface for that channel. The descriptors are stored at fixed addresses in the CTR as described in previous section. The *ADT Field Definitions* table provides an overview of field definitions for ADT entries.

Table 22-14: ADT Field Definitions

Field	No. of Bits	Description	Access
CE	1	Channel Enable. 0 = Disabled	RW, U
LE	1	Endianness Select. 0 = Big Endian, 1 = Little Endian	RW
PG	1	Page pointer. Software initializes to 0, hardware writes thereafter. 0 = Ping buffer, 1 = Pong buffer	RW, U
RDY1	1	Buffer Ready bit for ping buffer page. 0 = Not ready, 1 = Ready	RW
RDY2	1	Buffer Ready bit for pong buffer page. 0 = Not ready, 1 = Ready	RW
DNE1	1	Buffer Done bit for ping buffer page. 0 = Not done, 1 = Done	R, U, c0
DNE2	1	Buffer Done bit for pong buffer page. 0 = Not done, 1 = Done	R, U, c0
ERR1	1	Error Response detected for ping buffer page. 0 = No error, 1 = Error	R, U, c0
ERR2	1	Error Response detected for pong buffer page. 0 = No error, 1 = Error	R, U, c0
PS1	1	Packet Start bit for ping buffer page. 0 = No packet start, 1 = Packet start Reserved for synchronous and isochronous channels.	RW, U both TX and RX
PS2	1	Packet Start bit for pong buffer page. 0 = No packet start, 1 = Packet start Reserved for synchronous and isochronous channels.	RW, U both TX and RX
MEP1	1	Most Ethernet Packet indicator for ping buffer page. 0 = Not MEP, 1 = MEP. MEP1 only valid for the first page of a segmented buffer. Reserved for control synchronous and isochronous channels.	Rsvd for TX, R, U, c0 for RX
MEP2	1	Most Ethernet Packet indicator for pong buffer page. 0 = Not MEP, 1 = MEP. MEP2 only valid for the first page of a segmented buffer. Reserved for control synchronous and isochronous channels.	Rsvd for TX, R, U, c0 for RX
BD1	11 to 13	Buffer Depth for ping buffer page. 11 or 12 bits for asynchronous and control channels. 13 bits for synchronous and isochronous channels.	RW
BD2	11 to 13	Buffer Depth for pong buffer page. 11 or 12 bits for asynchronous and control channels. 13 bits for synchronous and isochronous channels.	RW
BA1	32	Buffer Base Address for ping buffer page	RW
BA2	32	Buffer Base Address for pong buffer page.	RW
Reserved	varies	Reserved. Software writes a 0 to all these bits when the entry is initialized. Reserved bits are RO after initialization.	RW, U

The *Ping-Pong System Memory Structure* figure shows that this system memory structure is similar for all channel types and shows the relationship between the BAn, BDn, and PG descriptor fields.

Figure 22-4: Ping-Pong System Memory Structure

Each ADT entry (also referred to as a *Channel Descriptor*) holds a 32-bit BAn field which defines the start of each ping or pong buffer within system memory. The BDn field is used to indicate the size for the respective ping or pong page. The maximum size is 2k entries for asynchronous and control channels and 8k entries for isochronous and synchronous channels.

Synchronous Channel Descriptors

The synchronous buffering scheme allows each ping or pong buffer to contain a single frame or a multiple number of frames. For this reason, the synchronous buffer depth (BDn) must be defined in terms of an integer number (n), frames per sub-buffer (m) and bytes per frame (bpf) of data (for example $BDn = n \ m \ bpf \ 1$). The *Synchronous ADT Entry Format* table shows the format for a synchronous ADT entry. The field definitions are defined in the *ADT Field Definitions* table. Each synchronous channel buffer can be up to 8k-bytes deep.

Table 22-15: Synchronous ADT Entry Format

Bit Offset	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	CE	LE	PG	Reserved												
16	Reserved															
32	RDY1	DNE1	ERR1	BD1[12:0]												
48	RDY2	DNE2	ERR2	BD2[12:0]												
64	BA1[15:0]															
80	BA1[31:16]															
96	BA2[15:0]															
112	BA2[31:16]															

Isochronous Channel Descriptors

The isochronous buffering scheme allows each ping or pong buffer to contain a single block or a multiple number of blocks. For this reason, the isochronous buffer depth (BD_n) must be defined in terms of an integer number (n) and block size (BS) (for example BD_n = n (BS + 1) 1).

The *Isochronous ADT Entry Format* table shows the format for an isochronous ADT entry. The field definitions are defined in the *ADT Field Definitions* table. Each isochronous channel buffer can be up to 8k-bytes deep.

Table 22-16: Isochronous ADT Entry Format

Bit Offset	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	CE	LE	PG	Reserved												
16	Reserved

64	BA1[15:0]															
80	BA1[31:16]															
96	BA2[15:0]															
112	BA2[31:16]															

Asynchronous and Control Channel Descriptors

Every asynchronous and control packet adheres to the Port Message Protocol (PMP), which designates the first two bytes of each packet as the packet length (PML). Each packet must be no more than 2048-bytes (PML 2048).

Software must set the buffer ready bit (RDY_n) for each buffer as it programs the DMA. As hardware processes each buffer, it sets the done bit (DNE_n) and generates an interrupt to inform HC. When hardware finishes processing a buffer, it can begin processing another buffer if RDY_n is set. The application is responsible for setting up and configuring the channel buffer descriptor prior to every DMA access on the channel.

Two packet buffering modes are supported by hardware for programming the DMA, single-packet mode (MLB_ACTL.MPB = 0) and multiple-packet mode (MLB_ACTL.MPB = 1). The MPB is written prior to enabling the channel DMA.

Single Packet Mode. The single-packet mode asynchronous and control buffering scheme supports a maximum of one packet per buffer (for example, ping or pong). Both non-segmented and segmented data packets are allowed while using single-packet mode. Non-segmented packets are exchanged when only one buffer (for example, ping or pong) is needed for packet transfer. Segmented packets are exchanged when a single packet is too long for one buffer and the packet must span multiple buffers.

The *Single-Packet Asynchronous and Control Entry Format* table shows the format for single-packet mode asynchronous and control ADT entries. The field definitions are defined in the *ADT Field Definitions* table.

Table 22-17: Single-Packet Asynchronous and Control Entry Format

Bit Offset	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	CE	LE	PG	Reserved												
16	Reserved															
32	RDY1	DNE1	ERR1	PS1	MEP1	BD1[10:0]										
48	RDY2	DNE2	ERR2	PS2	MEP2	BD2[10:0]										
64	BA1[15:0]															
80	BA1[31:16]															
96	BA2[15:0]															
112	BA2[31:16]															

Multiple Packet Mode. The multiple-packet mode asynchronous and control buffering scheme supports more than one packet per system memory buffer, as shown in the *Asynchronous/Control CDT Entry Format* table. Multiple-packet mode reduces the interrupt rate for packet channels at the cost of increasing buffering and latency.

For TX packet channels in multiple-packet mode, software sets the packet start bit (PS_n) for every buffer. Setting PS_n informs hardware that the first two bytes of the buffer contains the port message length (PML) of the first packet. After the first packet, hardware keeps track of where packets start and end within the current buffer. Software should not write to PS_n while the buffer is active (RDY_n = 1 and DNE_n = 0). For TX packet channels, the buffer is done (DNE_n = 1) when the last byte of the last packet in the buffer is read from system memory. Software should set the buffer depth to contain the exact number of complete packets for that buffer. Segmented buffers are not supported for TX packet channels in multiple-packet mode.

NOTE: The PS1 and PS2 bits are only valid for TX channels. Set PS1 and PS2 = 1 at the start of the buffer.

Table 22-18: Multiple-Packet Asynchronous and Control Entry Format

Bit Offset	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	CE	LE	PG	Reserved												
16	Reserved															
32	RDY1	DNE1	ERR1	PS1	BD1[11:0]											
48	RDY2	DNE2	ERR2	PS2	BD2[11:0]											
64	BA1[15:0]															
80	BA1[31:16]															
96	BA2[15:0]															
112	BA2[31:16]															

Interrupt Interface Block

The interrupt interface raises an interrupt when specific changes to HBI channel descriptors occur, including:

- For asynchronous and control read/write channels:
 - a packet is available to read in the channel buffer, or
 - sufficient empty space is available in the channel buffer to accept a requested packet write
- For isochronous read/write channels:
 - the number of valid bytes in the channel buffer exceeds the block size, or
 - the number of empty bytes in the channel buffer exceeds the block size

Operating Modes

The following sections describe the operating modes of the MLB interface. The channel type selection enables the logical channels to operate in synchronous, asynchronous, isochronous, or control channels.

NOTE: The logical channels can be any combination of channel type (for example synchronous, asynchronous, or control) and direction (transmit or receive).

Isochronous Data Exchange

An isochronous HBI channel is initially opened and synchronized with `HCMD0.CMD[2:0] = 010`. For isochronous channels, no further synchronization is required from the HBI perspective; however, an optional resynchronization command is available for HC flexibility. Setting `HCMD0.CMD[2:0] = 011` reinitializes the address pointer within the data buffer, ensuring that subsequent data exchange with the channel is aligned at an isochronous packet boundary. When the HC must close an isochronous channel before it has read or written an entire data packet, setting `HCMD0.CMD[2:0] = 000` reopens the channel without synchronizing the address pointer in the buffer. This action allows reading and writing to continue where the HC previously stopped.

For isochronous data transmission, the *Exchanging Isochronous Data on an HBI Channel* figure shows the flow control.

Figure 22-5: Exchanging Isochronous Data on an HBI Channel

Asynchronous and Control Data Exchange

An asynchronous or control HBI channel is initially opened using `HCMD0.CMD[2:0] = 010`. Occasionally, the HC may need to close a packet channel before it has completed writing or reading the current packet of data (for example, the HC needs to use this AGU to service another HBI channel). In this case, the HC can reopen the previous channel with `HCMD0.CMD[2:0] = 000`. This situation allows the HC to continue writing or reading a packet from

the point it left off. In this situation, the PML is already known and the packet length is not reread or rewritten by the HC.

During the reading of a packet, if the HC sets HCMD0.CMD[2:0]= 010 for the channel before the last byte of the packet is read, an internal hardware pointer is reset to the beginning of the packet buffer. This situation requires that the HC reread the PML (from HSTS1) and reread the packet data (from HDATn) from the beginning. In the same manner, if the HC resets HCMD0.CMD[2:0]= 010 for the channel before the last byte of a packet is written, an internal hardware pointer is reset to the beginning of the packet buffer. This situation requires that the HC rewrite the PML (to HCMD1) and rewrite the packet data (to HDATn) from the beginning. Any previous packet data in the buffer is overwritten.

Frame synchronization is not supported for asynchronous channels.

Synchronous Data Exchange

The MLB core provides two modes of operation; standard and multi-frame per sub-buffer which provide flexibility for implementing synchronous channels. Channels configured for standard mode require less buffer space, but have higher interrupt rates and more stringent latency requirements. Channels setup for multi-frame per sub-buffer mode require more buffer space, but have lower interrupt rates and less stringent latency requirements.

To set up a channel in multi-frame per sub-buffer mode:

1. Program the MLB_CTL0 . FCNT bit field to select the number of frames per sub-buffer.
2. Program the CAT to enable multi-frame sub-buffering (MFE= 1) for each particular channel.
3. Set the buffer depth in the CDT: $BD = 4 \times m \times bpf + 1$ where: m = frames per sub-buffer, bpf = bytes per frame.
4. Repeat for additional synchronous channels

A sample synchronous data buffer is shown in the *Synchronous Data Buffer Structure* figure. Each data buffer contains four sub-buffers and each sub-buffer contains space for 1 to 64 frames of data, determined by the MLB_CTL0 . FCNT bits.

Figure 22-6: Synchronous Data Buffer Structure

Data Transfer

Two modes of operation are supported for transferring channel data between the MLB and internal memory. DMA allows the multi-channel DMA engine to manage data transfers without core intervention. Core driven mode (I/O mode) allows software to manage the transfer of data between MLB and internal memory.

NOTE: All hardware channels must use the same data transfer method. Mixed mode operation where hardware channels operate in both I/O mode and DMA mode is not supported.

DMA

The processor supports DMA mode which uses only INCR8, INCR4 and SINGLE beat bursts. Program the `MLB_ACTL.DMAMODE = 1` to use DMA mode.

Programming Model

This section provides general guidelines for programming the MediaLB interface.

Channel Initialization

The software flow required to initialize a channel must be performed in order to ensure proper operation.

Configure the Hardware

1. Initialize the CTR and registers.
 - a. Set all the CTR (CAT, CDT, and ADT) bits to 0.
 - b. Set all bits of all registers to 0.
2. Configure the MediaLB interface.
 - a. Select 3-pin or 6-pin MediaLB operation: `MLB_CTL0.PEN = 0` (3-pin), `MLB_CTL0.PEN = 1` (6-pin).
 - b. Select MediaLB clock speed via `MLB_CTL0.CLK`.
 - c. Set MediaLB enable via `MLB_CTL0.EN`.
3. Configure the HBI interface.
 - a. Set `MLB_HCMR0` and `MLB_HCMR1 = 0xFFFFFFFF` to activate all channels.
 - b. Set the HBI enable bit: `MLB_HCTL.EN = 1`.

Program the CAT and the CDT

1. Initialize all bits of the CAT to 0.
2. Select a logical channel: $N = 1 - 63$.
3. Program the CDT for channel N.
 - a. Set the 14-bit base address (BA)
 - b. Set the 12-bit or 13-bit buffer depth (BD): BD = buffer depth in bytes 1
 - For synchronous channels: $(BD + 1) = 4 \text{ frames per sub-buffer (m) bytes-per-frame (bpf)}$
 - For isochronous channels: $(BD + 1) \bmod (BS + 1) = 0$

- For asynchronous channels: $(BD + 1)$ max packet length (1024 for a MOST Data Packet (MDP))
- 1536 for a MOST Ethernet Packet (MEP)
- For control channels: $(BD + 1)$ max packet length (64)

4. Program the CAT for the inbound DMA.

- For TX channels (to MediaLB) HBI is the inbound DMA
- For RX channels (from MediaLB) MediaLB is the inbound DMA
- Set the channel direction: $RNW = 0$
- Set the channel type: $CT[2:0] = 010$ (asynchronous), 001 (control), 011 (isochronous), or 000 (synchronous)
- Set the connection label: $CL[5:0] = N$
- If $CT[2:0] = 000$ (synchronous), set the mute bit ($MT = 1$)
- Set the channel enable: $CE = 1$
- Set all other bits of the CAT to 0

5. Program the CAT for the outbound DMA.

- For TX channels (to MediaLB) HBI is the outbound DMA
- For RX channels (from MediaLB) MediaLB is the outbound DMA
- Set the channel direction: $RNW = 1$
- Set the channel type: $CT[2:0] = 010$ (asynchronous), 001 (control), 011 (isochronous), or 000 (synchronous)
- Set the channel label: $CL[5:0] = N$
- If $CT[2:0] = 000$ (synchronous), set the mute bit ($MT = 1$)
- Set the channel enable: $CE = 1$
- Set all other bits of the CAT to 0

6. Repeat steps 2 through 5 to initialize all logical channels.

Program the ADT

- Initialize all bits of the ADT to 0
- Select a logical channel: $N = 1 - 63$
- Program the AMBA AHB block ping page for channel N
 - Set the 32-bit base address (BA1)

- b. Set the 11-bit buffer depth (BD1): $BD1 = \text{buffer depth in bytes} - 1$
 - For synchronous channels: $(BD1 + 1) = n \text{ frames per sub-buffer (m) bytes-per-frame (bpf)}$
 - For isochronous channels: $(BD1 + 1) \bmod (BS + 1) = 0$
 - For asynchronous channels: $5 (BD1 + 1) \leq 4096 \text{ (max packet length)}$
 - For control channels: $5 (BD1 + 1) \leq 4096 \text{ (max packet length)}$
 - c. For asynchronous and control Tx channels set the packet start bit (PS1) iff the page contains the start of the packet
 - d. Clear the page done bit (DNE1)
 - e. Clear the error bit (ERR1)
 - f. Set the page ready bit (RDY1)
4. Program the AMBA AHB block pong page for channel N
 - a. Set the 32-bit base address (BA2)
 - b. Set the 11-bit buffer depth (BD2): $BD2 = \text{buffer depth in bytes} - 1$
 - For synchronous channels: $(BD2 + 1) = n \text{ frames per sub-buffer (m) bytes-per-frame (bpf)}$
 - For isochronous channels: $(BD2 + 1) \bmod (BS + 1) = 0$
 - For asynchronous channels: $5 (BD2 + 1) \leq 4096 \text{ (max packet length)}$
 - For control channels: $5 (BD2 + 1) \leq 4096 \text{ (max packet length)}$
 - c. For asynchronous and control TX channels set the packet start bit (PS2) iff the page contains the start of the packet
 - d. Clear the page done bit (DNE2)
 - e. Clear the error bit (ERR2)
 - f. Set the page ready bit (RDY2)
 5. Select Big Endian (LE = 0) or Little Endian (LE = 1)
 6. Select the active page: PG = 0 (ping), PG = 1 (pong)
 7. Set the channel enable (CE) bit for all active logical channels
 8. Repeat steps 2 through 7 for all active logical channels.

Service

After initialization, each channel will require periodic servicing. Use the procedures in the following sections to service DMA and MLB interrupts and to poll for MLB system commands.

Servicing the DMA Channel Interrupts

1. Program the [MLB_ACMR0/MLB_ACMR1](#) registers to enable interrupts from all active DMA channels.
2. Select the status clear method. `MLB_ACTL.SCE = 0` (hardware clears on read), `MLB_ACTL.SCE = 1` (software writes a 1 to clear).
3. Select 1 or 2 interrupt signals. Configure the `MLB_ACTL.SMX` bit = 0 (one interrupt for channels 0 through 31 and another interrupt for channels 32 through 63 on). Configure the `MLB_ACTL.SMX` bit = 1 (single interrupt for all channels).
4. Wait for an interrupt.
5. Read the [MLB_ACSR0/MLB_ACSR1](#) registers to determine which channel or channels are causing the interrupt.
6. If the `MLB_ACTL.SCE` bit = 1, write the results of step 5 back to the [MLB_ACSR0](#) and [MLB_ACSR1](#) registers to clear the interrupt.
7. Select a logical channel ($N = 0 - 63$) with an interrupt to service.
8. Read the ADT entry for channel N to:
 - a. Determine the active page (ping or pong) via the PG bit
 - b. Determine which page(s) are done via the DNEN bits
 - c. Determine which channels encountered an AHB error via the ERRN bit
 - d. Determine which asynchronous and control Rx channel pages contain a packet start via the PSN bit (extract the PML)
9. Repeat steps 6 through 8 for all channels with pending interrupts
10. Repeat steps 4 through 9 while there are active channels.

Servicing the MediaLB Status Interrupts

1. Select the MediaLB channel status register ([MLB_MS0/MLB_MS1](#)) to be cleared by software, writing a 0 to the appropriate bits.
2. Program the [MLB_MIEN](#) register to enable protocol error interrupts for all active MediaLB channels. (`MLB_MIEN.CTXPE = 1`, `MLB_MIEN.CRXPE = 1`, `MLB_MIEN.ATXPE = 1`, `MLB_MIEN.ARXPE = 1`, `MLB_MIEN.SYNCPE = 1`, and `MLB_MIEN.ISOCPE = 1`).
3. Wait for an interrupt on the [MLB_INT0/MLB_INT1](#) signal.
4. Read the [MLB_MS0/MLB_MS1](#) registers to determine which channel(s) are causing the interrupt.
5. Read the RSTS/WSTS of the appropriate CDT(s) to determine the interrupt type.

6. Clear the RSTS/WSTS errors to ensure that the current status of channel operations is reflected in the register:

Option	Description
For synchronous RX channels	WSTS[3] = 0
For synchronous TX channels	RSTS[3] = 0
For isochronous RX channels	WSTS[2:1] = 00
For isochronous TX channels	RSTS[2:1] = 00
For asynchronous and control RX channels	WSTS[4] = 0 and WSTS[2] = 0
For asynchronous and control TX channels	RSTS[4] = 0 and RSTS[2] = 0

Polling for MediaLB System Commands

The MediaLB System status ([MLB_MSS](#)) register is used to detect a system command received from the MediaLB controller. The processor's peripheral automatically sends the appropriate system response to the MediaLB controller. The procedure for the application is:

1. The application periodically polls the [MLB_MSS](#) register.
2. Clear by writing a 0 to the appropriate bit in the [MLB_MSS](#) register after the application finishes the service.
3. If `MLB_MSS.SWSYSCMD = 1`, read the [MLB_MSD](#) register to receive the system data sent from MediaLB controller.

ADSP-2159x MLB Register Descriptions

MediaLB Device Interface Macro 2 (MLB) contains the following registers.

Table 22-19: ADSP-2159x MLB Register List

Name	Description
MLB_ACMR0	Peripheral Channel Mask 0 Register
MLB_ACMR1	Peripheral Channel Mask 1 Register
MLB_ACSR0	Peripheral Channel Status 0 Register
MLB_ACSR1	Peripheral Channel Status 1 Register
MLB_ACTL	Bus Control Register
MLB_CTL0	MediaLB Control 0 Register
MLB_CTL1	Control 1 Register
MLB_GCTL	MLB Global Control Register
MLB_HCBR0	HBI Channel Busy 0 Register
MLB_HCBR1	HBI Channel Busy 1 Register

Table 22-19: ADSP-2159x MLB Register List (Continued)

Name	Description
MLB_HCER0	HBI Channel Error 0 Register

MLB_MS0	Channel Status 0 Register
MLB_MS1	Channel Status 1 Register
MLB_MSD	System Data Register
MLB_MSS	System Status Register
MLB_PCTL0	MediaLB 6-pin Control 0 Register

Peripheral Channel Mask 0 Register

The `MLB_ACMR0` register allows control over which channel(s) generate interrupts on `MLB_INT[1:0]`. All of the bits in this register default to 0 (masked) so the HC must initially write to the `MLB_ACMR0` register to enable interrupts. Each bit of this register is read/write accessible.

Figure 22-7: MLB_ACMR0 Register Diagram

Table 22-20: MLB_ACMR0 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	CHM	Bitwise Channel Mask. The <code>MLB_ACMR0.CHM</code> bit field masks or unmasks channels 31-0.
		0 Mask interrupt for Channel 31:0 (bitwise; all channels shown)
		4294967295 Unmask interrupt for Channel 31:0 (bitwise; all channels shown)

Peripheral Channel Mask 1 Register

The [MLB_ACMR1](#) register allows control over which channel(s) generate interrupts on MLB_INT[1:0]. All of the bits in this register default to 0 (masked) so the HC must initially write to the [MLB_ACMR1](#) register to enable interrupts. Each bit of this register is read/write accessible.

Figure 22-8: MLB_ACMR1 Register Diagram

Table 22-21: MLB_ACMR1 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	CHM	Bitwise Channel Mask. The <code>MLB_ACMR1.CHM</code> bit field masks or unmasks channels 63:32.
		0 Mask interrupt for Channel 63:32 (bitwise; all channels shown)
		4294967295 Unmask interrupt for Channel 63:32 (bitwise; all channels shown)

Peripheral Channel Status 0 Register

The **MLB_ACSR0** register contains interrupt bits for each of the 64 physical channels. When a bit in this register is set, it indicates that the corresponding physical channel has an interrupt pending.

A peripheral interrupt is triggered when either **DNE_n** or **ERR_n** is set within the Bus Channel Descriptor. The HC is notified of the channel interrupt via **MLB_INT[1:0]**. When an interrupt occurs in **ACCUSER** (for channels 31 to 0) **MLB_INT[0]** is set. When an interrupt occurs in **MLB_ACSR1** (for channels 63 to 32) **MLB_INT[1]** is set.

Interrupts in the **MLB_ACSR0** and **MLB_ACSR1** registers can be optionally multiplexed onto a single interrupt signal, **MLB_INT[0]**, if the **MLB_ACTL.SMX** bit = 1.

If the **MLB_ACTL.SCE** bit = 0, hardware automatically clears the interrupt bit(s) after the HC reads the peripheral channel status registers. Alternatively, if the **MLB_ACTL.SCE** bit = 1, software must write a 1 to the appropriate bit(s) of the peripheral channel status registers to clear the interrupt(s).

Figure 22-9: MLB_ACSR0 Register Diagram

Table 22-22: MLB_ACSR0 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W1C)	CHS	Channel Status. The MLB_ACSR0.CHS bit field indicates channel status for channels 31-0.
		0 No interrupt on Channel 31:0 (bitwise; all channels shown)
		4294967295 Interrupt on Channel 31:0 (bitwise; all channels shown)

Peripheral Channel Status 1 Register

The `MLB_ACSR1` register contains interrupt bits for each of the 64 physical channels. When a bit in this register is set, it indicates that the corresponding physical channel has an interrupt pending.

A peripheral interrupt is triggered when either `DNEn` or `ERRn` is set within the Bus Channel Descriptor. The HC is notified of the channel interrupt via `MLB_INT[1:0]`. When an interrupt occurs in `ACCUSER` (for channels 31 to 0) `MLB_INT[0]` is set. When an interrupt occurs in `MLB_ACSR1` (for channels 63 to 32) `MLB_INT[1]` is set.

Interrupts in the `MLB_ACSR1` and `MLB_ACSR0` registers can be optionally multiplexed onto a single interrupt signal, `MLB_INT[0]`, if the `MLB_ACTL.SMX` bit = 1.

If the `MLB_ACTL.SCE` bit = 0, hardware automatically clears the interrupt bit(s) after the HC reads the peripheral channel status registers. Alternatively, if the `MLB_ACTL.SCE` bit = 1, software must write a 1 to the appropriate bit(s) of peripheral channel status registers to clear the interrupt(s).

Figure 22-10: MLB_ACSR1 Register Diagram

Table 22-23: MLB_ACSR1 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W1C)	CHS	Channel Status. The <code>MLB_ACSR1.CHS</code> bit field indicates channel status for channels 63-32.
		0 No interrupt on Channel 63:32 (bitwise; all channels shown)
		4294967295 Interrupt on Channel 63:32 (bitwise; all channels shown)

Bus Control Register

The `MLB_ACTL` register is written by the HC to configure the block for channel interrupts. This register contains bits to select the packet buffering mode and the DMA mode. This register also contains bits that are used to multiplex channel interrupts onto a single interrupt signal and to select the method of clearing channel interrupts.

Figure 22-11: MLB_ACTL Register Diagram

Table 22-24: MLB_ACTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
4 (R/W)	MPB	Packet Buffering Mode. The <code>MLB_ACTL.MPB</code> bit selects whether the buffering mode is single-packet or multiple-packet.
		0 single-packet mode
		1 multiple-packet mode
2 (R/W)	DMAMODE	DMA Mode. The <code>MLB_ACTL.DMAMODE</code> bit selects between DMA mode 1 and 0. DMA Mode 0 uses incrementing bursts of an unspecified length. This allows the block to perform single beat transfers as well as an incrementing (INCR) burst of unspecified length up to the maximum specified burst length (8 beats). DMA Mode 1 uses only INCR8, INCR4, and SINGLE beat bursts. The <code>hburst[2:0]</code> signal encodes the burst transfer used for a DMA operation.
		0 DMA Mode 0
		1 DMA Mode 1

Table 22-24: MLB_ACTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
1 (R/W)	SMX	Interrupt Multiplex Enable. The MLB_ACTL.SMX bit selects whether ACSR0 generates an interrupt on MLB_INT[0] and ACSR1 generates an interrupt on MLB_INT[1] or ACSR0 and ACSR1 generate an interrupt on MLB_INT[0] only.
		0 ACSR0 generates an interrupt on MLB_INT[0]; ACSR1 generates an interrupt on MLB_INT[1]
		1 ACSR0 and ACSR1 generate an interrupts on MLB_INT[0] only
0 (R/W)	SCE	Software Clear Enable. The MLB_ACTL.SCE bit selects whether hardware clears the interrupt after a ACSRn register read or software clears the interrupt.
		0 Hardware clears interrupt after a ACSRn register read
		1 Software clears interrupt

MediaLB Control 0 Register

The `MLB_CTL0` register contains bit that enable the module and provide module status. Note that the maximum speed for ML6-pin mode is 2048 x FS.

Figure 22-12: MLB_CTL0 Register Diagram

Table 22-25: MLB_CTL0 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
17:15 (R/W)	FCNT	Frames Per Sub-buffer. The <code>MLB_CTL0 . FCNT</code> bit field configures the frames per sub-buffer on synchronous channels.
		0 1 Frame per sub-buffer (Operation is the same as Standard mode)
		1 2 frames per sub-buffer
		2 4 frames per sub-buffer
		3 8 frames per sub-buffer
		4 16 frames per sub-buffer
		5 32 frames per sub-buffer
		6 64 frames per sub-buffer
14 (R/W)	CTLRETRY	Control Tx Packet Retry. When the <code>MLB_CTL0 . CTLRETRY</code> bit is set, a control packet that is flagged with a Break or Protocol error by the receiver is retransmitted. When cleared, a control packet that is flagged with a Break or Protocol error by the receiver is skipped.

Table 22-25: MLB_CTL0 Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
12 (R/W)	ASYRETRY	Asynchronous Tx Packet Retry. When the MLB_CTL0.ASYRETRY bit is set, an asynchronous packet that is flagged with a Break or Protocol error by the receiver is retransmitted. When cleared, an asynchronous packet that is flagged with a Break or ProtocolError by the receiver is skipped.
7 (R/NW)	LKSTAT	Lock Status. When the MLB_CTL0.LKSTAT bit is set (=0), the MediaLB block is synchronized to the incoming MediaLB frame with the following conditions. - If MLB_CTL1.LOCK =0 (unlocked), MLB_CTL1.LOCK is set after a FRAME-SYNC is detected at the same position for three consecutive frames. - If MLB_CTL1.LOCK =1 (locked), MLB_CTL1.LOCK is cleared after not receiving a FRAMESYNC at the expected time for two consecutive frames. In this case FRAMESYNC patterns occurring at locations other than the expected one are ignored.
5 (R/W)	PEN	6-pin Enable. The MLB_CTL0.PEN bit configures the MLB for 6-pin or 3-pin mode.
		0 3-pin interface enabled
		1 6-pin interface enabled
4:2 (R/W)	CLK	Clock Speed Select. The MLB_CTL0.CLK bit field sets the clock speed.
		0 256 x Fs (MLB_CTL.PEN = 0)
		1 512 x Fs (MLB_CTL.PEN = 0)
		2 1024 x Fs (MLB_CTL.PEN = 0)
		3 2048 x Fs (MLB_CTL.PEN = 1)
		4 Reserved
		5 Reserved
		6 Reserved
		7 Reserved
0 (R/W)	EN	Enable. When the MLB_CTL0.EN bit is set (=1), MediaLB clock, signal, and data are received and transmitted on the appropriate MediaLB pins.

Control 1 Register

The `MLB_CTL1` register contains bits that provide lock status and control system commands.

Figure 22-13: MLB_CTL1 Register Diagram

Table 22-26: MLB_CTL1 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15:8 (R/W)	NDA	Node Device Address. The <code>MLB_CTL1 . NDA</code> bit field is used for system commands directed to individual MediaLB nodes.
7 (R/W0C)	CLKM	Lock Missing Status. The <code>MLB_CTL1 . CLKM</code> bit is set when the MediaLB clock is not toggling at the pin. This bit is cleared by software.
6 (R/W0C)	LOCK	Lock Error Status. The <code>MLB_CTL1 . LOCK</code> bit is set when the MediaLB is unlocked. This bit is cleared by software.

MLB Global Control Register

The `MLB_GCTL` register contains bits that manage the MLB clock.

Figure 22-14: MLB_GCTL Register Diagram

Table 22-27: MLB_GCTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
2 (R/W)	CLKOUTSEL	CLKOUT Select. The <code>MLB_GCTL.CLKOUTSEL</code> bit selects either the MLB 3 pin clock or the 6 pin clock as <code>MLBCLKOUT</code> .
		0 MLB 3 pin clock is selected for <code>MLBCLKOUT</code>
		1 MLB 6 pin clock is selected for <code>MLBCLKOUT</code>
1 (R/W)	CLKOUTEN	CLKOUT Enable.

HBI Channel Busy 0 Register

The HC can determine which channel(s) are busy by reading the `MLB_HCBR0` register. An HBI channel is busy if:

- it is currently loaded into one of the two AGUs
- the channel is enabled, `CE = 1` from the Channel Allocation Table
- the DMA is active

When an HBI channel is busy, hardware may write back its local copy of the channel descriptor at any time. System software should not write a CDT descriptor for a channel that is busy. Only two HBI channels can be busy at any given time. Each bit of this register is read-only.

Figure 22-15: `MLB_HCBR0` Register Diagram

Table 22-28: `MLB_HCBR0` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	CHB	Channel Busy. The <code>MLB_HCBR0.CHB</code> bit field contains the bitwise channel busy bit for channels 31:0. When a bit is cleared (=0) the channel is idle. When a bit is set (=1) the channel is busy.

HBI Channel Busy 1 Register

The HC can determine which channel(s) are busy by reading the [MLB_HCBR1](#) register. An HBI channel is busy if:

- it is currently loaded into one of the two AGUs
- the channel is enabled, CE = 1 from the Channel Allocation Table
- the DMA is active

When an HBI channel is busy, hardware may write back its local copy of the channel descriptor at any time. System software should not write a CDT descriptor for a channel that is busy. Only two HBI channels can be busy at any given time. Each bit of this register is read-only.

Figure 22-16: MLB_HCBR1 Register Diagram

Table 22-29: MLB_HCBR1 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	CHB	Channel Busy. The MLB_HCBR1 . CHB bit field contains the bitwise channel busy bit for channels 63:32. When a bit is cleared (=0) the channel is idle. When a bit is set (=1) the channel is busy.

HBI Channel Error 0 Register

The `MLB_HCER0` register indicates which channels (channels 31:0) have encountered fatal errors.

Figure 22-17: MLB_HCER0 Register Diagram

Table 22-30: MLB_HCER0 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W0C)	CERR	Channel Error. The <code>MLB_HCER0.CERR</code> bit field reports bitwise errors for channels 31:0.

HBI Channel Error 1 Register

The `MLB_HCER1` register indicates which channel(s) have encountered fatal errors.

Figure 22-18: `MLB_HCER1` Register Diagram

Table 22-31: `MLB_HCER1` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W0C)	CERR	Channel Error. The <code>MLB_HCER1</code> . CERR bite field reports bitwise errors for channels 63:32.

HBI Channel Mask 0 Register

The `MLB_HCMR0` register controls which channels (for channels 31:0) are able to generate an HBI interrupt.

Figure 22-19: `MLB_HCMR0` Register Diagram

Table 22-32: `MLB_HCMR0` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	CHM	Channel Mask. The <code>MLB_HCMR0.CHM</code> bit field contains the bitwise channel mask bit for channels 31:0. When a bit is cleared (=0) the channel is masked. When set (=1) the channel is unmasked.

HBI Channel Mask 1 Register

The `MLB_HCMR1` register controls which channels (for channels 63:32) are able to generate an HBI interrupt.

Figure 22-20: `MLB_HCMR1` Register Diagram

Table 22-33: `MLB_HCMR1` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	CHM	Bitwise channel mask bit for channels 63:32. The <code>MLB_HCMR1.CHM</code> bit field contains the bitwise channel mask bit for channels 63:32. When a bit is cleared (=0) the channel is masked. When set (=1) the channel is unmasked.

HBI Control Register

The `MLB_HCTL` register controls and monitors general operation of the HBI block through the Address Generation Units) by reading and writing the register through the I/O interface. Each bit of this register is read/write.

Figure 22-21: MLB_HCTL Register Diagram

Table 22-34: MLB_HCTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15 (R/W)	EN	HBI Enable. Setting the <code>MLB_HCTL.EN</code> bit enables the HBI.
1 (R/W)	RST1	AGU1 Software Reset. Setting the <code>MLB_HCTL.RST1</code> bit resets AGU1.
0 (R/W)	RST0	AGU0 Software Reset. Setting the <code>MLB_HCTL.RST0</code> bit resets AGU0.

Memory Interface Address Register

The `MLB_MADR` register contains bit fields that contain the Channel Table RAM (CTR) or Data Buffer RAM (DBR) addresses. It also contains bits that set target location and read-not-write parameters.

Figure 22-22: `MLB_MADR` Register Diagram

Table 22-35: `MLB_MADR` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W)	WNR	Write-Not-Read. The <code>MLB_MADR.WNR</code> bit selects Write-Not-Read.
		0 Read
		1 Write
30 (R/W)	TB	Target Bit. The <code>MLB_MADR.TB</code> bit sets the target location.
		0 Channel Table RAM (CTR)
		1 Data Buffer RAM (DBR)
15:8 (R/W)	ADDRH	Address Higher Bits. The <code>MLB_MADR.ADDRH</code> bit field contains the DBR address of the 8-bit entry (bits [13:8]).
7:0 (R/W)	ADDRL	Address Lower Bits. The <code>MLB_MADR.ADDRL</code> bit field contains the CTR address of the 128-bit entry or the DBR address of the 8-bit entry (bits [7:0]).

Memory Interface Control Register

The `MLB_MCTL` register contains a bit that indicates that the data transfer is complete.

Figure 22-23: `MLB_MCTL` Register Diagram

Table 22-36: `MLB_MCTL` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
0 (R/W0C)	XCMP	Transfer Complete (Write 0 to clear). The <code>MLB_MCTL.XCMP</code> bit indicates that the data transfer is complete.

Memory Interface Control Data 0 Register

The `MLB_MDAT0` register contains Channel Table RAM (CTR) data (bits [31:0] of 128-bit entry) or Data Buffer RAM (DBR) data (bits [7:0] of 8-bit entry).

Figure 22-24: MLB_MDAT0 Register Diagram

Table 22-37: MLB_MDAT0 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	DATA	DATA. The <code>MLB_MDAT0</code> . <code>DATA</code> bit field contains CTR data or DBR data.

Memory Interface Control Data 1 Register

The `MLB_MDAT1` register contains Channel Table RAM (CTR) data (bits [63:32] of 128-bit entry).

Figure 22-25: `MLB_MDAT1` Register Diagram

Table 22-38: `MLB_MDAT1` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	DATA	DATA. The <code>MLB_MDAT1</code> . DATA bit field contains CTR data.

Memory Interface Control Data 2 Register

The `MLB_MDAT2` register contains Channel Table RAM (CTR) data (bits [95:64] of 128-bit entry).

Figure 22-26: MLB_MDAT2 Register Diagram

Table 22-39: MLB_MDAT2 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	DATA	DATA. The MLB_MDAT2 . DATA bit field contains CTR data.

Memory Interface Control Data 3 Register

The `MLB_MDAT3` register contains Channel Table RAM (CTR) data (bits [127:96] of 128-bit entry).

Figure 22-27: `MLB_MDAT3` Register Diagram

Table 22-40: `MLB_MDAT3` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	DATA	DATA. The <code>MLB_MDAT3</code> . DATA bit field contains CTR data.

Memory Interface Control Data Write Enable 0 Register

The `MLB_MDWE0` register contains the bitwise write enable for Channel Table RAM (CTR) data bits [31:0]. When cleared (=0) the bit is disabled, when set (=1) the bit is enabled.

Figure 22-28: MLB_MDWE0 Register Diagram

Table 22-41: MLB_MDWE0 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	MSK	Write Enable. The <code>MLB_MDWE0</code> .MSK bit field contains the bitwise write enable for CTR data.

Memory Interface Control Data Write Enable 1 Register

The `MLB_MDWE1` register contains the bitwise write enable for Channel Table RAM (CTR) data bits [63:32]. When cleared (=0), the bit is disabled. When set (=1), the bit is enabled.

Figure 22-29: MLB_MDWE1 Register Diagram

Table 22-42: MLB_MDWE1 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	MSK	Bitwise write enable for CTR data - bits[63:32]. The <code>MLB_MDWE1</code> . MSK bit field contains the bitwise write enable for CTR data.

Memory Interface Control Data Write Enable 2 Register

The `MLB_MDWE2` register contains the bitwise write enable for Channel Table RAM (CTR) data bits [95:64]. When cleared (=0), the bit is disabled. When set (=1), the bit is enabled.

Figure 22-30: MLB_MDWE2 Register Diagram

Interrupt Enable Register

The `MLB_MIEN` register is used to enable various interrupt conditions.

Figure 22-32: `MLB_MIEN` Register Diagram

Table 22-45: `MLB_MIEN` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
29 (R/W)	CTXBREAK	Control Transmit Break Enable. When the <code>MLB_MIEN.CTXBREAK</code> bit is set, a ReceiverBreak response received from the receiver on a control Tx channel causes the appropriate channel bit in the <code>MLB_MS0</code> or <code>MLB_MS1</code> registers to be set.
28 (R/W)	CTXPE	Control Transmit Protocol Error Enable. When the <code>MLB_MIEN.CTXPE</code> bit is set, a ProtocolError generated by the receiver on a control Tx channel causes the appropriate channel bit in the <code>MLB_MS0</code> or <code>MLB_MS1</code> registers to be set.
27 (R/W)	CTXDONE	Control Transmit Packet Done Enable. When the <code>MLB_MIEN.CTXDONE</code> bit is set, a packet transmitted with no errors on a control Tx channel causes the appropriate channel bit in the <code>MLB_MS0</code> or <code>MLB_MS1</code> registers to be set.

Table 22-45: MLB_MIEN Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
26 (R/W)	CRXBREAK	Control Receive Break Enable. When the MLB_MIEN.CRXBREAK bit is set, a ControlBreak command received from the transmitter on a control Rx channel causes the appropriate channel bit in the MLB_MS0 or MLB_MS1 registers to be set.
25 (R/W)	CRXPE	Control Receive Protocol Error Enable. When the MLB_MIEN.CRXPE bit is set, a ProtocolError detected on a control Rx channel causes the appropriate channel bit in the MLB_MS0 or MLB_MS1 registers to be set.
24 (R/W)	CRXDONE	Control Receive Packet Done Enable. When the MLB_MIEN.CRXDONE bit is set, a packet received with no errors on a control Rx channel causes the appropriate channel bit in the MLB_MS0 or MLB_MS1 registers to be set.
22 (R/W)	ATXBREAK	Asynchronous Transmit Break Enable. When the MLB_MIEN.ATXBREAK bit is set, a ReceiverBreak response received from the receiver on an asynchronous Tx channel causes the appropriate channel bit in the MLB_MS0 or MLB_MS1 registers to be set.
21 (R/W)	ATXPE	Asynchronous Transmit Protocol Error Enable. When the MLB_MIEN.ATXPE bit is set, a ProtocolError generated by the receiver on an asynchronous Tx channel causes the appropriate channel bit in the MLB_MS0 or MLB_MS1 registers to be set.
20 (R/W)	ATXDONE	Asynchronous Transmit Done Enable. When the MLB_MIEN.ATXDONE bit is set, a packet transmitted with no errors on an asynchronous Tx channel causes the appropriate channel bit in the MLB_MS0 or MLB_MS1 registers to be set.
19 (R/W)	ARXBREAK	Asynchronous Receive Break Enable. When the MLB_MIEN.ARXBREAK bit is set, a AsyncBreak command received from the transmitter on an asynchronous Rx channel causes the appropriate channel bit in the MLB_MS0 or MLB_MS1 registers to be set.
18 (R/W)	ARXPE	Asynchronous Receive Protocol Error Enable. When the MLB_MIEN.ARXPE bit is set, a protocol error detected on an asynchronous Rx channel causes the appropriate channel bit in the MLB_MS0 or MLB_MS1 registers to be set.
17 (R/W)	ARXDONE	Asynchronous Receive Packet Done Enable. When the MLB_MIEN.ARXDONE bit is set, a packet received with no errors on an asynchronous Rx channel causes the appropriate channel bit in the MLB_MS0 or MLB_MS1 registers to be set.

Table 22-45: MLB_MIEN Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
16 (R/W)	SYNCPE	Synchronous Protocol Error Enable. When the MLB_MIEN . SYNCPE bit is set, a protocol error detected on a synchronous Rx channel causes the appropriate channel bit in the MLB_MS0 or MLB_MS1 registers to be set. This occurs only when isochronous flow control is disabled.
1 (R/W)	ISOCBUFO	Isochronous Receive Buffer Overflow Enable. When the MLB_MIEN . ISOCBUFO bit is set, a buffer overflow on an isochronous Rx channel causes the appropriate channel bit in the MLB_MS0 or MLB_MS1 registers to be set. This occurs only when isochronous flow control is disabled.
0 (R/W)	ISOCPE	Isochronous Receive Protocol Error Enable. When the MLB_MIEN . ISOCPE bit is set, a protocol error detected on an isochronous Rx channel causes the appropriate channel bit in the MLB_MS0 or MLB_MS1 registers to be set.

Channel Status 0 Register

The `MLB_MS0` register indicates the channel status for MediaLB channels 31 to 0. Channel status bits are set by hardware and cleared by software. Status is only set if the appropriate bits in the `MLB_MIEN` register are set.

Figure 22-33: `MLB_MS0` Register Diagram

Table 22-46: `MLB_MS0` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W0C)	MCS	MediaLB Channel Status. The <code>MLB_MS0.MCS</code> bit field indicates the MediaLB channel status for channels 31 to 0.

Channel Status 1 Register

The `MLB_MS1` register indicates the channel status for MediaLB channels 32 to 63. Channel status bits are set by hardware and cleared by software. Status is only set if the appropriate bits in the `MLB_MIEN` register are set.

Figure 22-34: `MLB_MS1` Register Diagram

Table 22-47: `MLB_MS1` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W0C)	MCS	MediaLB Channel Status. The <code>MLB_MS1</code> .MCS bit field indicates the MediaLB channel status for channels 63 to 32.

System Data Register

The `MLB_MSD` register allows system software to receive control information from the MLB controller. The `MLB_MSD` register is updated once per frame by the hardware during the MLB system channel.

The `MLB_MSD` register is loaded with the data from the `MLBDAT_IN` signal during the system channel quadlet. System software must read this register before the start of the next MLB frame to prevent the current data from being lost.

Figure 22-35: MLB_MSD Register Diagram

Table 22-48: MLB_MSD Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:24 (R/NW)	SD3	System Data Byte 3 (MSB). The <code>MLB_MSD.SD3</code> bits are updated with MediaLB Data [31:24] when a MediaLB software system command is received in the system quadlet. If the <code>MLB_MSS.SWSYSCMD</code> bit is already set, then SD3 is not updated.
23:16 (R/NW)	SD2	System Data Byte 2. The <code>MLB_MSD.SD2</code> bits are updated with MediaLB Data [23:16] when a MediaLB software system command is received in the system quadlet. If the <code>MLB_MSS.SWSYSCMD</code> bit is already set, then SD2 is not updated.
15:8 (R/NW)	SD1	System Data Byte 1. The <code>MLB_MSD.SD1</code> bits are updated with MediaLB Data [15:8] when a MediaLB software system command is received in the system quadlet. If the <code>MLB_MSS.SWSYSCMD</code> bit is already set, then SD1 is not updated.
7:0 (R/NW)	SD0	System Data Byte 0 (LSB). The <code>MLB_MSD.SD0</code> bits are updated with MediaLB Data [7:0] when a MediaLB software system command is received in the system quadlet. If the <code>MLB_MSS.SWSYSCMD</code> bit is already set, then SD0 is not updated.

System Status Register

The `MLB_MSS` register allows system software to monitor and control the status of the MLB network. The register is updated once per frame by hardware during the MLB system channel. The bits of this register are not valid until the processor is locked to the MLB interface (except for the bits associated with MLB lock and unlock, SDMU and SDML). System software must service events before the start of the next MLB frame to prevent the current frame status from being lost.

Figure 22-36: MLB_MSS Register Diagram

Table 22-49: MLB_MSS Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
5 (R/W)	SERVREQ	Service Request Enable. When the <code>MLB_MSS.SERVREQ</code> bit set, the MediaLB block responds with a device present, request service system response if a matching channel scan system command is detected. When cleared, the MediaLB block responds with a device present system response.
4 (R/W0C)	SWSYSCMD	Software System Command Detected. The <code>MLB_MSS.SWSYSCMD</code> bit indicates that a software system command was detected (in the system quadlet). The <code>MLB_MSS.SWSYSCMD</code> bit is set by hardware, cleared by software. Data is stored in the <code>MLB_MSD</code> register for this command.
3 (R/W0C)	CSSYSCMD	Channel Scan System Command Detected. The <code>MLB_MSS.CSSYSCMD</code> bit indicates that a channel scan system command was detected (in the system quadlet). The <code>MLB_MSS.CSSYSCMD</code> bit is set by hardware, cleared by software. If the node address specified in the data quadlet matches the value in the <code>MLB_CTL1.NDA</code> bit field, the device responds either device present or device present, request service system response in the next system quadlet.

Table 22-49: MLB_MSS Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
2 (R/W0C)	ULKSYSCMD	Network Unlock System Command Detected. The <code>MLB_MSS.ULKSYSCMD</code> bit indicates a network unlock system command was detected (in the system quadlet). The <code>MLB_MSS.ULKSYSCMD</code> bit is by hardware, cleared by software.
1 (R/W0C)	LKSYSCMD	Network Lock System Command Detected. The <code>MLB_MSS.LKSYSCMD</code> bit indicates a network lock system command was detected (in the system quadlet). The <code>MLB_MSS.LKSYSCMD</code> bit is set by hardware and cleared by software.
0 (R/W0C)	RSTSYSCMD	Reset System Command Detected. The <code>MLB_MSS.RSTSYSCMD</code> bit indicates a reset system command was detected (in the system quadlet). The <code>MLB_MSS.RSTSYSCMD</code> bit is set by hardware, cleared by software.

1 (R/W)	CMRES	MediaLB 6-pin common mode resistor enable. This signal is no longer used.

23 Two-Wire Interface (TWI)

The processor has a two-wire interface (TWI), that provides a simple exchange method of control data between multiple devices. The TWI module is compatible with the widely used I²C bus standard. Additionally, the TWI module is fully compatible with serial camera control bus (SCCB) functionality for easier control of various CMOS camera sensor devices.

The TWI module offers the capabilities of simultaneous master and slave operation and support for both 7-bit addressing and multimedia data arbitration. The TWI interface uses two pins for transferring clock (TWI_SCL) and data (TWI_SDA) and supports the protocol at speeds up to 400K bits/sec. The TWI interface pins are compatible with 3.3V logic levels.

To preserve processor bandwidth, the TWI module can be set up with transfer-initiated interrupts to only service FIFO buffer data reads and writes. Protocol-related interrupts are optional. The TWI externally moves 8-bit data while maintaining compliance with the I²C bus protocol.

NOTE: All TWI instances (TWI0-5) operate in the SCLK0 domain.

TWI Features

The TWI is fully compatible with the widely used I²C bus standard.

The TWI controller includes the following features.

- Simultaneous master and slave operation on multiple device systems
- Support for multi-master bus arbitration
- 7-bit addressing
- 100K bits/second and 400K bits/second data rates
- General call address support
- Master clock synchronization and support for clock low extension
- Separate multiple-byte receive and transmit FIFOs
- Low interrupt rate

- Individual override control of data and clock lines in the event of bus lock-up
- Input filter for spike suppression
- Serial camera control bus support as specified in the *OmniVision Serial Camera Control Bus (SCCB) Functional Specification*
- Programmable drive/tolerance of TWI pins. Refer to the [PADS_PCFG0](#) register description in General-Purpose Ports (PORT) chapter for details.

TWI Functional Description

The TWI interface is a shift register that serially transmits and receives data bits. It moves data 1 bit at a time at the SCL rate, to and from other TWI devices. The SCL signal synchronizes the shifting and sampling of the data on the serial data pin.

ADSP-2159x TWI Register List

The Two-Wire Interface controller TWI allows a device to interface to an inter-IC bus as specified by the Philips I²C Bus Specification version 2.1, dated January 2000. A set of registers governs TWI operations. For more information on TWI functionality, see the TWI register descriptions.

Table 23-1: ADSP-2159x TWI Register List

Name	Description
TWI_CLKDIV	SCL Clock Divider Register
TWI_CTL	Control Register
TWI_FIFCTL	FIFO Control Register
TWI_FIFOSTAT	FIFO Status Register
TWI_IMSK	Interrupt Mask Register
TWI_ISTAT	Interrupt Status Register
TWI_MSTRADDR	Master Mode Address Register
TWI_MSTRCTL	Master Mode Control Registers
TWI_MSTRSTAT	Master Mode Status Register
TWI_RXDATA16	Rx Data Double-Byte Register
TWI_RXDATA8	Rx Data Single-Byte Register
TWI_SLVADDR	Slave Mode Address Register
TWI_SLVCTL	Slave Mode Control Register
TWI_SLVSTAT	Slave Mode Status Register
TWI_TXDATA16	Tx Data Double-Byte Register
TWI_TXDATA8	Tx Data Single-Byte Register

TWI Block Diagram

The *TWI Block Diagram* figure shows the basic blocks of the TWI interface.

Figure 23-1: TWI Block Diagram

External Interface

The TWI_SDA (serial data) and TWI_SCL (serial clock) signals are open drain and require pull-up resistors. These bidirectional signals externally interface the TWI controller to the I²C bus and no other external connections or logic are necessary.

Serial Clock Signal (SCL)

The serial clock signal (`TWI_SCL`) is an input in slave mode. In master mode, the TWI controller must set this signal to the desired frequency.

The TWI controller supports the standard mode of operation (up to 100 kHz) or fast mode (up to 400 kHz). The TWI control register (`TWI_CTL`) sets the `TWI_CTL.PRESCALE` value which sets the relationship between the system clock (`SCLK0`) and the internally timed events of the TWI controller. The internal time reference is derived from `SCLK0` using a prescaled value. The prescale value is the number of `SCLK0` periods used in the generation of one internal time reference. Set the value of prescale to create an internal time reference with a period of 10 MHz. It is represented as a 7-bit binary value as follows.

$$\text{PRESCALE} = f_{\text{SCLK0}}/10\text{MHz}$$

NOTE: It is not always possible to achieve 10-MHz accuracy. In such cases, it is safe to round up the `PRESCALE` value to the next highest integer. For example, if `SCLK0` is 100 MHz, the `PRESCALE` value is calculated as $100\text{ MHz}/10\text{ MHz} = 10$. A prescale value of 14 in this case ensures that all timing requirements are met.

During master mode operation, the TWI module uses the `TWI_CLKDIV` register values to create the minimum `TWI_CLKDIV.CLKHI` and `TWI_CLKDIV.CLKLO` durations of the `TWI_SCL` signal. The `TWI_CLKDIV.CLKHI` field specifies the minimum number of 10-MHz time reference periods the `TWI_SCL` waits before a new clock low period begins, assuming a single master. (The 10-MHz time reference periods are represented as an 8-bit binary value). The TWI uses the `TWI_CLKDIV.CLKLO` field to specify the minimum number of internal time reference periods (represented as an 8-bit binary value); the `TWI_SCL` signal is held low.

Serial clock frequencies can vary from 400 kHz to less than 20 kHz. The resolution of the clock generated is 1/10 MHz or 100 ns. The following equation describes the frequency.

$$\text{CLKDIV} = \text{TWI_SCL period}/10\text{ MHz time reference.}$$

For example, for an `TWI_SCL` of 400 kHz (period = $1/400\text{ kHz} = 2500\text{ ns}$) and an internal time reference of 10 MHz (period = 100 ns), the following equation applies:

$$\text{CLKDIV} = 2500\text{ ns}/100\text{ ns} = 25$$

Therefore, a `TWI_SCL` signal with a 30% duty cycle has `TWI_CLKDIV.CLKLO`=17 and `TWI_CLKDIV.CLKHI`=8. Adding `TWI_CLKDIV.CLKLO` and `TWI_CLKDIV.CLKHI` equals `CLKDIV`.

NOTE: The `TWI_CLKDIV.CLKHI` and `TWI_CLKDIV.CLKLO` fields are not intended to guarantee a certain frequency. Rather, they guarantee a certain minimum high and low duration for the `TWI_SCL` signal. Slew rate controls falling edges. The *RC* time constant governs the rising edges. The pull-up resistor and the `TWI_SCL` capacitance form the time constant. See the “Register Descriptions” section for more details.

Serial Data Signal (SDA)

The TWI transmits and receives serial data, depending on the direction of the transfer, on the bidirectional serial data signal (`SDA`).

Internal Interface

The peripheral bus interface supports the transfer of 16-bit wide data. The processor uses the interface in the support of register and FIFO buffer reads and writes. The TWI internal interface is comprised of the blocks described as follows.

Register block. Contains all control and status bits and reflects what can be written or read as outlined by the programming model. Each function block updates their corresponding status bits.

FIFO buffer. Configured as a 1-byte-wide, 2-deep transmit FIFO buffer and a 1-byte-wide, 2-deep receive FIFO buffer.

Transmit shift register. Serially shifts its data out externally off chip. The output can be controlled for generation of acknowledgments or it can be manually overwritten.

Receive shift register. Receives its data serially from off chip. The receive shift register is 1 byte wide and data received can either be transferred to the FIFO buffer or used in an address comparison.

Address compare block. Supports address comparison in the event the TWI controller module is accessed as a slave.

Prescaler block. Must be programmed to generate a 10-MHz time reference relative to the system clock. The block uses this time base for filtering of data and timing events specified by the electrical data sheet (See the Philips specification). The block uses the time base to generate the TWI_SCL clock as well.

Clock generation module. Generates an external TWI_SCL clock when in master mode. It includes the logic necessary for synchronization in a multi-master clock configuration and clock stretching when configured in slave mode.

NOTE: The TWI does not support DMA based operation.

TWI Architectural Concepts

The TWI controller follows the transfer protocol of the Philips I²C Bus specification version 2.1 dated January 2000.

NOTE: The TWI unit does not support DMA-based operation.

TWI Protocol

The *Data Transfer* figure shows a simple complete transfer.

Figure 23-2: Data Transfer

The TWI controller register contents maps to a basic transfer. The *Data Transfer with Bit Illustration* figure details the same transfer from the *Data Transfer* figure noting the corresponding TWI controller bit names. In this illustration, the TWI controller successfully transmits 1 byte of data. The slave has acknowledged both address and data.

S = START
P = STOP
ACK = ACKNOWLEDGE

Figure 23-3: Data Transfer with Bit Illustration

Clock Generation and Synchronization

The TWI controller implementation only issues a clock during master mode operation and only at the time a transfer initiates. If arbitration for the bus is lost, the serial clock output immediately three-states. If multiple clocks attempt to drive the serial clock line, the TWI controller synchronizes its clock with the other remaining clocks. The *Clock Synchronization* figure shows this functionality.

Figure 23-4: Clock Synchronization

The TWI controller serial clock (TWI_SCL) output follows these rules:

- Once the clock high (TWI_CLKDIV.CLKHI) count is complete, the serial clock output is driven low and the clock low (TWI_CLKDIV.CLKLO) count begins.
- Once the clock low count is complete, the serial clock line is three-stated. This state allows the external pull-up resistor to pull the TWI_SCL signal high. The clock synchronization logic enters into a delay mode (shaded area) until the TWI_SCL signal is detected at logic 1 level. Now, the clock high count begins.

Bus Arbitration

The TWI controller initiates a master mode transmission only when the bus is idle. If the bus is idle and two masters initiate a transfer, arbitration for the bus begins. The *Bus Arbitration* figure shows the arbitration.

Figure 23-5: Bus Arbitration

The TWI controller monitors the serial data bus (SDA) while the `TWI_SCL` signal is high. If the `TWI_SDA` signal is determined to be an active logic 0 level while the data of the TWI controller is a logic 1 level, the TWI controller has lost arbitration. It stops generating the clock and data signals. Arbitration is not only performed at the serial clock edges, but also during the entire time the `TWI_SCL` signal is high.

Start and Stop Conditions

Start and stop conditions involve serial data transitions while the serial clock is a logic 1 level. The TWI controller generates and recognizes these transitions. Typically, start and stop conditions occur at the beginning and at the conclusion of a transmission, except repeated start combined transfers. The *Start and Stop Conditions* figure shows the transitions.

Figure 23-6: Start and Stop Conditions

The TWI special case start and stop conditions of the TWI controller include the following.

- Controller addressed as a slave-receiver. If the master asserts a stop condition during the data phase of a transfer, the TWI controller concludes the transfer (`TWI_ISTAT . SCOMP`).
- Controller addressed as a slave-transmitter. If the master asserts a stop condition during the data phase of a transfer, the TWI controller concludes the transfer (`TWI_ISTAT . SCOMP`) and indicates a slave transfer error (`TWI_ISTAT . SERR`).
- Controller as a master-transmitter or master-receiver. If the stop bit (`TWI_MSTRCTL . STOP`) is set during an active master transfer, the TWI controller issues a stop condition as soon as possible avoiding any error conditions. The TWI controller operates as if data transfer count had been reached.

General Call Support

The TWI controller always decodes and acknowledges a general call address if:

- The TWI controller is enabled as a slave

- General call is enabled

The `TWI_SLVCTL.GEN` bit configures general call addressing (0x00) only when the TWI controller is a slave-receiver.

If the data associated with the transfer is (NAK) not acknowledged, the `TWI_SLVCTL.NAK` bit can be set. If the TWI controller issues a general call as a master-transmitter, set the appropriate address (`TWI_MSTRADDR` register) and transfer direction (`TWI_MSTRCTL.DIR` bit) and load the transmit FIFO data.

NOTE: The byte following the general call address usually defines the slaves response to the call. The interpretation of the command in the second byte is based on the value of its LSB. For a TWI slave device, the bytes received after the general call address are considered data.

Fast Mode

Fast mode essentially uses the same mechanics as the standard mode of operation. Fast mode affects electrical specifications and timing. When fast mode is enabled, (FAST) timing is modified to meet the following electrical requirements.

- Serial data rise times before arbitration evaluation (t_r)
- Stop condition set-up time from serial clock to serial data (t_{SUSTO})
- Bus free time between a stop and start condition (t_{BUF})

TWI Operating Modes

The TWI has two modes of operation: repeated start and clock stretching. The following sections describe the operating modes.

Repeated Start

A repeated start condition is the absence of a stop condition between two transfers. The two transfers can be of any direction type. Examples include a transmit followed by a receive, or a receive followed by a transmit. The following sections guide the programmer in developing a service routine.

Transmit Receive Repeated Start

The *Repeated Start Followed by Data Receive* figure shows a repeated start followed by a data receive sequence. The shading in the figure indicates that the slave has control of the bus.

Figure 23-7: Repeated Start Followed by Data Receive

The tasks performed at each interrupt are:

- Transmit FIFO service (TWI_I_STAT.TXSERV) interrupt request. This interrupt is generated due to a FIFO access. Since this byte is the last of this transfer, the TWI uses the TWI_FIFOSTAT register to indicate that the transmit FIFO is empty. When read, TWI_MSTRCTL.DCNT bit field=0. Set the TWI_MSTRCTL.RSTART bit to indicate a repeated start and set the TWI_MSTRCTL.DIR bit if the following transfer is a data receive.
- Master transfer complete (TWI_I_STAT.MCOMP) interrupt. This interrupt request is generated when all data transfers (TWI_MSTRCTL.DCNT bit field=0). If no errors occur, a start condition initiates. Clear the TWI_MSTRCTL.RSTART bit and program the TWI_MSTRCTL.DCNT bits with the desired number of bytes to receive.
- Receive FIFO service (TWI_I_STAT.RXSERV) interrupt. This interrupt request is generated due to the arrival of a byte in the receive FIFO. Simple data handling is the only requirement.
- Master transfer complete (TWI_I_STAT.MCOMP) interrupt. This interrupt request is generated when the transfer completes.

Receive Transmit Repeated Start

The *Repeated Start Data Receive Followed by Data Transmit* figure illustrates a repeated start data receive followed by a data transmit sequence. The shading in the figure indicates that the slave has control of the bus.

Figure 23-8: Repeated Start Data Receive Followed by Data Transmit

The tasks performed at each interrupt are:

- Receive FIFO service (TWI_I_STAT.RXSERV) interrupt. This interrupt request is generated due to the arrival of a data byte in the receive FIFO. Set the TWI_MSTRCTL.RSTART bit to indicate a repeated start and clear the TWI_MSTRCTL.DIR bit if the following transfer is a data transmit.
- Master transfer complete (TWI_I_STAT.MCOMP) interrupt. This interrupt request has occurred due to the completion of the data receive transfer. If no errors occur, a start condition initiates. Clear the TWI_MSTRCTL.RSTART bit and program the TWI_MSTRCTL.DCNT bits with the desired number of bytes to transmit.
- Transmit FIFO service (TWI_I_STAT.TXSERV) interrupt. This interrupt request is generated due to a FIFO access. Simple data handling is the only requirement.
- Master transfer complete (TWI_I_STAT.MCOMP) interrupt. This interrupt request is generated when the transfer completes.

NOTE: There is no timing constraint to meet the conditions—program the bits as required. Refer to [Clock Stretching During Repeated Start](#) section for more on how the controller stretches the clock during repeated start transfers.

Clock Stretching

Clock stretching is an added function of the TWI controller in master mode operation. This behavior uses self-induced stretching of the I²C clock while waiting to service interrupts. Hardware initiates stretching automatically. No programming is necessary. The TWI controller as a master supports three modes of clock stretching:

- [Clock Stretching During FIFO Underflow](#)
- [Clock Stretching During FIFO Overflow](#)
- [Clock Stretching During Repeated Start](#)

Clock Stretching During FIFO Underflow

During a master mode transmit, an interrupt request occurs the instant the transmit FIFO becomes empty. The most recent byte begins transmission. If the `TWI_ISTAT.TXSERV` interrupt request is not serviced, the concluding acknowledge phase of the transfer stretches.

Stretching of the clock continues until new data bytes are written to the transmit FIFO ([TWI_TXDATA8](#) or [TWI_TXDATA16](#) registers). No other action is required to release the clock and continue the transmission. This behavior continues until the transmission completes (`TWI_MSTRCTL.DCNT=0`). The transmission concludes (`TWI_ISTAT.MCOMP`). The *Clock Stretching during FIFO Underflow* figure and table show the stretching.

Figure 23-9: Clock Stretching during FIFO Underflow

TWI Controller	Processor
Interrupt: XMTSERV – Transmit FIFO buffer is empty.	Acknowledge: Clear the interrupt request source bits. Write to the transmit FIFO buffer.
...	...
Interrupt: MCOMP – Master transmit complete (DCNT= 0x00).	Acknowledge: Clear the interrupt request source bits.

Clock Stretching During FIFO Overflow

During a master mode receive operation, an interrupt occurs at the instant the receive FIFO becomes full. It is during the acknowledge phase of this received byte that clock stretching begins. The TWI module makes no attempt to initiate the reception of another byte. Stretching of the clock continues until the data bytes previously received are read from the receive FIFO buffer (`TWI_RXDATA8` or `TWI_RXDATA16` registers). No other action is required to release the clock and continue the reception of data. This behavior continues until the reception is complete (`TWI_MSTRCTL.DCNT=0`). Reception concludes (`TWI_ISTAT.MCOMP`). The *Clock Stretching During FIFO Overflow* figure and table show the clock stretching.

Figure 23-10: Clock Stretching During FIFO Overflow

TWI Controller	Processor
Interrupt: RCVSERV – Receive FIFO buffer is full.	Acknowledge: Clear the interrupt request source bits. Read the receive FIFO buffer.
...	...
Acknowledge: Clear the interrupt source bits.	Interrupt: MCOMP – Master receive complete.

Clock Stretching During Repeated Start

The repeated start feature in I²C protocol requires a transition between two subsequent transfers. With the use of clock stretching, the task of managing transitions becomes simpler and common to all transfer types.

Once an initial TWI master transfer completes (transmit or receive), the clock initiates a stretch during the repeated start phase between transfers. Concurrent with this event, the initial transfer generates a `TWI_ISTAT.MCOMP` interrupt to signify the initial transfer has completed (`TWI_MSTRCTL.DCNT=0`). This initial transfer is handled without any special bit setting sequences or timing.

The clock stretching logic described applies here. With no system-related timing constraints, the subsequent transfer (receive or transmit) is set up and activated. This sequence can repeat as many times as required to string a series of repeated start transfers together. The *Clock Stretching during Repeated Start Condition* figure and table show the clock stretching.

Figure 23-11: Clock Stretching during Repeated Start Condition

TWI Controller	Processor
Interrupt: MCOMP – Initial transmit has completed and DCNT = 0x00. Note: transfer in progress, RSTART previously set.	Acknowledge: Clear the interrupt request source bits. Write to TWIx_MASTER_CTL, setting MDIR (receive), clearing RSTART, and setting new DCNT value (nonzero).
Interrupt: RCVSERV – Receive FIFO is full.	Acknowledge: Clear the interrupt request source bits. Read the receive FIFO buffer.
...	...
Interrupt: MCOMP – Master receive complete	Acknowledge: Clear the interrupt request source bits.

TWI Programming Model

The topics in this section provide information on the basic programming steps required to set up and run the two wire interface.

General Setup

General setup refers to register writes that are required for both slave mode and master mode operations.

Perform general setup before setting either the master or slave enable bits.

1. Program the `TWI_CTL.EN` bit to enable the TWI controller and set the prescale value (`TWI_CTL.PRESCALE` bit).
2. Program the prescale value to the binary representation of $f_{SCLK0}/10$ MHz. Round up all values to the next whole number.
3. Set the `TWI_CTL.EN` bit to enable the controller.

Once the TWI controller is enabled, a bus busy condition can be detected. This condition clears after t_{BUF} has expired, assuming no additional bus activity has been detected.

Slave Mode

When enabled, slave mode operation supports both receive and transmit data transfers.

It is not possible to enable only one data transfer direction and not acknowledge (NAK) the other. The following setup reflects this functionality.

1. Program the `TWI_SLVADDR` register. The TWI uses the appropriate 7 bits in determining a match during the address phase of the transfer.
2. Program the `TWI_TXDATA8.VALUE` or `TWI_TXDATA16` registers. These values are the initial data values for transmission when the slave is addressed and transmission is needed. This step is optional. If no data is written when the slave is addressed and transmission is needed, the serial clock (`TWI_SCL`) stretches. An interrupt is generated until data is written to the transmit FIFO.
3. Program the `TWI_IMSK` register. There are enable-bits associated with the desired interrupt sources. For example, programming the value 0x000F results in an interrupt request output to the processor, when the TWI module detects a valid address match. An interrupt request also occurs when a valid slave transfer completes or has an error, or a subsequent transfer has begun and the previous transfer has not been serviced.
4. Program the `TWI_SLVCTL` register. This step prepares and enables slave mode operation. For example, programming the value 0x0005 enables slave mode operation and requires 7-bit addressing. It indicates that data in the transmit FIFO buffer is for slave mode transmission.

The *Slave Mode Interaction* table and *TWI Slave Mode Program Flow* diagram represent the interaction between the TWI controller and the processor using this example.

Figure 23-12: TWI Slave Mode Program Flow

Table 23-3: Slave Mode Interaction

TWI Controller	Processor
Interrupt: SINIT – Slave transfer in progress.	Acknowledge: Clear the interrupt source bits.
Interrupt: RCVSERV – Receive buffer is full.	Acknowledge: Clear the interrupt source bits. Read TWIx_FIFO_STAT. Read the receive FIFO buffer.
...	...
Interrupt: SCOMP – Slave transfer complete.	Acknowledge: Clear the interrupt source bits. Read the receive FIFO buffer.

Master Mode Program Flow

The *Master Mode Program Flow* figure shows the program for the TWI in master mode.

Figure 23-13: Master Mode Program Flow

Master Mode Clock Setup

Master mode operation is set up and executed on a per-transfer basis.

An example of programming steps for a receive and for a transmit is given separately in following sections. The programming step for clock setup listed here is common to both transfer types.

1. Program the `TWI_CLKDIV` register to define the minimum high and minimum low duration for the clock.

The `TWI_CLKDIV.CLKHI` and `TWI_CLKDIV.CLKLO` fields do not guarantee a certain frequency. Rather, they guarantee a certain minimum high and low duration for `TWI_SCL`. The slew rate controls falling edges. The RC time constant formed by the pull-up resistor and the SCL capacitance govern rising edges. See the “Register Descriptions” section for more details.

Master Mode Transmit

Follow these programming steps for a single master mode transmission:

1. Program the `TWI_MSTRADDR` register. This step defines the address transmitted during the address phase of the transfer.

2. Program the `TWI_TXDATA8` or `TWI_TXDATA16` register. This step configures the initial data transmitted. It is an error to complete the address phase of the transfer and not have data available in the transmit FIFO buffer.
3. Program the `TWI_FIFCTL` register. The programming indicates if the transmit FIFO buffer interrupt requests occur with each byte transmitted (8-bits) or with every 2 bytes transmitted (16-bits).
4. Program the `TWI_IMSK` register. This step enables the bits associated with the desired interrupt request sources. For example, programming the value 0x0030 results in an interrupt output to the processor when the master transfer completes, and the master transfer has an error.
5. Program the `TWI_MSTRCTL` register. This step prepares and enables master mode operation. For example, programming the value 0x0201: enables master mode operation, generates a 7-bit address, sets the direction to master-transmit, uses standard mode timing, and transmits 8 data bytes before generating a stop condition.

The *Master Mode Transmit Setup Interaction* table represents the interaction between the TWI controller and the processor using this example.

Table 23-4: Master Mode Transmit Setup Interaction

TWI Controller	Processor
Interrupt: XMTSERV – Transmit buffer is empty.	Acknowledge: Clear the interrupt request source bits. Write to the transmit FIFO buffer.
...	...
Interrupt: MCOMP – Master transfer complete.	Acknowledge: Clear the interrupt request source bits.

Master Mode Receive

Follow these programming steps for a single master mode receive.

1. Program the `TWI_MSTRADDR` register. This step defines the address transmitted during the address phase of the transfer.
2. Program the `TWI_FIFCTL` register. This step indicates if the receive FIFO buffer interrupt requests occur with each byte received (8-bits) or with every 2 bytes received (16-bits).
3. Program the `TWI_IMSK` register. This step configures the enable bits associated with the desired interrupt sources. For example, programming the value 0x0030 results in an interrupt request output to the processor when the master transfer completes, and the master transfer has an error.
4. Program the `TWI_MSTRCTL` register. This step prepares and enables master mode operation. For example, programming the value 0x0205: enables master mode operation, generates a 7-bit address, sets the direction to master-receive, uses standard mode timing, and receives 8 data bytes before generating a stop condition.

The *Master Mode Receive Setup Interaction* table shows the interaction between the TWI controller and the processor using this example.

Table 23-5: Master Mode Receive Setup Interaction

TWI Controller	Processor
Interrupt: RCVSERV – Receive buffer is full.	Acknowledge: Clear the interrupt request source bits. Read the receive FIFO buffer.
...	...
Interrupt: MCOMP – Master transfer complete.	Acknowledge: Clear the interrupt request source bits. Read the receive FIFO buffer.

NOTE: After the `TWI_MSTRCTL.DCNT` bit decrements to zero, the TWI master device sends a NAK to indicate to the slave transmitter to release the bus. This operation allows the master to send the stop signal to terminate the transfer.

ADSP-2159x TWI Register Descriptions

Two-Wire Interface (TWI) contains the following registers.

Table 23-6: ADSP-2159x TWI Register List

Name	Description
<code>TWI_CLKDIV</code>	SCL Clock Divider Register
<code>TWI_CTL</code>	Control Register
<code>TWI_FIFCTL</code>	FIFO Control Register
<code>TWI_FIFOSTAT</code>	FIFO Status Register
<code>TWI_IMSK</code>	Interrupt Mask Register
<code>TWI_ISTAT</code>	Interrupt Status Register
<code>TWI_MSTRADDR</code>	Master Mode Address Register
<code>TWI_MSTRCTL</code>	Master Mode Control Registers
<code>TWI_MSTRSTAT</code>	Master Mode Status Register
<code>TWI_RXDATA16</code>	Rx Data Double-Byte Register
<code>TWI_RXDATA8</code>	Rx Data Single-Byte Register
<code>TWI_SLVADDR</code>	Slave Mode Address Register
<code>TWI_SLVCTL</code>	Slave Mode Control Register
<code>TWI_SLVSTAT</code>	Slave Mode Status Register
<code>TWI_TXDATA16</code>	Tx Data Double-Byte Register
<code>TWI_TXDATA8</code>	Tx Data Single-Byte Register

SCL Clock Divider Register

During master mode operation, the `TWI_CLKDIV` holds values, which the TWI uses to create the high and low durations of the serial clock (SCL). The clock signal SCL is an output in master mode and an input in slave mode. The values in the `TWI_CLKDIV.CLKLO` and `TWI_CLKDIV.CLKHI` fields add up to the `CLKDIV` value the following equation.

$$\text{CLKDIV} = \text{TWI SCL period} / 10 \text{ MHz time reference}$$

Serial clock frequencies can vary from 400 KHz to less than 20 KHz. The resolution of the clock generated is 1/10 MHz or 100 ns. For example, for an SCL of 400 KHz (period = 1/400 KHz = 2500 ns) and an internal time reference of 10 MHz (period = 100 ns):

$$\text{CLKDIV} = 2500 \text{ ns} / 100 \text{ ns} = 25$$

For an SCL with a 30% duty cycle, use `TWI_CLKDIV.CLKLO` = 17 and `TWI_CLKDIV.CLKHI` = 8.

Figure 23-14: TWI_CLKDIV Register Diagram

Table 23-7: TWI_CLKDIV Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15:8 (R/W)	CLKHI	SCL Clock High Periods. The <code>TWI_CLKDIV.CLKHI</code> specifies the number of 10 MHz time reference periods the serial clock (SCL) waits before a new clock low period begins, assuming a single master.
7:0 (R/W)	CLKLO	SCL Clock Low Periods. The <code>TWI_CLKDIV.CLKLO</code> specifies the number of internal time reference periods the serial clock (SCL) is held low.

Control Register

The `TWI_CTL` enables the TWI, establishes a relationship between the system clock (`SCLK0`) and the TWI controller's internally timed events, and enables SCCB compatibility.

Figure 23-15: TWI_CTL Register Diagram

Table 23-8: TWI_CTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
9 (R/W)	SCCB	SCCB Compatibility. The <code>TWI_CTL.SCCB</code> enables SCCB compatible operation for the TWI. SCCB compatibility is an optional feature and should not be used in an I ² C bus system. When this feature is enabled, all slave asserted acknowledgement bits are ignored by this master. This feature is valid only during transfers where the TWI is mastering an SCCB bus. Slave mode transfers should be avoided when this feature is enabled because the TWI controller always generates an acknowledge in slave mode.
		0 Disable SCCB compatibility. When disabled, master transfers are not SCCB compatible.
		1 Enable SCCB compatibility. When enabled, master transfers are SCCB compatible. All slave-asserted acknowledgment bits are ignored by this master.
7 (R/W)	EN	Enable Module. The <code>TWI_CTL.EN</code> enables TWI controller operation for either master and/or slave mode of operation. It is recommended that this bit be set at the time <code>TWI_CTL.PRESCALE</code> is initialized and remain set. This method guarantees accurate operation of bus busy detection logic.
		0 Disable
		1 Enable

Table 23-8: TWI_CTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
6:0 (R/W)	PRESCALE	SCLK0 Prescale Value. The <code>TWI_CTL.PRESCALE</code> holds the pre-scaled value for the TWI internal time reference. This reference is derived from SCLK0 according to the formula: $\text{TWI_CTL.PRESCALE} = f_{\text{SCLK0}}/10\text{MHz}$ The <code>TWI_CTL.PRESCALE</code> specifies the number of system clock (SCLK0) periods used in the generation of one internal time reference. The value of <code>TWI_CTL.PRESCALE</code> must be set to create an internal time reference with a period of 10 MHz. It is represented as a 7-bit binary value.

FIFO Control Register

The `TWI_FIFOCTL` control bits affect only the FIFO and are not tied in any way with master or slave mode operation.

Figure 23-16: `TWI_FIFOCTL` Register Diagram

Table 23-9: `TWI_FIFOCTL` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
3 (R/W)	RXILEN	Rx Buffer Interrupt Length. The <code>TWI_FIFOCTL.RXILEN</code> determines the rate at which receive buffer interrupts are to be generated. Interrupts may be generated with each byte received or after two bytes are received. Interrupt status is available in <code>TWI_FIFOSTAT.RXSTAT</code> .
		0 RXSERVI on 1 or 2 Bytes in FIFO
		1 RXSERVI on 2 Bytes in FIFO
2 (R/W)	TXILEN	Tx Buffer Interrupt Length. The <code>TWI_FIFOCTL.TXILEN</code> determines the rate at which transmit buffer interrupts are to be generated. Interrupts may be generated with each byte transmitted or after two bytes are transmitted. Interrupt status is available in <code>TWI_FIFOSTAT.TXSTAT</code> .
		0 TXSERVI on 1 Byte of FIFO Empty
		1 TXSERVI on 2 Bytes of FIFO Empty
1 (R/W)	RXFLUSH	Rx Buffer Flush. The <code>TWI_FIFOCTL.RXFLUSH</code> directs the TWI to flush the contents of the receive buffer and update <code>TWI_FIFOSTAT.RXSTAT</code> to indicate the buffer is empty. This state is held until this bit is cleared. During an active receive, the receive buffer in this state responds to the receive logic as if it is full.
		0 Normal Operation of Rx Buffer
		1 Flush Rx Buffer

Table 23-9: TWI_FIFOCTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
0 (R/W)	TXFLUSH	Tx Buffer Flush. The <code>TWI_FIFOCTL.TXFLUSH</code> directs the TWI to flush the contents of the transmit buffer and update <code>TWI_FIFOSTAT.TXSTAT</code> to indicate the buffer is empty. This state is held until this bit is cleared. During an active transmit, the transmit buffer in this state responds to the transmit logic as if it is empty.
		0 Normal Operation of Tx Buffer
		1 Flush Tx Buffer

FIFO Status Register

The `TWI_FIFOSTAT` fields indicate the state of the FIFO buffers' receive and transmit contents. The FIFO buffers do not discriminate between master data and slave data. By using the status and control bits provided, the FIFO can be managed to allow simultaneous master and slave operation.

Figure 23-17: TWI_FIFOSTAT Register Diagram

Table 23-10: TWI_FIFOSTAT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
3:2 (R/NW)	RXSTAT	Rx FIFO Status. The read-only <code>TWI_FIFOSTAT.RXSTAT</code> indicates the number of valid data bytes in the receive FIFO buffer. The status is updated with each FIFO buffer read using the peripheral data bus or write access by the receive shift register. Simultaneous accesses are allowed.
		0 Empty. The FIFO is empty.
		1 Contains 1 Byte. The FIFO contains one byte of data. A single byte peripheral read of the FIFO is allowed.
		2 Reserved
		3 Full. The FIFO is full and contains two bytes of data. Either a single or double byte peripheral read of the FIFO is allowed.
1:0 (R/NW)	TXSTAT	Tx FIFO Status. The read-only <code>TWI_FIFOSTAT.TXSTAT</code> field indicates the number of valid data bytes in the FIFO buffer. The status is updated with each FIFO buffer write using the peripheral data bus or read access by the transmit shift register. Simultaneous accesses are allowed.
		0 Empty. The FIFO is empty. Either a single or double byte peripheral write of the FIFO is allowed.
		1 Contains 1 Byte. The FIFO contains one byte of data. A single byte peripheral write of the FIFO is allowed.
		2 Reserved
		3 Full. The FIFO is full and contains two bytes of data.

Interrupt Mask Register

The **TWI_IMSK** enables interrupt sources to assert the interrupt output. Each mask bit corresponds with one interrupt request source bit in **TWI_ISTAT**. Reading and writing **TWI_IMSK** does not affect the contents of the **TWI_ISTAT**.

Figure 23-18: TWI_IMSK Register Diagram

Table 23-11: TWI_IMSK Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15 (R/W)	SCLI	Serial Clock Interrupt Mask.
		0 Mask (Disable) Interrupt
		1 Unmask (Enable) Interrupt
14 (R/W)	SDAI	Serial Data Interrupt Mask.
		0 Mask (Disable) Interrupt
		1 Unmask (Enable) Interrupt
7 (R/W)	RXSERV	Rx FIFO Service Interrupt Mask.
		0 Mask (Disable) Interrupt
		1 Unmask (Enable) Interrupt
6 (R/W)	TXSERV	Tx FIFO Service Interrupt Mask.
		0 Mask (Disable) Interrupt
		1 Unmask (Enable) Interrupt

Table 23-11: TWI_IMSK Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
5 (R/W)	MERR	Master Transfer Error Interrupt Mask.
		0 Mask (Disable) Interrupt
		1 Unmask (Enable) Interrupt
4 (R/W)	MCOMP	Master Transfer Complete Interrupt Mask.
		0 Mask (Disable) Interrupt
		1 Unmask (Enable) Interrupt
3 (R/W)	SOVF	Slave Overflow Interrupt Mask.
		0 Mask (Disable) Interrupt
		1 Unmask (Enable) Interrupt
2 (R/W)	SERR	Slave Transfer Error Interrupt Mask.
		0 Mask (Disable) Interrupt
		1 Unmask (Enable) Interrupt
1 (R/W)	SCOMP	Slave Transfer Complete Interrupt Mask.
		0 Mask (Disable) Interrupt
		1 Unmask (Enable) Interrupt
0 (R/W)	SINIT	Slave Transfer Initiated Interrupt Mask.
		0 Mask (Disable) Interrupt
		1 Unmask (Enable) Interrupt

Interrupt Status Register

The `TWI_ISTAT` contains information about functional areas requiring servicing. Many of the bits serve as an indicator to further read and service various status registers. After servicing the interrupt source associated with a bit, the user must clear that interrupt source bit by writing a 1 to it.

Figure 23-19: TWI_ISTAT Register Diagram

Table 23-12: TWI_ISTAT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15 (R/W1C)	SCLI	Serial Clock Interrupt. If the TWI is enabled (<code>TWI_CTL.EN</code>), SCLI is set on a high-to-low transition of the serial clock pin (<code>SCLx</code>). Normally, this bit is not required for I ² C bus transfers. It will be initially set on an I ² C transfer and does not require clearing.
		0 No Interrupt. No transition was detected on the <code>SCLx</code> pin.
		1 Interrupt Detected. A high-to-low transition was detected on the <code>SCLx</code> pin. This bit is W1C.
14 (R/W1C)	SDAI	Serial Data Interrupt. If the TWI is enabled (<code>TWI_CTL.EN</code>), SDAI is set on a high-to-low transition of the serial data pin (<code>SDAx</code>). Normally, this bit is not required for I ² C bus transfers. It will be initially set on an I ² C transfer and does not require clearing.
		0 No Interrupt. No transition was detected on the <code>SDAx</code> pin.
		1 Interrupt Detected. A high-to-low transition was detected on the <code>SDAx</code> pin. This bit is W1C.

Table 23-12: TWI_ISTAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
7 (R/W1C)	RXSERV	Rx FIFO Service. If <code>TWI_FIFOCTL.RXILEN = 0</code> , the <code>TWI_ISTAT.RXSERV</code> is set each time the <code>TWI_FIFOSTAT.RXSTAT</code> field is updated to either 01 or 11. If <code>TWI_FIFOCTL.RXILEN = 1</code> , the <code>TWI_ISTAT.RXSERV</code> is set each time <code>TWI_FIFOSTAT.RXSTAT</code> is updated to 11.
		0 No Interrupt. The FIFO does not require servicing, or the <code>TWI_FIFOSTAT.RXSTAT</code> field has not changed since this bit was last cleared.
		1 Interrupt Detected. The receive FIFO buffer has one or two 8-bit words of data available to be read.
6 (R/W1C)	TXSERV	Tx FIFO Service. If <code>TWI_FIFOCTL.TXILEN = 0</code> , the <code>TWI_ISTAT.TXSERV</code> is set each time the <code>TWI_FIFOSTAT.TXSTAT</code> field is updated to either 01 or 00. If <code>TWI_FIFOCTL.TXILEN = 1</code> , the <code>TWI_ISTAT.TXSERV</code> is set each time <code>TWI_FIFOSTAT.TXSTAT</code> is updated to 00.
		0 No Interrupt. FIFO does not require servicing, or the <code>TWI_FIFOSTAT.TXSTAT</code> field has not changed since this bit was last cleared.
		1 Interrupt Detected. The transmit FIFO buffer has one or two 8-bit locations available to be written.
5 (R/W1C)	MERR	Master Transfer Error. The <code>TWI_ISTAT.MERR</code> indicates that a master error has occurred. The conditions surrounding the error are indicated by the master status register (TWI_MSTRSTAT).
		0 No Interrupt
		1 Interrupt Detected
4 (R/W1C)	MCOMP	Master Transfer Complete. The <code>TWI_ISTAT.MCOMP</code> indicates that the initiated master transfer has completed. In the absence of a repeat start, the bus has been released.
		0 No Interrupt
		1 Interrupt Detected
3 (R/W1C)	SOVF	Slave Overflow. The <code>TWI_ISTAT.SOVF</code> indicates that the <code>TWI_ISTAT.SCOMP</code> bit was set at the time a subsequent transfer has acknowledged an address phase. The transfer continues, however, it may be difficult to delineate data of one transfer from another.
		0 No Interrupt
		1 Interrupt Detected

Table 23-12: TWI_ISTAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
2 (R/W1C)	SERR	Slave Transfer Error. The <code>TWI_ISTAT.SERR</code> indicates that a slave error has occurred. A restart or stop condition has occurred during the data receive phase of a transfer.
		0 No Interrupt
		1 Interrupt Detected
1 (R/W1C)	SCOMP	Slave Transfer Complete. The <code>TWI_ISTAT.SCOMP</code> indicates that the transfer is complete and either a stop, or a restart was detected.
		0 No Interrupt
		1 Interrupt Detected
0 (R/W1C)	SINIT	Slave Transfer Initiated. The <code>TWI_ISTAT.SINIT</code> indicates whether or not a slave transfer is in progress.
		0 No Interrupt. A transfer is not in progress, or an address match has not occurred since the last time this bit was cleared.
		1 Interrupt Detected. The slave has detected an address match, and a transfer has been initiated.

Master Mode Address Register

During the addressing phase of a transfer, the TWI controller, with its master enabled, transmits the contents of `TWI_MSTRADDR`. When programming this register, omit the read/write bit. That is, only the upper 7 bits that make up the slave address should be written to this register. For example, if the slave address is `b#1010000X`, where `X` is the read/write bit, the `TWI_MSTRADDR` is programmed with `b#1010000`, which corresponds to `0x50`. When sending out the address on the bus, the TWI controller appends the read/write bit as appropriate based on the state of the `TWI_MSTRCTL.DIR` bit.

Figure 23-20: TWI_MSTRADDR Register Diagram

Table 23-13: TWI_MSTRADDR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
6:0 (R/W)	ADDR	Master Mode Address.

Master Mode Control Registers

The `TWI_MSTRCTL` controls the logic associated with master mode operation. Bits in this register do not affect slave mode operation and should not be modified to control slave mode functionality.

Figure 23-21: `TWI_MSTRCTL` Register Diagram

Table 23-14: `TWI_MSTRCTL` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15 (R/W)	SCLOVR	Serial Clock Override. The <code>TWI_MSTRCTL.SCLOVR</code> provides direct control of the serial clock line when required. Normal master and slave mode operation should not require override operation. When <code>TWI_MSTRCTL.SCLOVR</code> is set, the TWI overrides normal serial clock output, driving it to an active 0 level and overriding all other logic. This state is held until this bit is cleared. When <code>TWI_MSTRCTL.SCLOVR</code> is cleared, the TWI permits normal serial clock operation under the control of master mode clock generation and slave mode clock stretching logic.
		0 Permit Normal SCL Operation
		1 Override Normal SCL Operation
14 (R/W)	SDAOVR	Serial Data Override. The <code>TWI_MSTRCTL.SDAOVR</code> provides direct control of the serial data line when required. Normal master and slave mode operation should not require override operation. When <code>TWI_MSTRCTL.SDAOVR</code> is set, the TWI overrides normal serial data operation under the control of the transmit shift register and acknowledge logic, driving serial data output to an active 0 level and overriding all other logic. This state is held until this bit is cleared. When <code>TWI_MSTRCTL.SDAOVR</code> is cleared, the TWI permits normal serial data operation.
		0 Permit Normal SDA Operation
		1 Override Normal SDA Operation

Table 23-14: TWI_MSTRCTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration				
13:6 (R/W)	DCNT	Data Transfer Count. The <code>TWI_MSTRCTL.DCNT</code> indicates the number of data bytes to transfer. As each data word is transferred, the TWI decrements this counter. When <code>TWI_MSTRCTL.DCNT</code> decrements to 0, a stop condition is generated. Setting <code>TWI_MSTRCTL.DCNT</code> to 0xFF disables the counter. In this transfer mode, data continues to be transferred until it is concluded by setting the <code>TWI_MSTRCTL.STOP</code> bit. In the event a master transmit is aborted due to a slave data NAK, the value of <code>TWI_MSTRCTL.DCNT</code> equals the number of bytes not sent. The byte which was NAK'ed by the slave is counted as a sent byte.				
5 (R/W)	RSTART	Repeat Start. The <code>TWI_MSTRCTL.RSTART</code> enables the TWI to issue a repeat start condition at the conclusion of the current transfer (<code>TWI_MSTRCTL.DCNT =0</code>) and begin the next transfer. The current transfer concludes with updates to the appropriate status and interrupt bits. If errors occurred during the previous transfer, a repeat start does not occur. In the absence of any errors, master enable (<code>TWI_MSTRCTL.EN</code>) does not self clear on a repeat start. <table><tr><td>0</td><td>Disable Repeat Start</td></tr><tr><td>1</td><td>Enable Repeat Start</td></tr></table>	0	Disable Repeat Start	1	Enable Repeat Start
0	Disable Repeat Start					
1	Enable Repeat Start					
4 (R/W)	STOP	Issue Stop Condition. The <code>TWI_MSTRCTL.STOP</code> directs the TWI to issue a stop condition. The transfer concludes as soon as possible avoiding any error conditions (as if data transfer count had been reached). At that time, the <code>TWI_IMSK</code> is updated along with any associated status bits. <table><tr><td>0</td><td>Permit Normal Operation</td></tr><tr><td>1</td><td>Issue Stop</td></tr></table>	0	Permit Normal Operation	1	Issue Stop
0	Permit Normal Operation					
1	Issue Stop					
3 (R/W)	FAST	Fast Mode. The <code>TWI_MSTRCTL.FAST</code> selects whether the TWI operates in fast mode or standard mode. In fast mode, the TWI uses timing specifications for transfers at up to 400K bits/s. In standard mode, the TWI uses timing specifications for transfers at up to 100K bits/s. <table><tr><td>0</td><td>Select Standard Mode</td></tr><tr><td>1</td><td>Select Fast Mode</td></tr></table>	0	Select Standard Mode	1	Select Fast Mode
0	Select Standard Mode					
1	Select Fast Mode					
2 (R/W)	DIR	Transfer Direction for Master. The <code>TWI_MSTRCTL.DIR</code> selects the transfer direction for the TWI as master initiated receive or transmit. <table><tr><td>0</td><td>Master Transmit</td></tr><tr><td>1</td><td>Master Receive</td></tr></table>	0	Master Transmit	1	Master Receive
0	Master Transmit					
1	Master Receive					

Table 23-14: TWI_MSTRCTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
0 (R/W)	EN	Enable Master Mode. The <code>TWI_MSTRCTL.EN</code> enables master mode functionality. A start condition is generated if the bus is idle. This bit self clears at the completion of a transfer (after <code>TWI_MSTRCTL.DCNT</code> decrements to zero), including transfers terminated due to errors. If disabled (=0) during operation, the transfer is aborted, and all logic associated with master mode transfers are reset. Serial data and serial clock (SDA, SCL) are no longer driven. Write-1-to-clear status bits are not affected.
		0 Disable
		1 Enable

Master Mode Status Register

The `TWI_MSTRSTAT` holds information during master mode transfers and at their conclusion. Generally, master mode status bits are not directly associated with the generation of interrupt requests, but these bits offer information on the current transfer. Slave mode operation does not affect master mode status bits.

Note that while `TWI_MSTRSTAT.SCLSEN` is set (this condition could be due to having no pull-up resistor on `TWI_SCL` or another agent is driving `TWI_SCL` low), the acknowledge bits (`TWI_MSTRSTAT.ANAK` and `TWI_MSTRSTAT.DNAK`) do not update. This result occurs because the acknowledge conditions are sampled during the high phase of `TWI_SCL`.

Figure 23-22: `TWI_MSTRSTAT` Register Diagram

Table 23-15: `TWI_MSTRSTAT` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
8 (R/NW)	<code>BUSBUSY</code>	Bus Busy. The <code>TWI_MSTRSTAT.BUSBUSY</code> indicates whether the bus is currently busy or free. This indication is not limited to only this device but is for all devices. On a start condition, the setting of the register value is delayed due to the input filtering. On a stop condition the clearing of the register value occurs after <code>tBUF</code> .
		0 Bus Free. The bus is free. The clock and data bus signals have been inactive for the appropriate bus free time.
		1 Bus Busy. The bus is busy. Clock or data activity has been detected.

Table 23-15: TWI_MSTRSTAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
7 (R/NW)	SCLSEN	Serial Clock Sense. The <code>TWI_MSTRSTAT.SCLSEN</code> indicates the active or inactive state of the serial clock. Use this status bit when direct sensing of the serial clock line is required. The register value is delayed due to the input filter (nominally 50 ns). Normal master and slave mode operation should not require this feature.
		0 SCL Inactive "One". An inactive "one" is being sensed on the serial clock.
		1 SCL Active "Zero". An active "zero" is being sensed on the serial clock. The source of the active driver is not known and can be internal or external.
6 (R/NW)	SDASEN	Serial Data Sense. The <code>TWI_MSTRSTAT.SDASEN</code> indicates the active or inactive status of the serial data. Use this status bit when direct sensing of the serial data line is required. The register value is delayed due to the input filter (nominally 50 ns). Normal master and slave mode operation should not require this feature.
		0 SDA Inactive "One". An inactive "one" is currently being sensed on the serial data line.
		1 SDA Active "Zero". An active "zero" is currently being sensed on the serial data line. The source of the active driver is not known and can be internal or external.
5 (R/W1C)	BUFWRERR	Buffer Write Error. The <code>TWI_MSTRSTAT.BUFWRERR</code> indicates whether the current master transfer was aborted due to a receive buffer write error. The receive buffer and receive shift register were both full at the same time. This bit is W1C.
		0 No Status
		1 Buffer Write Error
4 (R/W1C)	BUFRDERR	Buffer Read Error. The <code>TWI_MSTRSTAT.BUFRDERR</code> indicates whether the current master transfer was aborted due to the detection of a NAK during data transmission. This bit is W1C.
		0 No Status
		1 Buffer Read Error
3 (R/W1C)	DNAK	Data Not Acknowledged. The <code>TWI_MSTRSTAT.DNAK</code> indicates whether the current master transfer was aborted due to the detection of a NAK during data transmission. This bit is W1C.
		0 No Status
		1 Data NAK

Table 23-15: TWI_MSTRSTAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
2 (R/W1C)	ANAK	Address Not Acknowledged. The <code>TWI_MSTRSTAT.ANAK</code> indicates whether the current master transfer was aborted due to the detection of a NAK during the address phase of the transfer. This bit is W1C.
		0 No Status
		1 Address NAK
1 (R/W1C)	LOSTARB	Lost Arbitration. The <code>TWI_MSTRSTAT.LOSTARB</code> indicates whether the current transfer was aborted due to the loss of arbitration with another master. This bit is W1C.
		0 No Status
		1 Lost Arbitration
0 (R/NW)	MPROG	Master Transfer in Progress. The <code>TWI_MSTRSTAT.MPROG</code> indicates whether or not a master transfer is in progress. If clear (<code>TWI_MSTRSTAT.MPROG = 0</code>), currently no transfer is taking place. This can occur after a transfer is complete or while an enabled master is waiting for an idle bus.
		0 No Status
		1 Master Transfer in Progress

Rx Data Double-Byte Register

The `TWI_RXDATA16` holds a 16-bit data value read from the FIFO buffer. To reduce interrupt output rates and peripheral bus access times, a double byte receive data access can be performed. Two data bytes can be read, effectively emptying the receive FIFO buffer with a single access.

The data is read in little endian byte order, where byte 0 is the first byte received and byte 1 is the second byte received. With each access, the receive status (`TWI_FIFOSTAT.RXSTAT`) field is updated to indicate it is empty. If an access is performed while the FIFO buffer is not full, the read data is unknown and the existing FIFO buffer data and its status remains unchanged.

Figure 23-23: TWI_RXDATA16 Register Diagram

Table 23-16: TWI_RXDATA16 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15:0 (R0/W)	VALUE	Rx Data 16-Bit Value.

Rx Data Single-Byte Register

The `TWI_RXDATA8` holds an 8-bit data value read from the FIFO buffer. Receive data is read from the corresponding receive buffer in a first-in first-out order. Although peripheral bus reads are 16 bits, a read access to `TWI_RXDATA8` accesses only one transmit data byte from the FIFO buffer. With each access, the receive status (`TWI_FIFOSTAT.RXSTAT`) field is updated. If an access is performed while the FIFO buffer is empty, the data is unknown and the FIFO buffer status remains indicating it is empty.

Figure 23-24: `TWI_RXDATA8` Register Diagram

Table 23-17: `TWI_RXDATA8` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
7:0 (R0/W)	VALUE	Rx Data 8-Bit Value.

Slave Mode Address Register

The `TWI_SLVADDR` holds the slave mode address, which is the valid address to which the slave-enabled TWI controller responds. The TWI controller compares this value with the received address during the addressing phase of a transfer.

Figure 23-25: TWI_SLVADDR Register Diagram

Table 23-18: TWI_SLVADDR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
6:0 (R/W)	ADDR	Slave Mode Address.

Slave Mode Control Register

The `TWI_SLVCTL` controls the logic associated with slave mode operation. Settings in this register do not affect master mode operation and should not be modified to control master mode functionality.

Figure 23-26: TWI_SLVCTL Register Diagram

Table 23-19: TWI_SLVCTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
4 (R/W)	GEN	General Call Enable. The <code>TWI_SLVCTL.GEN</code> enables general call address matching. When enabled, a general call slave receive transfer is accepted. All status and interrupt source bits associated with transfers are updated. Note that general call address detection is available only when slave mode is enabled.
		0 Disable General Call Matching
		1 Enable General Call Matching
3 (R/W)	NAK	Not Acknowledge. The <code>TWI_SLVCTL.NAK</code> directs the TWI to generate a NAK (if set) or an ACK (if cleared) at the conclusion of data transfer for slave receive. For NAK, the slave is still considered to be addressed at the conclusion of transfer.
		0 Generate ACK
		1 Generate NAK
2 (R/W)	TDVAL	Transmit Data Valid for Slave. The <code>TWI_SLVCTL.TDVAL</code> selects whether the data in the transmit FIFO is available (valid) for slave transmission (<code>TWI_SLVCTL.TDVAL</code> set). If the FIFO data is not available (invalid) for slave transmission (<code>TWI_SLVCTL.TDVAL</code> cleared), the data in the transmit FIFO is for master mode transmits, and the data is not allowed to be used during a slave transmit; the transmit FIFO is treated as if it is empty.
		0 Data Invalid for Slave Tx
		1 Data Valid for Slave Tx

Table 23-19: TWI_SLVCTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
0 (R/W)	EN	Enable Slave Mode. The <code>TWI_SLVCTL.EN</code> enables slave operation. Enabling slave and master modes of operation concurrently is allowed. If disabled, no attempt is made to identify a valid address. If <code>TWI_SLVCTL.EN</code> is cleared during a valid transfer, clock stretching ceases, the serial data line is released, and the current byte is not acknowledged.
		0 Disable
		1 Enable

Slave Mode Status Register

During and at the conclusion of register slave mode transfers, the `TWI_SLVSTAT` holds information on the current transfer. Generally slave mode status bits are not associated with the generation of interrupt requests. Master mode operation does not affect slave mode status bits.

Figure 23-27: TWI_SLVSTAT Register Diagram

Table 23-20: TWI_SLVSTAT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
1 (R/NW)	GCALL	General Call. The <code>TWI_SLVSTAT.GCALL</code> indicates whether or not--at the time of addressing--the address was determined to be a general call. This bit self clears if slave mode is disabled (<code>TWI_SLVCTL.EN = 0</code>).
		0 Not a General Call Address
		1 General Call Address
0 (R/NW)	DIR	Transfer Direction for Slave. The <code>TWI_SLVSTAT.DIR</code> indicates whether--at the time of addressing--the transfer direction was determined to be slave transmit or receive. This bit self clears if slave mode is disabled (<code>TWI_SLVCTL.EN = 0</code>).
		0 Slave Receive
		1 Slave Transmit

Tx Data Double-Byte Register

The `TWI_TXDATA16` register holds a 16-bit data value written into the FIFO buffer. To reduce interrupt latency output rates and peripheral bus access times, a double byte transfer data access can be done. Two data bytes can be written, effectively filling the transmit FIFO buffer with a single access.

The data is written in little endian byte order, where byte 0 is the first byte to be transferred and byte 1 is the second byte to be transferred. With each access, the transmit status (`TWI_FIFOSTAT.TXSTAT`) field is updated. If an access is performed while the FIFO buffer is not empty, the write is ignored and the existing FIFO buffer data and its status remains unchanged. This register when read back returns zero.

Figure 23-28: TWI_TXDATA16 Register Diagram

Table 23-21: TWI_TXDATA16 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15:0 (R0/W)	VALUE	Tx Data 16-Bit Value.

Tx Data Single-Byte Register

The `TWI_TXDATA8` register holds an 8-bit data value written into the FIFO buffer. Transmit data is entered into the corresponding transmit buffer in a first-in first-out order. For 16-bit peripheral bus writes, a write access to this register adds only one transmit data byte to the FIFO buffer. With each access, the transmit status (`TWI_FIFOSTAT.TXSTAT`) field is updated. If an access is performed while the FIFO buffer is full, the write is ignored and the existing FIFO buffer data and its status remains unchanged. This register returns zero when read back.

Figure 23-29: TWI_TXDATA8 Register Diagram

Table 23-22: TWI_TXDATA8 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
7:0 (R0/W)	VALUE	Tx Data 8-Bit Value.

24 Ethernet Media Access Controller (EMAC)

The EMAC peripheral in the processor enables network connectivity to applications through an Ethernet interface. The module is fully compliant to the following standards:

NOTE: On the processor, EMAC0 is 10/100/1000 BaseT-compliant and supports AVB (Audio Video Bridging) standards.

- Carrier Sense Multiple Access With Collision Detection (CSMA/CD) Access Method and Physical Layer Specifications, Standard 802.3-2005, Institute of Electrical and Electronics Engineers (IEEE).
- Standard for a Precision Clock Synchronization Protocol for Networked Measurement and Control Systems, Standard 1588–2008, Institute of Electrical and Electronics Engineers (IEEE).
- Reduced Media Independent Interface Specification, Revision 1.2, RMII Consortium.
- Reduced Gigabit Media Independent Interface (RGMI), Revision 2.6, HP/Marvell.
- Timing and Synchronization for Time-Sensitive Applications in Bridged LANs, Standard 802.1AS-2011, Institute of Electrical and Electronics Engineers (IEEE).
- Forwarding and Queuing Enhancements for Time-Sensitive Streams, Standard 802.1Qav-2009, Institute of Electrical and Electronics Engineers (IEEE).
- The EMAC supports IEEE 803.3az-2010 standard for Energy Efficient Ethernet. This feature enables the Media Access Control (MAC) sublayer along with a family of physical layers to operate in the Low-Power Idle (LPI) mode.

NOTE: Copyright © 2010 Synopsys, Inc.; portions of this chapter are included with permission from Synopsys, Inc.

EMAC Features

The Ethernet features include the following:

- Supports 10/100 Mbps data transfer rates with external PHY interfaced through RMII
- Full-duplex and half-duplex support for Ethernet
- Dedicated DMA controller with independent read write channels

- Supports dual-buffer (ring) or linked-list (chained) descriptor chaining
- Direct interface with the system crossbar bus
- Provides support for CSMA/CD protocol for half-duplex operation
- IEEE 802.3x flow control for full-duplex and half-duplex
- Automatic network monitoring statistics with management counters
- Flexible address filtering options for uni-cast, multi-cast, and broadcast addresses
- Support for promiscuous mode in reception
- Supports IEEE 802.1Q VLAN tag detection
- VLAN tag-based frame filtering - Perfect match and hash-based filtering
- Supports programmable Inter-frame Gap (IFG)
- Checksum offload engine for checking IPv4 header checksum and TCP/UDP/ICMP checksum encapsulated in IPv4 or IPv6 datagrams
- Station management interface for PHY device configuration and management
- Automatic CRC and pad generation controllable on a per-frame basis
- CRC replacement, source address field insertion or replacement, and VLAN insertion, replacement, and deletion in transmitted frames with per-frame control
- Layer 3 and layer 4-based frame filtering - TCP or UDP over IPv4 or IPv6
- Supports Gigabit data transfer rates with external PHY interfaced through RGMII
- Ethernet frame timestamping as described in IEEE 1588–2002 and IEEE 1588–2008. The transmit or receive status of each frame include 64-bit timestamps
- Hardware assisted time stamping capable of up to 8-ns resolution
- Automatic detection of PTP messages through Ethernet, IPv4, and IPv6 packets
- Four programmable PPS outputs that physically represent PTP system time
- Auxiliary snapshot to timestamp external events
- Four auxiliary input pins available
- Two separate channels (channel 1 and channel 2) or queues for transmission and reception of time-sensitive traffic. Channel 0 is available by default and carries the legacy best-effort Ethernet traffic on the transmit side.
- IEEE 802.1-Qav specified credit-based shaper (CBS) algorithm for channel 1 and channel 2
- Slot number function to schedule the data fetching by DMA from the system memory for channel 1 and channel 2

- Separate DMA, Tx FIFO, and Rx FIFO (MTL) for each additional channel
- Programmable control to route received VLAN tagged non-AV packets to channels or queues
- Standard IEEE 802.3az-2010 for Energy Efficient Ethernet
- EMAC0 supports the following FIFO sizes: 2048 bytes for transmit FIFO and also for receive FIFO
- Supports MII/RMII/RGMII interfaces for external PHY interface

EMAC Functional Description

This section provides information on the function of Ethernet MAC peripheral.

Hardware for the Media Access Control protocol

This function allows applications to support TCP/IP based network communication. At the system end, the module supports direct connection with the system crossbar bus for memory or MMR transactions. It supports RMII (Reduced Media Independent Interface), RGMII (Reduced Gigabit Media Independent Interface), MII (Media Independent Interface), and SMI (Station Management Interface) for interfacing with the external PHY chip.

Dedicated DMA Controller with independent read/write channels

Performs both data and status transfers between the application and the media independent interfaces. Internal transmit and receive FIFOs are used to buffer and regulate the frames. Dedicated interrupt lines connect the EMAC interrupt sources to the System Event Controller (SEC).

MAC Management Counters (MMC) block

An extended set of registers that collect various statistics compliant with IEEE 802.3 definitions regarding the operation of the interface. The registers are updated for each new transmitted or received frame when the condition to update the counter is met. The EMAC provides a set of such counters, along with extended usage control.

PTP (Precision Time Protocol) engine

Provides hardware assistance for the implementation of the IEEE 1588 version 1 and version 2 standards, which allows time synchronization between systems.

Audio Video (AV) functionality

Enables transmission of time-sensitive traffic over bridged local area networks (LANs). The EMAC provides hardware support for IEEE 802.1-Qav specified credit-based shaper (CBS) algorithm. In addition, slot number function allows scheduling of fetching of data by DMA from system memory.

ADSP-2159x EMAC Register List

The Ethernet MAC (EMAC) module provides an Ethernet interface to the processor. The interface is compliant to IEEE Standard 802.3-2005. A set of registers govern EMAC operations. For more information on EMAC functionality, see the EMAC register descriptions.

Table 24-1: ADSP-2159x EMAC Register List

Name	Description
EMAC_ADDR0_HI	MAC Address 0 High Register
EMAC_ADDR0_LO	MAC Address 0 Low Register

EMAC Definitions

The following definitions are helpful for using the EMAC.

EMAC SCB

System Crossbar Interface of EMAC

EMAC DMA

DMA Controller of EMAC

EMAC MFL

MAC FIFO Layer inside EMAC

EMAC CORE

CORE layer inside EMAC which performs the actual Ethernet operations, including interface with PHY through the reduced media interface(s).

MMC

MAC Management Counter

SMI

Station Management Interface that controls PHY through MDIO and MDC signals.

RMII

Reduced Media Independent Interface

MAC

Media Access Control

PTP

Precision Time Protocol

EMAC Block Diagram and Interfaces

The *EMAC Simplified Block Diagram* illustrates the overall functional architecture of the Ethernet MAC peripheral. The EMAC module is comprised of four major layers: EMAC SCB, EMAC DMA, EMAC MFL, and EMAC CORE. Each of these layers (subblocks) is explained in depth in their respective sections in this chapter.

Figure 24-1: EMAC Simplified Block Diagram

A more comprehensive block diagram is shown in the *EMAC Complete Block Diagram*. It includes most of the important blocks inside the EMAC. The EMAC is connected to processor memory and the system crossbar through the System Crossbar Bus Interface (SCB) and System Peripheral Bus Interface (SPB). These connections are which are part of the SCB layer. The SPB interface is connected to all modules that require MMR programming.

The DMA controller performs application data transfer frame by frame, through well-defined descriptor structures. A FIFO layer acts as a buffer between the DMA controller and EMAC CORE.

The EMAC CORE is the most important block because it contains subblocks to support IEEE802.3 based communication with external network interfaces of 10/100/1000 Mbps speeds. It includes the PTP subblock, which assists applications requiring time synchronization; the AV Feature subblock, which enables transmission of time-sensitive traffic over bridged LANs; and a MMC subblock, which generates packet transfer statistics.

Figure 24-2: EMAC Complete Block Diagram

EMAC CORE Subblocks

The *Core Transmit Engine Subblocks* table summarizes the core transmit engine subblocks and their functions. Refer to the EMAC CORE section for further explanation of each of these subblocks.

Table 24-5: CORE Transmit Engine Subblocks

CORE Transmit Engine Sub Block	Function
Transmit Bus Interface	Interface to the FIFO.
Transmit Frame Controller	Appends Zero-PAD data, if required, for short frames. Appends CRC for frame checksum from the CRC generator.
Transmit Protocol Engine	Generates preamble and SFD, as per 802.3 protocol. Generates jam pattern in half-duplex mode, for collisions. Jabber timeout, for excessively large frames. Flow control for half-duplex mode (back pressure). Generates transmit frame status.
Transmit Scheduler	Maintains the inter-frame gap between two transmitted frames. Follows the truncated binary exponential back-off algorithm for half-duplex mode.

Table 24-5: CORE Transmit Engine Subblocks (Continued)

CORE Transmit Engine Sub Block	Function
Transmit CRC Generator	Generate CRC for the frame checksum field of the Ethernet frame.
Transmit Flow Control	Receives the pause frame, appends the calculated CRC, and sends the frame to the protocol engine module.
Transmit Checksum Offload Engine	Supports checksum calculation and insertion in the transmit path, for IPV4/TCP/UDP/ICMP packets.

The *Core Receive Engine Subblocks* table summarizes the core receive engine subblocks and their function. Refer to the EMAC CORE section for more information on each of these subblocks.

Table 24-6: Core Receive Engine Subblocks

CORE Receive Engine Subblock	Functionality Overview
Receive Protocol Engine	Strips the incoming preamble and SFD. Checks for correct length or type field. Performs internal loopback, if necessary. Generates receive status. Supports watchdog of received frames. Supports jumbo frames.
Receive CRC Module	Checks for CRC error, by comparing with FCS.
Receive Frame Controller Module	Packs incoming 8-bit input stream to 32-bit data internally. Performs frame filtering, for uni-cast, multi-cast, and broadcast frames. Attaches the calculated IP checksum input from checksum offload engine. Updates the receive status to bus interface.
Receive Flow Control Module	Detects the receiving pause frame and pauses the frame transmission for the delay specified within the received pause frame. Works in full duplex mode.
Receive IP Checksum Offload Engine	Calculates IPv4 header checksums and verify against the received IPv4 header checksums. Identifies a TCP, UDP, or ICMP payload in the received IP data-grams.
Receive Bus Interface Unit Module	Interface to the FIFO.
Address Filtering Module	Filters destination and source address based on uni-cast, multi-cast, and broadcast frames. Provides CRC hash filtering.

EMAC PHY Interface

The EMAC can interface to the PHY through the RMII interface standard. The *RMII Pins* table shows the RMII pins available in the EMAC, in terms of their generic names. Refer to the data sheet for exact pin names.

Table 24-7: RMII Pins

Sl. No.	Generic Signal Name (IEEE Standards)	RMII Pin Functionality
1.	TXD0	RMII transmit data pin D0 (di-bit lower)
2.	TXD1	RMII transmit data pin D1 (di-bit higher)
3.	RXD0	RMII receive data pin D0 (di-bit lower)
4.	RXD1	RMII receive data pin D1 (di-bit higher)
5.	RMII CLK	RMII common clock (for TX and RX), also called reference clock
6.	TXEN	RMII transmit enable pin (TX valid)
7.	CRS	RMII carrier sense / receive data valid
8.	MDC	Serial management clock driven by EMAC
9.	MDIO	Serial management bidirectional data

Figure 24-3: RMII Di-bit Data Transfer

Extended EMAC PHY Interface

The EMAC can interface to the PHY through the RGMII interface standard. The *RGMII Pins* table shows the RGMII pins available in the EMAC, in terms of their generic names. Refer to the data sheet for exact pin names.

Table 24-8: RGMII Pins

Sl. No.	Generic Signal Name (IEEE Standards)	RGMII Pin Functionality
1.	TXD3-0	RGMII transmit data pins D3-0
2.	RXD3-0	RGMII receive data pins D3-0
3.	TXCLK	RGMII transmit reference clock driven by EMAC
4.	RXCLK	RGMII receive reference clock driven by PHY
5.	TXCTL	RGMII transmit enable pin (TX valid)
6.	RXCTL	RGMII receive data valid

Table 24-8: RGMII Pins (Continued)

Sl. No.	Generic Signal Name (IEEE Standards)	RGMII Pin Functionality
7.	MDC	Serial management clock driven by EMAC
8.	MDIO	Serial management bidirectional data

Figure 24-4: RGMII Data Bit Transfer

EMAC PHY Interface

The EMAC can interface to the PHY through the MII interface standard. The *MII Pins* table shows the MII pins available in the EMAC, in terms of their generic names. Refer to the data sheet for exact pin names.

Table 24-9: MII Pins

Sl. No.	Generic Signal Name (IEEE Standards)	MII Pin Functionality
1.	TXCLK	MII transmit clock
2.	TXD0-3	MII transmit data pins 0-3
3.	TXEN	MII transmit enable
4.	RXCLK	MII receive clock
5.	RXD0-3	MII receive data pins 0-3
6.	RXDV	MII receive data valid
7.	RXER	MII receive error
8.	CRS	MII carrier sense
9.	COL	MII collision detect

Figure 24-5: MII Data Bit Transfer

PHY Interface Selection

The EMAC0 supports both 10/100 Mbps data-transfer rates with external PHY interfaced through RMII and MII and 10/100/1000 Mbps data-transfer rates with external PHY interfaced through RGMII.

Select the external PHY interface for EMAC0 using the `PADS_PCFG0` register, as shown in the following table.

<code>PADS_PCFG0.EMACPHYISEL</code>	0 = MII Interface 1 = RGMII Interface 2 = RMII Interface
<code>PADS_PCFG0.EMACRESET</code>	0 = reset is asserted 1 = reset is deasserted To select PHY interface, set <code>PADS_PCFG0.EMACPHYISEL</code> bit as required and then set <code>PADS_PCFG0.EMACRESET</code> .

RGMII Board Design Recommendations

Use the following guidelines during when performing board design when using the RGMII interface.

MAC to PHY (Transmit)

The Ethernet MAC transmits data to the Ethernet PHY. The Ethernet MAC sends data with $tskewT$ (the timing of TXC at the MAC) that meets the RGMII specification ($tskewT = -500\text{ ps to }+500\text{ ps}$ skew window for transmitter to drive data). The RGMII specification requires that at the PHY end, $tskewR$ is sampled at 1.0 to 2.6 ns. According to the RGMII standard, clocks must be routed such that an additional trace delay of greater than 1.5 ns and less than 2 ns is added to the associated clock signal.

To meet this standard without adding trace delays, most of the PHYs in the industry already include delay logic that can compensate for this on-board delay. These PHY types can manage a $tskewR$ of $\pm 500\text{ ps}$ (the skew for TXC data sampling seen inside the PHY).

The PHY or the on-board delay must delay the clock signal by 1.5 to 2.0 ns so that $tskewR$ is sampled at 1.0 to 2.6 ns. The *MAC to PHY Delay Diagram (Transmitting Data)* figure shows where the delays must occur.

Figure 24-6: MAC to PHY Delay Diagram (Transmitting Data)

PHY to MAC (Receive)

The Ethernet MAC receives data from the Ethernet PHY. Just as in the transmit case, a trace delay of greater than 1.5 ns and less than 2 ns must be added to the associated clock signal, as required by the RGMII specification. Also similar to the transmit case, most of the PHYs in the industry already include delay logic that can compensate for the RXC clock as well.

As shown in the *MAC to PHY Delay Diagram (Receiving Data)* figure, a board trace or the PHY can be used to generate the required 1.5–2.0 ns delay to RXC and the 1.0–2.6 ns tskeW_R.

Figure 24-7: MAC to PHY Delay Diagram (Receiving Data)

There following are two options for board design.

- The on-board delay must delay the clock signal by 1.5 to 2.0 ns. In this case, no additional delay must be introduced by the PHY.
- Most of the PHYs in the industry already include a mode that can introduce a delay logic. If this mode of the PHY is used then the trace lengths on the board need to be matched exactly.

The second option is recommended since it is easier to implement the delay by using the mode in the PHY rather than during the board design. This is the approach followed in the ADI EZ-Kits.

NOTE: Refer to the product specific datasheet for exact processor timing.

For the trace length recommendations for the EMAC signals, please refer to the [SYNOPSIS?] datasheet.

For the exact requirements as recommended by the RGMII protocol, please refer to the RGMII specification.

Clock Sources

The Ethernet MAC is clocked internally from SCLK0. Check the processor data sheet for the valid frequency range of the appropriate SCLK0 signal for Ethernet operation.

Source a 50-MHz clock externally to operate the EMAC in RMII mode. This clock is the same for both transmit and receive. The MDC station management clock is derived from the SCLK0 and driven from the MAC to the PHY, when accessing any PHY registers. .

Figure 24-8: EMAC Clock Sources for RMII PHY interface

EMAC0 Clock Sources

EMAC0 supports RGMII, RMII and MII interfaces. The external PHY sources a 2.5 MHz or 25 MHz clock (for 10/100 or gigabit Ethernet respectively) to operate the EMAC RXCLK in RGMII mode. The RGMII TXCLK is driven from CLK07 of the CDU (Clock Distribution Unit) and needs to be configured to 125 MHz regardless of the EMAC0 speeds (10/100/1000 Mbit/s). The `EMAC_MACCFG.PS` and `EMAC_MACCFG.FES` bits are used to divide the clocks down.

The following tables show the clock sources for the RGMII, MII and RMII interfaces.

Figure 24-9: EMAC Clock Sources - RGMII PHY Interface

Figure 24-10: EMAC Clock Sources - MII PHY Interface

Figure 24-11: EMAC Clock Sources - RMII PHY Interface

EMAC Architectural Concepts

This section explains different architectural concepts relevant to EMAC peripheral, such as EMAC SCB, EMAC DMA, EMAC MFL, EMAC CORE, and others.

EMAC Feature Summary

The *EMAC Feature Summary* table provides a summary of the features that are available on EMAC0 .

Table 24-10: EMAC Feature Summary

Feature	Value (EMAC0)
Speed of Operation	10/100/1000 Mbps
EMAC_VER.UVER hardcoded value	0x10
PHY Interface	RGMII or RMII or MII
Receive FIFO Size (in Bytes)	2048
Transmit FIFO Size (in Bytes)	2048
Energy Efficient Ethernet (EEE)	Yes
PTP (IEEE 1588)	Yes

Table 24-10: EMAC Feature Summary (Continued)

Feature	Value (EMAC0)
AV Feature	Yes
No of TX Channels	3
No of RX Channels	3

EMAC System Crossbar Interface (EMAC SCB)

The EMAC SCB bus interface provides the bus connectivity to support highly effective throughput of data traffic. System bus use is maximized by allowing simultaneous read and write transfers initiated from different DMA channels. The EMAC controller connects directly to the SCB0 crossbar. The following interfaces are available with the design.

- A 32-bit SCB master interface for reading and writing to and from the application memory.
- A 32-bit SPB slave interface for register programming.

Refer to the “System Crossbars (SCB)” chapter for more information on how the crossbar operates. This chapter details only the EMAC-specific information.

Table 24-11: EMAC-SCB Interface Data Transfer Specifications with Crossbar

Specification Term	Comments
1 beat in SCB	SINGLE burst
BLN4 bursts	4 beats in SCB
BLN8 bursts	8 beats in SCB
BLN16 bursts	16 beats in SCB
Bus size	32-bit fixed bus size; equals 1 beat
INCR bursts	Incrementing Bursts
INCR ALIGNED bursts	Incrementing aligned bursts
UNDEF bursts	Undefined burst length
PBL	Programmable Burst Length for DMA

The *EMAC DMA Read/Write channels with System Crossbar* figure shows DMA write channel and read channel datapaths and their connection to the system crossbar.

Figure 24-12: EMAC DMA Read/Write channels with System Crossbar

NOTE: Transmit descriptor read and receive descriptor write-back (status update) operations can occur simultaneously. However, transmit descriptor read and write-back operations cannot occur simultaneously. Transmit DMA (or receive DMA) does not initiate the next transfer unless the previous one is complete.

Priority of SCB Requests

The descriptor transfers have higher priority than the data transfers. For example, if there are two bus requests, such as a receive descriptor read and a transmit data read, the receive descriptor read has a higher priority. The next receive data write (subsequent to the receive descriptor read) does not depend on the completion of the transmit data-read transfer.

If there are requests for descriptor reads from both DMA channels, they are serviced based on a first-come first-serve. Receive DMA has higher priority if the descriptor-read requests are generated from both the DMA channels in the same clock cycle. Similarly, in the write channel, descriptor writes from DMA have higher priority than the data-write transfers for the receive DMA.

SCB Interface Programming Options

The SCB bus interface supports the following programmable options for the EMAC module. These options are available using the `EMAC_DMA0_BMODE` register with the `EMAC_DMA0_BUSMODE` register. These programming options apply to DMA1 and DMA2 as well.

- **Outstanding transactions.** The EMAC-SCB supports up to four outstanding read/write requests on the SCB bus. Software can control these requests by programming the `EMAC_DMA0_BMODE.WROSRLMT` and `EMAC_DMA0_BMODE.RDOSRLMT` bits. Maximum outstanding requests = $\text{EMAC_DMA0_BMODE.WROSRLMT} + 1$ (or) $\text{EMAC_DMA0_BMODE.RDOSRLMT} + 1$.
- **Allowed burst sizes.** The allowed burst sizes are 4 (`EMAC_DMA0_BMODE.BLEN4`), 8 (`EMAC_DMA0_BMODE.BLEN8`), 16 (`EMAC_DMA0_BMODE.BLEN16`) and the SINGLE burst. The EMAC-SCB uses only those burst sizes configured by the program (through the `EMAC_DMA0_BMODE` register) for data transfer through the SCB bus. However, SINGLE burst is available by default, when the `EMAC_DMA0_BMODE.UNDEF` bit is cleared. Data transfers are restricted to the maximum burst size from this list of programmed burst sizes.

- **Burst splitting and burst selection.** The EMAC-SCB splits the DMA requests into multiple bursts on the SCB system bus. Splitting is based on DMA count and software controllable burst enable bits (shown in the allowed burst sizes) as well as burst types (INCR and INCR_ALIGNED). Burst types are also controllable through the software. SINGLE burst is enabled when the `EMAC_DMA0_BMODE.UNDEF` bit is not set. Burst length select priority is in the sequence: UNDEF, 16, 8, and 4.
- **INCR burst type**
 - If the `EMAC_DMA0_BMODE.UNDEF` bit is set, the EMAC-SCB always chooses the maximum allowed burst length based on the `EMAC_DMA0_BMODE.BLEN16`, `EMAC_DMA0_BMODE.BLEN8`, `EMAC_DMA0_BMODE.BLEN4` bits. When the DMA requests are not multiples of the maximum allowed burst length, the SCB can choose a burst-length of any value less than the maximum enabled. (All lesser burst-length enables are redundant). For example, when length bits are enabled and the DMA requests a burst of 42 beats, the SCB splits it into three bursts of 16, 16 and 10 beats respectively.
 - If `EMAC_DMA0_BMODE.UNDEF` is not enabled, then the burst length is based on the priority of the enabled bits in the following order `EMAC_DMA0_BMODE.BLEN16`, `EMAC_DMA0_BMODE.BLEN8`, `EMAC_DMA0_BMODE.BLEN4`. When the DMA requests a burst transfer, the SCB interface splits the requested bursts into multiple transfers using only the enabled burst lengths. This splitting can occur when the requested burst is not a multiple of the maximum enabled burst. If it cannot choose any of the enabled burst lengths, then it selects the burst length as 1.

For example, the DMA requests a burst transfer of 42 beats, the SCB interface splits it into multiple bursts of size 16, 16, 8, 1 and 1 beats respectively. (In this case, the allowed burst sizes are enabled and the sequence is in decreasing burst sizes).

- **INCR_ALIGNED burst type.** When the address-aligned burst-type is enabled (`EMAC_DMA0_BMODE.AAL`), the SCB interface splits the DMA requested bursts. The "INCR Burst Type" section explains burst splitting conditions further. Each burst-size aligns to the least significant bits of the start address. The SCB interface initially generates smaller bursts so that the remaining transfers move with the maximum (enabled) fixed burst lengths.

For example, in the same setting as explained earlier for `EMAC_DMA0_BMODE.UNDEF` set, the DMA requests a burst size of 42 beats at the start address of 0x000003A4. (`EMAC_DMA0_BMODE.BLEN16`, `EMAC_DMA0_BMODE.BLEN8`, and `EMAC_DMA0_BMODE.BLEN4` are enabled). The SCB starts the first transfer with size 3 such that the address of the next burst is aligned (0x000003B0) for a burst of 16. Therefore, the sequence of bursts is 3, 16, 16, and 7, respectively.

When `EMAC_DMA0_BMODE.UNDEF` is not set, then (having a start address of 0x000003A4 with 42 beats), the sequence of burst transfers is 1, 1, 1, 16, 16, 4, and 3 respectively. The sequence of smaller bursts at the beginning is used to align the address to the next higher enabled burst-lengths programmed in the register.

- **Burst operations for DMA transactions.** The `EMAC_DMA0_BMODE.PBL` (programmable burst length) field indicates the maximum number of beats to transfer in one DMA transaction. This value is also the maximum used in a single block read/write. It is shown in the following table.

- For example, if `EMAC_DMA0_BUSMODE.PBL=32` and if `EMAC_DMA0_BMODE.BLEN16` is enabled, the DMA automatically splits 32 bursts in to 2 x 16 bursts. If `EMAC_DMA0_BUSMODE.PBL=8`, and if `EMAC_DMA0_BMODE.BLEN16` and `EMAC_DMA0_BMODE.BLEN8` are enabled, the maximum burst is limited to `EMAC_DMA0_BMODE.BLEN8`. If the `EMAC_DMA0_BUSMODE.PBL8` bit is set, the programmed `EMAC_DMA0_BUSMODE.PBL` value is multiplied by 8 times internally. However, the result cannot be more than the maximum limits specified.
- Set the `EMAC_DMA0_BUSMODE.USP` bit to make the receive DMA burst length configuration independent of the transmit DMA configuration. When this bit is set, the EMAC uses the `EMAC_DMA0_BUSMODE.RPBL` bits to define the burst length of receive DMA. If the `EMAC_DMA0_BUSMODE.USP` bit is not set, the `EMAC_DMA0_BUSMODE.RPBL` bits are used for both transmit and receive. Programs must ensure that the PBL maximum limit is not violated.
- The receive and transmit descriptors are always accessed in the maximum burst-size for the 16-bytes to be read (PBL-max limit is $(\text{TX or RX FIFO size}/2)/4$ words. (PBL maximum for transmit and receive limits burst-size).

Table 24-12: DMA PBL Max Limits

Burst Limit Max Term	Definition
PBL-maximum limit	$(\text{FIFO size}/2)/4$ words
PBL-maximum limit (transmit)	$2048 \text{ bytes}/2 / 4 = 256$ words
PBL-maximum limit (receive)	$2048 \text{ bytes}/2 / 4 = 256$ words

DMA Bursts Using the SCB Interface

The transmit DMA initiates a data transfer when sufficient space to accommodate the configured burst is available in the transmit FIFO. Or, the transmit DMA initiates a data transfer when the number of bytes until the end of frame is less than the configured burst-length. The DMA indicates the start address and the number of transfers required to the SCB master interface. When the SCB interface is configured for fixed-length burst, then it transfers data using the best combination of INCR4/8/16 and 1 beat transaction.

The receive DMA initiates a data transfer when sufficient data to accommodate the configured burst is available in the MTL receive FIFO. Or, the receive DMA initiates a data transfer when the end of frame is detected in the receive FIFO. For example, when the amount is less than the configured burst-length. The DMA indicates the start address and the number of transfers required to the SCB master interface. When the SCB interface is configured for fixed-length burst, then it transfers data using the best combination of INCR 4, 8, 16 or 1 beat transaction. If the end-of frame is reached before the fixed-burst ends on the SCB interface, then dummy transfers are performed to complete the fixed-burst. Otherwise (if `EMAC_DMA0_BUSMODE.FB` is reset), it transfers data using INCR (undefined length) transactions.

When the SCB interface is configured for address-aligned beats, both DMA engines ensure that the first burst transfer is less than or equal to the configured PBL size. (The address-aligned beats configuration uses the `EMAC_DMA0_BUSMODE.AAL` bit). Therefore, all subsequent beats start at an address that is aligned to the configured PBL.

SCB Bus Transaction Status

The SCB uses the `EMAC_DMA0_BMSTAT.BUSRD` and `EMAC_DMA0_BMSTAT.BUSWR` bits to indicate whether the channel is active or not.

Fatal Bus Error

The EMAC SCB asserts the error interrupt (`EMAC_DMA0_STAT.FBI`) when the corresponding fatal bus error interrupt is enabled in the DMA interrupt enable register. The application must reset the core to restart the DMA.

DMA Controller (EMAC DMA)

The EMAC has a built-in DMA controller that performs reads and writes of application data and descriptors through the SCB master interface.

The DMA controller has independent transmit and receive engines, and a CSR (control and status register) space. The transmit engine transfers data from system memory to a FIFO, while the receive engine transfers data from the FIFO to the system memory. The controller uses a descriptor chain-based transfer mechanism to move data efficiently from source to destination with minimal processor core intervention. The DMA is specially designed for packet-oriented data transfers such as Ethernet frames. The controller can be programmed to interrupt the application for situations such as frame transmit and receive transfer completion, and other normal or abnormal conditions.

The DMA and the application device driver communicate through two internal data structures:

1. DMA control and status registers (CSR).
2. Data buffers and descriptor lists. Descriptor lists operate in ring mode and chain mode, as shown in the *EMAC DMA Descriptor Models* figure.

Figure 24-13: EMAC DMA Descriptor Models

Descriptors that reside in the application memory act as pointers to receive and transmit buffers. Descriptors have the following extra attributes.

- There are two descriptor lists, one for receive, and one for transmit. The base address of each list is written into the address registers of the receive and transmit descriptor lists respectively.
- A descriptor list is forward linked (either implicitly or explicitly). The last descriptor can point back to the first entry to create a ring structure.
- Explicit chaining of descriptors is accomplished by setting the second address chained in both receive and transmit descriptors.
- The descriptor lists reside in the address space of the application memory.
- Each descriptor can point to a maximum of two buffers. This attribute enables two buffers, physically addressed, rather than contiguous buffers in memory.

A data buffer resides in the physical memory space of the application. It consists of an entire frame or part of a frame, but cannot exceed a single frame. Buffers can contain only data. The descriptor maintains buffer status. *Data chaining* refers to frames that span multiple data buffers. However, a single descriptor cannot span multiple frames. The DMA skips to the next frame buffer when the end-of-frame is detected. Data chaining is enabled or disabled.

NOTE: It is possible to define a skip length (in terms of $N \times 32$ -bit words) between two subsequent descriptors, when using ring mode. Program the `EMAC_DMA0_BUSMODE.DSL/EMAC_DMA1_BUSMODE.DSL/EMAC_DMA2_BUSMODE.DSL` field to enable this attribute. With this option available, programs are not always restricted to a contiguous memory location in ring mode.

DMA Related Registers

The *Summary of DMA Related Registers* table provides a summary of DMA registers relative to their function. Refer to the “Register Descriptions” sections for complete bit descriptions of each of these registers.

Table 24-13: Summary of DMA Related Registers

Register Name	Description
Bus Mode ^{*1}	Establishes the bus operating modes for the DMA based on the SCB master interface.
Transmit Poll Demand	Enables the transmit DMA to check whether the DMA owns the current descriptor. The transmit poll demand command wakes up the TxDMA when it is in suspend mode. The TxDMA can go into suspend mode because of an underflow error in a transmitted frame or because of the unavailability of descriptors owned by transmit DMA. Issue this command anytime and the TxDMA resets this command once it starts refetching the current descriptor from host memory.
Receive Poll Demand	Enables the receive DMA to check for new descriptors. This command wakes up the RxDMA from the SUSPEND state. The RxDMA can go into SUSPEND state only because of the unavailability of descriptors owned by it.
Receive Descriptor List Address	Points to the start of the receive descriptor list. The descriptor lists reside in the application memory space and must be word-aligned (32-bit data bus). The DMA internally converts the descriptor list to a bus width aligned address by making the corresponding LSBs low.

Table 24-13: Summary of DMA Related Registers (Continued)

Register Name	Description
Transmit Descriptor List Address	Points to the start of the transmit descriptor list. The descriptor lists reside in the application memory space and must be word-aligned (for 32-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LSB to low.
DMA Status	Contains all the status bits that the DMA reports to the application. The software driver reads this register during an interrupt service routine or during polling. Most of the fields in this register interrupt the host.
Operation Mode	Establishes the transmit and receive operating modes and commands. The operation mode register is the last control register written as part of DMA initialization.
Interrupt Enable	Enables the interrupts reported by DMA status register. After a hardware or software reset, all interrupts are disabled.
Missed Frame and Buffer Overflow Counter	The DMA maintains two counters to track the number of missed frames during reception. This register reports the current value of the counter, which is used for diagnostic purposes.
Receive Interrupt Watchdog Timer	When written with non-zero value, enables the watchdog timer for receive interrupt (RI) in the DMA status register.
SCB Bus Mode	Controls the SCB interface master behavior. It controls the burst splitting and the number of outstanding requests.
SCB Status	Provides the active status of the SCB interface read and write channels.
Current Host Transmit Descriptor	Points to the start address of the current transmit descriptor read by the DMA.
Current Host Receive Descriptor	Points to the start address of the current receive descriptor read by the DMA.
Current Host Transmit Buffer Address	Points to the current transmit buffer address the DMA is reading.
Current Host Receive Buffer Address	Points to the current receive buffer address the DMA is reading.

*1 Do not write to the `EMAC_DMA0_BUSMODE.DSL/EMAC_DMA1_BUSMODE.DSL/EMAC_DMA2_BUSMODE.DSL` registers until the first write updates. Otherwise, the second write operation does not update properly. For correct operation, the delay between two writes to the same register location must be at least 8 cycles of 50 MHz RMII REFCLK.

Table 24-14: DMA Registers with Consecutive Writes

Registers with Implications for Consecutive Writes
DMA Bus Mode

DMA Descriptors

The DMA module in the Ethernet subsystem transfers data based on a linked list of descriptors. The descriptor addresses must be aligned to the 32-bit bus width. The descriptors can be either 4 x 32-bit words (16 bytes) or 8 x 32-bit words (32 bytes). Configure the controller for the appropriate word length using the DMA bus mode register. The descriptor words are numbered from 0 to 7 for both the transmit and receive engine.

Typical factors for deciding the descriptor word size are as follows:

- When the time stamping or receive checksum engines are not enabled, the extended descriptors are not required. The software can use descriptors with the default size of 16 bytes (4 words).
- When the time stamping feature is enabled, the software must allocate 32 bytes (8 words) of memory for every descriptor. (The time stamping feature is used with the IEEE 1588 PTP engine).
- When only the receive checksum offload is enabled (time stamping disabled), software must allocate 32 bytes (8 words) of memory for every descriptor. However, only word 4 of the extended words (descriptors 4–7) contains the required status information. Treat the rest of the extended words as reserved or dummy.

Transmit Descriptor

The *Transmit Descriptor Words* figure shows the transmit descriptor structure in memory. The application software must program the TDES0 control bits during descriptor initialization. When the DMA updates the descriptor, it writes back all the control bits except the OWN bit (which it clears) and updates the status bits. The following tables give the contents of the transmitter descriptor word 0 (TDES0) through word 7 (TDES7).

Figure 24-14: Transmit Descriptor Words

Table 24-15: Transmit Descriptor Fields (TDES0)

Bit	Name	Description
31	OWN	Ownership. When set, this bit indicates that the DMA owns the descriptor. When this bit is reset, it indicates that the application owns the descriptor. The DMA clears this bit either when it completes the frame transmission or when the buffers allocated in the descriptor are read completely. The ownership bit of the first descriptor of the frame must be set after all subsequent descriptors belonging to the same frame have been set. This configuration avoids a possible race condition between fetching a descriptor and the driver setting an ownership bit.
30	IC	Interrupt on Completion. When set, this bit sets the transmit interrupt (DMA status register [0]) after the present frame is transmitted.

Table 24-15: Transmit Descriptor Fields (TDES0) (Continued)

Bit	Name	Description
29	LS	Last Segment. When set, this bit indicates that the buffer contains the last segment of the frame.
28	FS	First Segment. When set, this bit indicates that the buffer contains the first segment of a frame.
27	DC	Disable CRC. When this bit is set, the EMAC does not append a cyclic redundancy check (CRC) to the end of the transmitted frame. This functionality is valid only when the first segment (TDES0[28]) is set.
26	DP	Disable Pad. When set, the EMAC does not automatically add padding to a frame shorter than 64 bytes. When this bit is reset, the DMA automatically adds padding and CRC to a frame shorter than 64 bytes. The CRC field is added despite the state of the DC (TDES0[27]) bit. This functionality is valid only when the first segment (TDES0[28]) is set.
25	TTSE	Transmit Time Stamp Enable. When set, this bit enables IEEE1588 hardware time stamping for the transmit frame referenced by the descriptor. This field is valid only when the first segment control bit (TDES0[28]) is set.
24	CRCR	CRC Replacement Control. When set, the EMAC replaces the last four bytes of the transmitted packet with recalculated CRC bytes. The host should ensure that the CRC bytes are present in the frame being transferred from the transmit buffer. This bit is valid when the first segment bit (TDES0[28]) and the disable CRC bit (TDES0[27]) are set.
24	Reserved	
23:22	CIC	Checksum Insertion Control. These bits control the checksum calculation and insertion. Bit encodings are as follows: 00 = Checksum Insertion disabled. 01 = Only IP header checksum calculation and insertion are enabled. 10 = IP header checksum and payload checksum calculation and insertion are enabled, but pseudo-header checksum is not calculated in hardware. 11 = IP header checksum and payload checksum calculation and insertion are enabled, and pseudo-header checksum is calculated in hardware.
21	TER	Transmit End of Ring. When set, this bit indicates that the descriptor list reached its final descriptor. The DMA returns to the base address of the list, creating a descriptor ring.
20	TCH	Second Address Chained. When set, this bit indicates that the second address in the descriptor is the next descriptor address rather than the second buffer address. When TDES0[20] bit is set, TBS2 (TDES1[28:16]) is a <i>do-not-care</i> value. TDES0[21] takes precedence over TDES0[20].
19:18	Reserved	

Table 24-15: Transmit Descriptor Fields (TDES0) (Continued)

Bit	Name	Description
19:18	VLIC	VLAN Insertion Control. When set, these bits request the MAC to perform VLAN tagging or untagging before transmitting the frames. If the frame is modified for VLAN tags, the MAC automatically recalculates and replaces the CRC bytes. Bit encodings are as follows. 00 = Do not add a VLAN tag. 01 = Remove the VLAN tag from the frames before transmission. This option should be used only with the VLAN frames. 10 = Insert a VLAN tag with the tag value programmed in the VLAN tag inclusion or replacement EMAC_VLAN_INCL register. 11 = Replace the VLAN tag in frames with the tag value programmed in the VLAN tag inclusion or replacement EMAC_VLAN_INCL register. This option should be used only with the VLAN frames. These bits are valid when the first segment bit (TDES0[28]) is set.
17	TTSS	Transmit Time Stamp Status. This bit is a status bit to indicate that a time stamp is captured for the described transmit frame. When this bit is set, TDES2 and TDES3 have a time stamp value captured for the transmit frame. This field is only valid when the last segment control bit of the descriptor (TDES0[29]) is set.
16	IHE	IP Header Error. When set, this bit indicates that the EMAC transmitter detected an error in the IP datagram header. The transmitter checks the header length in the IPv4 packet against the number of header bytes received from the application. It indicates an error status when there is a mismatch. For IPv6 frames, a header error is reported if the main header length is not 40 bytes. Furthermore, the Ethernet length or type field value for an IPv4 or IPv6 frame must match the IP header version received with the packet. For IPv4 frames, an error status is also indicated if the header length field has a value less than 0x5.
15	ES	Error Summary. Indicates the logical OR of the following bits: TDES0[14] = Jabber Timeout TDES0[13] = Frame Flush TDES0[11] = Loss of Carrier TDES0[10] = No Carrier TDES0[9] = Late Collision TDES0[8] = Excessive Collision TDES0[2] = Excessive Deferral TDES0[1] = Underflow Error TDES0[16] = IP Header Error TDES0[12] = IP Payload Error
14	JT	Jabber Timeout. When set, this bit indicates that the EMAC transmitter has experienced a jabber timeout. This bit is only set when the EMAC_MACCFG.JB bit is not set.
13	FF	Frame Flushed. When set, this bit indicates that the DMA or MFL flushed the frame due to a software flush command given by the CPU.

Table 24-15: Transmit Descriptor Fields (TDES0) (Continued)

Bit	Name	Description
12	IPE	IP Payload Error. When set, this bit indicates that EMAC transmitter detected an error in the TCP, UDP, or ICMP IP datagram payload. The transmitter checks the payload length received in the IPv4 or IPv6 header against the actual number of TCP, UDP, or ICMP packet bytes received from the application. It issues an error status when there is a mismatch.
11	LC	Loss of Carrier. When set, this bit indicates a loss of carrier occurred during frame transmission. This functionality is valid only for the frames transmitted without collision when the EMAC operates in half-duplex mode. Loss of Carrier. When set, this bit indicates that the EMAC aborted the frame transmission because of a collision occurring after the collision window (64 byte-times, including preamble, in RMII mode; 512 byte-times, including preamble and carrier extension, in RGMII mode). This bit is not valid if the underflow error bit is set.
10	NC	No Carrier. When set, this bit indicates that the carrier sense signal from the PHY did not assert during transmission.
9	LC	Late Collision. When set, this bit indicates that the EMAC aborted the frame transmission because of a collision occurring after the collision window (64 byte-times, including preamble). This bit is not valid if the underflow error bit is set. Late Collision. When set, this bit indicates that the EMAC aborted the frame transmission because of a collision occurring after the collision window (64 byte-times, including preamble, in RMII mode; 512 byte-times, including preamble and carrier extension, in RGMII mode). This bit is not valid if the underflow error bit is set.
8	EC	Excessive Collision. When set, this bit indicates that the EMAC aborted the transmission after 16 successive collisions, while attempting to transmit the current frame. If the <code>EMAC_MACCFG.DR</code> disable retry bit is set, this bit is set after the first collision, and the transmission of the frame aborts.
7	VF	VLAN Frame. When set, this bit indicates that the transmitted frame was a VLAN-type frame.
6:3	CC	Collision Count. When set, these bit indicate that the EMAC aborted the frame transmission due to a collision occurring after the collision window (64 byte-times, including preamble). This bit is not valid if the Underflow Error bit is set. This field is updated only in half-duplex mode.
6:3	SLOTNUM	Slot Number Control Bits. In AV mode, these bits indicate the slot interval in which the data should be fetched from the corresponding buffers, addressed by TDES2 or TDES3. When the transmit descriptor is fetched, the DMA compares the slot number value in this field with the slot function control and status register (RSN). It fetches the data from the buffers only if there is a match in values. These bits are valid only for AV channels (not channel 0).
2	ED	Excessive Deferral. When set, this bit indicates that the transmission has ended because of excessive deferral when the <code>EMAC_MACCFG.DC</code> deferral check bit is set high. Excessive deferral is over 24,288-bit times. (155,680-bits times in 1,000-Mbps mode or when jumbo frame is enabled).
1	UF	Underflow Error. When set, this bit indicates that the EMAC aborted the frame because data arrived late from the application memory. Underflow error indicates that the DMA encountered

Table 24-15: Transmit Descriptor Fields (TDES0) (Continued)

Bit	Name	Description
		an empty transmit buffer while transmitting the frame. The transmission process enters the suspended state and sets both transmit underflow (EMAC_DMA0_STAT.UNF) and transmit interrupt (EMAC_DMA0_STAT.TI) bits.
0	DB	Deferred Bit. When set, this bit indicates that the EMAC defers before transmission because of the presence of carrier. This bit is valid only in half-duplex mode.

Table 24-16: Transmit Descriptor Word 1 (TDES1)

Bit	Name	Description
31-29	Reserved	
31-29	SAIC	Source Address Insertion Control. Request the MAC to add or replace the source address field in the Ethernet frame with the value given in the MAC address register 0 or MAC address register 1. If the source address field is modified in a frame, the MAC automatically recalculates and replaces the CRC bytes. SAIC[2] chooses between MAC address register 0 and MAC address register 1 for source address insertion or replacement. The following list describes SAIC[1:0]. 00 = Do not include the source address. 01 = Include or insert the source address. For reliable transmission, the application must provide frames without source addresses. 10 = Replace the source address. For reliable transmission, the application must provide frames with source addresses. 11 = Reserved. This field is valid only when the first segment bit (TDES0[28]) is set.
28-16	TBS2	Transmit Buffer 2 Size. These bits indicate the second data buffer size in bytes. This field is not valid if TDES0[20] is set.
15-13	Reserved	
12-0	TBS1	Transmit Buffer 1 Size. These bits indicate the first data buffer byte size, in bytes. If this field is 0, the DMA ignores this buffer and uses buffer 2 or the next descriptor, depending on the value of TCH (TDES0[20]).

Table 24-17: Transmit Descriptor 2 (TDES2)

Bit	Name	Description
31-0	Buffer 1 Address Pointer	These bits indicate the physical address of buffer 1. There is no limitation on the buffer address alignment

Table 24-18: Transmit Descriptor 3 (TDES3)

Bit	Name	Description
31-0	Buffer 2 Address Pointer (Next Descriptor Address)	Indicates the physical address of buffer 2 when DMA uses a descriptor ring structure. If the second address chained (TDES1[24]) bit is set, this address contains the pointer to the physical memory where the next descriptor is present. The buffer address pointer must align to the bus width only when TDES1[24] is set. LSBs are ignored internally.

Table 24-19: Transmit Descriptor 6 (TDES6)

Bit	Name	Description
31–0	TTSL	Transmit Frame Time Stamp Low. The DMA updates this field with the least significant 32 bits of the time stamp captured for the corresponding transmit frame. This field has the time stamp only if the last segment bit (LS) in the descriptor is set and time stamp status (TTSS) bit is set.

Table 24-20: Transmit Descriptor 7 (TDES7)

Bit	Name	Description
31–0	TTSH	Transmit Frame Time Stamp High. The DMA updates this field with the most significant 32 bits of the time stamp captured for the corresponding receive frame. This field has the time stamp only if the last segment bit (LS) in the descriptor is set and time stamp status (TTSS) bit is set.

DMA Transmit Process

The following sections describe how the transmission process works for direct memory access on the EMAC controller.

- [Default \(Non-OSF\) Mode](#)
- [OSF Mode Enabled](#)
- [Transmit Frame Processing](#)
- [Transmit Polling Suspended](#)

Default (Non-OSF) Mode

The following sequence describes the default process for DMA transmit works. The sequence applies DMA1 and DMA2 as well.

1. The application sets up the transmit descriptor (using TDES0- TDES3) and sets the OWN bit (TDES0) after setting up the corresponding data buffers with Ethernet frame data.
2. Once the `EMAC_DMA0_OPMODE.ST` bit is set, the DMA enters the run state.
3. While in the run state, the DMA polls the transmit descriptor list for frames requiring transmission. After polling starts, it continues in either sequential descriptor ring order or chained order. If the DMA detects a descriptor flagged as owned by the application, or if an error condition occurs, transmission suspends. Both the transmit buffer unavailable (`EMAC_DMA0_STAT.TU`) and normal interrupt summary (`EMAC_DMA0_STAT.NIS`) bits are set. The transmit engine proceeds to Step 9.
4. If the acquired descriptor is flagged as owned by DMA (`TDES0[31] = 1#b1`), the DMA decodes the transmit data buffer address from the acquired descriptor.
5. The DMA fetches the transmit data from the application memory and transfers the data to the MFL for transmission.

6. If an Ethernet frame is stored over data buffers in multiple descriptors, the DMA closes the intermediate descriptor and fetches the next descriptor. Steps 3, 4, and 5 repeat until the end-of-Ethernet-frame data transfers to the MFL.
7. Frame transmission completes. If IEEE 1588 time stamping was enabled for the frame, the time stamp value obtained from MFL is written to the transmit descriptor (TDES2 and TDES3) that contains the end-of-frame buffer. (The transmit status indicates if IEEE 1588 time stamping enables). The status information is then written to this transmit descriptor (TDES0). Because the OWN bit is cleared during this step, the application now owns this descriptor. If time stamping was not enabled for this frame, the DMA does not alter the contents of TDES2 and TDES3.
8. Transmit interrupt (`EMAC_DMA0_STAT.TI`) is set after completing transmission of a frame. The frame has interrupt on completion (`TDES1 [31]`) set in its last descriptor. The DMA engine then returns to Step 3.
9. In the suspend state, the DMA tries to reacquire the descriptor (and returns to Step 3) when it receives a transmit poll demand and the `EMAC_DMA0_STAT.UNF` bit is cleared.

NOTE: If the `EMAC_DMA0_OPMODE.OSF` bit is not set, the actual inter frame gap (IFG) is more than the value programmed in the `EMAC_MACCFG` register.

OSF Mode Enabled

While in the run state, the transmit process can simultaneously acquire two frames without closing the status descriptor of the first (if the `EMAC_DMA0_OPMODE.OSF` bit is set). As the transmit process finishes transferring the first frame, it immediately polls the transmit descriptor list for the second frame. If the second frame is valid, the transmit process transfers this frame before writing the status information of the first frame.

In OSF mode, the run state transmit DMA operates in the following sequence.

1. The DMA operates as described in steps 1–6 of [Default \(Non-OSF\) Mode](#).
2. Without closing the previous last descriptor of the frame, the DMA fetches the next descriptor.
3. If the DMA owns the acquired descriptor, the DMA decodes the transmit buffer address in this descriptor. If the DMA does not own the descriptor, the DMA goes into suspend mode and skips to Step 7.
4. The DMA fetches the transmit frame from the application memory and transfers the frame to the MFL until the end-of-frame data is transferred. It closes the intermediate descriptors when this frame splits across multiple descriptors.
5. The DMA waits for the frame transmission status and time stamp of the previous frame. Once the status is available, the DMA writes the time stamp to TDES2 and TDES3, if the time stamp was captured (as indicated by a status bit). The DMA then writes the status, with a cleared OWN bit, to the corresponding TDES0, thus closing the descriptor. If time stamping was not enabled for the previous frame, the DMA does not alter the contents of TDES2 and TDES3.
6. If enabled, the transmit interrupt is set; the DMA fetches the next descriptor, and then proceeds to Step 3 (when status is normal). If the previous transmission status shows an underflow error, the DMA goes into suspend mode (Step 7).

7. In suspend mode, if a pending status and time stamp are received from the MFL, the DMA writes the time stamp (if enabled for the current frame) to TDES2 and TDES3. The DMA then writes the status to the corresponding TDES0. It then sets relevant interrupts and returns to suspend mode.
8. After receiving a transmit poll demand (`EMAC_DMA0_TXPOLL`), the DMA can exit suspend mode and enter the run state. (Go to Step 1 or Step 2 depending on pending status)

NOTE: If the `EMAC_DMA0_OPMODE.OSF` bit is set, the DMA fetches the next descriptor in advance of closing the current descriptor. Therefore, the descriptor chain must have more than two different descriptors for proper operation.

NOTE: If the `EMAC_DMA0_OPMODE.OSF` bit is set, the DMA starts fetching the second frame immediately after completing the transfer of the first frame to the FIFO. It does not wait for the status to update. In the meantime, the MFL receives the second frame into the FIFO while transmitting the first frame. The difference in cycles is not seen for the first descriptor, because the time taken for the complete descriptor processing remains the same whether `EMAC_DMA0_OPMODE.OSF` is set or not. The difference appears only for the following descriptor because its processing began earlier.

Transmit Frame Processing

The transmit DMA engine expects that the data buffers contain complete Ethernet frames, excluding: preamble, pad bytes, and FCS fields. The destination address, source address, and type or length fields contain valid data. If the transmit descriptor indicates that the EMAC CORE must disable CRC or PAD insertion, the buffer must have complete Ethernet frames (excluding preamble), including the CRC bytes.

Frames can be data-chained and can span several buffers. Frames must be delimited by the first descriptor (TDES0[28]) and the last descriptor (TDES0[29]), respectively.

As transmission starts, the first descriptor must have (TDES0[28]) set. Frame data transfers from the application buffer to the transmit FIFO. Concurrently, if last descriptor (TDES0[29]) of the current frame clears, the transmit process attempts to acquire the next descriptor. The transmit process expects this descriptor to have TDES0[28] clear. If TDES1[29] is clear, it indicates an intermediary buffer. If TDES0[29] is set, it indicates the last buffer of the frame.

After the last buffer of the frame has been transmitted, the DMA writes back the final status information. The DMA writes to the transmit descriptor 0 (TDES0) word of the descriptor that has the last segment set in transmit descriptor 0 (TDES0[29]). Now, if interrupt-on-completion (TDES0[30]) is set, the transmit interrupt (DMA_STAT [0]) is set, the next descriptor is fetched, and the process repeats.

Actual frame transmission begins after the MFL transmit FIFO has reached either a programmable transmit threshold (`EMAC_DMA0_OPMODE.TTC`), or a full frame is contained in the FIFO. There is also an option for store-and-forward mode (`EMAC_DMA0_OPMODE.TSF`). Descriptors are released (OWN bit TDES0 [31] clears) when the DMA finishes transferring the frame.

Transmit Polling Suspended

Either of the following conditions suspends transmit polling:

1. The DMA detects a descriptor owned by the application (TDES0 [31] = 0).

2. A frame transmission aborts when a transmit error due to underflow is detected. The appropriate transmit descriptor 0 (TDES0) bit is set.

If the second condition occurs, both of the abnormal interrupt summary ([15]) and transmit underflow bits ([5]) are set. The information is written to transmit descriptor 0, causing the suspension. If the DMA goes into a SUSPEND state due to the first condition, then both `EMAC_DMA0_STAT.NIS` and `EMAC_DMA0_STAT.TU` are set.

In both cases, the position in the transmit list is retained. The retained position is that of the descriptor following the last descriptor closed by the DMA.

The driver must explicitly issue a transmit poll demand command after rectifying the suspension cause. If the first condition occurs, the driver must give descriptor ownership to the DMA and then issue a poll demand command to resume the transfer.

Receive Descriptor

The *Receive Descriptor Words* figure shows the structure of the receive descriptor. It can have 32 bytes of descriptor data (8 DWORDs) when advanced time stamping or checksum is enabled.

Figure 24-15: Receive Descriptor Words

Table 24-21: Receive Descriptor Fields (RDES0)

Bit	Name	Description
31	OWN	Ownership. When set, this bit indicates that the DMA of the EMAC subsystem owns the descriptor. When this bit is reset, this bit indicates that the application owns the descriptor. The DMA clears this bit either when it completes the frame reception or when the buffers that are associated with this descriptor are full.
30	AFM	Destination Address Filter Fail. When set, this bit indicates a frame that failed in the DA filter in the EMAC CORE.

Table 24-21: Receive Descriptor Fields (RDES0) (Continued)

Bit	Name	Description
29–16	FL	Frame Length. These bits indicate the byte length of the received frame that transferred to application memory (including CRC). This field is valid when last descriptor (RDES0[8]) is set and either the descriptor error (RDES0[14]) or overflow error bits are reset. This field is valid when last descriptor (RDES0[8]) is set. When the last descriptor and error summary bits are not set, this field indicates the accumulated number of bytes that transferred for the current frame.
15	ES	Error Summary. Indicates the logical OR of the following bits. RDES0[1] = CRC Error RDES0[3] = RGMII Receive Error RDES0[4] = Watchdog Timeout RDES0[6] = Late Collision RDES0[7] = Time Stamp Available RDES4[4:3] = IP Header/Payload Error RDES0[11] = Overflow Error RDES0[14] = Descriptor Error. This field is valid only when the last descriptor (RDES0[8]) is set.
14	DE	Descriptor Error. When set, this bit indicates a frame truncation caused by a frame that does not fit within the current descriptor buffers. The DMA does not own the next descriptor. The frame is truncated. This field is valid only when the last descriptor (RDES0[8]) is set.
13	Reserved	
13	SAF	Source Address Filter Fail. When set, this bit indicates that the SA field of frame failed the SA filter in the EMAC Core.
12	LE	Length Error. When set, this bit indicates that the actual length of the frame received and that the length or type field does not match. This bit is valid only when the frame type (RDES0[5]) bit is reset.
11	OE	Overflow Error. When set, this bit indicates that the received frame is damaged due to buffer overflow in MFL.
10	VLAN	VLAN Tag. When set, this bit indicates that the frame pointed to by this descriptor is a VLAN frame tagged by the EMAC CORE.
9	FS	First Descriptor. When set, this bit indicates that this descriptor contains the first buffer of the frame. If the size of the first buffer is 0, the second buffer contains the beginning of the frame. If the size of the second buffer is also 0, the next descriptor contains the beginning of the frame.
8	LS	Last Descriptor. When set, this bit indicates that the buffers pointed to by this descriptor are the last buffers of the frame
7	Time Stamp Available	When set, this bit indicates that a snapshot of the time stamp is written in descriptor words 6 (RDES6) and 7 (RDES7). This functionality is valid only when the last descriptor bit (RDES0[8]) is set
6	LC	Late Collision. When set, this bit indicates that a late collision has occurred while receiving the frame in half-duplex mode.

Table 24-21: Receive Descriptor Fields (RDES0) (Continued)

Bit	Name	Description
5	FT	Frame Type. When set, this bit indicates that the receive frame is an Ethernet-type frame (the LT field is greater than or equal to 16'h0600). When this bit is reset, it indicates that the received frame is an IEEE802.3 frame. This bit is not valid for runt frames less than 14 bytes.
4	RWT	Receive Watchdog Timeout. When set, this bit indicates that the receive watchdog timer has expired while receiving the current frame. The current frame is truncated after the watchdog timeout.
3	Reserved	
3	RE	Receive Error. When set, this bit indicates that the RGMII PHY sent RGMII RXERR on RXCTL pin during frame reception. This error also includes the carrier extension error in RGMII and half-duplex mode.
2	DE	Dribble Bit Error. When set, this bit indicates that the received frame has a non-integer multiple of bytes (odd nibbles).
1	CE	CRC Error. When set, this bit indicates that a Cyclic Redundancy Check (CRC) error occurred on the received frame. This field is valid only when the last descriptor (RDES0[8]) is set.
0	Extended Status Available	When set, this bit indicates that the extended status is available in descriptor word 4 (RDES4). This functionality is valid only when the last descriptor bit (RDES0[8]) is set.

Table 24-22: Receive Descriptor Fields 1 (RDES1)

Bit	Name	Description
31	DIC	Disable Interrupt on Completion. When set, this bit prevents setting the EMAC_DMA0_STAT.RI bit of the status register for the received frame ending in the buffer indicated by this descriptor. This activity, in turn, disables the assertion of the interrupt to the application due to RI for that frame.
30–29	Reserved	
28–16	RBS2	Receive Buffer 2 Size. These bits indicate the second data buffer size, in bytes. The buffer size must be a multiple of 4 (32-bit bus), even if the value of RDES3 (buffer2 address pointer) does not align to bus width. If the buffer size is not an appropriate multiple of 4, 8, or 16, the resulting behavior is undefined. This field is not valid if RDES1[14] is set.
15	RER	Receive End of Ring. When set, this bit indicates that the descriptor list reached its final descriptor. The DMA returns to the base address of the list, creating a descriptor ring.
14	RCH	Second Address Chained. When set, this bit indicates that the second address in the descriptor is the next descriptor address rather than the second buffer address. When this bit is set, RBS2 (RDES1[28:16]) is a <i>do-not-care</i> value. RDES1[15] takes precedence over RDES1[14].
13	Reserved	
12–0	RBS1	Receive Buffer 1 Size. Indicates the size of the first data buffer in bytes. The buffer size must be a multiple of 4 (32-bit bus), even if the value of RDES2 (buffer1 address pointer) is not aligned. When the buffer size is not a multiple of 4, the resulting behavior is undefined. If this field is 0, the DMA ignores this buffer and uses buffer 2 or next descriptor depending on the value of RCH (Bit 14).

Table 24-23: Receive Descriptor Fields 2 (RDES2)

Bit	Name	Description
31–0	Buffer 1 Address Pointer	These bits indicate the physical address of buffer 1. There are no limitations on the buffer address alignment except for the following condition: The DMA uses the configured value for its address generation when the RDES2 value stores the start of frame. The DMA performs a write operation with the RDES2[1:0] bits as 0 during the transfer of the start of frame. However, the frame data shifts per the address pointer of the actual buffer. The DMA ignores RDES2[1:0] when the address pointer is to a buffer where the middle or last part of the frame is stored. (RDES2[1:0] corresponds to a bus width of 32).

Table 24-24: Receive Descriptor Fields 3 (RDES3)

Bit	Name	Description
31–0	Buffer 2 Address Pointer (Next Descriptor Address)	These bits indicate the physical address of buffer 2 when DMA uses a descriptor ring structure. If the second address chained (RDES1[24]) bit is set, this address contains the pointer to the physical memory where the next descriptor is present. If RDES1[24] is set, the buffer (next descriptor) address pointer must be bus width-aligned (RDES3[1:0] = 0, corresponding to a bus width of 32. LSBs are ignored internally.) However, when RDES1[24] is reset, there are no limitations on the RDES3 value, except for the following condition: The DMA uses the configured value for its buffer address generation when the RDES3 value stores the start of frame. The DMA ignores RDES3[1:0] when the address pointer is to a buffer where the middle or last part of the frame is stored. (RDES3[1:0] corresponds to a bus width of 32.)

Table 24-25: Receive Descriptor Fields 4 (RDES4)

Bit	Name	Description
31-26	Reserved	
25	Layer 4 Filter Match	When set, this bit indicates that the received frame matches layer 4 filter fields. This status is given only when one of the following conditions is true: - Layer 3 fields are not enabled and all enabled layer 4 fields match. - All enabled layer 3 and layer 4 filter fields match.
24	Layer 3 Filter Match	When set, this bit indicates that the received frame matches layer 3 IP address fields. This status is given only when one of the following conditions is true: - All enabled layer 3 fields match and all enabled layer 4 fields are bypassed. - All enabled filter fields match.
23-21	Reserved	
20-18	VLAN Tag Priority	These bits give the VLAN tag's user value in the received packet. These bits are valid only when the RDES4[16] and RDES4[17] are set.
17	AV Tagged Packet Received	When set, this bit indicates that an AV tagged packet is received. Otherwise, this bit indicates that an untagged AV packet is received. This bit is valid when RDES4[16] is set.
16	AV Packet Received	When set, this bit indicates that an AV packet is received.
15	Reserved	

Table 24-25: Receive Descriptor Fields 4 (RDES4) (Continued)

Bit	Name	Description
14	Timestamp Dropped	When set, this bit indicates that the time stamp is captured for this frame but dropped in the MFL RxFIFO because of overflow.
13	PTP Version	When set, this bit indicates that the received PTP message has the IEEE 1588 version 2 format. When reset, it has the version 1 format. This description is valid only if the message type (RDES4[11:8]) is non-zero.
12	PTP Frame Type	When set, this bit indicates that the PTP message transfers directly over Ethernet. When this bit is not set and the message type is non-zero, it indicates that the PTP message transfers over UDP-IPv4 or UDP-IPv6. Bits 6 and 7 have the information on IPv4 or IPv6.
11–8	Message Type	These bits are encoded to give the type of the message received. 0000 = No PTP message received 0001 = SYNC (all clock types) 0010 = Follow_Up (all clock types) 0011 = Delay_Req (all clock types) 0100 = Delay_Resp (all clock types) 0101 = Pdelay_Req (in peer-to-peer transparent clock) or Announce (in ordinary or boundary clock) 0110 = Pdelay_Resp (in peer-to-peer transparent clock) or Management (in ordinary or boundary clock) 0111 = Pdelay_Resp_Follow_Up (in peer-to-peer transparent clock) or Signaling (for ordinary or boundary clock) 1xxx - Reserved
7	IPv6 Packet Received	When set, this bit indicates that the received packet is an IPv6 packet.
6	IPv4 Packet Received	When set, this bit indicates that the received packet is an IPv4 packet.
5	IP Checksum Bypassed	When set, this bit indicates that the checksum offload engine is bypassed.
4	IP Payload Error	When set, this bit indicates that the 16-bit IP payload checksum that the core calculated does not match the corresponding checksum field in the received segment. (For example: the TCP, UDP, or ICMP checksum). The bit is also set when the TCP, UDP, or ICMP segment length does not match the payload length value in the IP header field.
3	IP Header Error	When set, this bit indicates that the 16-bit IPv4 header checksum calculated by the core does not match the received checksum bytes. Or, it indicates that the IP datagram version is not consistent with the Ethernet type value.

Table 24-25: Receive Descriptor Fields 4 (RDES4) (Continued)

Bit	Name	Description
2-0	IP Payload Type	These bits indicate the type of payload encapsulated in the IP datagram processed by the receive checksum offload engine (COE). The COE also sets these bits to 2'b00 when it does not process the payload of the IP datagram. It does not process the payload because of an IP header error or fragmented IP. 000 = Unknown or did not process IP payload 001 = UDP 010 = TCP 011 = ICMP 1xx = Reserved

Table 24-26: Extended Receive Descriptor Fields 4 (RDES4)

Bit	Name	Description
31-26	Reserved	
25	Layer 4 Filter Match	When set, this bit indicates that the received frame matches layer 4 filter fields. This status is given only when one of the following conditions is true: • Layer 3 fields are not enabled and all enabled layer 4 fields match. • All enabled layer 3 and layer 4 filter fields match.
24	Layer 3 Filter Match	When set, this bit indicates that the received frame matches layer 3 IP address fields. This status is given only when one of the following conditions is true: • All enabled layer 3 fields match and all enabled layer 4 fields are bypassed. • All enabled filter fields match.
23-21	Reserved	
20-18	VLAN Tag Priority	These bits give the VLAN tag's user value in the received packet. These bits are valid only when the RDES4[16] and RDES4[17] are set.
17	AV Tagged Packet Received	When set, this bit indicates that an AV tagged packet is received. Otherwise, this bit indicates that an untagged AV packet is received. This bit is valid when RDES4[16] is set.
16	AV Packet Received	When set, this bit indicates that an AV packet is received.
15	Reserved	
14	Timestamp Dropped	When set, this bit indicates that the timestamp was captured for this frame but got dropped in the MFL Rx FIFO because of overflow.

Table 24-27: Receive Descriptor Fields 6 (RDES6)

Bit	Name	Description
31–0	RTSL	Receive Frame Time Stamp Low. The DMA updates this field with the least significant 32 bits of the time stamp captured for the corresponding receive frame. The DMA updates this field only for the last descriptor of the receive frame. The status bit (RDES0[8]) indicates the last descriptor.

Table 24-28: Receive Descriptor Fields 7 (RDES7)

Bit	Name	Description
31–0	RTSH	Receive Frame Time Stamp High. The DMA updates this field with the most significant 32 bits of the time stamp captured for the corresponding receive frame. The DMA updates this field only for the last descriptor of the receive frame. The status bit (RDES0[8]) indicates the last descriptor.

EMAC DMA Receive Process

The following sections describe how the receive process for direct memory access works on the EMAC controller.

- [Receive Frame Processing](#)
- [Receive Descriptor Acquisition](#)
- [Receive Process Suspended](#)

The reception process for DMA works as follows:

1. The application sets up receive descriptors (RDES0–RDES3) and sets the OWN bit (RDES0 [31]).
2. Once the `EMAC_DMA0_OPMODE.SR` bit is set, the DMA enters the run state. While in the run state, the DMA attempts to acquire free descriptors by polling the receive descriptor list. If the fetched descriptor is not free (the application owns the descriptor), the DMA enters the suspend state and jumps to Step 9.
3. The DMA decodes the receive data buffer address from the acquired descriptors.
4. Incoming frames are processed and placed in the data buffers of the acquired descriptor.
5. When the buffer is full or the frame transfer is complete, the receive engine fetches the next descriptor.
6. If the current frame transfer is complete, the DMA proceeds to Step 7. If IEEE 1588 time stamping is enabled, the DMA writes the time stamp (if available) to the current descriptor. If the DMA does not own the next fetched descriptor and the frame transfer is not complete, the DMA sets the descriptor error bit in the RDES0. (The bit is set unless flushing is disabled.) The DMA closes the current descriptor (clears the OWN bit). The DMA marks it as intermediate by clearing the last segment (LS) bit in the RDES0 value (marks it as last descriptor if flushing is not disabled). The DMA then proceeds to Step 8. If the DMA owns the next descriptor but the current frame transfer is not complete, the DMA closes the current descriptor as intermediate and reverts to Step 4.
7. If IEEE 1588 time stamping is enabled, the DMA writes the time stamp (if available) to RDES2 and RDES3 of the current descriptor. The DMA then takes the status of the receive frame from the MFL and writes the status word to RDES0 of the current descriptor. The OWN bit is cleared and the last segment bit is set.

8. The receive engine checks the OWN bit of the latest descriptor. If the host owns the descriptor (OWN bit is 0), the `EMAC_DMA0_STAT.RU` bit is set. The DMA receive engine enters the suspended state (Step 9). If the DMA owns the descriptor, the engine returns to Step 4 and awaits the next frame.
9. Before the receive engine enters the suspend state, partial frames are flushed from the receive FIFO (programs control flushing using the `EMAC_DMA0_OPMODE.DFF` bit).
10. The receive DMA exits the suspend state when a receive poll demand is given or the start of next frame is available from the receive FIFO of the MFL. The engine proceeds to Step 2 and refetches the next descriptor.

Receive Frame Processing

The EMAC transfers the received frames to the application memory only when:

- the frame passes the address filter subblock, and
- the frame size is greater than or equal to configurable threshold bytes set for the receive FIFO of MFL, or
- the complete frame is written to the FIFO in store-and-forward mode.

If the frame fails the address filtering, the EMAC block drops the frame (unless the `EMAC_MACFRMFILT.RA` bit is set). Frames that are shorter than 64 bytes, because of collision or premature termination, can be purged from the receive FIFO.

After receiving 64 bytes (configurable threshold), the MFL block requests that the DMA block begin transferring the frame data to the receive buffer pointed to by the current descriptor. The DMA sets first descriptor (`RDES0 [9]`) after the SCB becomes ready to receive the data (if DMA is not fetching transmit data from the application). The descriptors release when the OWN (`RDES [31]`) bit is reset to 0. The bit is reset either as the data buffer fills up or as the last segment of the frame is transferred to the receive buffer. If the frame is contained in a single descriptor, both the last descriptor (`RDES [8]`) and the first descriptor (`RDES [9]`) are set.

The DMA fetches the next descriptor, sets the last descriptor (`RDES [8]`) bit, and releases the `RDES0` status bits in the previous frame descriptor. Then, the DMA sets the `EMAC_DMA0_STAT.RI` bit. The same process repeats unless the DMA encounters a descriptor the application owns. If this encounter occurs, the receive process sets the `EMAC_DMA0_STAT.RU` bit and then enters the suspend state. The position in the receive list is retained.

Receive Descriptor Acquisition

The receive engine always attempts to acquire an extra descriptor in anticipation of an incoming frame. Descriptor acquisition is attempted when any of the following conditions is satisfied:

- The `EMAC_DMA0_OPMODE.SR` bit is set immediately after being placed in the run state.
- The data buffer of current descriptor is full before the frame ends for the current transfer.
- The controller completes frame reception, but the current receive descriptor is not yet closed.
- The receive process suspends because of an application-owned buffer (`RDES0 [31] = 0`) and a new frame is received.
- A receive poll demand issues.

Receive Process Suspended

If a new receive frame arrives while the receive process is in the suspend state, the DMA refetches the current descriptor in the application memory. If the DMA now owns the descriptor, the receive process reenters the run state and starts frame reception. If the application still owns the descriptor, by default, the DMA discards the current frame at the top of the receive FIFO and increments the missed frame counter. If more than one frame is stored in the receive FIFO, the process repeats.

Avoid the discarding or flushing of the frame at the top of the receive FIFO by setting the `EMAC_DMA0_OPMODE.DFF` bit. In such conditions, the receive process sets the receive buffer unavailable status and returns to the suspend state.

OWN Bit (Ownership) Semaphore

Usage or ownership of the transmit or receive descriptor between the application and EMAC is mutually exclusive. While the EMAC accesses the descriptor, the application cannot modify it. Conversely, while the host updates the descriptor, the EMAC cannot use the content of the descriptor. This functionality is implemented through the OWN bit in the transmit or receive descriptor, acting as a semaphore to prevent multiple, simultaneous access to the descriptors.

The following example is based on a usage case of 4 WORDs enabled for descriptors. A chain structure configuration is assumed. (The `EMAC_DMA0_BUSMODE.ATDS` bit is not set). However, the explanation of the OWN bit semaphore remains consistent irrespective of any particular mode of operation.

1. Transmit OWN Bit:

- TDES0 – TDES3 words implement the transmit descriptors. TDES0 [31] is defined as the OWN bit. When TDES0 [31] is set to 0, this bit indicates that the descriptor is available for the application to update. The application sets up the descriptors, including the buffer addresses, by updating TDES0 through TDES3.
- To release ownership of the descriptor to the EMAC, the application sets the transmit OWN bit, TDES0 [31], to 1. TDES0 [31] = 1 indicates that the descriptor is ready for the EMAC to use. DMA reads the descriptors, then fetches the data for transmission from the buffer locations pointed to by the transmit descriptors (TDES2 and TDES3). When either the last data buffer is empty or the end-of-frame is reached, DMA clears the TDES0 [31] bit to 0. Now, the transmit descriptor releases to the application for updates.

2. Receive OWN Bit:

- RDES0 – RDES3 words implement the receive descriptors. RDES0 [31] is defined as the OWN bit. When RDES0 [31] is set to 0, this bit indicates that the descriptor is available for the application to update. The application sets up the descriptors, including the buffer locations for writing the received data, by updating RDES0 through RDES3. To give ownership of the descriptor to the EMAC, the host sets the receive OWN bit, RDES0 [31], to 1.
- RDES0 [31] = 1 indicates that the descriptor is ready for use by the EMAC. DMA reads the descriptors, then writes the received data to the buffers with locations pointed to by the receive descriptors (RDES2

and RDES3). When either the last data buffer is full or the end-of-frame is reached, DMA clears the RDES0 [31] bit to 0. Now, the receive descriptor releases to the application for updates

Application Data Buffer Alignment

The transmit and receive data buffers do not have any restrictions on the start address alignment. The start address for the buffers aligns to any of the 4 bytes. However, the DMA always initiates transfers with the address aligned to the bus width with dummy data for the byte lanes not required. This alignment typically happens during the transfer of the beginning or end of an Ethernet frame.

Example for Buffer Read

If the transmit buffer address is 0x0002 and 15 bytes must transfer, the DMA reads 5 full words (5 x 32-bit data) from address 0x0000. However, when transferring data to the EMAC transmit FIFO, the extra bytes (the first 2 bytes) are dropped or ignored. Similarly, the last 3 bytes of the last transfer are also ignored. The DMA always transfers a full 32-bit data to the transmit FIFO, unless it is the end-of-frame.

Example for Buffer Write

If the receive buffer address is 0x0002 and 15 bytes of a received frame must transfer, the DMA writes 5 full words (5 x 32-bit data) to address 0x0000. However, the first 2 bytes of first transfer and the last 3 bytes of the third transfer have dummy data.

Buffer Size Calculations

The DMA engines do not update the size fields in the transmit and receive descriptors alone. The DMA updates only the status fields (RDES0 and TDES0) of the descriptors. The driver must perform the size calculations. The transmit DMA transfers the exact number of bytes (indicated by buffer size field of TDES1) towards the EMAC CORE. If a descriptor is marked as first (FS bit of TDES1 is set), then the DMA marks the first transfer from the buffer as the start of frame. If a descriptor is marked as last (LS bit of TDES1), the DMA marks the last transfer from that data buffer as the end-of frame to the EMAC.

The receive DMA transfers data to a buffer until the buffer is full or the end-of frame is received from the MFL. If a descriptor is not marked as last (LS bit of RDES0), then the buffers of the descriptor are full. The amount of valid data in a buffer is its buffer size field minus the data buffer pointer offset, when the FS bit of that descriptor is set. The offset is zero when the data buffer pointer aligns to the data bus width. If a descriptor is marked as last, then the buffer cannot be full (as indicated by the buffer size in RDES1). To compute the amount of valid data in this final buffer, the driver must:

- Read the frame length (FL bits of RDES0 [29:16]), and
- Subtract the sum of the buffer sizes of the preceding buffers in the frame

The receive DMA always transfers the start of next frame with a new descriptor.

EMAC FIFO Layer (EMAC MFL)

The MAC FIFO layer provides FIFO memory to buffer and regulates the frames between the application system memory and the EMAC CORE. It also allows the transfer of data between the application clock domain and the

EMAC clock domains. The MFL layer has transfer controllers for each direction, called the transmit controller (TxFIFO) and the receive controller (RxFIFO). The datapath for both directions is 32-bit wide and each controller has a dedicated FIFO.

The EMAC0 transmit FIFO size is fixed to 2048 bytes. The EMAC0 receive FIFO size is fixed to 2048 bytes.

FIFO Layer Transmit Path

The DMA engine controls all transactions for the transmit path with the application. Ethernet frames read from the system memory are pushed into the FIFO by the DMA. The frame is then popped out and transferred to the EMAC CORE when triggered. When the end-of-frame transfers, the status of the transmission is taken from the EMAC CORE and transferred back to the DMA. The FIFO fill level is indicated to the DMA so that it can initiate a data fetch in required bursts from the system memory through the SCB interface.

When the DMA enables the `EMAC_DMA0_OPMODE.OSF` bit, the MFL receives the second frame into the FIFO while transmitting the first frame. When the first frame has transferred, the status is sent to DMA. If the DMA has already completed sending the second packet to the MFL, it waits for the status of the first packet before proceeding to the next frame.

The following are the modes of operation for FIFO transactions.

1. Threshold mode. When the number of bytes in the FIFO crosses the configured threshold level, the data is ready to be popped out and forwarded to the EMAC CORE. The data is also ready when the end-of-frame is written before the threshold is crossed. The DMA uses the `TTC` bits of the DMA bus mode register to configure the threshold level.
2. Store-and-Forward mode. In this mode, the MFL pops the frame towards the EMAC CORE after a complete frame is stored in the FIFO. If the TX FIFO size is smaller than the Ethernet frame for transmission (such as a jumbo frame), then the frame forwards in two cases. The TX FIFO is almost full or the requested FIFO does not have space to accommodate the requested burst-length. Therefore, the FIFO read controller never stalls in store-and-forward mode even if the Ethernet frame length is bigger than the TX FIFO depth.

The FIFO threshold in the store-and-forward mode is given by the following formula.

$\text{DataWidth} = 32 \text{ bits}$ and $\text{PBL} = \text{Burst Length}$ programmed through the `DMA_BUSMODE` register.

NOTE: To avoid occurrences of a TX underflow event when using the store-and-forward mode, or in other words, to ensure that the entire frame is stored in the FIFO before the MFL pops the frame towards the EMAC CORE for transmission, ensure that the FIFO threshold (calculated with the above formula) is greater than the packet size. The PBL needs to be programmed accordingly.

Transmit FIFO and Half-Duplex Retransmissions

While a frame transfers from the FIFO, a collision event can occur on the EMAC line interface in half-duplex mode. The EMAC then indicates a retry attempt to the MFL. The EMAC gives the status before the end-of-frame transfers from MFL. Then, the MFL enables the retransmission by popping out the frame again from the FIFO.

After more than 96 bytes pop out of FIFO, the FIFO controller frees up that space. The controller makes it available to the DMA to push in more data. Retransmission is not possible after this threshold is crossed or when the EMAC CORE indicates a late-collision event.

Transmit FIFO Flush Operation

The EMAC provides control to the software to flush the transmit FIFO in the MFL layer using the `EMAC_DMA0_OPMODE.FTF` bit. The flush operation is immediate. The MFL clears the transmit FIFO and the corresponding pointers to the initial state. It clears the FIFO and pointers even if it is in the middle of transferring a frame to the EMAC CORE. The data that the MAC transmitter has already accepted is not flushed. The data is scheduled for transmission and results in underflow. The transmit FIFO does not complete the transfer of the rest of the frame. As in all underflow conditions, a runt frame is transmitted and observed on the line. The status of the frame is marked with both underflow and frame flush events (TDES0 bits 13 and 1).

The MFL also stops accepting any data from the application (DMA) during the flush operation. The MFL generates and transfers transmit status words to the application for the number of frames flushed inside the MFL (including partial frames). Frames that completely flush in the MFL have the status bit for frame flush (TDES0 bit 13) set. The MFL completes the flush operation when the application (DMA) accepts all of the status words for the frames that flushed. The MFL then clears the transmit FIFO flush control register bit. The MFL starts accepting new frames from the application (DMA).

FIFO Layer Receive Path

The receive controller operates in the following sequence:

1. When the EMAC CORE receives a frame, it pushes in data with the frame start and end indicators. The MFL accepts the data and pushes it into the FIFO.
2. The receive controller takes the data out of the FIFO and sends it to the DMA.
 - Threshold mode (default). This mode is configured using `EMAC_DMA0_OPMODE.RTC`. When the FIFO receives 64 bytes or a full packet of data, the receive controller pops out the data and indicates its availability to the DMA. Some error frames cannot be dropped, because the error status is received at the end-of-frame. By this time, the start of that frame has already been read out of the FIFO.
 - Rx FIFO Store-and-Forward mode. This mode is configured using `EMAC_DMA0_OPMODE.RSF`. A frame is read out only after being written completely into the receive FIFO. In this mode, all error frames are dropped such that only valid frames are read out and forwarded to the application. Error frames are dropped when the EMAC CORE is configured for this feature.
3. After the end-of-frame transfers, the status word from the EMAC CORE is also the pushed FIFO. When the status of a partial frame due to overflow is given out, the frame length field in the status word is not valid.

Receive FIFO Multi-Frame Handling

Since the status is available immediately following the data, the MFL stores any number of frames into the FIFO, as long as it is not full.

Receive FIFO Error Handling

If the MFL Rx FIFO is full before it receives the end of frame data from the EMAC, the DMA declares an overflow condition. The whole frame (including the status word) drops. The overflow counter in the DMA (overflow counter-register) increments. This activity occurs even if the `EMAC_DMA0_OPMODE.FEF` bit is set. If the start address of such a frame has already transferred, the rest of the frame drops. A dummy end of frame is written to the FIFO along with the status word. The status indicates a partial frame due to overflow. In such frames, the frame length field is invalid.

The MFL receive control logic can filter error and undersized frames using the `EMAC_DMA0_OPMODE.FEF` and `EMAC_DMA0_OPMODE.FUF` bits. If the start address of the frame has already transferred to the Rx FIFO read controller, that frame is not filtered. The start address of the frame transfers to the read controller after the frame crosses the receive threshold (set by the `EMAC_DMA0_OPMODE.RTC` bits).

If the MFL receive FIFO is configured for store-and-forward mode, it can filter and drop all error frames.

EMAC CORE

The EMAC CORE is the lowest block in the EMAC peripheral and it performs all operations with the external world (PHY chip). It has independent transmit and receive modules. The modules interact with the EMAC FIFO layer at one end and interacts with the PHY chip through the RMII interface at the other end. Both modules have several subblocks which are discussed in subsequent sections.

Transmission is initiated when the MFL (FIFO layer) pushes in data with the start of frame. The CORE then transmits to the reduced media-independent interface. After the end of frame transfers out, the CORE gives the status of the transmission back to the MFL. The MFL forwards the transmission to the application through DMA.

A receive operation initiates when the EMAC detects an SFD on the RMII/RGMII. The CORE strips the preamble and SFD before proceeding to process the frame. The header fields are checked for the filtering and the FCS field used to verify the CRC for the frame. The frame drops in the core when it fails the address filter.

NOTE: The term *CORE* (written in capitals) refers to the internal block of Ethernet peripheral. Do not confuse the term with the *processor core*.

Table 24-29: EMAC CORE Related Registers

Register Name	Description
MAC Configuration ^{*1}	Establishes receive and transmit operating modes including: • Watchdog, Jabber, and Jumbo frame sizes • Inter Frame Gap • Speed Control – 10/100/1000 Mbps • Full or Half Duplex • Loopback Mode • Checksum Offload • Enabling Tx or Rx Engines

Table 24-29: EMAC CORE Related Registers (Continued)

Register Name	Description
MAC Frame Filter	Contains the filter controls for receiving frames. Some of the controls from this register go to the address check block of the MAC, which performs the first level of address filtering. The second level of filtering is performed on the incoming frame, based on other controls such as pass bad frames and pass control frames.
Hash Table High/Low ¹	A 64-bit hash table is used for group address filtering. For hash filtering, the contents of the destination address in the incoming frame passes through the CRC logic. The upper 6 bits of the CRC register index the contents of the hash table.
SMI Address ¹	Controls the management cycles to the external PHY through the Station Management interface. The register also includes a field to program the frequency of MDC.
SMI Data ¹	Stores write data for the PHY register at the address specified in SMI Address register. This register also stores read data from the PHY register at the address specified by SMI address register.
Flow Control ¹	Controls the generation and reception of the control (pause command) frames by the flow control module of the EMAC. The fields of the control frame are selected as specified in the 802.3x specification. The EMAC uses the pause time value from this register in the pause time field of the control frame. The host must make sure that the activate bit is cleared before writing to the register.
VLAN Tag ¹	Contains the IEEE 802.1Q VLAN tag to identify the VLAN frames. The MAC compares the 13th and 14th bytes of the receiving frame (length or type) with 16.h8100. The following 2 bytes are compared with the VLAN tag. If a match occurs, it sets the received VLAN bit in the receive frame status. The legal length of the frame increases from 1518 bytes to 1522 bytes.
Debug	Provides the status of all main modules of the transmit and receive datapaths and the FIFOs. An all-zero status indicates that the MAC core is in idle state (and FIFOs are empty) and no activity exists in the datapaths.
Interrupt Status	The contents of this register identify the events in the EMAC-CORE that can generate MMC and PTP-related interrupts.
Interrupt Mask	Enables the program to mask the interrupt signal because of the corresponding PTP event in the interrupt status register.
MAC Address0 High/Low ¹	Holds the upper or lower 16 bits of the MAC address of the station. The first DA byte that is received on the RMII interface corresponds to the LS byte (bits [7:0]) of the MAC address low register. For example, if 0x112233445566 is received (0x11 is the first byte) on the RMII as the destination address, then the macaddress0 register [47:0] is compared with 0x665544332211.
Operation Mode ¹	

*1 There must not be any further writes to these registers until the first write updates. Otherwise, the second write operation is not updated properly. For correct operation, the delay between two writes to the same register location must be at least 8 cycles of 50MHz RMII REFCLK.

NOTE: Refer to the “Register Description” section for the detailed bit-level explanation of the registers.

EMAC CORE Transmission Engine

The following modules constitute the transmission function (transmission engine components) of the EMAC:

- [Transmit Bus Interface Module \(TBU\)](#)
- [Transmit Frame Controller Module \(TFC\)](#)
- [Transmit Checksum Offload Engine \(TCOE\)](#)
- [Transmit Protocol Engine Module \(TPE\)](#)
- [Transmit Scheduler Module \(STX\)](#)
- [Transmit CRC Generator Module \(CTX\)](#)
- [Transmit Flow Control Module \(FTX\)](#)

Transmit Bus Interface Module (TBU)

This module interfaces the transmit path of the EMAC CORE with the MAC Layer FIFO interface. This module outputs the transmit status to the application at the end of normal transmission or collision.

Transmit Frame Controller Module (TFC)

The transmit frame controller regulates frames as well as converts the 32-bit input data into an 8-bit stream.

When the number of bytes received from the application falls below 60 (DA+SA+LT+DATA), the state machine automatically appends zeros to the transmitting frame. The state machine makes the data length exactly 46 bytes to meet the requirement for minimum data field of IEEE 802.3. The EMAC module can also be programmed to not append any padding.

The frame controller receives the computed CRC and appends it as the FCS field to the data transmitting out. When the EMAC is programmed to not append the CRC value to the end of Ethernet frames, the TFC module ignores the computed CRC. However, when the EMAC is programmed to append pads for frames (DA+SA+LT+DATA) less than 60 bytes, then the CRC is always appended at the end of padded frame.

Transmit Checksum Offload Engine (TCOE)

Communication protocols such as TCP and UDP implement checksum fields, which help determine the integrity of data transmitted over a network. The most widespread use of Ethernet is to encapsulate TCP and UDP over IP datagrams. Therefore, the EMAC has a checksum offload engine (COE) to support checksum calculation and insertion in the transmit path, and error detection in the receive path.

NOTE: The checksum for TCP, UDP, or ICMP is calculated over a complete frame, and then inserted into its corresponding header field. Because of this requirement, this function is enabled only when the transmit FIFO configuration is for store-and-forward mode. (The `EMAC_DMA0_OPMODE.TSF` bit is set.) If the MAC configuration is for threshold (cut-through) mode, the transmit COE is bypassed.

NOTE: Programs must make sure that the transmit FIFO is deep enough to store a complete frame before that frame transfers to the EMAC CORE transmitter. The program must enable the checksum insertion only in the frames that are less than the following number of bytes in size (even in the store-and-forward mode):

FIFO depth – PBL – 3 FIFO locations, where PBL is the programmed burst-length in the DMA bus mode register.

IP Header Checksum

In IPv4 datagrams, the 16-bit header checksum field indicates the integrity of the header fields (bytes 11 and 12 of the IPv4 datagram). The COE detects an IPv4 datagram when the Ethernet type field of the frame has the value 0x0800 and the version field of the IP datagram has the value 0x4. The checksum field of the input frame is ignored during calculation and replaced with the calculated value.

The IP header error status bit in transmit descriptor word TDES0 indicates the result of this IP header checksum calculation. The status bit is set whenever the values of the Ethernet type field and the IP header version field are not consistent. Or, the status bit is set when the Ethernet frame does not have enough data, as indicated by the IP header length field. In other words, this bit is set when an IP header error is asserted under the following circumstances.

For IPv4 datagrams:

- The received Ethernet type is 0x0800, but the version field of the IP header is not equal to 0x4.
- The IPv4 header length field indicates a value less than 0x5 (20 bytes).
- The total frame length is less than the value given in the IPv4 header length field.

For IPv6 datagrams:

- The Ethernet type is 0x86dd but the IP header version field is not equal to 0x6.
- The frame ends before the IPv6 header (40 bytes) or extension header (as given in the corresponding header length field in an extension header) is received.

If the COE detects an IP header error, it still inserts an IPv4 header checksum if the Ethernet type field indicates an IPv4 payload.

NOTE: IPv6 headers do not have a checksum field. Therefore, the COE does not modify the IPv6 header fields.

TCP/UDP/ICMP Checksum

The TCP/UDP/ICMP checksum engine processes the IPv4 or IPv6 header (including extension headers) and determines whether the encapsulated payload is TCP, UDP, or ICMP.

NOTE: See IETF specifications RFC 791, RFC 793, RFC 768, RFC 792, RFC 2460, and RFC 4443 for IPv4, TCP, UDP, ICMP, IPv6, and ICMPv6 packet header specifications, respectively.

NOTE: For non-TCP/UDP/ICMP/ICMPv6 payloads, this checksum engine is bypassed and nothing further is modified in the frame.

NOTE: For ICMP-over-IPv4 packets, the checksum field in the ICMP packet must always be 0x0000 in both modes, because pseudo-headers are not defined for such packets. If it does not equal 0x0000, an incorrect checksum can be inserted into the packet.

NOTE: This engine does not process fragmented IP frames (IPv4 or IPv6), IP frames with security features (such as an encapsulated security payload), and IPv6 frames with routing headers. The checksum engine bypasses the checksum insertion for such frames even if the checksum insertion is enabled.

The checksum is calculated for the TCP, UDP, or ICMP payload and inserted into its corresponding field in the header. This engine can work in the following two ways.

- The TCP, UDP, or ICMPv6 pseudo-header is not included in the checksum calculation and is assumed to be present in the checksum field of the input frame. This engine includes the checksum field in the checksum calculation, and then replaces the checksum field with the final calculated checksum.
- The engine ignores the checksum field, includes the TCP, UDP, or ICMPv6 pseudo-header data into the checksum calculation, and overwrites the checksum field with the final calculated value.

The status bit for the payload checksum error in the transmit descriptor word TDES0 indicates the result of this operation. The checksum engine sets the status bit for the payload checksum error when:

- The checksum engine detects that the frame has been forwarded to the MAC transmitter engine in the store-and-forward mode, *and*
- The end of frame (EOF) has not been written to the FIFO, *or*
- The packet ends before the number of bytes indicated by the payload length field in the IP header is received.

When the packet is longer than the indicated payload length, the COE ignores them as stuff bytes, and no error is reported. When the engine detects the first type of error, it does not modify the TCP, UDP, or ICMP header. For the second error type, it still inserts the calculated checksum into the corresponding header field.

Transmit checksum offloading is enabled by setting the CIC bits [23:22] of TDES0 word in the transmit descriptor.

Transmit Protocol Engine Module (TPE)

The transmit protocol engine consists of a state-machine that controls the protocol-level operation of Ethernet frame transmission. The module performs the following functions to meet the IEEE 802.3 specifications.

- Generates preamble and SFD
- Generates carrier extension in half-duplex mode (only in RGMII mode)
- Supports frame bursting in half-duplex mode (only in RGMII mode)
- Generates jam pattern in half-duplex mode
- Contains time stamp snapshot logic for IEEE 1588 support
- Jabber timeout
- Flow control for half-duplex mode (back pressure)
- Generates transmit frame status

When a new frame transmission is requested, the protocol engine sends out the preamble and SFD, followed by the data received. The preamble is defined as 7 bytes of 10101010 pattern. The SFD is defined as 1 byte of 10101011 pattern.

The collision window is defined as 1 slot time (512-bit times for 10/100 Mbps and 4096 bit times for 1000 Mbps). The jam pattern generation is applicable only to half-duplex mode, not to full-duplex mode. A collision can occur any time from the beginning of the frame to the end of the CRC field. When a collision happens, the state machine sends a 32-bit jam pattern of 0x55555555 on the RMII/RGMII. The pattern informs all other stations that a collision has occurred. If the collision happens during the preamble transmission phase, it completes the transmission of preamble and SFD and then sends the jam pattern. If the collision occurs after the collision window and before the end of the FCS field, it sends a 32-bit jam pattern. It also sets the late collision bit in the transmit frame status.

In RGMII half-duplex mode (1,000 Mbps), the transmit state machine ensures that all valid carrier events exceed a slot time of 4,096 bit times. To accomplish this, any transmit frame shorter than 512 bytes from the TFC module is extended using a carrier extension. This is signaled to the PHY using RGMII_TXCTL pin and sending 0x00 through RGMII_TXD.

The module maintains a jabber timer to cut off the transmission of Ethernet frames when the TFC module transfers more than 2,048 (default) bytes. The timeout changes to 10,240 bytes when the jumbo frame is enabled.

The transmit state machine uses the deferral mechanism for the flow control (back pressure) in half-duplex mode. When the application asks to stop receiving frames, the module sends a jam pattern of 32 bytes. It sends the pattern whenever it senses a reception of a frame. Transmit flow control must be enabled. This activity results in a collision and the remote station backs off.

The application can request a flow control signal by setting the EMAC_FLOWCTL.FCBBPA bit. If the application requests a frame transmission, then it is scheduled and transmitted even when the back pressure is activated. If the back pressure is activated for a long time, then the remote stations abort their transmissions due to excessive collisions. (For example, a long time is when more than 16 consecutive collision events occur.)

If PTP time stamping is enabled for the transmit frame, this block takes a snapshot of the PTP system time when the SFD is put onto the transmit bus.

Transmit Scheduler Module (STX)

The transmit scheduler is responsible for scheduling the frame transmission on the RMII RGMII/MII. The two major functions of this module are:

- Maintain the inter-frame gap between two transmitted frames.
- Follow the truncated binary exponential back-off algorithm for half-duplex mode.

The scheduler maintains an idle period of the configured inter-frame gap (EMAC_MACCFG.IFG bits) between any two transmitted frames. The scheduler starts its IFG counter when the carrier signal of the reduced media-independent interface goes inactive. In half-duplex mode and when IFG is configured for 96-bit times, the scheduler follows the rule of deference specified in Section 4.2.3.2.1 of the IEEE 802.3 specification. The module resets its IFG counter when a carrier is detected during the first two-thirds (64-bit times for all IFG values) of the IFG interval. If the

carrier is detected during the final one third of the IFG interval, the scheduler continues the IFG count and enables the transmitter after the IFG interval.

Transmit CRC Generator Module (CTX)

The transmit CRC generator module generates the CRC for the FCS field of the Ethernet frame (DA + SA + LT + DATA + PAD).

This module calculates the 32-bit CRC for the FCS field of the Ethernet frame. The following polynomial defines the encoding:

$$G(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x + 1.$$

Transmit Flow Control Module (FTX)

The transmit flow control module generates pause frames and transmits them to the frame controller as necessary, in full-duplex mode. The application can request the flow control module to send a pause frame by setting the `EMAC_FLOWCTL.FCBBPA` bit.

If the application has requested flow control, the flow control module generates and transmits a single pause frame. The value of the pause time in the generated frame contains the programmed pause time value configured using the `EMAC_FLOWCTL.PT` bit. The module can extend the pause or end the pause prior to the time specified in the previously transmitted pause frame. To change the pause, the application must request another pause frame transmission after programming the `EMAC_FLOWCTL.PT` bit with an appropriate value.

If the flow control signal goes inactive prior to the sampling time, the flow control module transmits a pause frame with zero pause time. This event indicates to the remote end that the receive buffer is ready to receive new data frames.

Source Address, VLAN, and CRC Insertion, Replacement, or Deletion

The MAC supports the following functions for transmit frames:

- Source address insertion or replacement
- VLAN insertion, replacement, or deletion
- CRC replacement

Source Address Insertion or Replacement

The software can use the SA insertion or replacement feature to instruct the MAC to do the following for transmit frames:

- Insert the content of the MAC address registers in the SA field.
- Replace the content of the SA field with the content of the MAC address registers.

The software can enable the SA insertion or replacement feature for all transmit frames or selective frames.

- To enable SA insertion or replacement feature for all frames, program bits[30:28] of the MAC Configuration register.

- To enable the SA insertion or replacement feature for selective frames, program the SA insertion control field (TDES1 Bits [31:29]) in the first transmit descriptor of the frame. When bit 31 of TDES1 is set, the SA insertion control field indicates insertion or replacement by MAC address1 registers. When bit 31 of TDES1 is reset, it indicates insertion or replacement by MAC address 0 registers. If MAC address1 registers are not enabled, then EMAC uses MAC address0 registers for insertion or replacement. The choice is not based on the value of the most significant bit of the SA insertion control field.

When SA insertion is enabled, the application ensures that the frames sent to the MAC do not have the SA field. This functionality is because the MAC does not check the presence of SA field in the transmit frame. MAC inserts the content of the MAC address registers in the SA field. Similarly, when SA replacement is enabled, the application ensures that frames sent to the MAC have the SA field. The MAC replaces the 6 bytes, following the destination address field in the transmit frame, with the content of the MAC address registers.

VLAN Insertion, Replacement, or Deletion

The software can use the VLAN insertion, replacement, or deletion feature to instruct the MAC to do the following for transmit frames:

- Insert or replace the VLAN type field (C-VLAN or S-VLAN indicated by bit 19 (CSVL) of VLAN tag inclusion or replacement register and VLAN tag field in the transmit frame with bit [15:0], VLT, of VLAN tag inclusion or replacement register.
- Delete the VLAN type and VLAN tag fields in transmit frame.

The software can enable the VLAN insertion, replacement, or deletion feature for all transmit frames or selective frames. To enable this function for all transmit frames, program Bits[17:16] of the VLAN Tag Inclusion or Replacement register. To enable this function for selective, program the VLAN insertion control field (TDES0 Bits [19:18]) in the first transmit descriptor of the frame. When VLAN replacement or deletion is enabled, the MAC checks the presence of the VLAN type field (0x8100 or 0x88a8), after the Destination Address (DA) and SA fields, in the transmit frame. The replace or delete operation does not occur when the VLAN type field is not detected in the 2 bytes following the DA and SA fields. However, when VLAN insertion is enabled, the MAC does not check the presence of VLAN type field in the transmit frame. MAC inserts the VLAN type and VLAN tag fields.

CRC Replacement

The software can use the CRC replacement feature to instruct the MAC to replace the FCS field in the transmit frame with the CRC computed by the MAC. This feature works on per-frame basis. To enable the CRC replacement feature, program the CRC replacement control field (bit 24 of transmit descriptor word 0 (TDES0)) in the first transmit descriptor of the frame.

NOTE: This feature is valid only when disable CRC control (bit 27 in TDES0) is enabled. The software provides the FCS field in the transmit frame. If SA or VLAN insertion control is enabled, the MAC appends or replaces the FCS field with the computed CRC when Disable CRC Control is enabled or disabled, respectively.

The *CRC Replacement* table shows how CRC replacement is performed based on the values of bit 27 (DC) and bit 24 (CRCR) of transmit descriptor word 0 (TDES0).

Table 24-30: CRC Replacement

DC	CRCR	Description
0	x	Append CRC. When DC = 0, the MAC appends the computed CRC irrespective of the CRCR setting.
1		Replace CRC
1	0	No operation (User has appended the CRC)

Source Address Filtering

The *Source Address Filtering* table provides filtering possibilities for the source address using the EMAC AFM module. The MAC receive frame filter register ([EMAC_MACFRMFILT](#)) contains these bits.

Table 24-31: Source Address Filtering

Frame Type	SA Filter Operation			Result
	PR	SAIF	SAF	
Unicast	1	X	X	Pass all frames
	0	0	0	Pass on perfect or group filter match but do not drop failing frames
	0	1	0	Fail on perfect or group filter match but do not drop frame
	0	0	1	Pass on perfect or group filter match and drop failing frames
	0	1	1	Fail on perfect or group filter match and drop failing frames

EMAC CORE Reception Engine

The following are the functional blocks (reception engine components) in the receive path of the EMAC core.

- [Receive Protocol Engine Module \(RPE\)](#)
- [Receive CRC Module \(CRX\)](#)
- [Receive Frame Controller Module \(RFC\)](#)
- [Receive Flow Control Module \(FRX\)](#)
- [Receive Checksum Offload Engine \(RCOE\)](#)
- [Receive Bus Interface Unit Module \(RBU\)](#)
- [Address Filtering Module \(AFM\)](#)

Receive Protocol Engine Module (RPE)

The receive protocol engine is a state-machine that strips the preamble, SFD, and carrier extension (in 1000 Mbps half-duplex mode) of the received frame. Once the receive data valid signal ([ETH0_CRS](#)) signal of RMII or RXCTL

signal of RGMII becomes active, the protocol engine begins hunting for the SFD field from the receive modifier logic. Until then, the state machine drops the receiving preambles. Once the SFD is detected, it begins sending the data of the Ethernet frame to the frame controller, beginning with the first byte following the SFD (destination address).

NOTE: According to the IEEE 802.3 Ethernet specifications, the EMAC receiver does not need to look or check for the preamble pattern. It has to wait only for the SFD pattern to identify the start of a frame. Then the EMAC receiver accepts a frame even when no preamble is received before the SFD pattern.

If PTP time stamping is enabled, the RPE takes a snapshot of the PTP system time when detecting any SFD of the frame on the reduced media-independent interface. Unless the MAC filters out and drops the frame, this time stamp passes on to the application

The protocol engine also decodes the length or type field of the receiving Ethernet frame. The state machine sends the data of the frame up to the count specified in the length or type field if these conditions are met:

- The length or type field is less than 0x600
- The MAC is programmed for the auto CRC or PAD stripping option

It then starts dropping bytes (including the FCS field).

If the length or type field is greater than or equal to 0x600, the protocol engine sends all received Ethernet frame data to the frame controller. The transfer does not depend on the value of the programmed auto-CRC strip option.

The EMAC is programmed with the watchdog timer enabled (default setting). In this configuration, frames above 2,048 (10,240 if jumbo frame is enabled) bytes (DA + SA + LT + DATA + PAD + FCS) are cut off at the protocol engine. Set the `EMAC_MACCFG.WD` bit to disable this feature. However, even when the watchdog timer is disabled, frames greater than 16 KB are cut off and a watchdog timeout status is issued.

The EMAC supports loopback of transmitted frames onto its receiver. By default, the EMAC loopback function is disabled. Set the `EMAC_MACCFG.LM` bit to enable the function.

At the end of every received frame, the protocol engine generates received frame status and sends it to the frame controller. Control, missed frame, and filter fail status are added to the receive status in the frame controller.

Receive CRC Module (CRX)

The receive CRC module checks for any CRC errors in the receiving frame.

This module calculates the 32-bit CRC for the received frame that includes the destination address field through the FCS field (DA+SA+LT+DATA+PAD+FCS). The following generating polynomial defines the encoding.

$$G(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x + 1$$

Irrespective of the auto pad or CRC strip, the CRC module receives the entire frame to compute the CRC check for received frame.

Receive Frame Controller Module (RFC)

The main functions of the frame controller are:

- Converting the 8-bit stream data to 32-bit data
- Frame filtering
- Attaching the calculated IP checksum
- Updating the receive status

If the `EMAC_MACFRMFILT.RA` bit is set, the RFC module initiates the data transfer as soon as possible. At the end of the data transfer, the frame controller sends out the received frame status that includes the address filtering pass or fail status.

If the `EMAC_MACFRMFILT.RA` bit is reset, the frame controller performs frame filtering based on the destination or source address. (The application still must perform another level of filtering if it decides not to receive any bad frames like runt, CRC error frames, for example.) After receiving the destination or source address bytes, the frame controller checks the filter-fail signal from the AFM module for an address match. On detecting a filter-fail from AFM, the frame is dropped and not transferred to the application.

Receive Flow Control Module (FRX)

The receive flow controller detects the receiving pause frame and pauses the frame transmission for the delay specified within the received pause frame. The flow controller is enabled only in full-duplex mode. The EMAC uses the `EMAC_FLOWCTL.RFE` bit to enable or disable the function for pause frame detection.

Once the receive flow control is enabled, the flow controller begins monitoring the received frame destination address for any match with the multicast address of the control frame (0x0180C2000001). If a match is detected, it indicates to the frame controller, that the destination address of the received frame matches the reserved control frame destination address. The RFC module then decides whether to transfer the received control frame to the application, based on the `EMAC_MACFRMFILT.PCF` bit setting.

The receive flow controller also decodes the type, opcode, and pause timer field of the receiving control frame. The flow controller requests the MAC transmitter pause the transmission of any data frame.

- If the byte count of the frame status indicates 64 bytes, *and*
- If there is no CRC error

The transmission is paused for the decoded pause time value, multiplied by the slot time (64-byte times). Meanwhile, if another pause frame is detected with a zero pause time value, the module resets the pause time and gives another pause request to the transmitter. The module does not generate a pause request to the transmitter:

- If the received control frame does not match the type field (0x8808), opcode (0x00001), or byte length (64 bytes), *or*
- If there is a CRC error

For a pause frame with a multicast destination address, the frame controller filters the frame based on the address match from the flow controller. For a pause frame with a unicast destination address, the filtering in the FRX module depends on:

- If the destination address matched the contents of the MAC address register 0 (`EMAC_ADDR0_HI` or `EMAC_ADDR0_LO`), *and*
- If the `EMAC_FLOWCTL.UP` bit is set

The module detects a pause frame even with a unicast destination address. The EMAC uses the `EMAC_MACFRMFILT.PCF` bits to control the filtering for control frames in addition to the address filter module.

Receive Checksum Offload Engine (RCOE)

When checksum offloading is enabled, both IPv4 and IPv6 frames in the received Ethernet frames are detected and processed for data integrity. Programs can enable this module by setting the `EMAC_MACCFG.IPC` bit. The EMAC receiver identifies IPv4 or IPv6 frames by checking for value 0x0800 or 0x86DD, respectively, in the received Ethernet type field of frames. This identification applies to VLAN-tagged frames as well. *Extended descriptor mode (8 x32-bit words) must be enabled to get the IPC checksum engine status in RDES4.* To check status, poll bit 0 of RDES0 word of receive descriptor. Then, if this bit is set, parse bits [7:0] of RDES4 word.

The receive checksum offload engine calculates IPv4 header checksums and checks if they match the received IPv4 header checksums. The IP header error bit is set for any mismatch between the indicated payload type (Ethernet type field) and the IP header version. The IP header error bit is also set when the received frame does not have enough bytes, as indicated by the length field of the IPv4 header. (The bit is set when fewer than 20 bytes are available in an IPv4 or IPv6 header).

This engine also identifies a TCP, UDP, or ICMP payload in the received IP datagrams (IPv4 or IPv6). The engine calculates the checksum of such payloads properly, as defined in the TCP, UDP, or ICMP specifications. This engine includes the TCP/UDP/ICMPv6 pseudo-header bytes for checksum calculation and checks whether the received checksum field matches the calculated value. The result of this operation appears as a payload checksum error bit in the receive status word. This status bit is also set if the length of the TCP, UDP, or ICMP payload does not tally to the expected payload length given in the IP header.

NOTE: The COE engine bypasses the payload of fragmented IP datagrams, IP datagrams with security features, IPv6 routing headers, and payloads other than TCP, UDP, or ICMP. This information is given in the receive status(whether the checksum engine is bypassed or not).

The *Checksum Error Status* table shows bit combination in receive descriptors (frame status with full checksum offload engine enabled and advanced timestamps not enabled).

Table 24-32: Checksum Error Status

IEEE802.3 Frame: bit 5 of RDES0	Header Checksum Error (HCE): bit 3 of RDES4	Payload Checksum Error (PCE): bit 4 of RDES4	Frame Status
0	0	0	The frame is an IEEE 802.3 frame (length field value is less than 0x0600).
1	0	0	IPv4/IPv6 type frame in which no checksum error is detected.

Table 24-32: Checksum Error Status (Continued)

IEEE802.3 Frame: bit 5 of RDES0	Header Checksum Error (HCE): bit 3 of RDES4	Payload Checksum Error (PCE): bit 4 of RDES4	Frame Status
1	0	1	IPv4/IPv6 type frame in which a payload checksum error (as described for PCE) is detected
1	1	0	IPv4/IPv6 type frame in which IP header checksum error (as described for IPC HCE) is detected.
1	1	1	IPv4/IPv6 type frame in which both PCE and IPC HCE is detected.
0	0	1	IPv4/IPv6 type frame in which there is no IP HCE and the payload check is bypassed due to unsupported payload.
0	1	1	Type frame which is neither IPv4 or IPv6 (COE bypasses the checksum check completely)
0	1	0	Reserved

Receive Bus Interface Unit Module (RBU)

The receive bus interface unit (RBU) constructs the 32-bit data received from the frame controller into a 32-bit FIFO-based protocol.

Address Filtering Module (AFM)

The address filtering (AFM) module performs the destination checking function on all received frames and reports the address filtering status to the frame controller. The address checking is based on different parameters (frame filter register, `EMAC_MACFRMFILT`) chosen by the application. These parameters are inputs to the AFM module as control signals. The AFM module reports the status of the address filtering based on the combination of these inputs. The AFM module also reports whether the receiving frame is a multicast frame or a broadcast frame, as well as the address filter status. The AFM module uses the physical (MAC) address of the station and the multicast hash table for address checking.

- **Hash or Perfect Address Filter.** The destination address filter can be configured to pass a frame when its destination address matches either the hash filter or the perfect filter. Set the `EMAC_MACFRMFILT.HPF` bit, the corresponding `EMAC_MACFRMFILT.HUC`, or `EMAC_MACFRMFILT.HMC` bits. This configuration applies to both unicast and multicast frames. If the `EMAC_MACFRMFILT.HPF` bit is reset, only one of the filters (hash or perfect) is applied to the received frame.

NOTE: Hash filtering is not perfect filtering because a 48-bit MAC address is reduced to a 6-bit hash value. So, there can be instances where more than one address has the same hash value.

- **Unicast Destination Address Filter.**
 - The AFM supports one MAC address two MAC addresses for unicast perfect filtering. If perfect filtering is selected, the AFM compares all 48 bits of the received unicast address with the programmed MAC address for any match. (The `EMAC_MACFRMFILT.HUC` bit is reset for perfect filtering).

- In hash filtering mode, the AFM performs imperfect filtering for unicast addresses using a 64-bit hash table. (The `EMAC_MACFRMFILT.HUC` bit is set in hash filtering mode.) For hash filtering, the AFM uses the upper 6-bit CRC of the received destination address to index the content of the hash table. A value of 000000 selects bit 0 of the selected register, and a value of 111111 selects bit 63 of the hash table register. If the corresponding bit (indicated by the 6-bit CRC) is set to 1, the unicast frame has passed the hash filter. Otherwise, the frame has failed the hash filter.
- **Multicast Destination Address Filter.**
 - Program the EMAC to pass all multicast frames by setting the `EMAC_MACFRMFILT.PM` bit. If the `EMAC_MACFRMFILT.PM` bit is reset, the AFM filters multicast addresses based on the `EMAC_MACFRMFILT.HMC` bit. In perfect filtering mode, the multicast address is compared with the programmed MAC destination address register. The EMAC also supports group address filtering.
 - In hash filtering mode, the AFM performs imperfect filtering using a 64-bit hash table. For hash filtering, the AFM uses the upper 6-bit CRC of the received multicast address to index the content of the hash table. A value of 000000 selects bit 0 of the selected register and a value of 111111 selects bit 63 of the hash table register. If the corresponding bit is set to 1, then the multicast frame has passed the hash filter. Otherwise, the frame has failed the hash filter.
- **Broadcast Address Filter.** The AFM does not filter any broadcast frames in the default mode. However, if the EMAC is programmed to reject all broadcast frames by setting the `EMAC_MACFRMFILT.DBF` bit, the AFM asserts the filter fail signal, whenever a broadcast frame is received.
- **Unicast Source Address Filter.** EMAC can also perform a perfect filtering, based on the source address field of the received frames. By default, the AFM compares the SA field with the values programmed in the SA registers. The MAC address register 1 can be configured to contain SA instead of DA for comparison, by setting bit 30 of the corresponding register. Group filtering with SA is also supported. User can filter a group of addresses by masking one or more bytes of the address. The frames that fail the SA filter are dropped by the MAC if the `EMAC_MACFRMFILT.SAF` bit is set. When the bit is set, the result of SA filter and DA filter is AND'ed to decide whether the frame needs to be forwarded. This means that either of the filter fail result drops the frame and both filters have to pass in order to forward the frame to the application.
- **Inverse Filtering Operation.** There is an option to invert the filter-match result at the final output. The EMAC uses the `EMAC_MACFRMFILT.DAIF` bit to control this operation. The function of this bit applies to both unicast and multicast DA frames. The result of the unicast or multicast destination address filter is inverted in this mode.
- **Inverse Filtering Operation.** For both destination and source address filtering, there is an option to invert the filter-match result at the final output. This is controlled by the `EMAC_MACFRMFILT.DAIF` or `EMAC_MACFRMFILT.SAIF` bits. The `EMAC_MACFRMFILT.DAIF` bit is applicable for both unicast and multicast DA frames. The result of the unicast /multicast destination address filter is inverted in this mode. Similarly, when the `EMAC_MACFRMFILT.SAIF` bit is set, the result of unicast source address filter is reversed.

- **Inverse Filtering Operation.** There is an option to invert the filter-match result at the final output. The EMAC uses the `EMAC_MACFRMFILT.DAIF` bit to control this operation. The function of this bit applies to both unicast and multicast DA frames. The result of the unicast or multicast destination address filter is inverted in this mode.

Destination Address Filtering

The *Destination Address Filtering* table provides filtering possibilities for the destination address using the EMAC AFM module. The MAC receive frame filter register (`EMAC_MACFRMFILT`) contains these bits.

Table 24-33: Destination Address Filtering

Frame Type	Bit Setting (0 = Cleared, 1 = Set, X = Do-not-care)							DA Filter Operation
	PR	HPF	HUC	HMC	DAIF	PM	DBF	
Broadcast	1	X	X	X	X	X	X	Pass
	0	X	X	X	X	X	0	Pass
	0	X	X	X	X	X	1	Fail
Unicast	1	X	X	X	X	X	X	Pass all frames
	0	X	0	X	0	X	X	Pass on perfect or group filter match
	0	X	0	X	1	X	X	Fail on perfect or group filter match
	0	0	1	X	0	X	X	Pass on hash filter match
	0	0	1	X	1	X	X	Fail on hash filter match
	0	1	1	X	0	X	X	Pass on hash or perfect or group filter match
	0	1	1	X	1	X	X	Fail on hash or perfect or group filter match
Multicast	1	X	X	X	X	X	X	Pass all frames
	X	X	X	X	X	1	X	Pass all frames
	0	X	X	0	0	0	X	Pass on perfect or group filter match and drop PAUSE control frames if PCF = 0x
	0	0	X	1	0	0	X	Pass on hash filter match and drop PAUSE control frames if PCF = 0x
	0	1	X	1	0	0	X	Pass on hash or perfect or group filter match and drop PAUSE control frames if PCF = 0x

Table 24-33: Destination Address Filtering (Continued)

Frame Type	Bit Setting (0 = Cleared, 1 = Set, X = Do-not-care)							DA Filter Operation
	PR	HPF	HUC	HMC	DAIF	PM	DBF	
	0	X	X	0	1	0	X	Fail on perfect or group filter match and drop PAUSE control frames if PCF = 0x
	0	0	X	1	1	0	X	Fail on hash filter match and drop PAUSE control frames if PCF = 0x
	0	1	X	1	1	0	X	Fail on hash or perfect or group filter match and drop PAUSE control frames if PCF = 0x

Source Address Filtering

The *Source Address Filtering* table provides filtering possibilities for the source address using the EMAC AFM module. The MAC receive frame filter register ([EMAC_MACFRMFILT](#)) contains these bits.

Table 24-34: Source Address Filtering

Frame Type	SA Filter Operation			Result
	PR	SAIF	SAF	
Unicast	1	X	X	Pass all frames
	0	0	0	Pass on perfect or group filter match but do not drop failing frames
	0	1	0	Fail on perfect or group filter match but do not drop frame
	0	0	1	Pass on perfect or group filter match and drop failing frames
	0	1	1	Fail on perfect or group filter match and drop failing frames

VLAN Tag Based Filtering

EMAC0 supports VLAN tag perfect filtering and VLAN tag hash filtering.

VLAN Tag Perfect Filtering

In VLAN tag perfect filtering, the MAC compares the VLAN tag of the received frame and provides the VLAN frame status to the application. Based on the programmed mode, the MAC compares the lower 12 bits or all 16 bits of the received VLAN tag to determine the perfect match. If VLAN tag perfect filtering is enabled, the MAC forwards the VLAN-tagged frames along with VLAN tag match status. It drops the VLAN frames that do not match. Inverse matching for VLAN frames can be enabled using the `EMAC_VLANTAG.VTIM` bit. In addition, matching of S-VLAN tagged frames along with the default C-VLAN tagged frames can be enabled using `EMAC_VLANTAG.ESVL` bit. The VLAN frame status bit (Bit 10 of `RDES0`) indicates the VLAN tag match status for the matched frames.

NOTE: The source or destination address (if enabled) has precedence over the VLAN tag filters. A frame which fails the source or destination address filter is dropped irrespective of the VLAN tag filter results. By default, the VLAN tag-based perfect filter is available in all configurations.

VLAN Tag Hash Filtering

The MAC provides VLAN tag hash filtering with a 16-bit hash table. The MAC performs the VLAN hash matching based on the `EMAC_VLANTAG.VTHM` bit setting. If the `EMAC_VLANTAG.VTHM` bit is set, the most significant 4 bits of VLAN tag's CRC-32 are used to index the content of the VLAN hash table register (`EMAC_VLAN_HSHTBL`). A value of 1 in the `EMAC_VLAN_HSHTBL` register, corresponding to the index, indicates that the VLAN tag of the frame matched and the packet is forwarded. A value of 0 indicates that VLAN-tagged frame is dropped.

The MAC also supports the inverse matching of the VLAN frames. In the inverse matching mode, when the VLAN tag of a frame matches the perfect or hash filter, the packet is dropped. If the VLAN perfect and VLAN hash match are enabled, a frame matches if either the VLAN hash or the VLAN perfect filter matches. When inverse match is set, a packet is forwarded only when both perfect and hash filters indicate mismatch. The *VLAN Matching and Final VLAN Match Status* table shows the possibilities for VLAN matching and the final VLAN match status. When the `EMAC_MACFRMFILT.RA` bit is set, all frames are received and the VLAN match status is indicated in bit 10 of receive descriptor word 0 (RDES0). When the `EMAC_MACFRMFILT.RA` bit is not set and the `EMAC_MACFRMFILT.VTFE` bit register is set, the frame is dropped when the final VLAN match status is fail.

When VLAN VID is programmed to 0 in the `EMAC_VLANTAG.VL` bit field, all VLAN-tagged frames are perfect matches. But the status of the VLAN hash match depends on the VLAN hash enable bit and VLAN inverse filter bit. The *VLAN Matching and Final VLAN Match Status* table shows the possibilities for VLAN matching and the final VLAN match status.

Table 24-35: VLAN Matching and Final VLAN Match Status

VID	VLAN Perfect Filter Match Status (VPF)	VLAN Hash Enable Bit	VLAN Hash filter Match Status (VTHMS)	VLAN Inverse Filter Bit (VTIM)	Final VLAN Match Status
VID=0	Pass	0	X	X	Pass
	Pass	1	X	0	Pass
	Pass	1	Fail	1	Pass
	Pass	1	Pass	1	Fail
VID!=0	Pass	X	X	0	Pass
	Fail	0	X	0	Fail
	Fail	1	Fail	0	Fail
	Fail	1	Pass	0	Pass
	Fail	0	X	1	Pass
	Pass	X	X	1	Fail

Table 24-35: VLAN Matching and Final VLAN Match Status (Continued)

VID	VLAN Perfect Filter Match Status (VPF)	VLAN Hash Enable Bit	VLAN Hash filter Match Status (VTHMS)	VLAN Inverse Filter Bit (VTIM)	Final VLAN Match Status
	Fail	1	Pass	1	Fail
	Fail	1	Fail	1	Pass

Layer 3 and Layer 4 Frame Filtering

The MAC supports Layer 3 and Layer 4 based frame filtering. The Layer 3 filtering refers to the IP source or destination address filtering in the IPv4 or IPv6 frames whereas Layer 4 filtering refers to the source or destination port number filtering in TCP or UDP. The Layer 3 and Layer 4 frame filtering feature automatically enables the IPC full checksum offload engine on the receive side.

When Layer 3 and Layer 4 filtering is enabled, the frames are filtered in the following way:

Matched Frames. The MAC forwards the frames, which match all enabled fields, to the application along with the status. The MAC gives the matched field status only if the `EMAC_MACCFG . IPC` bit is set. The MAC forwards the frames, which match all enabled fields, to the application along with the status.

NOTE: The source or destination address and VLAN tag filters (if enabled) have precedence over Layer 3 and Layer 4 filtering. This means that a frame which fails the source or destination address or VLAN tag filter is dropped irrespective of the Layer 3 and Layer 4 filter results.

Unmatched Frames. The MAC drops the frames that do not match any of the enabled fields. You can use the inverse match feature to block or drop a frame with specific TCP or UDP over IP fields and forward all other frames. If the Rx FIFO operates in the threshold mode and threshold is programmed to a small value, such that frame transfer to application starts before the failed Layer 3 and Layer 4 filter results are available, a partial frame with appropriate abort status may be received by the application.

Non-TCP or UDP IP Frames. By default, all non-TCP or UDP IP frames are bypassed from the Layer 3 and Layer 4 filters. You can optionally program the MAC to drop all non-TCP or UDP over IP frames.

Layer 3 and Layer 4 Filters Register Set

The MAC implements a set of registers for Layer 3 and Layer 4 based frame filtering. In a register set, there is a control register, such as the `EMAC_L3L4_CTL` register (Layer 3 and Layer 4 control register), to control the frame filtering. In addition, there are five address registers to program the Layer 3 and Layer 4 fields to be matched, which are:

- `EMAC_L4_ADDR` (Layer 4 Address Register)
- `EMAC_L3_ADDR0` (Layer 3 Address 0 Register)
- `EMAC_L3_ADDR1` (Layer 3 Address 1 Register)
- `EMAC_L3_ADDR2` (Layer 3 Address 2 Register)

- [EMAC_L3_ADDR3](#) (Layer 3 Address 3 Register)

Layer 3 Filtering

The MAC supports perfect matching or inverse matching for IP source and destination address. In addition, a program can match the complete IP address or mask the lower bits matching, that is, compare all bits of the address except the specified lower mask bits.

For IPv6 frames filtering, programs can enable the last four data registers of a register set to contain the 128-bit IP source or IP destination address. Program the IP source or destination address in the order defined in the IPv6 specification, that is, the first byte of the IP source or destination address in the received frame is in the higher byte of the register and the subsequent registers follow the same order.

For IPv4 frames filtering, a program can enable the second and third data registers of a register set to contain the 32-bit IP source address and IP destination address. The remaining two data registers are reserved. Program the IP source and destination address in the order defined in the IPv4 specification, that is, the first byte of IP source and destination address in the received frame in the higher byte of the respective register.

Layer 4 Filtering

The MAC supports perfect matching or inverse matching for TCP or UDP source and destination port numbers. Only one type (TCP or UDP) is programmable at a time. The first data register contains the 16-bit source and destination port numbers of TCP or UDP, that is, the lower 16 bits for source port number and higher 16 bits for destination port number. Program the TCP or UDP source and destination port numbers in the order defined in the TCP or UDP specification, that is, the first byte of TCP or UDP source and destination port number in the received frame is in the higher byte of the register.

EMAC Station Management Interface (SMI)

The IEEE 802.3 MII station management interface, also known as the MDIO management interface, allows the processor to monitor and control one or more external Ethernet physical-layer transceivers. (Physical-layer transceivers are commonly called PHYs). The management interface physically consists of a 2-wire serial connection composed of the MDC (management data clock) output signal and the MDIO (management data input/output) bidirectional data signal. The IEEE 802.3 MII station management interface also applies to RMII .

The application can address only one register in the PHY in any given time and send control data or receive status information. All the transfers are initiated by the EMAC CORE, and the PHY chip only acts as a slave device.

Standard PHY control and status registers typically provide

- Device capability status bits (for example: auto-negotiation, duplex modes, 10/100 speeds, and protocols)
- Device status bits (for example: auto-negotiation complete, link status, remote fault)
- Device control bits (for example: reset, speed selection, loopback, and auto-negotiation start)

Upon power-up, an MDIO read access (at default rates) of device capabilities in PHY status registers can determine the supported PHY features.

The MII management logical interface specifies:

- A set of 16-bit device control or status registers within the PHYs, including both required registers with standardized bit definitions as well as optional vendor-specified registers.
- A 5-bit device addressing scheme which allows the MAC to select one of up to 32 externally connected PHY devices.
- A 5-bit register addressing scheme for selecting the target register within the addressed device.
- A transfer frame protocol for 16-bit read and write accesses to PHY registers through the MDC and MDIO signals under control of the MAC.

Table 24-36: Station Management Interface pins

Station Management Interface Pins	Pin Description
MDIO – Management Data I/O	A periodic clock that runs at a maximum period of 400 ns. Always driven by the EMAC to PHY.
MDC – Management Data Clock	Data signal driven by EMAC or PHY, depending on write or read access based on EMAC; synchronous to MDC.

MDC Clock Frequency

The EMAC uses the `EMAC_SMI_ADDR.CR` bit field to determine the frequency of MDC as shown in the *MDC Clock Frequency Selection* table. The clock range selection determines the frequency of the clock relative to the SCLK0 frequency. The table shows the suggested range of SCLK0 frequency applicable for each value of the `EMAC_SMI_ADDR.CR` field. The programmability based on SCLK0 frequency range ensures that the MDC clock frequency range is within the IEEE specifications of 1.0 MHz to 2.4 MHz. However, the EMAC MDC can also support higher frequencies for PHY devices that support the frequencies.

Table 24-37: MDC Clock Frequency Selection

EMAC_SMI_ADDR.CR Selection	Programmed SCLK0 Frequency Range	Frequency of MDC	Min and Max MDC Freq (Per Specifications)
0000	60–100 MHz	SCLK0/42	MIN = 1.43 MHz and MAX = 2.39 MHz
0010	20–35 MHz	SCLK0/16	MIN = 1.25 MHz and MAX = 2.19 MHz
0011	35–60 MHz	SCLK0/26	MIN = 1.35 MHz and MAX = 2.31 MHz

The *MDIO Frame Parameters* table provides MDIO data transfer parameters. The write and read sequences provided in the tables, *MDIO Write Data Sequence* and *MDIO Read Data Sequence*, are based on these parameters.

Table 24-38: MDIO Frame Parameters

Parameter	Description
IDLE	The MDIO line is three-state (noted as Z in sequence); there is no clock on MDC.
PREAMBLE	32 continuous bits, each of value 1
START	Start of frame is 01
OPCODE	10 for read and 01 for write
PHY ADDR	5-bit address select for one of 32 PHYs (noted as AAAAA in sequence)
REG ADDR	Register address in the selected PHY (noted as RRRRR in sequence)
TA	Turnaround is Z0 for read and 10 for write (Z = high impedance)
DATA	Any 16-bit value. Driven by MAC or PHY based on direction (noted as DDD...DDD).

Table 24-39: MDIO Write Data Sequence

IDLE	PREAMBLE	START	OPCODE	PHY ADDR	REG ADDR	TA	DATA	IDLE
Z	111...111	01	01	AAAAA	RRRRR	10	DDD... DDD	Z

Table 24-40: MDIO Read Data Sequence

IDLE	PREAMBLE	START	OPCODE	PHY ADDR	REG ADDR	TA	DATA	IDLE
Z	111...111	01	10	AAAAA	RRRRR	Z0	DDD... DDD	Z

SMI Write Operation

When programs set the `EMAC_SMI_ADDR.SMIW` (write) and `EMAC_SMI_ADDR.SMIB` (busy) bits, the station management interface (SMI) initiates a write operation into the PHY registers. The write operation uses the management frame format (the PHY address, the register address in PHY, and the write data) specified in the IEEE specifications. (Section 22.2.4.5 of IEEE standard). The application must not change the `EMAC_SMI_ADDR` register contents or the `EMAC_SMI_DATA` register while the transaction is ongoing.

Write operations to the `EMAC_SMI_ADDR` register or the `EMAC_SMI_DATA` register during the transfer period are ignored (while the `EMAC_SMI_ADDR.SMIB` bit is high). The transaction completes without error. After the write operation has completed, the SMI indicates the same by resetting the `EMAC_SMI_ADDR.SMIB` bit. The EMAC drives the MDIO line for the complete duration of the frame. The *SMI Write Operation through MDIO/MDC Pins* figure shows this operation.

Figure 24-16: SMI Write Operation through MDIO/MDC Pins

SMI Read Operation

When programs set the `EMAC_SMI_ADDR.SMIB` bit with the `EMAC_SMI_ADDR.SMIW` bit cleared (`=0`), the station management interface (SMI) initiates a read operation in the PHY registers. It transfers the PHY address and the register address in the PHY to the SMI. The application must not change the `EMAC_SMI_ADDR` register contents or the `EMAC_SMI_DATA` register while the transaction is ongoing.

Write operations to the `EMAC_SMI_ADDR` register or the `EMAC_SMI_DATA` register during the transfer period are ignored (while the `EMAC_SMI_ADDR.SMIB` bit is high). The transaction completes without error. After the read operation has completed, the SMI resets the `EMAC_SMI_ADDR.SMIB` bit and updates the `EMAC_SMI_DATA` register with the data read from the PHY. The EMAC drives the MDIO line for the complete duration of the frame except during the data fields when the PHY drives the MDIO line. The *SMI Read Operation through MDIO/MDC Pins* figure shows this operation.

Figure 24-17: SMI Read Operation through MDIO/MDC Pins

EMAC Management Counters (MMC)

The EMAC provides a comprehensive set of 32-bit MAC management counters. It uses these counters for gathering statistics on the received and transmitted frames. The MMC subblock also includes

- A control register (`EMAC_MMC_CTL`) for managing the behavior of the counters
- Two 32-bit registers containing interrupts generated (`EMAC_MMC_RXINT` and `EMAC_MMC_TXINT`)
- Two 32-bit registers containing masks for the interrupt register (`EMAC_MMC_RXIMSK` and `EMAC_MMC_TXIMSK`)

The MMC receive counters are updated for frames passed by the address filtering subblock in the EMAC CORE. Statistics of frames dropped by the AFM module are not updated unless they are runt frames of less than 6 bytes. (Destination address bytes are not received fully.) The module is also capable of gathering statistics on encapsulated IPv4, IPv6, and TCP, UDP, or ICMP payloads in received Ethernet frames.

The MMC register naming conventions are as follows:

- Tx as a prefix or suffix indicates counters associated with transmission.
- Rx as a prefix or suffix indicates counters associated with reception.
- _G as a suffix indicates registers that count good frames only.
- _GB as a suffix indicates registers that count frames regardless of whether they are good or bad.

Transmitted frames are considered *good* when transmitted successfully. In other words, a transmitted frame is good if the frame transmission does not abort due to any of the following errors:

- Jabber timeout
- No carrier or loss of carrier
- Late collision
- Frame underflow
- Excessive deferral
- Excessive collision

Received frames are good when none of the following errors exists:

- CRC error
- Runt frame (shorter than 64 bytes)
- Alignment error
- Length error (non-type frames only)
- Out-of-range (non-type frames only, longer than maximum size)

The maximum frame size depends on the frame type, as follows:

- Untagged frame maxsize = 1518
- VLAN frame maxsize = 1522
- Jumbo frame maxsize = 9018
- Jumbo VLAN frame maxsize = 9022

The `EMAC_MMC_CTL` register also contains bits that control preset, freeze and roll-over of counters. The EMAC uses the `EMAC_MMC_CTL.RDRST` bit to enable an auto-reset feature whenever the counters are read. The EMAC uses the `EMAC_MMC_CTL.RST` bit to reset all the counters.

The MMC can trigger an interrupt when the corresponding bits are enabled in the transmit, receive, and IPC mask registers, and when the particular counter reaches half or full. The status is also updated in the corresponding interrupt register.

MMC Receive Interrupt Register

The `EMAC_MMC_RXINT` register maintains the interrupts that are generated when the receive statistic counters reach half their maximum values (0x80000000), and when they cross their maximum values (0xFFFFFFFF). When `EMAC_MMC_CTL.NOROLL` is set, then interrupts are set, but the counter remains at all ones. The `EMAC_MMC_RXINT` register is a 32-bit wide register. An interrupt bit is cleared when the respective MMC counter that caused the interrupt is read. The least significant byte lane (bits 7:0) of the respective counter must be read to clear the interrupt bit.

MMC Transmit Interrupt Register

The `EMAC_MMC_TXINT` register maintains the interrupts generated when the transmit statistic counters reach half their maximum values (0x80000000), and when they cross their maximum values (0xFFFFFFFF). When `EMAC_MMC_CTL.NOROLL` is set, then interrupts are set, but the counter remains at all ones. The `EMAC_MMC_TXINT` register is a 32-bit wide register. An interrupt bit is cleared when the respective MMC counter that caused the interrupt is read. The least significant byte lane (bits 7:0) of the respective counter must be read to clear the interrupt bit.

MMC Receive Checksum Offload Interrupt Register

The `EMAC_MMC_RXINT.CRCERR` register maintains the interrupts generated when receive IPC statistic counters reach half their maximum values (0x80000000), and when they cross their maximum values (0xFFFFFFFF). When `EMAC_MMC_CTL.NOROLL` is set, then interrupts are set, but the counter remains at all ones. The `EMAC_MMC_RXINT.CRCERR` register is 32 bits wide. When the MMC IPC counter that caused the interrupt is read, its corresponding interrupt bit is cleared. The least-significant byte lane (bits 7:0) of the counter must be read to clear the interrupt bit.

EMAC Precision Time Protocol (PTP) Engine

The following sections describe the precision time protocol (PTP) engine.

IEEE1588 and the PTP Engine

The Ethernet MAC peripheral includes a PTP engine to assist applications requiring time synchronization. The PTP module is tightly integrated with the EMAC CORE to aid hardware time stamping defined in the IEEE1588 2002/2008 standards. Applications can use accurate hardware time stamps through TCP/IP stacks (if using network layer communication) to exchange time information across devices connected over network. Applications can also use accurate hardware timestamps through Ethernet device drivers (if using MAC layer communication) to exchange time information.

PTP Engine

For calculation of drift in time between two Ethernet devices, the device records its system time whenever a timing message is sent or received (IEEE 1588 protocol). Due to the indeterministic delay of a software system for a node, the software is unable to capture an accurate time when the message is sent or received. However, the hardware can monitor the signal on the communication media and get an accurate message of arrival and departure time.

The PTP (precision time protocol) module is closely integrated with the EMAC module. It provides hardware assistance to implement both the IEEE 1588–2002 and IEEE 1588–2008 standards on Ethernet (IEEE 802.3). It takes

one input clock signal as its PTP clock and maintains the timing information (called *system time*) at the nanosecond level.

The PTP module includes hardware for clock and system time adjustment. The pulse-per-second (PPS) signals physically represent the system time. PPS can be programmed to a fixed frequency or provide flexibility to the signal in terms of pulse width, interval, start, and stop time of the signals. The PTP module can be programmed to trigger an alarm interrupt when system time reaches specified time.

The PTP module can be programmed to detect different types of received frames, capture the system time, and time stamp those frames with the captured system time. Programs can configure any frame so that the PTP module capture the system time when it is transmitted. The PTP module can also capture the system time when an event is detected on the auxiliary snapshot trigger input pins (EMAC_PTPAUXIN[n]).

IEEE1588 Standard

Many systems require two independent devices to operate in a time synchronized fashion. If each system relied solely on its oscillator, differences between the characteristics and operating conditions of each oscillator would limit the ability of the clocks to operate synchronously. To serve applications requiring synchronized clocks, the system uses a periodic correction mechanism.

A simple way to synchronize multiple systems is to choose one system (with the best clock) as a master. The system master broadcasts the clock and timing information to other systems (slaves) and then the slaves adjust their clocks and timing according to that of master. However, this method has limitations. The master cannot broadcast the time at infinitesimal intervals. Path delay (propagation delay) exists between a master and a slave and the delay varies between each slave and master.

IEEE 1588 is also known as precision time protocol or PTP. The standard specifies a protocol used to synchronize the time and clock of multiple devices, dispersed but interconnected by any communication. For example, Ethernet (IEEE 802.3). According to the protocol, timing messages are exchanged between two devices. Then, one of the devices calculates its drift from other device and corrects its system time. (Both devices must have the same representation of their system time). The protocol resolves path delay between devices. It also helps synchronize the clocks of multiple devices and all of the limitations mentioned are resolved.

IEEE 1588 was published in 2002 where four types of timing messages were defined: Sync, Follow_Up, Delay_Req, and Delay_Resp. Here the protocol synchronizes two or more devices where one is a master and others are slaves. The master device sends Sync, Follow_Up, and Delay_Resp messages to the slave device in the system. The slave sends the Delay_Req messages to the master device. A following section provides more information on IEEE 1588–2002.

In 2008 a newer version of IEEE 1588 was introduced which provides further mechanisms to measure the peer-to-peer delay. Three more timing messages (PdelayReq, PdelayResp, and PdelayRespFollowup) were added to implement peer-to-peer synchronization. A following section provides more information on IEEE 1588–2008.

IEEE 1588–2002

The IEEE 1588–2002 standard defines the precision time protocol (PTP). The protocol allows precise synchronization of clocks in measurement and control systems that use network communication, local computing, and distributed objects. The protocol applies to systems that communicate by local area networks that support multicast

messaging, including (but not limited to) Ethernet. This protocol also allows heterogeneous systems that include clocks of varying inherent precision, resolution, and stability to synchronize. The protocol supports system-wide synchronization accuracy in the submicrosecond range with minimal network and local clock computing resources.

The PTP is transported over UDP/IP. The system or network is classified into master and slave nodes for distributing the timing or clock information. The *IEEE 1588–2002 PTP Process* figure shows the process that PTP uses for synchronizing a slave node to a master node by exchanging PTP messages.

Figure 24-18: IEEE 1588–2002 PTP Process

As shown in the figure, the PTP uses the following process:

1. The master broadcasts the PTP sync messages to all its nodes. The sync message contains the reference time information of the master. The time at which this message leaves the system of the master is t_1 . The master must capture this time for Ethernet ports, at RMII.
2. The slave receives the Sync message and also captures the exact time, t_2 , using its timing reference.
3. The master sends a Follow_up message to the slave, which contains t_1 information for later use.
4. The slave sends a Delay_Req message to the master, noting the exact time, t_3 , at which this frame leaves the RMII.
5. The master receives the message, capturing the exact time, t_4 , at which it enters its system.
6. The master sends the t_4 information to the slave in the Delay_Resp message.
7. The slave uses the four values of t_1 , t_2 , t_3 , and t_4 to synchronize its local timing reference to the timing reference of the master.

Most of the PTP implementation happens in the software above the UDP layer. However, the hardware support must capture the exact time when specific PTP packets enter or leave the Ethernet port at the RMII/RGMII. Hardware must capture this timing information and return it to the software for the proper implementation of PTP with high accuracy.

IEEE 1588–2008 Advanced Time Stamps

In addition to the basic time stamp features mentioned in IEEE 1588–2002 time stamps, the EMAC supports the following advanced time stamp features defined in the IEEE 1588–2008 standard.

- Support for the IEEE 1588–2008 (Version 2) time stamp format.
- Provides an option to take snapshot of all frames or only PTP type frames.
- Provides an option to take snapshot of only event messages.
- Provides an option to select the node to be a master or slave.
- Identifies the PTP message type, version, and PTP payload in frames sent directly over Ethernet and sends the status.
- Provides an option to run nanoseconds time in digital or binary format.

Peer-to-Peer (P2P) PTP Message Support

The IEEE 1588–2008 version supports Peer-to-Peer PTP (Pdelay) message in addition to SYNC, Delay Request, Follow-up, and Delay Response messages. Refer to the *Propagation Delay Calculation between Nodes Supporting Peer-to-Peer Path Correction* figure. The figure shows the method to calculate the propagation delay between nodes supporting peer-to-peer path correction.

Figure 24-19: Propagation Delay Calculation between Nodes Supporting Peer-to-Peer Path Correction

As shown in the figure, the propagation delay is calculated in the following way:

1. Port-1 issues a Pdelay_Req message and generates a time stamp, t_1 , for the Pdelay_Req message.
2. Port-2 receives the Pdelay_Req message and generates a time stamp, t_2 , for this message.
3. Port-2 returns a Pdelay_Resp message and generates a time stamp, t_3 , for this message. To minimize errors due to frequency offset between the two ports, Port-2 returns the Pdelay_Resp message as quickly as possible after the receipt of the Pdelay_Req message. The Port-2 returns any one of the following:
 - The difference between the time stamps t_2 and t_3 in the Pdelay_Resp message.
 - The difference between the time stamps t_2 and t_3 in the Pdelay_Resp_Follow_Up message.
 - The time stamps t_2 and t_3 in the Pdelay_Resp and Pdelay_Resp_Follow_Up messages respectively.
4. Port-1 generates a time stamp, t_4 , on receiving the Pdelay_Resp message.

Port-1 uses all four time stamps to compute the mean link delay.

Block Diagram

The *PTP Block Diagram* figure shows the functional block diagram of PTP module.

Figure 24-20: PTP Block Diagram

A system time module is present which keeps the time of PTP module. It consists of hardware which can be programmed for time initialization, time correction, and clock correction.

The time stamp module captures the time (provided by the system time module) at various conditions. For example, when the EMAC sends or receives a frame or during the rising edge of the auxiliary snapshot trigger (EMAC_PTPAUXIN[n]) pins. When system time is captured after detection of a frame, the time stamp module

automatically includes the time information in the frame descriptor. Time stamping on the detection of a frame can be programmed on a per frame basis.

The PTP clock drives the PTP module. This clock can be selected from three different clock sources.

The pulse per second (PPS) module generates a pulse or train of pulse on the PPS output pins, (EMAC_PTPPPS[n]). It is the physical representation of system time. PPS can be fixed (where only frequency varies) or flexible (where width, interval, start time, and stop time can be programmed).

The target time module acts as an alarm for the PTP module. Whenever system time reaches a value equal to programmed target time, the target time trigger interrupt is generated. By appropriate programming, The target time trigger can also start or stop flexible PPS output at specific time.

PTP Module Clock

The PTP module clock features include [Clock Source Selection](#) and [Clock Frequency Range](#).

Clock Source Selection

The PTP module can take one of these clock sources as its input clock — SCLK0, RMII reference RGMII Rx clock, or PTP external clock.

As shown in the *PTP Clock Source Selection* table, the [PADS_PCFG0](#) register selects the PTP clock source.

Table 24-41: PTP Clock Source Selection

PADS_PCFG0	PTP Clock Source	Clock Description
00	EMAC_RMII	RMII reference clock
00	RGMII_RXCLK	RGMII Rx Clock
10	PTP external clock	Clock available on EMAC_PTCLKIN[n] pin
X1	SCLK0	Processor system clock

Clock Frequency Range

The resolution, or granularity, of the reference time source determines the accuracy of the synchronization. Therefore, a higher PTP clock frequency gives better system performance. The timing constraints achievable for logic operating on the selected PTP clock source limit the maximum PTP clock frequency.

The minimum PTP clock frequency depends on the time required between two consecutive frames. The IEEE specification determines the RMII clock frequency. The minimum PTP clock frequency required for proper operation depends on the operating mode and operating speed of the MAC. See the *Minimum PTP Clock Frequency* table.

A minimum delay required between two consecutive time stamp captures is 8 clock cycles of RMII or 4 clock cycles of RGMII and 3 clock cycles of PTP clocks. If the delay between two time stamp captures is less than this delay, the EMAC does not take a time stamp snapshot for the second frame.

The following table assumes:

- Minimum Ethernet packet size = 64 bytes

- Minimum IFG = 96 bit times = 12 bytes
- Preamble = 8 bytes
- 3 PTP Clock + 4GMII/MII Clock Min gap between two SFDs (start of frame delimiters)
- 3 PTP Clock + 8 RMII Clock Min gap between two SFDs
- 3 PTP Clock + 4 RGMII Clock Min gap between two SFDs

Mode (Full Duplex in all cases)	Minimum Gap between two SFDs	PTP clock	Comments
10 Mbps RMII	64 bytes of data + 8 bytes of preamble + min IFG	3 PTP clock cycle + 8RMII clock cycle 3360 RMII clock cycles	In RMII @ 10 Mbps, 1 byte transmitted in 40 clock cycles
	(2560 + 320 + 480) RMII clock cycles	3 PTP clock cycle 3352 RMII clock cycles	RMII clock = 50 MHz
	3360 RMII clocks	PTP clock cycle 1117.33 20 ns = 22346 ns	1 RMII clock cycle = (1/50 MHz) = 20 ns
		<i>PTP frequency min = 0.045 MHz</i>	
10 Mbps RGMII	64 bytes of data + 8 bytes of preamble + min IFG	3 PTP clock cycle + 4RGMII clock cycle 168 RGMII clock cycles	In RGMII, 1 byte transmitted in 4 clock cycles
	(128 + 16 + 24) MII clock cycles	3 PTP clock cycle <= 164 RGMII clock cycles	RGMII clock at 100 Mbps = 2.5 MHz
	168 MII clock cycles	PTP clock cycle 54.67 400ns = 21860 ns	1 RGMII clock cycle = (1/2.5 MHz) = 400 ns
		<i>PTP frequency min = 0.045 MHz</i>	
100 Mbps RMII	64 bytes of data + 8 bytes of preamble + min IFG	3 PTP clock cycle + 8RMII clock cycle 336 RMII clock cycles	In RMII, 1 byte transmitted in 4 clock cycles
	(256 + 32 + 48) RMII clock cycles	3 PTP clock cycle 328 RMII clock cycles	RMII clock = 50 MHz
	336 RMII clocks	PTP clock cycle 109.33 20 ns = 2186 ns	1 RMII clock cycle = (1/50 MHz) = 20 ns
		<i>PTP frequency min = 0.45 MHz</i>	
100 Mbps RGMII	64 bytes of data + 8 bytes of preamble + min IFG	3 PTP clock cycle + 4RGMII clock cycle 168 RGMII clock cycles	In RGMII, 1 byte transmitted in 4 clock cycles
	(128 + 16 + 24) MII clock cycles	3 PTP clock cycle 164 RGMII clock cycles	RGMII clock at 100 Mbps = 25 MHz
	168 MII clock cycles	PTP clock cycle 54.67 40 ns = 2186 ns	1 RGMII clock cycle = (1/25 MHz) = 40 ns
		<i>PTP frequency min = 0.45 MHz</i>	

Mode (Full Duplex in all cases)	Minimum Gap between two SFDs	PTP clock	Comments
1000 Mbps RGMII	64 bytes of data + 8 bytes of preamble + min IFG	3 PTP clock cycle + 4 RGMII clock cycle 84 RGMII clock cycles	In RGMII @ 1000 Mbps, 1 byte transmitted in 1 clock cycles
	(64 + 8 + 12) RGMII clock cycles	3 PTP clock cycle 80 RGMII clock cycles	RGMII clock at 100 Mbps = 125 MHz
	84 RGMII clocks	PTP clock cycle 26.67 8 ns = 213 ns	1 RGMII clock cycle = (1/125 MHz) = 8 ns
		<i>PTP frequency min = 4.6 MHz</i>	

The minimum PTP clock frequency also depends on the maximum value of the `EMAC_TM_SUBSEC` register, so that even at the highest `EMAC_TM_SUBSEC.SSINC` value, the `EMAC_TM_SEC` register value can be incremented every second. Since the `EMAC_TM_SUBSEC.SSINC` is an 8-bit field, the minimum PTP clock frequency allowed is approximately 4 MHz.

Time Stamp Module

The time stamp module captures time in seconds and nanoseconds maintained as system time. The time stamp module also captures time when specific events occur. Events include detection of a frame transmitted or received over the EMAC and a rising edge on the `EMAC_PTPAUXIN[n]` pins. The time stamp module does not need to time stamp all of the transmitted or received frames over the EMAC. The PTP module can be programmed to detect specific kinds of frames for time stamping.

Frame Detection and Time Stamping

The PTP module automatically monitors all received and transmitted IEEE 1588 event messages on the Ethernet. If the module detects an event message, it takes a snapshot of the system time. The PTP module stores the value to the 64-bit fields in transmit or receive descriptor.

The time stamping occurs at the EMAC RMII/RGMII interface when the module sees the start of frame of an event message packet.

Transmit Path Time Stamping

The EMAC captures a time stamp when a frame transmits on the RMII/RGMII. Time stamp capture is controllable on a per-frame basis. In other words, each transmit frame can be marked to indicate whether a time stamp is captured for that frame or not.

Applications can extend the descriptor word length from 4 words to 8 words by setting the `EMAC_DMA0_BUSMODE.ATDS` bit. To enable the time stamp function, set the TTSE (transmit time stamp enable) bit in transmit descriptor word TDES0. When the PTP module captures a time stamp of a transmitted frame, it notifies the application by setting the TTSS (transmit time stamp status) in TDES0.

The EMAC returns the time stamp to the software inside the corresponding transmit descriptor, automatically connecting the time stamp to the specific frame. The 64-bit time stamp information is written to the TDES6 and TDES7 fields. The TDES6 field holds the 32-bit LSBs of the time stamp (system time nanoseconds), except as described in transmit time stamp field, and the TDES7 field holds the 32-bit MSBs (system time seconds). After the

PTP module time stamps the frame, the application can get the time stamp along with the transmit status from the EMAC.

NOTE: The PTP module time stamps all the transmitting frames having TTSE set in its TDES0. It does not distinguish according to the type of transmitting frame.

Receive Path Time Stamping

The PTP module automatically monitors all received and transmitted IEEE 1588 event messages on the Ethernet. If an event message is detected, the module takes a snapshot of the system time. The module stores its value to the 64-bit fields in transmit or receive descriptor. The time stamping is done at the EMAC RMII/RGMII interface when the module sees the start of frame of an event message packet.

PTP module captures the time stamp of received frames on the RMII/RGMII. Time stamp capture is controllable on a per-frame and per-type basis. In other words, each received frame is time stamped according to the frame type.

Applications can extend the descriptor word length from 4 words to 8 words by setting the `EMAC_DMA0_BUSMODE.ATDS` bit to store time stamp and received message status. The PTP notifies the application of receive time stamp availability when it sets bit 7 (time stamp available) in receive descriptor word RDES0.

When bit 0 (extended status available) is set in RDES0, it indicates that the extended status of the PTP frame is provided in the RDES4 word. Extended status includes PTP version, PTP frame type, and message type. The EMAC returns the time stamp to the software inside the corresponding receive descriptor. The 64-bit time stamp information is written back to the RDES6 and RDES7 fields in memory. The RDES6 holds the 32-bit LSBs of the time stamp (system time nanoseconds), except as mentioned in receive time stamp field, and the RDES7 field holds 32-bit MSBs (system time seconds).

The time stamp is written only to that receive descriptor for which the last descriptor status field has been set to 1. When the time stamp is not available (for example, because of an RxFIFO overflow), an all-ones pattern is written to the descriptors (RDES6 and RDES7). The write operation indicates that the time stamp is not correct. RDES0 [7] indicates whether the time stamp is updated in RDES6/7.

The PTP module processes received frames to identify valid PTP frames. Use the `EMAC_TM_CTL` register to control the snapshot of the time sent to the application.

The PTP module can be programmed to detect all received frames or only some types of PTP frames, according to bit settings in the `EMAC_TM_CTL` register. Refer to the *PTP Frame Type Selections* table.

Table 24-42: PTP Frame Type Selections

TSENALL (bit 8)	SNAPTYPSEL (bits [17:16])	TSMSTRENA (bit 15)	TSEVNTENA (bit 14)	Frames
1	X	X	X	All
0	00	X	0	Sync, Follow_Up, Delay_Req, Delay_Resp
0	00	0	1	Sync
0	00	1	1	Delay_Req

Table 24-42: PTP Frame Type Selections (Continued)

TSENALL (bit 8)	SNAPTYPSEL (bits [17:16])	TSMSTRENA (bit 15)	TSEVNTENA (bit 14)	Frames
0	01	X	0	Sync, Follow_Up, Delay_Req, Delay_Resp, Pdelay_Req, Pdelay_Resp, Pdelay_Resp_Follow_Up
0	01	0	1	Sync, Pdelay_Req, Pdelay_Resp
0	01	1	1	Delay_Req, Pdelay_Req, Pdelay_Resp
0	10	X	X	Sync, Delay_Req
0	11	X	X	Pdelay_Req, Pdelay_Resp

PTP Processing and Control

When the EMAC receives a frame, frame detection and time stamping are based on some of the PTP fields in the frame. The *PTP Message Format (IEEE 1588–2008)* table shows the common message header for the PTP messages. This format is derived from the IEEE standard 1588–2008. When the EMAC sends a PTP frame, the frame follows this format.

When a frame is received, the PTP module compares these fields with standard values and finds out the type of PTP frame and other information. For example, PTP version, IP version, and others. The module then updates the related fields in RDES4. When a frame is transmitted, programs must ensure that all the fields are appropriate. The PTP module on the other end of a communication must correctly detect and decode the frame.

Table 24-43: PTP Message Format (IEEE 1588–2008)

Bits								Octets	Offset
7	6	5	4	3	2	1	0		
transportSpecific				messageType				1	0
Reserved				versionPTP				1	1
messageLength								2	2
domainNumber								1	4
Reserved								1	5
flagField								2	6
correctionField								8	8
Reserved								4	16
sourcePortIdentity								10	20
sequenceId								2	30

Table 24-43: PTP Message Format (IEEE 1588–2008) (Continued)

Bits	Octets	Offset
controlField (used in version 1. For version 2, messageType field is used for detecting different message types.)	1	32
logMessageInterva	1	33

There are some fields in the Ethernet payload that can be used to detect the PTP packet type and control the snapshot taken. These fields are different for the following PTP frames:

- PTP Frames Over IPv4
- PTP Frames Over IPv6
- PTP Frames Over Ethernet

For these PTP frames, EMAC does not consider the PTP version 1 messages as valid when the frame consists of peer delay multicast address as destination address (DA).

PTP Frame Over IPv4

The *IPv4-UDP PTP Frame Fields Required for Control and Status* table provides information about the fields that are matched to control snapshot for the PTP packets. The packets are sent over UDP over IPv4 for IEEE 1588 version 1 and 2. The octet positions for the tagged frames are offset by 4. The positions are based on IEEE 1588–2008 standards and the message format. The format is defined in the *PTP Message Format (IEEE 1588–2008)* table in the [PTP Processing and Control](#) section.

Table 24-44: IPv4-UDP PTP Frame Fields Required for Control and Status

Field Matched	Octet Position	Matched Value	Description
MAC Frame type	12, 13	0x0800	IPv4 datagram
IP Version and Header Length	14	0x45	IP version is IPv4
Layer 4 Protocol	23	0x11	UDP
IP Multicast Address (IEEE 1588 Version 1)	30, 31, 32, 33	0xE0,0x00, 0x01,0x81 (or 0x82 or 0x83 or 0x84)	Multicast IPv4 addresses allowed. 224.0.1.129 224.0.1.130 224.0.1.131 224.0.1.132
IP Multicast Address (IEEE 1588 Version 2)	30, 31, 32, 33	0xE0, 0x00, 0x01, 0x81 (Hex) 0xE0, 0x00, 0x00, 0x6B (Hex)	PTP-Primary multicast address: 224.0.1.129 PTP-Peer delay multicast address: 224.0.0.107

Table 24-44: IPv4-UDP PTP Frame Fields Required for Control and Status (Continued)

Field Matched	Octet Position	Matched Value	Description
UDP Destination Port	36, 37	0x013F 0x0140	0x013F - PTP Event Messages. These are SYNC, Delay_Req (IEEE 1588 version 1 and 2) or Pdelay_Req, Pdelay_Resp (IEEE 1588 version 2 only). 0x0140 - PTP general messages
PTP Control Field (IEEE version 1)	74	0x00/0x01/0x02/ 0x03/0x04	0x00 - SYNC 0x01 - Delay_Req 0x02 - Follow_Up 0x03 - Delay_Resp 0x04 - Management
PTP Message Type Field (IEEE version 2)	42 (nibble)	0x0/0x1/0x2/0x3/0x8/0x9/0xA/0xB/ 0xC/0xD	0x0 - SYNC 0x1 - Delay_Req 0x2 - Pdelay_Req 0x3 - Pdelay_Resp 0x8 - Follow_Up 0x9 - Delay_Resp 0xA - Pdelay_Resp_Follow_Up 0xB - Announce 0xC - Signaling 0xD - Management
PTP Version	43 (nibble)	0x1 or 0x2	0x1 - Supports PTP version 1 0x2 - Supports PTP version 2

PTP Frame Over IPv6

The *IPv6-UDP PTP Frame Fields Required for Control And Status* table provides information about the fields that are matched to control the snapshots for the PTP packets. The packets are sent over UDP over IPv6 for IEEE 1588 version 1 and 2. The octet positions for the tagged frames are offset by 4. The positions are based on IEEE 1588–2008 standards and the message format defined in PTP Message Format (IEEE 1588–2008).

Table 24-45: IPv6-UDP PTP Frame Fields Required for Control and Status

Field Matched	Octet Position	Matched Value	Description
MAC Frame type	12, 13	0x86DD	IP datagram
IP Version	14 (bits [7:4])	0x06	IP version is IPv6
Layer 4 Protocol	20 (IPv6 extension header not defined for PTP packets)	0x11	UDP

Table 24-45: IPv6-UDP PTP Frame Fields Required for Control and Status (Continued)

Field Matched	Octet Position	Matched Value	Description
PTP Multicast Address	38–53	FF0x:0:0:0:0:0:0:0:181 (Hex) FF02:0:0:0:0:0:0:0:6B (Hex)	PTP - primary multicast address: FF0x:0:0:0:0:0:0:0:181 (Hex) PTP - Peer delay multicast address: FF02:0:0:0:0:0:0:0:6B (Hex)
UDP Destination Port	56, 57 (IPv6 extension header not defined for PTP packets)	0x013F, 0x0140	0x013F - PTP event messages 0x0140 - PTP general messages
PTP Control Field (IEEE 1588 version 1)	93 (IPv6 extension header not defined for PTP packets)	0x00/0x01/0x02/ 0x03/0x04	0x00 - SYNC 0x01 - Delay_Req 0x02 - Follow_Up 0x03 - Delay_Resp 0x04 - Management (version1)
PTP Message Type Field (IEEE version 2)	74 (nibble) (IPv6 extension header not defined for PTP packets)	0x0/0x1/0x2/0x3/0x8/0x9/0xA/0xB/ 0xC/0xD	0x0 - SYNC 0x1 - Delay_Req 0x2 - Pdelay_Req 0x3 - Pdelay_Resp 0x8 - Follow_Up 0x9 - Delay_Resp 0xA - Pdelay_Resp_Follow_Up 0xB - Announce 0xC - Signaling 0xD - Management
PTP Version	75 (nibble)	0x1 or 0x2	0x1 - Supports PTP version 1 0x2 - Supports PTP version 2

PTP Frame Over Ethernet

Refer to the *Ethernet PTP Frame Fields Required for Control and Status* table. The table provides information about the fields that are matched to control the snapshots for the PTP packets sent over Ethernet for IEEE 1588 version 1 and 2. The octet positions for the tagged frames are offset by 4. The positions are based on IEEE 1588–2008 standards and the message format defined in the table.

Table 24-46: Ethernet PTP Frame Fields Required for Control and Status

Field Matched	Octet Position	Matched value	Description
MAC Destination Multicast Address (The address match of destination address (DA) programmed in MAC address 0 is used when the <code>EMAC_TM_CTL.TSENMACADDR</code> bit is set)	0–5	01-1B-19-00-00-00 01-80-C2-00-00-0E	All PTP messages can use any of the following multicast addresses: 01-1B-19-00-00-00 01-80-C2-00-00-0E
MAC Frame Type	12, 13	0x88F7	PTP Ethernet frame
PTP control field (IEEE Version 1)	45	0x00/0x01/0x02/ 0x03/0x04	0x00 - SYNC 0x01 - Delay_Req 0x02 - Follow_Up 0x03 - Delay_Resp 0x04 - Management
PTP Message Type Field (IEEE version 2)	14 (nibble)	0x0/0x1/0x2/0x3/0x8/0x9/0xA/0xB/ 0xC/0xD	0x0 - SYNC 0x1 - Delay_Req 0x2 - Pdelay_Req 0x3 - Pdelay_Resp 0x8 - Follow_Up 0x9 - Delay_Resp 0xA - Pdelay_Resp_Follow_Up 0xB - Announce 0xC - Signaling 0xD - Management
PTP Version	15(nibble)	0x1 or 0x2	0x1 - Supports PTP version 1 0x2 - Supports PTP version 2

Auxiliary Time Stamp Snapshot

The auxiliary snapshot feature stores snapshots of the system time whenever a rising edge is detected on the `EMAC_PTPAUXIN[n]` pins.

The PTP stores 64 bits of captured time stamp in a 4-deep FIFO. When a snapshot is stored, the PTP indicates this event to the EMAC with the auxiliary snapshot interrupt. The `EMAC_TM_STMPSTAT.ATSTS` bit is set. The value of the snapshot is read through the `EMAC_TM_AUXSTMP_SEC` and `EMAC_TM_AUXSTMP_NSEC` registers. If the FIFO becomes full and an external trigger to take the snapshot is asserted, then the snapshot trigger-missed status is set in the `EMAC_TM_STMPSTAT.ATSSTM` bit. The latest snapshot is not written to the FIFO when it is full.

When a host reads the 64-bit time stamp from the FIFO through the `EMAC_TM_AUXSTMP_SEC` and `EMAC_TM_AUXSTMP_NSEC` registers, the space becomes available to store the next snapshot.

NOTE: A space in the FIFO is created whenever the `EMAC_TM_AUXSTMP_SEC` register is read. Therefore, read the `EMAC_TM_AUXSTMP_NSEC` register before reading the `EMAC_TM_AUXSTMP_SEC` register.

The program can clear the FIFO by setting the `EMAC_TM_CTL.ATSFC` bit. When multiple snapshots are present in the FIFO, the `EMAC_TM_STMPSTAT.ATSNS` bits indicate the count.

NOTE: The minimum gap between two events on the `EMAC_PTPAUXIN[n]` pin must be 4 cycles of `PTP_CLK` + 3 cycles of `SCLK0`). Otherwise, the logic misses the rising-edge of the trigger.

System Time

To get a snapshot of the time, the EMAC requires a reference time in 64-bit format as defined in the IEEE 1588 specification. The PTP module maintains 80-bit time, known as system time. The PTP clock updates system time.

The 80-bit timing reference is split into the following three registers:

- `EMAC_TM_NSEC` – 32-bit nanoseconds register which provides time in nanoseconds
- `EMAC_TM_SEC` – 32-bit seconds register which provides time in seconds
- `EMAC_TM_HISEC` – 16-bit high seconds register which provides time beyond the seconds register. The IEEE 1588 standard does not include this register. Its use is application-specific.

The 64-bit system time (seconds and nanoseconds) is the source for taking time stamps for Ethernet frames being transmitted or received at the RMII.

Since the PTP clock frequency does not correspond to a 1ns period, the `EMAC_TM_NSEC` register is incremented with a value equal to the PTP clock period for every PTP clock cycle. The function uses the `EMAC_TM_SUBSEC` register. The `EMAC_TM_NSEC` value is incremented with the value programmed in `EMAC_TM_SUBSEC` register every PTP clock cycle.

Whenever the `EMAC_TM_SEC` register overflows from `0xFFFFFFFF` to `0x00000000`, the seconds overflow interrupt is triggered. The EMAC uses the `EMAC_TM_STMPSTAT.TSSOVF` bit to indicate the event. After a seconds overflow, the `EMAC_TM_HISEC` register increments by one.

The system time module supports the following two types of rollover modes for the `EMAC_TM_NSEC` register.

- Digital rollover mode. The maximum value in the nanoseconds field is `0x3B9AC9FF`, that is, 10^9 nanoseconds. After it reaches this value, the `EMAC_TM_SEC` register increments and the `EMAC_TM_NSEC` register restarts counting from zero. Accuracy in digital rollover mode it is 1 ns per bit.
- Binary rollover mode. The nanoseconds field rolls over and increments the seconds field after the value reaches `0x7FFFFFFF`. Accuracy in binary rollover mode is ~0.466 ns per bit.

System Time Adjustment

The following sections describe the process for system time adjustment.

System Time Initialization

System time can be initialized with 64-bit time when the PTP module is enabled. The initial value is written to the `EMAC_TM_SECUPDT` and `EMAC_TM_NSECUPDT` system time update registers. The system time counter is written with the value in the registers when the `EMAC_TM_CTL.TSINIT` bit is set.

Coarse Correction Method

If slave system time has an offset based on the system time of the master, then the coarse correction method can correct it. The time offset value is written to the `EMAC_TM_SECUPDT` and `EMAC_TM_NSECUPDT` registers. The offset value is then added to or subtracted from the system time when the `EMAC_TM_CTL.TSUPDT` bit is set. Use the `EMAC_TM_NSECUPDT.ADDSUB` bit to choose addition or subtraction. System time correction occurs in one clock cycle using the coarse correction method.

NOTE: During subtraction, the `EMAC_TM_SECUPDT` register value must be less than the value of the `EMAC_TM_SEC` register. Check the value prior to subtracting using coarse correction.

Fine Correction Method

If a slave PTP clock frequency has a drift based on the master PTP clock (as defined in IEEE 1588), it can be corrected using the fine correction method. Using this method, system time is corrected over a period (unlike coarse correction where it happens in one clock cycle). This correction helps maintain linear time and does not introduce drastic changes (or a large jitter) in the reference time between PTP sync message intervals.

Using this method, an accumulator sums the contents of the `EMAC_TM_ADDEND` register. The *System Time Update, Fine Correction Method* figure shows the method. The arithmetic-carry that the accumulator generates acts as a pulse to increment the system time counter. The accumulator and the addend are 32-bit registers. Here, the accumulator acts as a high-precision frequency divider.

Figure 24-21: System Time Update, Fine Correction Method

Calculating Addend Value

This section describes the fine correction process for system time.

In this example, the master clock runs at 50 MHz and the slave clock has drifted to 66 MHz. The goal is to adjust the slave system time to 50 MHz, so that the slave PTP module synchronizes with the master. Using the figure in [Fine Correction Method](#), the nanoseconds increment signal runs at 50 MHz. The nanoseconds increment is the carry from accumulator register. The addend value increments the carry from accumulator at the rate of the slave clock (66 MHz).

The accumulator overflows and generates a carry every N addend value, so $N \times \text{Addend} = 2^{32}$.

The accumulator increments at 66 MHz. This addition brings the carry to 50 MHz $N = 66/50 = 1.32$.

Hence, the addend = $2^{32}/1.32 = 0xC1F07C1F$.

Therefore, if addend is programmed with $0xC1F07C1F$, the slave system time runs at 50 MHz which synchronizes with the master.

In the [Fine Correction Method](#) figure, the subsecond increment is the value programmed in the `EMAC_TM_SUBSEC` register which increments the `EMAC_TM_NSEC` register according to the frequency of the nanoseconds increment signal.

In the example, the sub second increment is 20 (for digital rollover) or 43 (for binary rollover). This addition increments the `EMAC_TM_NSEC` register by 20 ns (1/50 MHz).

The software must calculate the drift in frequency and update the `EMAC_TM_ADDEND` register accordingly.

NOTE: The PTP reference clock is the clock at which the system time is updated. When the `EMAC_TM_CTL.TSCFUPDT` bit is set to 0, this clock equals the PTP clock. Using fine correction, the PTP reference clock is generated on the nanoseconds increment signal at which the system time updates.

Target Time Trigger (Alarm)

The PTP module provides an alarm function by triggering an alarm at a preset time. It sets the `EMAC_TM_STMPSTAT.TSTARGET0` bit when the system time matches the value of the `EMAC_TM_PPS0TGTM` and `EMAC_TM_PPS0NTGTM` registers. This trigger can generate an interrupt and command the flexible PPS module to start or stop PPS output, depending on value programmed in `EMAC_TM_PPSCCTL.TRGTMODSEL0` bits.

The trigger is enabled by setting `EMAC_TM_CTL.TSTRIG` bit. Once an alarm has occurred, if the PTP needs another alarm, the software must:

- Clear the status bit
- Reprogram the `EMAC_TM_PPS0TGTM` and `EMAC_TM_PPS0NTGTM` registers to a future value, and
- Set the `EMAC_TM_CTL.TSTRIG` bit

If the time programmed in the target time registers has elapsed, then a target time programming error is indicated by setting the `EMAC_TM_STMPSTAT.TSTRGTERR0` bit.

The alarm time is represented in absolute units, not relative units. For example, if the software must generate an alarm after 10 seconds, it must read the current system time value. Then, the software must add the number corresponding to 10 seconds, and write the result back to the target time registers.

Pulse-Per-Second (PPS)

Pulse-per-second (PPS) is a physical representation of system time. It consists of a single pulse or train of pulses. The PTP uses PPS for extra synchronization or to monitor the synchronization performance between clocks. With proper configuration, the PTP module can generate PPS signals that are output on the `EMAC_PTPPPS[n]` pins. The PTP supports two kinds of PPS output, fixed and flexible.

Fixed Pulse-Per-Second Output

The EMAC supports fixed pulse-per-second (PPS) output that indicates 1-second intervals (default). Change the frequency of the PPS output by configuring the `EMAC_TM_PPSCCTL.PPSCTL0` bits. The default value for these bits is 0000, which configures a 1Hz signal with a pulse width equal to the period of the PTP clock.

The *PPS Output Frequencies* table shows various PPS output frequencies.

Table 24-47: PPS Output Frequencies

PPSCTL Bit Setting	Binary Rollover	Digital Rollover
0001	2 Hz	1 Hz

Table 24-47: PPS Output Frequencies (Continued)

PPSCTL Bit Setting	Binary Rollover	Digital Rollover
0010	4 Hz	2 Hz
0011	8 Hz	4 Hz
...	...	...
1111	32.768 kHz	16.384 kHz

In binary rollover mode, the PPS output has a duty cycle of 50% with these frequencies.

In digital rollover mode, the PPS output frequency is an average number. The actual clock is a different frequency that is synchronized every second. PPS output pulses have different periods and duty cycles and this behavior is because of the non-linear toggling of the bits in digital rollover mode. For example:

- When `EMAC_TM_PPSCTL.PPSCTL0 = 0001`, the PPS (1 Hz) has a low period of 537 ms and a high period of 463 ms.
- When `EMAC_TM_PPSCTL.PPSCTL0 = 0010`, the PPS (2 Hz) is a sequence of:
 - One clock of 50-percent duty cycle and 537-ms period
 - Second clock of 463-ms period (268 ms low and 195 ms high)
- When `EMAC_TM_PPSCTL.PPSCTL0 = 0011`, the PPS (4 Hz) is a sequence of:
 - Three clocks of 50-percent duty cycle and 268-ms period
 - Fourth clock of 195-ms period (134 ms low and 61 ms high)

Flexible Pulse-Per-Second Output

The EMAC also provides the flexibility to program the start or stop time, width, and interval of the pulse generated on the PPS output. Enable this feature, called flexible PPS, by setting the `EMAC_TM_PPSCTL.PPSEN` bit.

The flexible PPS output options are:

- Supports programming the start point of the single pulse and start and stop points of the pulse train in terms of system time. The target time registers program the start and stop time.
- Supports programming the stop time in advance. Programs can configure the stop time before the actual start time has elapsed.
- Supports programming the width, between the rising edge and corresponding falling edge of the PPS signal output, in terms of number of units of subsecond increment. This value is configured in the `EMAC_TM_SUBSEC` register.
- Supports programming the interval, between the rising edges of PPS signal, in terms of number of units of subsecond increment. This value is configured in the `EMAC_TM_SUBSEC` register.
- Provides the option to cancel the programmed PPS start or stop request.

- Indicates error if the start or stop time programmed has already elapsed.

PPS Start or Stop Time

Start time can initially be programmed in the target time registers. If necessary, the start or stop time can be programmed again but only after the earlier programmed value is synchronized to the PTP clock domain. The `EMAC_TM_PPS0NTGTM.TSTRBUSY` bit indicates the status of synchronization. Programs can configure the start or stop time in advance, even before the earlier stop or start time has elapsed.

Program the start or stop time with advanced system time to ensure proper PPS signal output. If the application programs a start or stop time that has already elapsed, then the EMAC sets the `EMAC_TM_STMPSTAT.TSTRGTERR0` bit, indicating the error. If enabled, the EMAC also sets the target time trigger (alarm) interrupt event. The application can cancel the start or stop request only if the corresponding start or stop time has not elapsed. If the time has elapsed, the cancel command has no effect.

PPS Width and Interval

The PPS width and interval are programmed in terms of granularity of system time, that is, the number of the units of subsecond increment value. For example, with the PTP reference clock of 50 MHz, a PPS pulse width of 40 ns, and an interval of 100 ns, program the width and interval to 2 and 5, respectively.

Use a faster PTP reference clock to achieve smaller granularity. Before commanding to trigger a pulse or pulse train on the PPS output, programs must configure or update the interval and width of the PPS signal output.

PPS Command

When the PPS module has a flexible PPS output configuration, the PTP can use the `EMAC_TM_PPSCTL.PPSCTL0` bits to command the PPS module to use any of the flexible PPS features.

Programming these bits with a non-zero value instructs the PPS module to initiate an event. Once the command transfers or synchronizes to the PTP clock domain, these bits clear automatically. Software must ensure that these bits are programmed only when they are all-zero.

The *Flexible PPS Output Commands* table explains the different commands and their function.

Table 24-48: Flexible PPS Output Commands

PPSCTL (Bits 3–0)	Command	Description
0000	No Command	
0001	Start Single Pulse	Generates single pulse rising at start point defined in target time registers and of duration defined in <code>EMAC_TM_PPS0WIDTH</code> register.
0010	Start Pulse Train	Generates train of pulses rising at the start time configured in the target time registers, of duration configured in the <code>EMAC_TM_PPS0WIDTH</code> register. The train of pulses repeats at the interval configured in the <code>EMAC_TM_PPS0INTVL</code> register. By default, the PPS pulse train is free-running unless stopped by stop pulse train at time or stop pulse train immediately commands.
0011	Cancel Start	Cancels the start single pulse and start pulse train commands when the system time has not crossed the programmed start time.

Table 24-48: Flexible PPS Output Commands (Continued)

PPSCTL (Bits 3–0)	Command	Description
0100	Stop Pulse Train at Time	Stops the train of pulses initiated by the command for start pulse train after the time programmed in the target time registers elapses.
0101	Stop Pulse Train Immediately	Immediately stops the train of pulses initiated by the command for start pulse train.
0110	Cancel Stop Pulse Train	Cancels the stop pulse train at time command when the programmed stop time has not elapsed. The PPS pulse train becomes free-running on the successful execution of this command.
0111-1111	Reserved	

PTP Interrupts

Set the `EMAC_IMSK.TS` bit to enable interrupts from the PTP module. The EMAC uses the `EMAC_ISTAT.TS` bit to indicate the status of the interrupt. The PTP supports the following three types of interrupts.

Auxiliary Snapshot Trigger

When an external event occurs on the `EMAC_PTPAUXIN[n]` pins and a time stamp snapshot occurs, an auxiliary snapshot interrupt is triggered. The EMAC uses the `EMAC_TM_STMPSTAT.ATSTS` bit to indicate the interrupt.

Target Time Reached

This interrupt is triggered when the system time becomes equal to the value written in the `EMAC_TM_PPSONTGTM` and `EMAC_TM_PPSONTGTM` registers. Enable or disable the interrupt using the `EMAC_TM_CTL.TSTRIG` and `EMAC_TM_PPSCTL.TRGTMODESEL0` bits. This interrupt can be used as an alarm and is indicated on the `EMAC_TM_STMPSTAT.TSTARGET0` bit.

System Time Seconds Register Overflow

This interrupt is triggered when the `EMAC_TM_SEC` register overflows from `0xFFFF FFFF` to `0x0000 0000`. This interrupt is indicated on the `EMAC_TM_STMPSTAT.TSSOVF` bit. As soon as `EMAC_TM_SEC` register overflows, the `EMAC_TM_HISEC` register increments by one.

Audio Video Data Transmission

The audio video (AV) feature enables transmission of time-sensitive traffic over bridged local area networks (LANs). The following standards define the various aspects of the AV feature implementation.

- IEEE 802.1Qav-2009: Allows the bridges to provide time-sensitive and loss-sensitive real-time audio video data transmission (AV traffic). It specifies the priority regeneration and controlled bandwidth queue draining algorithms that are used in bridges and AV traffic sources.
- IEEE 802.1Qat-2009: Allows reservation of the network resources for specific traffic streams traversing a bridged local area network.
- IEEE 802.1AS-2011: Specifies the protocol and procedures used to ensure that the synchronization requirements are met for time-sensitive applications. For example, audio and video and across bridged and virtual-bridged LANs. Virtual-bridged LANs consist of LAN media where the transmission delays are fixed and

symmetrical. For example, IEEE 802.3 full-duplex links include the maintenance of synchronized time during normal operation followed by addition, removal, or failure of network components and network reconfiguration.

As shown in the *Transmit and Receive Path Block Diagram* figure, one SCB master interface connects to three DMA channels (channel 0, channel 1, and channel 2). The DMA arbiter helps in arbitration of all the paths (transmit and receive) in channel 0, channel 1 and channel 2. Each channel has a separate control and status register (CSR) for managing the transmit and receive functions, descriptor handling, and interrupt handling.

Figure 24-22: Transmit and Receive Path Block Diagram

Transmit Path Functions

The transmit path of channel 0 supports strict-priority algorithm and is used for best-effort traffic. For a channel, the strict-priority algorithm determines that a frame is available for transmission if the channel contains one or more frames. When the threshold mode for EMAC MFL Tx FIFO is enabled, the strict-priority algorithm determines that a frame is available for transmission. The algorithm determines when the channel contains a partial frame of size equal to the programmed threshold limit.

The transmit paths of channel 1 and channel 2 support traffic management by using the credit-based shaper algorithm. For a channel, the credit-based shaper algorithm determines that a frame is available for transmission if the following conditions are true:

- The channel contains one or more frames.
- The credit for the channel is positive as per the algorithm.

Programs can disable the credit-based shaper algorithm for all channels or for lower-priority channels. The credit-based shaper algorithm can be disabled for channel 1 and channel 2 or for channel 1 only. When the credit-based shaper algorithm for a channel is disabled, the channel uses the default strict-priority algorithm.

Each transmit DMA has a separate descriptor chain for fetching the transmit data. The transmit channel that receives access to the system bus depends on the DMA arbiter. For information about the DMA arbiter, see [DMA Arbiter](#).

The transmit path has separate FIFOs for each channel, as shown in the *Transmit and Receive Path Block Diagram* figure. The data fetched by the DMA is placed in the respective FIFO. The traffic management and scheduler unit (TMS) controls which FIFO data the MAC transmits. If the credit-based shaper algorithm is enabled for a channel (1 or 2), then the corresponding channel is selected for transmission when the following conditions are true:

- The frame is available in the channel and has a positive or zero credit.
- The higher priority channel has no frame waiting in the FIFO.

If the credit-based shaper algorithm is disabled for all channels, then the frame awaiting transmission from a channel is selected. The selection is made based on the priority scheme described in the *Fixed Priority Scheme for DMA Channels* table.

Receive Path Functions

To differentiate between the AV and non-AV traffic, the MAC provides a status. The status indicates if data is an AV packet and identifies its corresponding VLAN Priority tag value. This status is updated in the extended status field of the receive descriptor as explained in "Receive Descriptor". The `EMAC_MAC_AVCTL.AVTbit` field specifies a value that is compared with the `EtherType` field of the incoming Ethernet frame to detect an AV packet. The AV packets can be of the following two types:

- **AV data packets.** The AV data packets are always tagged. The tagged AV control packets are received based on the programmed priority value. The `EMAC_MAC_AVCTL.AVP` bit field specifies the channel to which an AV packet with a given priority must be sent.
- **AV control packets.** The AV control packets are either tagged or untagged. The untagged AV control packets are received on channel 0 by default. To receive these packets on channel 1 or channel 2, program the `EMAC_MAC_AVCTL.AVCH` bit field. Similar to the AV data packets, the tagged AV control packets are received based on the programmed priority value.

The following describes how tagged AV control packets and AV data packets are sent to a channel.

Table 24-49: AV Packets

Receive paths of channel 1 and channel 2 are enabled.	Channel 2 The following packets, with priority value greater than or equal to the value programmed in <code>EMAC_MAC_AVCTL.AVP</code> bit field, are received on channel 2: AV packets Non-AV tagged packets (if <code>EMAC_MAC_AVCTL.VQE</code> bit is set)
	Channel 1 The following packets, with priority value less than the value programmed in AV MAC control register, are received on channel 1: AV packets Non-AV tagged packets (if <code>EMAC_MAC_AVCTL.VQE</code> bit is set)
	Channel 0 All other packets are received on channel 0.
For example, priority value of 3 is programmed in the <code>EMAC_MAC_AVCTL.AVP</code> bit field.	Channel 2 The following packets with priority value from 3 to 7 are received on channel 2: AV packets Non-AV tagged packets (if the <code>EMAC_MAC_AVCTL.VQE</code> bit is set)
	Channel 1 The following packets with priority value 2 are received on channel 1: AV packets Non-AV tagged packets (if the <code>EMAC_MAC_AVCTL.VQE</code> bit is set)
	Channel 0 All other packets are received on channel 0.

DMA Arbiter

The DMA arbitrates between the transmit and receive paths of DMA channel 0, channel 1, and channel 2 for accessing descriptors and data buffers.

The fixed priority scheme is the default priority scheme for the DMA channels. In fixed priority scheme, the highest priority channel (channel 2) always wins the arbitration whenever it requests the bus. The *Fixed Priority Scheme for DMA Channels* table provides information about the priority levels of the DMA channels.

Table 24-50: Fixed Priority Scheme for DMA Channels

Priority Level	Channel
0 (low)	Channel 0
1	Channel 1
2 (high)	Channel 2

Slot Number Function

The slot number function schedules the data fetching by DMA from the system memory. This feature is useful when the source AV data must transmit at specific intervals. The transmit descriptor word 0 (TDES0) [6:3] bits program the slot number at which the DMA fetches the data from system memory. This 4-bit field allows the host to schedule data up to 16 slots of 125 micro-second each. This field is applicable only for the AV channels (channel 1 and channel 2).

When DMA fetches a transmit descriptor, it compares the slot number of the transmit descriptor with the internally generated reference slot interval. The slot interval is a counter that updates every 125 usec of the IEEE 1588 system time. In addition, the slot interval counter is initialized to zero when the value in the `EMAC_TM_SEC` register increments, that is, `EMAC_TM_NSEC` rolls over. The DMA fetches the data only if it matches the current slot or the next slot. The DMA remains in the descriptor fetch state until there is a match.

Programs can also set the `EMAC_DMA1_CHSFCS.ASC` bit to enable the DMA to fetch the data only if it matches the current slot or the next two slots.

NOTE: If the slot number in the descriptor is less than the reference slot number, the DMA takes it as a future slot.

Programs can enable the check for slot number by setting the `EMAC_DMA1_CHSFCS.ESC` bit. When this check is not enabled, the packets are fetched immediately after the descriptor is read. Programs can read the `EMAC_DMA1_CHSFCS.RSN` bit field to discover the value of the reference slot number in DMA.

Interrupts

Each DMA channel has its own dedicated interrupt channel, the software can take advantage of it for processing various DMA channels.

Credit-Based Shaper Algorithm Functions

The Traffic Manager and Scheduler (TMS) block (shown in the *Transmit and Receive Path Block Diagram* figure) uses the credit-based shaper algorithm to arbitrate the AV traffic in all channels and the legacy Ethernet traffic in channel 0. Channel 1 and channel 2 can be programmed to use the credit-based shaper algorithm. The following sections provide information about implementing the Credit-Based Shaper Algorithm:

Credit Value

The credit value is accumulated every transmit clock cycle, that is, 40 ns for 100 Mbps or 8 ns for 1000 Mbps. The credit to be added or subtracted per cycle can be fractional, based on the required `idleSlope` and `sendSlope` values as described in the following table.

Table 24-51: idleSlope and sendSlope Values

Mode	Values	Description
100 Mbps	portTransmitRate = 100 Mbps idleSlope = 70 Mbps (assuming 70% bandwidth reserved for a higher priority traffic class) sendSlope = 30 Mbps	Credit = 2.8 bits accumulates per cycle (40 ns) for the higher priority traffic class when besteffort frame is being transmitted. Credit = 1.2 bits drains per cycle (40 ns) when higher priority traffic class frame is being transmitted.

The DMA stores the channel traffic in the respective Tx FIFO based on the slot number in the transmit descriptor (if enabled) or depending on the bandwidth availability on the SCB.

The credit for a channel builds up only when the frame is available but it cannot be transmitted because the MAC is sending a frame from another channel. The EMAC supports another mode in which the credit can build up in advance for a channel in which no frame is available in its FIFO. This enables sending a burst of high priority traffic in a channel as soon as data is available. This can be enabled with the `EMAC_DMA1_CHCBSCTL.CC/EMAC_DMA2_CHCBSCTL.CC` bit of the channel 1 and channel 2 CBS control registers.

When the `EMAC_DMA1_CHCBSCTL.CC/EMAC_DMA2_CHCBSCTL.CC` bit is reset, the accumulated credit parameter in the Credit-Based Shaper Algorithm is set to zero if there is positive credit and there is no frame to transmit in a channel. The credit does not accumulate when there is no frame waiting in a channel and other channels are transmitting. When the `EMAC_DMA1_CHCBSCTL.CC/EMAC_DMA2_CHCBSCTL.CC` bit is set, the accumulated credit parameter in the Credit-Based Shaper Algorithm is not reset to zero if there is positive credit and no frame to transmit in a channel. The credit accumulates even when there is no frame waiting in a channel and other channels are transmitting.

idleSlopeCredit and sendSlopeCredit Values

The software must program the idleSlopeCredit and sendSlopeCredit values. The programmed values should be the credit accumulated or drained per clock cycle scaled by 1024, such as, $2.8 \times 1024 = 2867$ and $1.2 \times 1024 = 1229$ respectively. In addition, the software must program the hiCredit and loCredit values, scaled by 1024, to adjust for scaling of the idleSlopeCredit and sendSlopeCredit values.

This means that if computed hiCredit and loCredit values are 12000 bits and 3036 bits respectively, then the values to be programmed in the `EMAC_DMA1_CHHIC/EMAC_DMA2_CHHIC` and `EMAC_DMA1_CHLOC/EMAC_DMA2_CHLOC` registers are 12000×1024 bits and two's complement of 3036×1024 respectively.

Bandwidth Status

The hardware maintains the status of the actual bandwidth consumed by each higher priority channel (channel 1 and channel 2) in the CBS status registers (`EMAC_DMA1_CHCBSSTAT/EMAC_DMA2_CHCBSSTAT`). This allows the software to estimate the average bandwidth consumed by numerically higher traffic classes as compared to the reserved bandwidth.

The CBS status register gives the average number of bits transmitted during the previous programmed slot interval (1, 2, 4, 8, or 16 slots of 125 us) in a channel. The status register is updated even if the Credit-Based Shaper Algorithm is not enabled for a channel. The number of slots over which the average bits transmitted per slot are computed is programmed in the `EMAC_DMA1_CHCBSCTL.SLC/EMAC_DMA2_CHCBSCTL.SLC` bits. For example, if these bit fields are programmed for two slots, then the average bits are computed over slot numbers 0-1, 2-3, 4-5, and so on.

The value programmed in the `EMAC_DMA1_CHISC/EMAC_DMA2_CHISC` register of a channel is proportional to the bandwidth reserved for the channel. The software can allocate any bandwidth that is not used by the higher priority channel to the reserved bandwidth of the lower priority channel.

A lower priority channel, using the Credit-Based Shaper Algorithm, cannot use the unused reserved bandwidth of any higher priority channel that is using the Credit-Based Shaper Algorithm. However, a lower priority channel that is using the strict-priority algorithm can use the unused reserved bandwidth of any higher priority channel that uses the Credit-Based Shaper Algorithm. For example, channel 1 and channel 2 use the Credit-Based Shaper Algorithm (with reserved bandwidth of 50% and 25% respectively) and channel 0 uses the strict-priority algorithm. If channel 1 uses only 40% of the reserved bandwidth, then the remaining 10% is used by channel 0. The channel 2 cannot exceed the reserved bandwidth of 25%.

Energy-Efficient Ethernet

Energy-Efficient Ethernet (EEE) is an optional operational mode that enables the IEEE 802.3 Media Access Control (MAC) sublayer along with a family of Physical layers to operate in the Low-Power Idle (LPI) mode. The EEE operational mode supports the IEEE 802.3 MAC operation at 100 Mbps, 1000 Mbps, and 10 Gbps. The MAC supports the IEEE Standard 802.3az-2010 for EEE.

The LPI mode allows power saving by switching off parts of the communication device functionality when there is no data awaiting transmission and receipt. The systems on both sides of the link can disable some functionality and save power during the periods of low-link utilization. The MAC controls whether the system should enter or exit the LPI mode and communicates this to the PHY.

The EEE specifies the capabilities negotiation methods that the link partners can use to determine whether EEE is supported and then select the set of parameters that common to both devices.

NOTE: The EEE feature is not supported when the MAC is configured to use the RMII interface. You should activate the EEE mode only when the MAC is operating with RGMII interface.

NOTE: According to the Energy-Efficient Ethernet standard (IEEE 802.3az-2010), the LPI mode is supported only in the full-duplex mode. Therefore, you should not enable the LPI mode when the MAC Transmitter is configured for the half-duplex mode.

Transmit Path Functions

In the transmit path, the software must set the `EMAC_LPI_CTLSTAT.LPIEN` bit to indicate to the MAC to stop transmission and initiate the LPI protocol. The MAC completes the transmission in progress, generates its transmission status, and then starts transmitting the LPI pattern instead of the IDLE pattern during Interframe gap (IFG).

To make the PHY enter the LPI state, the MAC performs the following tasks:

1. De-asserts the `ETH0_TXCTL_TXEN` signal.
2. Asserts the `TX_ER` signal.
3. Sets `EMAC_TXD[n][3:0]` to 0x1 (for 100 Mbps) or `EMAC_TXD[n][7:0]` to 0x01 (for 1000 Mbps).

NOTE: The MAC maintains the same state of the `TX_EN`, `TX_ER`, and `EMAC_TXD[n]` signals for the entire duration during which the PHY remains in the LPI state.

4. Updates the status using the `EMAC_LPI_CTLSTAT.TLPIEN` bit and generates an interrupt.

To bring the PHY out of the LPI state, that is, when the software resets the `EMAC_LPI_CTLSTAT.LPIEN` bit, the MAC performs the following tasks:

1. Stops transmitting the LPI pattern and starts transmitting the IDLE pattern.
2. Starts the LPI TW TIMER: The MAC cannot start the transmission until the wake-up time specified for the PHY expires. The auto-negotiated wake-up interval is programmed using the `EMAC_LPI_TMRCTL.TWT` bit field.
3. Updates the LPI exit status using the `EMAC_LPI_CTLSTAT.TLPIEX` bit and generates an interrupt.

The *LPI Transitions (Transmit)* figure shows the behavior of `TX_EN`, `TX_ER`, and `EMAC_TXD[n][3:0]` signals during the LPI mode transitions.

Figure 24-23: LPI Transitions (Transmit)

NOTE: The MAC does not stop the `TX_CLK` clock.

NOTE: If the MAC is in the Tx LPI mode and the Tx clock is stopped, the application should not write to CSR registers that are synchronized to Tx clock domain.

NOTE: If the MAC is in the LPI mode and the host issues a soft reset or hard reset, the MAC transmitter comes out of the LPI mode.

LPI Timers

LPI LS TIMER

The LPI LS timer counts, in milliseconds, the time expired since the link status is up. Programs can enable the monitoring of Bit 3 `EMAC_I_STAT.RGMIIIS` (link status) of Register 54 (SGMII/RGMII/SMII Control and Status Register) by setting the `EMAC_LPI_CTLSTAT.PLSEN` bit.

The link status is indicated to the MAC by Bit 3 (link status) of Register 54 (RGMII Control and Status Register) or the value programmed by the software in the `EMAC_LPI_CTLSTAT.PLS` bit. If the link status is not available in Register 54 (RGMII Control and Status Register), the software should get the PHY link status by reading the PHY register and accordingly update the `EMAC_LPI_CTLSTAT.PLS` bit.

This timer is cleared every time the link goes down. It starts to increment when the link is up again and continues to increment until the value of the timer becomes equal to the terminal count. When the terminal count is reached, the timer remains at the same value as long as the link is up. The terminal count is the value programmed in the `EMAC_LPI_TMRCTL.LST` bit field. The GMII interface does not assert the LPI pattern unless the terminal count is reached. This ensures a minimum time for which no LPI pattern is asserted after a link is established with the remote station. This period is defined as 1 second in the IEEE standard 802.3-az, version D2.0. The LPI LS timer is 10-bit wide. Therefore, the software can program up to 1023 milliseconds

LPI TW TIMER

The LPI TW timer counts, in microseconds, the time expired since the de-assertion of LPI. The terminal should be programmed using the `EMAC_LPI_TMRCTL.TWT` bit. The terminal count of the timer is the value of resolved Transmit TW that is the auto-negotiated time after which the MAC can resume the normal transmit operation. After exiting the LPI mode, the MAC resumes its normal operation after the TW timer reaches the terminal count.

The MAC supports the LPI TW timer in units of microsecond. The LPI TW timer is 16-bit wide. Therefore, the software can program up to 65535 us.

NOTE: Program the `EMAC_LPI_CTLSTAT.PLS` bit to 1'b0 before switching between the GMII and MII modes. This resets the internal timers. If the mode is changed after the LPI LS timer or LPI TW timer starts, the change in the TX clock frequency can result in incorrect timeout.

LPI Interrupt

The MAC generates the LPI interrupt when the Tx or Rx side enters or exits the LPI state. The interrupt is asserted when the LPI interrupt status is set. The LPI interrupt can be cleared by reading the [EMAC_LPI_CTLSTAT](#) register.

EMAC Event Control

The EMAC has dedicated interrupt signals registered with the system event controller (SEC) module. Various interrupt sources within the EMAC peripheral are shared through this interrupt line. Refer to the [System Event Controller \(SEC\) and Generic Interrupt Controller \(GIC\)](#) chapter for details on how interrupts work in this product and how to configure them.

EMAC Interrupt Signals

Interrupts from the EMAC are triggered from the EMAC DMA layer or the EMAC CORE layer. Interrupts are triggered from EMAC DMA when a particular status bit is set in the [EMAC_DMA0_STAT](#) register. An interrupt line is asserted only when the corresponding bits are enabled in the DMA interrupt enable register. Similarly, interrupts are triggered from the EMAC CORE when a particular MMC status bit, RGMII Link status bit, or PTP status bit is set in the interrupt status register.

An interrupt line is asserted only when the corresponding bits are enabled in the MMC mask registers for MMC counters or the interrupt mask register for PTP. DMA status register also reflects the MMC interrupt status. The following lists show the two groups of interrupts in the DMA status register.

NIS – Normal Interrupt source summary:

- Transmit Interrupt
- Transmit Buffer Unavailable
- Receive Interrupt
- Early Receive Interrupt

AIS – Abnormal Interrupt source summary:

- Transmit Process Stopped
- Transmit Jabber Timeout
- Receive FIFO Overflow
- Transmit Underflow
- Receive Buffer Unavailable
- Receive Process Stopped
- Receive Watchdog Timeout
- Early Transmit Interrupt
- Fatal Bus Error

The EMAC generates an interrupt only once for simultaneous, multiple events. The driver must read the [EMAC_DMA0_STAT](#) register for the cause of the interrupt. It can generate a new interrupt once the driver has cleared the appropriate bit in DMA status register.

For example, the controller generates a receive interrupt (`EMAC_DMA0_STAT.RI` bit) and the driver begins reading the [EMAC_DMA0_STAT](#) register. Next, a receive buffer unavailable interrupt (`EMAC_DMA0_STAT.RU` bit) occurs. The driver clears the `EMAC_DMA0_STAT.RI` bit but the internal interrupt signal is not deasserted, because of the active or pending `EMAC_DMA0_STAT.RU` interrupt. The driver must scan all of the descriptors, from the last recorded position to the first one owned by the DMA, to know which descriptor has asserted the interrupt.

Interrupts are cleared by writing a 1 to the corresponding bit position in the `EMAC_DMA0_STAT` register. When all the enabled interrupts within a group are cleared, the corresponding summary bit is cleared.

An interrupt delay timer provides (receive interrupt watchdog timer register) flexible control of the receive interrupt.

When the interrupt timer is programmed with a non-zero value, it is activated as soon as the RxDMA transfers a received frame to system memory. The transfer occurs without asserting the receive interrupt. This interrupt is not enabled in the corresponding receive descriptor (`RDES1[31]` in the receive DMA descriptors).

When this timer runs out (per the programmed value), the `EMAC_DMA0_STAT.RI` bit is set. The interrupt is asserted when the corresponding `EMAC_DMA0_STAT.RI` bit is enabled in the interrupt enable register. The timer is disabled before it runs out, when a frame is transferred to memory and when the `EMAC_DMA0_STAT.RI` bit is set because it is enabled for that descriptor.

PHYINT Interrupt Signal

A PHY device can notify the EMAC when it detects changes to the link status, such as auto-negotiation or a duplex-mode change. The external PHY chip typically includes an interrupt generation pin to aid this status change notification to the MAC. This signal is typically called PHYINT. A falling or rising edge on this signal can detect a PHY interrupt at the EMAC.

In the processor, any of the GPIO pins can be used as a PHYINT signal. Use the following procedure to configure a GPIO as a PHYINT signal.

1. Program the GPIO to detect a falling or rising edge sensitive interrupt.
2. Program the PHY to generate the interrupt on a signal status change.
3. If PHYINT is asserted, read the PHY status register through the station management interface.

NOTE: The PHYINT is not part of EMAC module. However, any GPIO pin can be configured to interrupt the processor when a rising edge generated by PHY is detected.

Refer to the PORT chapter for more info on configuring GPIO pins for input.

EMAC Programming Model

This section provides the programming model of Ethernet MAC peripheral for developers.

EMAC Programming Steps

The following sections provide some general programming information. The steps are written for EMAC DMA0, but apply to DMA1 and DMA2 as well.

DMA Initialization

Use the following procedure to initialize DMA. This procedure applies to all DMA channels.

1. Perform a software reset by setting the `EMAC_DMA0_BUSMODE.SWR` bit. This action resets all of the EMAC internal registers and logic.
2. Wait for the completion of the reset process by polling the `EMAC_DMA0_BUSMODE.SWR` bit which is only cleared (automatically) after the reset operation completes.
3. Poll the `EMAC_DMA0_BMSTAT.BUSRD` and `EMAC_DMA0_BMSTAT.BUSWR` bits to confirm that all previously initiated (before software-reset) or ongoing SCB transactions are complete.
4. Program the required fields in the `EMAC_DMA0_BMODE` register:
 - a. Address aligned bursts
 - b. Fixed burst or undefined burst
 - c. Burst length values and burst mode values
 - d. Descriptor length (only valid when using ring mode)
5. Program the SCB interface options in the `EMAC_DMA0_BMODE` register. If fixed burst-length is enabled, then select the maximum burst-length possible on the SCB bus (bits `EMAC_DMA0_BMODE.BLEN4`, `EMAC_DMA0_BMODE.BLEN8`, `EMAC_DMA0_BMODE.BLEN16`).
6. Create a proper descriptor chain for transmit and receive. In addition, ensure that the DMA owns the receive descriptors (the `OWN` bit of the descriptor is set). For OSF mode, create at least two descriptors.
7. Ensure that the software creates three or more different transmit or receive descriptors in the chain before reusing any of the descriptors.
8. Initialize the `EMAC_DMA0_RXDSC_CUR` and `EMAC_DMA0_TXDSC_CUR` registers with the base address of the receive and transmit descriptors respectively.
9. Program the required fields in the `EMAC_DMA0_OPMODE` register to initialize the mode of operation as follows:
 - a. Receive and transmit store and forward
 - b. Receive and transmit threshold control
 - c. Error Frame and undersized good frame forwarding enable
 - d. OSF mode
10. Clear the interrupt requests by writing to those bits of the `EMAC_DMA0_STAT` register (interrupt bits only) that are set. For example, by writing 1 into bit 16, the normal interrupt summary clears this bit.
11. Enable the interrupts by programming the `EMAC_DMA0_IEN` register.
12. Start the receive and transmit DMA by setting the `EMAC_DMA0_OPMODE.SR` and `EMAC_DMA0_OPMODE.ST` bits.

EMAC CORE Initialization

Use the following procedure to initialize the EMAC CORE.

1. Program the EMAC management address register ([EMAC_SMI_ADDR](#)) for controlling the management cycles for external PHY. For example, physical layer address ([EMAC_SMI_ADDR.PA](#)). In addition, set the [EMAC_SMI_ADDR.SMIB](#) bit for writing into PHY and reading from PHY.
2. Read the 16-bit data of management address register ([EMAC_SMI_DATA](#)) from the PHY for link up, speed of operation, and mode of operation. Specify the appropriate address value in the [EMAC_SMI_ADDR.PA](#) bit field.
3. Program the MAC address in the [EMAC_ADDR0_HI](#) and [EMAC_ADDR0_LO](#) registers.
4. If using hash filtering, program the hash table high and low registers register ([EMAC_HASHTBL_HI](#), [EMAC_HASHTBL_LO](#)).
5. Program the fields to set the appropriate filters for the incoming frames in the MAC frame filter register ([EMAC_MACFRMFILT](#)):
 - a. Receive all.
 - b. Promiscuous mode.
 - c. Hash or perfect filter.
 - d. Unicast, multicast, broadcast, and control frames filter settings.
6. Program the fields for proper flow control in flow control register ([EMAC_FLOWCTL](#)):
 - a. Pause time and other pause frame control bits.
 - b. Receive and transmit flow control bits.
 - c. Flow control busy or backpressure activate.
7. Program the EMAC interrupt mask register bits ([EMAC_IMSK](#)), as needed.
8. Program the appropriate fields in MAC configuration register ([EMAC_MACCFG](#)). For example, inter-frame gap while transmission and jabber disable. Based on the auto-negotiation desired, set the duplex mode ([EMAC_MACCFG.DM](#) bit) or speed select ([EMAC_MACCFG.FES](#) bit).
9. Set the transmit enable ([EMAC_MACCFG.TE](#)) and receive enable ([EMAC_MACCFG.RE](#)) bits.

Performing Normal Transmit and Receive Operations

For normal transmit and receive interrupts, the program must first read the interrupt status.

1. Poll the descriptors, reading the status of the descriptor owned by the application (either transmit or receive).
2. Set the appropriate values for the descriptors, ensuring that transmit and receive descriptors are DMA descriptors to resume the transmission and reception of data.

ADDITIONAL INFORMATION: If the descriptors are not DMA (or no descriptor is available), the DMA goes into SUSPEND state.

3. Write a 0 into the Tx/Rx poll demand registers ([EMAC_DMA0_TXPOLL](#) and [EMAC_DMA0_RXPOLL](#)).
Transmit or receive operations are resumed by freeing the descriptors and issuing a poll demand.
4. Read (for the debug process), the values of the current host transmitter or receiver descriptor address pointer ([EMAC_DMA0_TXDSC_CUR](#), [EMAC_DMA0_RXDSC_CUR](#)) registers.
5. Read (for the debug process), the values of the current host transmit buffer address pointer and receive buffer address pointer ([EMAC_DMA0_TXBUF_CUR](#), [EMAC_DMA0_RXBUF_CUR](#)) registers.

Stopping and Starting Transfers

Use the following procedure to stop and start EMAC transfers.

1. Disable the transmit DMA (if applicable), by clearing the [EMAC_DMA0_OPMODE](#).ST bit.
2. Wait for any previous frame transmissions to complete. Check for completion by reading the appropriate bits of the debug register ([EMAC_DBG](#)).
3. Disable the MAC transmitter and MAC receiver by clearing the [EMAC_MACCFG](#).TE and [EMAC_MACCFG](#).RE bits.
4. Disable the receive DMA (if applicable), after ensuring that the data in the receive FIFO transfers to the system memory by reading the [EMAC_DBG](#) register.
5. Make sure that both the transmit and receive FIFOs are empty.
6. To restart the operation, first start the DMA, and then enable the MAC transmitter and receiver.

Interrupts and Interrupt Service Routines

The following procedure describes specific steps for enabling interrupts and using their ISRs.

This procedure is typically performed with EMAC and DMA initialization and operations.

1. Receive interrupts are enabled for descriptors by default. Enable transmit interrupts for individual descriptors by setting the IC bit (bit 30) in the TDES0 word of the transmit descriptor.
2. Enable the required bits in the DMA interrupt enable register ([EMAC_DMA0_IEN](#).NIE).

ADDITIONAL INFORMATION: Setting the [EMAC_DMA0_IEN](#).NIE or [EMAC_DMA0_IEN](#).AIE bits can turn on the occurrence of all normal or abnormal interrupt conditions. Individual conditions can also be enabled on using individual bits in the [EMAC_DMA0_IEN](#) register.

3. Enable MMC overflow interrupts by setting appropriate bits in the [EMAC_MMC_RXIMSK](#) and [EMAC_MMC_TXIMSK](#) registers.
4. Enable PTP interrupts by setting the [EMAC_IMSK](#).TS bit.

5. Once an EMAC interrupt is asserted and the SEC branches execution to the EMAC ISR, perform the following software program sequence.
 - a. Read DMA status from the `EMAC_DMA0_STAT` register.
 - b. Clear the interrupt source by writing 1 (W1C) to the bits that are set in the `EMAC_DMA0_STAT` register.
 - c. Check for normal/abnormal/mmc/ptp interrupts by parsing the status bits read earlier, and call the appropriate service function.

ADDITIONAL INFORMATION: Normal interrupt assertions include the transmit and receive interrupt. Abnormal interrupt assertions include the receive underflow.

6. The MMC handler functions use the following sequence.
 - a. Read the `EMAC_ISTAT` register and parse for the `EMAC_ISTAT.MMCTX` and `EMAC_ISTAT.MMCRX` bits to determine if the interrupt is a transmit counter or receive counter-interrupt.
 - b. Read the `EMAC_MMC_RXINT` or `EMAC_MMC_TXINT` registers to determine which of the counters have triggered the interrupt.
 - c. Read the respective MMC counter that caused the interrupt to clear it.
7. PTP handler functions use the following sequence:
 - a. Read the `EMAC_ISTAT.TS` bit to determine if a PTP interrupt occurred.
 - b. Read `EMAC_TM_STMPSTAT` register to determine the interrupt source by parsing the `EMAC_TM_STMPSTAT.ATSTS`, `EMAC_TM_STMPSTAT.TSTARGET0` - `EMAC_TM_STMPSTAT.TSTARGET3`, and `EMAC_TM_STMPSTAT.TSSOVF` bits.
 - c. Clear the interrupt source by reading the `EMAC_TM_STMPSTAT` register.

Enabling Checksum for Transmit and Receive

Use the following steps to enable transmit and receive checksums.

Enabling receive and transmit checksums is typically performed with EMAC and DMA initialization and operations. Transmit and receive checksum features are independent of each other.

1. To enable transmit checksum insertion:
 - a. Enable store-and-forward mode in the FIFO by setting the `EMAC_DMA0_OPMODE.TSF` bit.
 - b. Ensure that the transmit frame can be contained within the 256 byte Tx FIFO conforming to the size rule: $\text{FIFO Depth} - \text{PBL} - 3$ FIFO locations, where PBL is burst length.
 - c. Program the following necessary parameters for transmit checksum, by programming (CIC) checksum insertion control in TDES0: IP header checksum, IP header checksum and payload checksum, IP header checksum, payload checksum, and pseudo header checksum.

A higher layer such as the IP stack sends out the packet to the EMAC which inserts the checksum as configured.

2. To enable receive checksum verification:

- a. Enable receive checksum offload engine by setting the `EMAC_MACCFG.IPC` bit.
- b. Enable 8 word descriptor (32 bytes), by setting the `EMAC_DMA0_BUSMODE.ATDS` bit.
- c. Provide a total of 8 x 32-bit word space for the receive descriptor.
- d. Wait for the receive interrupt and check for extended status availability by parsing bit 0 in the `RDES0` word.
- e. If extended status available, read `RDES4` and pass to a higher layer such as the IP stack.

The higher software layer can check for IPv4/IPv6/payload type and checksum payload or header errors.

Programming the System Time Module

Use the following procedure to configure the PTP module

1. Enable the PTP module by setting the `EMAC_TM_CTL.TSENA` bit 0.
2. System Time Initialization
 - a. The time (seconds and nanoseconds) at which system time is initialized. Write the time into the `EMAC_TM_SECUPDT` and `EMAC_TM_NSECUPDT` registers.
 - b. Set `EMAC_TM_CTL.TSINIT` bit. System time is initialized and this bit is cleared automatically.
 - c. Configure binary or digital rollover of the `EMAC_TM_NSEC` register using the `EMAC_TM_CTL.TSCTRLSSR` bit.
3. System Time Coarse Correction
 - a. Write the offset time (seconds and nanoseconds) to add to or subtract from the system time using the `EMAC_TM_SECUPDT` and `EMAC_TM_NSECUPDT` registers.
 - b. Choose between add or subtract offset time using the `EMAC_TM_NSECUPDT.ADDSUB` bit.
 - c. Set the `EMAC_TM_CTL.TSUPDT` bit to correct system time with offset time. This bit is cleared automatically.
4. System Time Fine Correction
 - a. Calculate the addend value based on the input PTP clock frequency and the frequency requirement. See [Fine Correction Method](#).
 - b. Write the calculated addend value in `EMAC_TM_ADDEND` register and set the `EMAC_TM_CTL.TSADDREG` bit to update the addend value. This bit is cleared automatically.
 - c. Configure the `EMAC_TM_SUBSEC` register based on new PTP frequency.

5. Target Time Trigger (Alarm)

- a. Set the `EMAC_IMSK.TS` bit to enable PTP interrupts.
- b. Program the `EMAC_TM_PPSCTL.TRGTMODSEL0` bit with 00 or 10 (for PPS start or stop time programming).
- c. Program the time when the interrupt must trigger using the `EMAC_TM_PPS0TGTM` and `EMAC_TM_PPS0NTGTM` registers. The programmed time must be greater than the current system time.

ADDITIONAL INFORMATION: If the programmed time is not greater than the target time, a programming error occurs. The EMAC uses the `EMAC_TM_STMPSTAT.TSTRGTERR0` bit to indicate the error.

- d. Set the `EMAC_TM_CTL.TSTRIG` bit to enable the target time trigger interrupt.

After the system time reaches the programmed target time (in step 2), the target time trigger interrupt occurs. The `EMAC_TM_STMPSTAT.TSTRGTERR0` and `EMAC_ISTAT.TS` bits indicate the error. The `EMAC_TM_CTL.TSTRIG` bit is cleared automatically.

Programming the PTP for Frame Detection and Time Stamping

Use the following procedure to configure the PTP module.

1. For time stamping a transmitting frame, set the `TTSE` bit in the `TDES0` register of the corresponding frame.
2. Extend the descriptor word length from 4 words to 8 words by setting the `EMAC_DMA0_BUSMODE.ATDS` bit.
3. Configure bits 18–10 in the `EMAC_TM_CTL` register so that the PTP module detects and time stamps only specific types of received frames. Refer to the `EMAC_TM_CTL` register description for more information.
4. Enable the PTP module by setting the `EMAC_TM_CTL.TSENA` bit.
5. Initialize the system time.
6. Verify the `RDES4` register for the status of the received frame and the `RDES6` and `RDES7` registers for time stamp nanoseconds and seconds value.

Programming for Auxiliary Time Stamps

1. Set the `EMAC_IMSK.TS` bit to enable PTP interrupts.
2. Set the `EMAC_TM_CTL.TSENA` bit to enable the PTP module.
3. Initialize system time.

ADDITIONAL INFORMATION: Whenever a rising edge on the auxiliary time stamp trigger pin is detected, system time seconds and nanoseconds are captured and stored into 4-deep auxiliary time stamp FIFO. An auxiliary time stamp trigger interrupt occurs. The EMAC uses the `EMAC_TM_STMPSTAT.ATSTS` and the `EMAC_IMSK.TS` bits to indicate the interrupt.

4. Read the contents of the FIFO one-by-one through `EMAC_TM_AUXSTMP_SEC` and `EMAC_TM_AUXSTMP_NSEC` registers. One level of the FIFO is cleared when the `EMAC_TM_AUXSTMP_SEC` register is read. Therefore, read the `EMAC_TM_AUXSTMP_NSEC` register before the `EMAC_TM_AUXSTMP_SEC` register.
5. Set the `EMAC_TM_CTL.ATSFC` bit to clear the FIFO.

Programming Fixed Pulse-Per-Second Output

Use the following procedure to program the fixed PPS output.

1. Enable the PTP module by setting the `EMAC_TM_CTL.TSENA` bit.
2. Output the PPS waveform by configuring the `EMAC_TM_PPSTCTL.PPSCTL0` bits and binary or digital roll-over using the `EMAC_TM_CTL.TSCTRLSSR` bit. See [Fixed Pulse-Per-Second Output](#).

Programming Flexible Pulse-Per-Second Output

Use the following procedure to program flexible PPS output.

1. Enable the PTP module by setting the `EMAC_TM_CTL.TSENA` bit.
2. Set the `EMAC_TM_PPSTCTL.PPSEN` bit to enable flexible PPS output.
3. Program the `EMAC_TM_PPSTCTL.TRGTMODSEL0` bits with 11 or 10 (for target time trigger interrupt).
4. Program the start time value when the PPS output starts using the `EMAC_TM_PPS0TGTM` and `EMAC_TM_PPS0NTGTM` registers. Ensure that the `EMAC_TM_PPS0NTGTM.TSTRBUSY` bit is reset before programming the target time registers again.
5. Program the period of the PPS signal output using the `EMAC_TM_PPS0INTVL` register for pulse train output. Program the width of the PPS signal output in the `EMAC_TM_PPS0WIDTH` register for single pulse or pulse train output.
6. Ensure that the `EMAC_TM_PPSTCTL.PPSCTL0` bits are cleared. Then, program the bits to 0001 to start single pulse, or to 0010 to start pulse train at programmed start time (Step 4).

ADDITIONAL INFORMATION: The PPS pulse train is free-running unless stopped by a STOP pulse train at time command (`EMAC_TM_PPSTCTL.PPSCTL0 = 0100`) or STOP pulse train immediately command (`EMAC_TM_PPSTCTL.PPSCTL0 = 0101`).

7. The start of pulse generation can be canceled by giving the cancel start command (`EMAC_TM_PPSTCTL.PPSCTL0 = 0011`) before the programmed start time (Step 4) elapses.
8. Program the stop time value when the PPS output must stop using the `EMAC_TM_PPS0TGTM` and `EMAC_TM_PPS0NTGTM` registers. Ensure that the `EMAC_TM_PPS0NTGTM.TSTRBUSY` bit is reset before programming the target time registers again.
9. Ensure that the `EMAC_TM_PPSTCTL.PPSCTL0` bits are cleared. Then, program the bits to 0100. This programming stops the train of pulses on PPS signal output after the programmed stop time (Step 8) elapses.

ADDITIONAL INFORMATION: The pulse train can be stopped immediately by giving the STOP pulse train immediately command (EMAC_TM_PPSCCTL.PPSCCTL0 = 0101). Program the EMAC_TM_PPSCCTL.PPSCCTL0 bits to 0110 before the programmed stop time (Step 8) elapses to cancel the stop pulse train command (given in Step 9).

EMAC Programming Concepts

The following sections provide basic information and guidelines to help with programming the EMAC module.

IEEE 802.3 Ethernet Packet Structure

The *IEEE 802.3 Frame Structure* table provides typical frame format of an Ethernet packet. Refer to the IEEE standards for detailed information on Ethernet packets and their format.

Table 24-52: IEEE 802.3 Frame Structure

Parameter	Description	Position in Ethernet Packet	Total Bytes
PREAMBLE	This parameter is a 56-bit (7-byte) pattern of alternating 1 and 0 bits (#10101010), which allows devices on the network to detect a new incoming frame for synchronization.	1	7
SFD	The SFD (#10101011) is a 1-byte pattern designed to break the preamble pattern, and signal the start of the actual frame.	2	1
DA	48-bit destination address. This parameter can be a unicast, multicast, or broadcast address.	3	6
SA	48-bit long source address, typically a unicast, multicast, or broadcast address.	4	6
LT	Typically this field is the length, in terms of the number of bytes, and can be anywhere between 0–1500. When the value is greater than or equal to 0x0600, this field also indicates the type of special payload carried by the frame. Examples include 0x8808 for flow control and 0x0800 for IPv4.	5	2
DATA	Actual application data payload, usually between 0–1500.	6	0–1500
PAD	This field compensates for data frames that are shorter than 64 bytes long, not including the preamble.	7	0–46
FCS	The frame check sequence is a 32-bit cyclic redundancy check that detects corrupted data within the entire frame. This parameter is generated from a CRC-32 polynomial code (CRC-32-IEEE): $G(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x + 1$.	8	4

Frame Size Statistics for Application Software

Table 24-53: Ethernet Frame Size Statistics

Frame size statistics	VLAN-specific change Comments	
Information bytes/Header	4 byte 802.1Q header inserted after source address and before Type/LAN in 802.3 packets = 22 bytes.	$6 \times 2 + 2 + 4 = 18$ bytes (DA+SA+LT+FCS)
Minimum Frame Size (typical)	If DATA is NULL, 42-byte padding makes 64 bytes (42 + 22)	64 bytes. If DATA is NULL, 46-byte padding makes 64 bytes (46 + 18)
Maximum Frame Size (typical)	1522 bytes	1518 bytes (1500 bytes DATA and 18-bytes header)
Jumbo Frame Size	9022 bytes	Typical industry standard. Ethernet jumbo frame size treated as 9018 bytes.

Software Visualization of Programmable Packet Size

The *Visualization of Programmable Packet Size* table provides the byte sizes of packets with various configurations.

Table 24-54: Visualization of Programmable Packet Size

Size in Bytes	Comments
16384	Receive watchdog and transmit jabber disabled, jumbo frames enabled.
10240	Receive watchdog and transmit jabber disabled, jumbo frames disabled.
2048	Receive watchdog and transmit jabber enabled.
1518	Typical max size of Ethernet frame. Receive watchdog and transmit jabber enabled.
64	Typical minimum size of Ethernet frame.
< 64	Runt frames requiring Zero-PAD.

Ethernet Packet Structure in C

The following is an example for Ethernet packet structure in the C language.

```
typedef struct ETHER_PACKET
{
    char  dst_addr[6];           //destination address
    char  src_addr[6];           //source address
    char  length[2];             //length of actual data
    char  data[DATA_SIZE];       //application data
    char  fdlimit[DELIMIT_SIZE]; //32-bit delimit (if manual appending)
    char  fcs[4];                //crc frame checksum, used by RX buffer.
} ETHER_PACKET;
```

DMA Descriptor Implementation in C

The following code is a simple implementation of descriptors in ring and chain model in C language. Typically 4 WORDs (32-bit) are used for descriptors. Using checksum offload or the PTP engine requires 8 WORDs. Only high-level common functions across transmit and receive descriptors are considered here.

```
/* DMA Ring Descriptor */
typedef struct EMAC_DMADESC_RING
{
    unsigned int      Status;          //TDES0 OR RDES0
    unsigned int      ControlDesc;     //TDES1 OR RDES1
    unsigned int      StartAddr1;     //TDES2 OR RDES2
    unsigned int      StartAddr2;     //TDES3 OR RDES3
#ifdef CHECKSUM_OFFLOAD
    struct EMAC_EXT_STAT ExtendedStat;
#endif
} EMAC_DMADESC_RING;

/* DMA Chain Descriptor */
typedef struct EMAC_DMADESC_CHAIN
{
    unsigned int      Status;          //TDES0 OR RDES0
    unsigned int      ControlDesc;     //TDES1 OR RDES1
    unsigned int      StartAddr;      //TDES2 OR RDES2
    struct EMAC_DMADESC_CHAIN *pNextDesc; //TDES3 OR RDES3
#ifdef CHECKSUM_OFFLOAD
    struct EMAC_EXT_STAT ExtendedStat;
#endif
} EMAC_DMADESC_CHAIN;

/* Extended Status Descriptor with PTP not enabled*/
typedef struct EMAC_EXT_STAT
{
#ifdef RX_DESC
    unsigned int      CheckSumStat;    //RDES4
#endif
#ifdef TX_DESC
    unsigned int      Reserved;        //TDES4
#endif
    unsigned int      Reserved;        //RDES5 OR TDES5
    unsigned int      Reserved;        //RDES6 OR TDES6
    unsigned int      Reserved;        //RDES7 OR TDES7
} EMAC_EXT_STAT;
```

PTP Header Structure in C

The following code is an example of the PTP message format.

```
/* PTP Message Format (Refer to PTP Frame Over IPv4) */
typedef struct EMAC_PTP_HEADER
{
    unsigned char      messageType:4, //PTP Version 2 message type
```

```

transportSpecific:4;
unsigned char    versionPTP;           //PTP Version (1 or 2)
unsigned short   messageLength;
unsigned char    domainNumber;
unsigned char    RESERVED1;
unsigned short   flagField;
unsigned char    correctionField[8];
unsigned char    RESERVED2[4];
unsigned char    sourcePortIdentity[10];
unsigned short   sequenceid;
unsigned char    controlField;         //PTP Version 1 message type
unsigned char    logMessageInterval;
}EMAC_PTP_HEADER;

```

ADSP-2159x EMAC Register Descriptions

Ethernet MAC (EMAC) contains the following registers.

Table 24-55: ADSP-2159x EMAC Register List

Name	Description
EMAC_ADDR0_HI	MAC Address 0 High Register
EMAC_ADDR0_LO	MAC Address 0 Low Register
EMAC_ADDR1_HI	MAC Address 1 High Register
EMAC_ADDR1_LO	MAC Address 1 Low Register
EMAC_DBG	Debug Register
EMAC_DMA0_BMMODE	DMA SCB Bus Mode Register
EMAC_DMA0_BMSTAT	DMA SCB Status Register
EMAC_DMA0_BUSMODE	DMA Bus Mode Register
EMAC_DMA0_IEN	DMA Interrupt Enable Register
EMAC_DMA0_MISS_FRM	DMA Missed Frame Register
EMAC_DMA0_OPMODE	DMA Operation Mode Register
EMAC_DMA0_RXBUF_CUR	DMA Rx Buffer Current Register
EMAC_DMA0_RXDSC_ADDR	DMA Rx Descriptor List Address Register
EMAC_DMA0_RXDSC_CUR	DMA Rx Descriptor Current Register
EMAC_DMA0_RXIWDOG	DMA Rx Interrupt Watch Dog Register
EMAC_DMA0_RXPOLL	DMA Rx Poll Demand register
EMAC_DMA0_STAT	DMA Status Register
EMAC_DMA0_TXBUF_CUR	DMA Tx Buffer Current Register
EMAC_DMA0_TXDSC_ADDR	DMA Tx Descriptor List Address Register

Table 24-55: ADSP-2159x EMAC Register List (Continued)

Name	Description
EMAC_DMA0_TXDSC_CUR	DMA Tx Descriptor Current Register
EMAC_DMA0_TXPOLL	DMA Tx Poll Demand Register
EMAC_DMA1_BUSMODE	DMA Bus Mode Register
EMAC_DMA1_CHCBSCTL	Channel 1 Credit Shaping Control Register
EMAC_DMA1_CHCBSSTAT	Channel 1 Average Traffic Transmitted Register
EMAC_DMA1_CHHIC	Channel 1 High Credit Value Register
EMAC_DMA1_CHISC	Channel 1 Idle Slope Credit Value Register
EMAC_DMA1_CHLOC	Channel 1 Low Credit Value Register
EMAC_DMA1_CHSFCS	Channel 1 Control Bits for Slot Function Register
EMAC_DMA1_CHSSC	Channel 1 Send Slope Credit Value Register
EMAC_DMA1_IEN	DMA Interrupt Enable Register
EMAC_DMA1_MISS_FRM	DMA Missed Frame Register
EMAC_DMA1_OPMODE	DMA Operation Mode Register
EMAC_DMA1_RXBUF_CUR	DMA Rx Buffer Current Register
EMAC_DMA1_RXDSC_ADDR	DMA Rx Descriptor List Address Register
EMAC_DMA1_RXDSC_CUR	DMA Rx Descriptor Current Register
EMAC_DMA1_RXIWDOG	DMA Rx Interrupt Watch Dog Register
EMAC_DMA1_RXPOLL	DMA Rx Poll Demand Register
EMAC_DMA1_STAT	DMA Status Register
EMAC_DMA1_TXBUF_CUR	DMA Tx Buffer Current Register
EMAC_DMA1_TXDSC_ADDR	DMA Tx Descriptor List Address Register
EMAC_DMA1_TXDSC_CUR	DMA Tx Descriptor Current Register
EMAC_DMA1_TXPOLL	DMA Tx Poll Demand Register
EMAC_DMA2_BUSMODE	DMA Bus Mode Register
EMAC_DMA2_CHCBSCTL	Channel 2 Credit Shaping Control Register
EMAC_DMA2_CHCBSSTAT	Channel 2 Avg Traffic Transmitted Status Register
EMAC_DMA2_CHHIC	Channel 2 High Credit Value Register
EMAC_DMA2_CHISC	Channel 2 Idle Slope Credit Value Register
EMAC_DMA2_CHLOC	Channel 2 Low Credit Value Register
EMAC_DMA2_CHSFCS	Channel 2 Control Bits for Slot Function Register
EMAC_DMA2_CHSSC	Channel 2 Send Slope Credit Value Register

Table 24-55: ADSP-2159x EMAC Register List (Continued)

Name	Description
EMAC_DMA2_IEN	DMA Interrupt Enable Register
EMAC_DMA2_MISS_FRM	DMA Missed Frame Register
EMAC_DMA2_OPMODE	DMA Operation Mode Register
EMAC_DMA2_RXBUF_CUR	DMA Rx Buffer Current Register
EMAC_DMA2_RXDSC_ADDR	DMA Rx Descriptor List Address Register
EMAC_DMA2_RXDSC_CUR	DMA Rx Descriptor Current Register
EMAC_DMA2_RXIWDOG	DMA Rx Interrupt Watch Dog Register
EMAC_DMA2_RXPOLL	DMA Rx Poll Demand register
EMAC_DMA2_STAT	DMA Status Register
EMAC_DMA2_TXBUF_CUR	DMA Tx Buffer Current Register
EMAC_DMA2_TXDSC_ADDR	DMA Tx Descriptor List Address Register
EMAC_DMA2_TXDSC_CUR	DMA Tx Descriptor Current Register
EMAC_DMA2_TXPOLL	DMA Tx Poll Demand Register
EMAC_FLOWCTL	FLow Control Register
EMAC_GIGE_CTLSTAT	RGMII Control and Status Register
EMAC_HASHTBL_HI	Hash Table High Register
EMAC_HASHTBL_LO	Hash Table Low Register
EMAC_IMSK	Interrupt Mask Register
EMAC_IPC_RXIMSK	MMC IPC Rx Interrupt Mask Register
EMAC_IPC_RXINT	MMC IPC Rx Interrupt Register
EMAC_ISTAT	Interrupt Status Register
EMAC_L3L4_CTL	Layer3 and Layer4 Control Register
EMAC_L3_ADDR0	Layer 3 Address0 Register
EMAC_L3_ADDR1	Layer 3 Address1 Register
EMAC_L3_ADDR2	Layer 3 Address2 Register
EMAC_L3_ADDR3	Layer 3 Address3 Register
EMAC_L4_ADDR	Layer 4 Address Register
EMAC_LPI_CTLSTAT	Low Power Idle Control and Status Register
EMAC_LPI_TMRCTL	Low Power Idle Timeout Register
EMAC_MACCFG	MAC Configuration Register
EMAC_MACFRMFILT	MAC Rx Frame Filter Register

Table 24-55: ADSP-2159x EMAC Register List (Continued)

Name	Description
EMAC_MAC_AVCTL	AV MAC Control Register
EMAC_MMC_CTL	MMC Control Register
EMAC_MMC_RXIMSK	MMC Rx Interrupt Mask Register
EMAC_MMC_RXINT	MMC Rx Interrupt Register
EMAC_MMC_TXIMSK	MMC TX Interrupt Mask Register
EMAC_MMC_TXINT	MMC Tx Interrupt Register
EMAC_RX1024TOMAX_GB	Rx 1024- to Max-Byte Frames (Good/Bad) Register
EMAC_RX128TO255_GB	Rx 128- to 255-Byte Frames (Good/Bad) Register
EMAC_RX256TO511_GB	Rx 256- to 511-Byte Frames (Good/Bad) Register
EMAC_RX512TO1023_GB	Rx 512- to 1023-Byte Frames (Good/Bad) Register
EMAC_RX64_GB	Rx 64-Byte Frames (Good/Bad) Register
EMAC_RX65TO127_GB	Rx 65- to 127-Byte Frames (Good/Bad) Register
EMAC_RXALIGN_ERR	Rx alignment Error Register
EMAC_RXBCASTFRM_G	Rx Broadcast Frames (Good) Register
EMAC_RXCRC_ERR	Rx CRC Error Register
EMAC_RXCTLFRM_G	Rx Good Control Frames Register
EMAC_RXFIFO_OVF	Rx FIFO Overflow Register
EMAC_RXFRMCNT_GB	Rx Frame Count (Good/Bad) Register
EMAC_RXICMP_ERR_FRM	Rx ICMP Error Frames Register
EMAC_RXICMP_ERR_OCT	Rx ICMP Error Octets Register
EMAC_RXICMP_GD_FRM	Rx ICMP Good Frames Register
EMAC_RXICMP_GD_OCT	Rx ICMP Good Octets Register
EMAC_RXIPV4_FRAG_FRM	Rx IPv4 Datagrams Fragmented Frames Register
EMAC_RXIPV4_FRAG_OCT	Rx IPv4 Datagrams Fragmented Octets Register
EMAC_RXIPV4_GD_FRM	Rx IPv4 Datagrams (Good) Register
EMAC_RXIPV4_GD_OCT	Rx IPv4 Datagrams Good Octets Register

EMAC_TXMCASTFRM_G	Tx Multicast Frames (Good) Register
EMAC_TXMCASTFRM_GB	Tx Multicast Frames (Good/Bad) Register
EMAC_TXMULTCOL_G	Tx Multiple Collision (Good) Register
EMAC_TXOCTCNT_G	Tx Octet Count (Good) Register
EMAC_TXOCTCNT_GB	Tx OCT Count (Good/Bad) Register
EMAC_TXOVRSIZE_G	Number of Tx Frames (Good) greater than maxsize
EMAC_TXPAUSEFRM	Tx Pause Frame Register
EMAC_TXSNGCOL_G	Tx Single Collision (Good) Register
EMAC_TXUCASTFRM_GB	Tx Unicast Frames (Good/Bad) Register
EMAC_TXUNDR_ERR	Tx Underflow Error Register
EMAC_TXVLANFRM_G	Tx VLAN Frames (Good) Register
EMAC_VLANTAG	VLAN Tag Register
EMAC_VLAN_HSHTBL	VLAN Hash Table Register
EMAC_VLAN_INCL	VLAN Tag Inclusion or Replacement Register
EMAC_WDOG_TIMEOUT	Watchdog Timeout Register

MAC Address 0 High Register

The `EMAC_ADDR0_HI` register holds the address 0 high bits.

Figure 24-24: EMAC_ADDR0_HI Register Diagram

Table 24-56: EMAC_ADDR0_HI Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
15:0 (R/W)	ADDR	Address. The <code>EMAC_ADDR0_HI</code> . <code>ADDR</code> bits contain the upper 16 bits (47:32) of the 6-byte first MAC address. This address is used by the MAC for filtering for received frames and for inserting the MAC address in the Transmit Flow Control (PAUSE) Frames.

MAC Address 0 Low Register

The `EMAC_ADDR0_LO` register holds the address 0 low bits.

Figure 24-25: `EMAC_ADDR0_LO` Register Diagram

Table 24-57: `EMAC_ADDR0_LO` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	ADDR	Address. The <code>EMAC_ADDR0_LO.ADDR</code> bits contain the lower 32 bits of the 6-byte first MAC address. This address is used by the MAC for filtering for received frames and for inserting the MAC address in the Transmit Flow Control (PAUSE) Frames.

MAC Address 1 High Register

The `EMAC_ADDR1_HI` register Contains the higher 16 bits of the second MAC address.

Figure 24-26: EMAC_ADDR1_HI Register Diagram

Table 24-58: EMAC_ADDR1_HI Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W)	AE	Address Enable. The <code>EMAC_ADDR1_HI . AE</code> bit, When this bit is set, the address filter module uses the second MAC address for perfect filtering.
30 (R/W)	SA	Source Address. The <code>EMAC_ADDR1_HI . SA</code> bit, When this bit is set, the <code>MAC Address1[47:0]</code> is used to compare with the SA fields of the received frame.
29:24 (R/W)	MBC	Mask byte control. The <code>EMAC_ADDR1_HI . MBC</code> bit, are mask control bits for comparison of each of the MAC Address bytes.
15:0 (R/W)	ADDRHI	Mac address. The <code>EMAC_ADDR1_HI . ADDRHI</code> bit, contains the upper 16 bits (47:32) of the second 6-byte MAC address.

MAC Address 1 Low Register

The `EMAC_ADDR1_LO` register Contains the lower 32 bits of the second MAC address.

Figure 24-27: EMAC_ADDR1_LO Register Diagram

Table 24-59: EMAC_ADDR1_LO Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	ADDRLO	Mac Address. The <code>EMAC_ADDR1_LO.ADDRLO</code> bit, contains the lower 32 bits of the first 6-byte MAC address. This is used by the MAC for filtering the received frames and inserting the MAC address in the Transmit Flow Control (Pause) Frames.

Debug Register

The `EMAC_DBG` register contains EMAC debug status information.

Figure 24-28: EMAC_DBG Register Diagram

Table 24-60: EMAC_DBG Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
25 (R/NW)	TXFIFOFULL	Tx FIFO Full. The <code>EMAC_DBG.TXFIFOFULL</code> bit, when high, indicates that the MFL TxStatus FIFO is full, and the MFL cannot accept any more frames for transmission.
24 (R/NW)	TXFIFONE	Tx FIFO Not Empty. The <code>EMAC_DBG.TXFIFONE</code> bit, when high, indicates that the MFL TxFIFO is not empty and has some data left for transmission.
22 (R/NW)	TXFIFOACT	Tx FIFO Active. The <code>EMAC_DBG.TXFIFOACT</code> bit, when high, indicates that the MFL TxFIFO write controller is active and transferring data to the TxFIFO.
21:20 (R/NW)	TXFIFOCTLST	Tx FIFO Controller State. The <code>EMAC_DBG.TXFIFOCTLST</code> bits indicate the state of the TxFIFO read controller as: 00=IDLE state, 01=READ state (transferring data to MAC transmitter), 10=Waiting for TxStatus from MAC transmitter, and 11=Writing the received TxStatus or flushing the TxFIFO

Table 24-60: EMAC_DBG Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
19 (R/NW)	TXPAUSE	Tx Paused. The EMAC_DBG.TXPAUSE bit, when high, indicates that the MAC transmitter is in PAUSE condition (in full-duplex only) and does not schedule any frame for transmission.
18:17 (R/NW)	TXFRCTL	Tx Frame Controller State. The EMAC_DBG.TXFRCTL bits indicate the state of the MAC transmit frame controller module.
	0	Idle Frame controller is in idle state.
	1	Wait Frame controller is waiting for status of previous frame or IFG/backoff period end.
	2	Pause Frame controller is generating and transmitting a PAUSE control frame (in full duplex mode).
	3	Transmit Frame controller is transferring input frame for transmission.
16 (R/NW)	MMTEA	MM Tx Engine Active. The EMAC_DBG.MMTEA bit, when high, indicates that the MAC core transmit protocol engine is actively transmitting data and is not in IDLE state.
9:8 (R/NW)	RXFIFOST	Rx FIFO State. The EMAC_DBG.RXFIFOST bits give the status of the RxFIFO fill level and indicate the relationship to the flow-control activation threshold.
	0	Rx FIFO Empty
	1	Rx FIFO Below De-activate FCT
	2	Rx FIFO Above De-activate FCT
	3	Rx FIFO Full
6:5 (R/NW)	RXFIFOCTLST	Rx FIFO Controller State. The EMAC_DBG.RXFIFOCTLST bits give the state of the RxFIFO read controller.
	0	Idle Read controller is in idle state.
	1	Read Data Read controller is reading frame data.
	2	Read Status Read controller is reading frame status or time-stamp.
	3	Flush Read controller is flushing the frame data and status.
4 (R/NW)	RXFIFOACT	Rx FIFO Active. The EMAC_DBG.RXFIFOACT bit, when high, indicates that the MFL RxFIFO write controller is active and is transferring a received frame to the FIFO.

Table 24-60: EMAC_DBG Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
2:1 (R/NW)	SFIFOST	Small FIFO State. The EMAC_DBG.SFIFOST bit, when high, indicates the active state of the small FIFO read and write controllers respectively of the MAC receive frame controller module.
0 (R/NW)	MMREA	MM Rx Engine Active. The EMAC_DBG.MMREA bit, when high, indicates that the MAC core receive protocol engine is actively receiving data and is not in IDLE state.

DMA SCB Bus Mode Register

The `EMAC_DMA0_BMMODE` register selects EMAC DMA system cross bar bus mode features.

Figure 24-29: EMAC_DMA0_BMMODE Register Diagram

Table 24-61: EMAC_DMA0_BMMODE Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W)	ENLPI	Enable Low Power Interface. The <code>EMAC_DMA0_BMMODE.ENLPI</code> bit field's when set to 1, it enable LPI mode supported by the GMAC configuration and accepts the LPI request from the system Clock controller.
22:20 (R/W)	WROSRLMT	SCB Maximum Write Outstanding Request. The <code>EMAC_DMA0_BMMODE.WROSRLMT</code> bit field's value limits the maximum outstanding request on the SCB write interface. Maximum outstanding requests = <code>WR_OSR_LMT+1</code> . EMAC-SCB supports up to 4 outstanding write requests.
18:16 (R/W)	RDOSRLMT	SCB Maximum Read Outstanding Request. The <code>EMAC_DMA0_BMMODE.RDOSRLMT</code> bit field's value limits the maximum outstanding request on the SCB read interface. Maximum outstanding requests = <code>RD_OSR_LMT+1</code> . EMAC-SCB supports up to 4 outstanding read requests.
13 (R/W)	ONEKBBE	1K Boundary Crossing Enable. When the <code>EMAC_DMA0_BMMODE.ONEKBBE</code> bit is set, the GMAC extensible bus master performs burst transfers that do not cross 1 KB boundary. When reset, the GMAC extensible bus master performs burst transfers that do not cross 4 KB boundary.

Table 24-61: EMAC_DMA0_BMMODE Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
12 (R/NW)	AAL	Address Aligned Beats. The EMAC_DMA0_BMMODE.AAL bit (read-only) reflects the state of the EMAC_DMA0_BUSMODE.AAL bit. When this bit is set to 1, EMAC-SCB performs address-aligned burst transfers on both read and write channels.
3 (R/W)	BLN16	SCB Burst Length 16. The EMAC_DMA0_BMMODE.BLEN16 bit, when set (or when EMAC_DMA0_BMMODE.UNDEF is set to 1), directs the EMAC-SCB to select a burst length of 16 on the SCB master interface.
2 (R/W)	BLN8	SCB Burst Length 8. The EMAC_DMA0_BMMODE.BLEN8 bit, when set (or when EMAC_DMA0_BMMODE.UNDEF is set to 1), directs the EMAC-SCB to select a burst length of 8 on the SCB master interface.
1 (R/W)	BLN4	SCB Burst Length 4. The EMAC_DMA0_BMMODE.BLEN4 bit, when set (or when EMAC_DMA0_BMMODE.UNDEF is set to 1), directs the EMAC-SCB to select a burst length of 4 on the SCB master interface.
0 (R/NW)	UNDEF	SCB Undefined Burst Length. The EMAC_DMA0_BMMODE.UNDEF bit (read-only) indicates the complement (invert) value of EMAC_DMA0_BUSMODE.FB bit. When this bit is set to 1, the EMAC-SCB is allowed to perform any burst length equal to or below the maximum allowed burst length as programmed in bits[3:1]. When this bit is set to 0, the EMAC-SCB is allowed to perform only fixed burst lengths as indicated by 16/8/4, or a burst length of 1.

DMA SCB Status Register

The `EMAC_DMA0_BMSTAT` register indicates EMAC DMA system cross bar status.

Figure 24-30: EMAC_DMA0_BMSTAT Register Diagram

Table 24-62: EMAC_DMA0_BMSTAT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
1 (R/NW)	BUSRD	Bus (SCB master) Read Active. The <code>EMAC_DMA0_BMSTAT.BUSRD</code> bit, when high, indicates that SCB Master's read channel is active and transferring data.
0 (R/NW)	BUSWR	Bus (SCB master) Write Active. The <code>EMAC_DMA0_BMSTAT.BUSWR</code> bit, when high, indicates that SCB Master's write channel is active and transferring data.

DMA Bus Mode Register

The `EMAC_DMA0_BUSMODE` register selects the DMA bus operating modes for EMAC DMA.

Figure 24-31: EMAC_DMA0_BUSMODE Register Diagram

Table 24-63: EMAC_DMA0_BUSMODE Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
25 (R/W)	AAL	Address Aligned Bursts. The <code>EMAC_DMA0_BUSMODE.AAL</code> bit, when set high and the <code>FB</code> bit equals 1, directs the SCB interface to generate all bursts aligned to the start address LS bits. If the <code>FB</code> bit is equal to 0, the first burst (accessing the data buffers start address) is not aligned, but subsequent bursts are aligned to the address.
24 (R/W)	PBL8	PBL * 8. The <code>EMAC_DMA0_BUSMODE.PBL8</code> bit, when set high, multiplies the PBL value programmed (bits [22:17] and bits [13:8]) eight times. Therefore, the DMA transfers the data in 8, 16, and 32 beats depending on the PBL value.
23 (R/W)	USP	Use Separate PBL. The <code>EMAC_DMA0_BUSMODE.USP</code> bit, when set high, configures the Rx DMA to use the value configured in bits [22:17] as PBL while the PBL value in bits [13:8] is applicable to Tx DMA operations only.

Table 24-63: EMAC_DMA0_BUSMODE Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
22:17 (R/W)	RPBL	Receive Programmable Burst Length. The <code>EMAC_DMA0_BUSMODE.RPBL</code> bits indicate the maximum number of beats to be transferred in one Rx DMA transaction. This is the maximum value that is used in a single block Read/Write. The Rx DMA always attempts to burst as specified in RPBL every time it starts a Burst transfer on the host bus. RPBL can be programmed with permissible values of 1, 2, 4, 8, 16, and 32. Any other value results in undefined behavior. These bits are valid and applicable only when USP is set high.
16 (R/W)	FB	Fixed Burst. The <code>EMAC_DMA0_BUSMODE.FB</code> bit controls whether the SCB Master interface performs fixed burst transfers or not. See the <code>EMAC_DMA0_BMODE.UNDEF</code> bit description for more information.
13:8 (R/W)	PBL	Programmable Burst Length. The <code>EMAC_DMA0_BUSMODE.PBL</code> bits indicate the maximum number of beats to be transferred in one DMA transaction. This is the maximum value that is used in a single block Read/Write. The DMA always attempts to burst as specified in PBL each time it starts a Burst transfer on the host bus. Any other value results in undefined behavior. When USP is set high, this PBL value is applicable for Tx DMA transactions only. $PBL\text{-max limit} = (FIFO\text{ size} / 2) / 4.$ $PBL\text{-max limit (transmit)} = 256\text{ bytes} / 2 / 4 = 32.$ $PBL\text{-max limit (receive)} = 128\text{ bytes} / 2 / 4 = 16.$ Note that this PBL is at the DMA end. If $PBL = 32$ and if <code>BLEN16</code> is enabled, the DMA automatically splits 32 bursts in to 2×16 bursts. If <code>EMAC_DMA0_BUSMODE.PBL = 8</code>, and if <code>EMAC_DMA0_BMODE.BLEN16</code> is enabled, the max burst is limited to <code>EMAC_DMA0_BMODE.BLEN8</code>. If <code>EMAC_DMA0_BUSMODE.PBL8</code> bit is set, the programmed PBL value is multiplied by 8 times internally. However, the result cannot be more than the above maximum limits specified above.
7 (R/W)	ATDS	Alternate Descriptor Size. The <code>EMAC_DMA0_BUSMODE.ATDS</code> bit, when set, increases the size of the alternate descriptor to 32 bytes (8 DWORDS). This is required when the Advanced Time Stamp feature or Full IPC Offload Engine is enabled in the receiver. When reset, the descriptor size reverts back to 4 DWORDS (16 bytes). The enhanced descriptor is not required if the Advanced Time Stamp and IPC Full Checksum Offload features are not enabled. In such case, you can use the 16 bytes descriptor to save 4 bytes of memory.

Table 24-63: EMAC_DMA0_BUSMODE Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
6:2 (R/W)	DSL	Descriptor Skip Length. The EMAC_DMA0_BUSMODE.DSL bit specifies the number of 32-bit words to skip between two unchained descriptors. The address skipping starts from the end of current descriptor to the start of next descriptor. When DSL value is equal to zero, then the descriptor table is taken as contiguous by the DMA, in Ring mode.
0 (R/W1S)	SWR	Software Reset. The EMAC_DMA0_BUSMODE.SWR bit, when set, directs the MAC DMA Controller to reset all MAC Subsystem internal registers and logic. It is cleared automatically after the reset operation has completed in all of the core clock domains. Read a 0 value in this bit before re-programming any register of the core. Note: The reset operation is completed only when all the resets in all the active clock domains are de-asserted. Therefore, it is essential that all the PHY inputs clocks (applicable for the selected PHY interface) are present for software reset completion. This field cleared to 1b0 by the core (Self Clear). The application cannot clear this type of field, and a register write of 1b0 to this bit has no effect on this field.

DMA Interrupt Enable Register

The `EMAC_DMA0_IEN` register enables (unmasks) EMAC DMA interrupts.

Figure 24-32: EMAC_DMA0_IEN Register Diagram

Table 24-64: EMAC_DMA0_IEN Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
16 (R/W)	NIE	Normal Interrupt Summary Enable. The <code>EMAC_DMA0_IEN.NIE</code> bit, when set, enables a normal interrupt. When this bit is reset, a normal interrupt is disabled. This bit enables the following bits: <code>EMAC_DMA0_STAT.TI</code> , <code>EMAC_DMA0_STAT.TU</code> , <code>EMAC_DMA0_STAT.RI</code> , and <code>EMAC_DMA0_STAT.ERI</code> .
15 (R/W)	AIE	Abnormal Interrupt Summary Enable. The <code>EMAC_DMA0_IEN.AIE</code> bit, when set, enables an abnormal interrupt. When this bit is reset, an Abnormal Interrupt is disabled. This bit enables the following bits: <code>EMAC_DMA0_STAT.TPS</code> , <code>EMAC_DMA0_STAT.TJT</code> , <code>EMAC_DMA0_STAT.OVF</code> , <code>EMAC_DMA0_STAT.RU</code> , <code>EMAC_DMA0_STAT.RPS</code> , <code>EMAC_DMA0_STAT.RWT</code> , <code>EMAC_DMA0_STAT.ETI</code> , and <code>EMAC_DMA0_STAT.FBI</code> .

Table 24-64: EMAC_DMA0_IEN Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
14 (R/W)	ERE	Early Receive Interrupt Enable. The EMAC_DMA0_IEN.ERE bit, when set (and with EMAC_DMA0_IEN.NIE =1), enables the Early Receive Interrupt. When this bit is reset, Early Receive Interrupt is disabled.
13 (R/W)	FBE	Fatal Bus Error Enable. The EMAC_DMA0_IEN.FBE bit, when set (and with EMAC_DMA0_IEN.AIE =1), enables the Fatal Bus Error Interrupt. When this bit is reset, Fatal Bus Error Enable Interrupt is disabled.
10 (R/W)	ETE	Early Transmit Interrupt Enable. The EMAC_DMA0_IEN.ETE bit, when this bit is set (and with EMAC_DMA0_IEN.AIE =1), enables the Early Transmit Interrupt. When this bit is reset, Early Transmit Interrupt is disabled.
9 (R/W)	RWE	Receive Watchdog Timeout Enable. The EMAC_DMA0_IEN.RWE bit, when set (and with EMAC_DMA0_IEN.AIE =1), enables the Receive Watchdog Timeout Interrupt. When this bit is reset, Receive Watchdog Timeout Interrupt is disabled.
8 (R/W)	RSE	Receive Stopped Enable. The EMAC_DMA0_IEN.RSE bit, when set (and with EMAC_DMA0_IEN.AIE =1), enables the Receive Stopped Interrupt is enabled. When this bit is reset, Receive Stopped Interrupt is disabled.
7 (R/W)	RUE	Receive Buffer Unavailable Enable. The EMAC_DMA0_IEN.RUE bit, when set (and with EMAC_DMA0_IEN.AIE =1), enables the Receive Buffer Unavailable Interrupt. When this bit is reset, the Receive Buffer Unavailable Interrupt is disabled.
6 (R/W)	RIE	Receive Interrupt Enable. The EMAC_DMA0_IEN.RIE bit, when set (and with EMAC_DMA0_IEN.NIE =1), enables the Receive Interrupt. When this bit is reset, Receive Interrupt is disabled.
5 (R/W)	UNE	Underflow Interrupt Enable. The EMAC_DMA0_IEN.UNE bit, when set (and with EMAC_DMA0_IEN.AIE =1), enables the Transmit Underflow Interrupt. When this bit is reset, Underflow Interrupt is disabled.
4 (R/W)	OVE	Overflow Interrupt Enable. The EMAC_DMA0_IEN.OVE bit, when set (and with EMAC_DMA0_IEN.AIE =1), enables the Receive Overflow Interrupt. When this bit is reset, Overflow Interrupt is disabled.

Table 24-64: EMAC_DMA0_IEN Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
3 (R/W)	TJE	Transmit Jabber Timeout Enable. The EMAC_DMA0_IEN.TJE bit, when set (and with EMAC_DMA0_IEN.AIE =1), enables the Transmit Jabber Timeout Interrupt. When this bit is reset, Transmit Jabber Timeout Interrupt is disabled.
2 (R/W)	TUE	Transmit Buffer Unavailable Enable. The EMAC_DMA0_IEN.TUE bit, when set (and with EMAC_DMA0_IEN.NIE =1), enables the Transmit Buffer Unavailable Interrupt. When this bit is reset, Transmit Buffer Unavailable Interrupt is disabled.
1 (R/W)	TSE	Transmit Stopped Enable. The EMAC_DMA0_IEN.TSE bit, when set (and with EMAC_DMA0_IEN.AIE =1), enables the Transmission Stopped Interrupt. When this bit is reset, Transmission Stopped Interrupt is disabled.
0 (R/W)	TIE	Transmit Interrupt Enable. The EMAC_DMA0_IEN.TIE bit, when set (and with EMAC_DMA0_IEN.NIE =1), enables the Transmit Interrupt. When this bit is reset, Transmit Interrupt is disabled.

DMA Missed Frame Register

The `EMAC_DMA0_MISS_FRM` register contains counters for EMAC DMA missed frames and buffer overflows.

Figure 24-33: EMAC_DMA0_MISS_FRM Register Diagram

Table 24-65: EMAC_DMA0_MISS_FRM Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
28 (RC/NW)	OVFFIFO	Overflow bit for FIFO Overflow Counter. The <code>EMAC_DMA0_MISS_FRM.OVFFIFO</code> bit holds the overflow bit for FIFO Overflow Counter.
27:17 (RC/NW)	MISSFROV	Missed Frames Buffer Overflow. The <code>EMAC_DMA0_MISS_FRM.MISSFROV</code> bits indicate the number of frames missed by the application due to buffer overflow.
16 (RC/NW)	OVFMIS	Overflow bit for Missed Frame Counter. The <code>EMAC_DMA0_MISS_FRM.OVFMIS</code> bit holds the overflow bit for the Missed Frame Counter.
15:0 (RC/NW)	MISSFRUN	Missed Frames Unavailable Buffer. The <code>EMAC_DMA0_MISS_FRM.MISSFRUN</code> bits indicate the number of frames missed by the controller because of the Application Receive Buffer being unavailable.

DMA Operation Mode Register

The `EMAC_DMA0_OPMODE` register selects receive and transmit DMA operating modes.

Figure 24-34: `EMAC_DMA0_OPMODE` Register Diagram

Table 24-66: `EMAC_DMA0_OPMODE` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
26 (R/W)	DT	Disable Dropping TCP/IP Errors. The <code>EMAC_DMA0_OPMODE.DT</code> bit, when set, directs the core not to drop frames that only have errors detected by the Receive Checksum Offload engine. Such frames do not have any errors (including FCS error) in the Ethernet frame received by the MAC but have errors in the encapsulated payload only. When this bit is reset, all error frames are dropped if the <code>EMAC_DMA0_OPMODE.FEF</code> bit is reset.
25 (R/W)	RSF	Receive Store and Forward. The <code>EMAC_DMA0_OPMODE.RSF</code> bit, when set, directs the MFL only to read a frame from the Rx FIFO after the complete frame has been written to it, ignoring the <code>EMAC_DMA0_OPMODE.RTC</code> bits. When this bit is reset, the Rx FIFO operates in threshold mode, subject to the threshold specified by the <code>EMAC_DMA0_OPMODE.RTC</code> bits.
24 (R/W)	DFF	Disable Flushing of received Frames. The <code>EMAC_DMA0_OPMODE.DFF</code> bit, when set, directs the Rx DMA not to flush any frames because of the unavailability of receive descriptors/buffers as it does normally when this bit is reset.

Table 24-66: EMAC_DMA0_OPMODE Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration																
21 (R/W)	TSF	Transmit Store and Forward. The EMAC_DMA0_OPMODE . TSF bit, when set, starts transmission when a full frame resides in the MFL Transmit FIFO. When this bit is set, the TTC values specified in Register 6[16:14] are ignored. This bit should be changed only when transmission is stopped.																
20 (R/W1S)	FTF	Flush Transmit FIFO. The EMAC_DMA0_OPMODE . FTF bit, when set, directs the transmit FIFO controller logic to reset to its default values and thus all data in the Tx FIFO is lost/flushed. This bit is cleared internally when the flushing operation is completed fully. The Operation Mode register should not be written to until this bit is cleared. The data which is already accepted by the MAC transmitter is not flushed. It is scheduled for transmission and results in underflow and runt frame transmission. Note: The flush operation completes only after emptying the Tx FIFO of its contents and all the pending Transmit Status of the transmitted frames are accepted by the host. In order to complete this flush operation, the PHY transmit clock is required to be active. This field cleared to 1b0 by the core (Self Clear). The application cannot clear this type of field, and a register write of 1b0 to this bit has no effect on this field.																
16:14 (R/W)	TTC	Transmit Threshold Control. The EMAC_DMA0_OPMODE . TTC bits control the threshold level of the MFL Transmit FIFO. Transmission starts when the frame size within the MFL Transmit FIFO is larger than the threshold. In addition, full frames with a length less than the threshold are also transmitted. These bits are used only when the EMAC_DMA0_OPMODE . TSF bit is reset. The value =011 is not used. <table><tr><td>0</td><td>64</td></tr><tr><td>1</td><td>128</td></tr><tr><td>2</td><td>192</td></tr><tr><td>3</td><td>256</td></tr><tr><td>4</td><td>40</td></tr><tr><td>5</td><td>32</td></tr><tr><td>6</td><td>24</td></tr><tr><td>7</td><td>16</td></tr></table>	0	64	1	128	2	192	3	256	4	40	5	32	6	24	7	16

6	24																	
7	16																	

Table 24-66: EMAC_DMA0_OPMODE Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
13 (R/W)	ST	Start/Stop Transmission. The EMAC_DMA0_OPMODE.ST bit, when set, places transmission in the Running state, and the DMA checks the Transmit List at the current position for a frame to be transmitted. Descriptor acquisition is attempted either from the current position in the list, which is the Transmit List Base Address set by Transmit Descriptor List Address, or from the position retained when transmission was stopped previously. If the current descriptor is not owned by the DMA, transmission enters the Suspended state, and the EMAC_DMA0_STAT.TU bit is set. The Start Transmission command is effective only when transmission is stopped. If the command is issued before setting the EMAC_DMA0_TXDSC_CUR address register, then the DMA behavior is unpredictable. When this bit is reset, the transmission process is placed in the Stopped state after completing the transmission of the current frame. The Next Descriptor position in the Transmit List is saved, and becomes the current position when transmission is restarted. The stop transmission command is effective only when the transmission of the current frame is complete or the transmission is in the Suspended state.
7 (R/W)	FEF	Forward Error Frames. The EMAC_DMA0_OPMODE.FEF bit, when reset, directs the Rx FIFO to drop frames with error status (CRC error, collision error, giant frame, watchdog timeout, overflow). However, if the frames start byte (write) pointer is already transferred to the read controller side (in Threshold mode), then the frames are not dropped. When EMAC_DMA0_OPMODE.FEF bit is set, all frames except runt error frames are forwarded to the DMA. But when Rx FIFO overflows when a partial frame is written, then such frames are dropped even when EMAC_DMA0_OPMODE.FEF is set.
6 (R/W)	FUF	Forward Undersized good Frames. The EMAC_DMA0_OPMODE.FUF bit, when set, directs the Rx FIFO to forward Undersized frames (frames with no Error and length less than 64 bytes) including pad-bytes and CRC). When reset, the Rx FIFO drops all frames of less than 64 bytes, unless it is already transferred because of lower value of Receive Threshold (for example, EMAC_DMA0_OPMODE.RTC = 01).
5 (R/W)	DGF	Drop Gaint Frames. The EMAC_DMA0_OPMODE.DGF bit, when set, the MAC drops the received giant frames in the Rx FIFO, that is, frames that are larger than the computed giant frame limit. When reset, the MAC does not drop the giant frames in the Rx FIFO.

Table 24-66: EMAC_DMA0_OPMODE Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
4:3 (R/W)	RTC	Receive Threshold Control. The <code>EMAC_DMA0_OPMODE.RTC</code> bits control the threshold level of the MFL Receive FIFO. Transfer (request) to DMA starts when the frame size within the MFL Receive FIFO is larger than the threshold. In addition, full frames with a length less than the threshold are transferred automatically. These bits are valid only when the <code>EMAC_DMA0_OPMODE.RSF</code> bit is zero, and are ignored when the <code>EMAC_DMA0_OPMODE.RSF</code> bit is set to 1. The value =11 is not used.
		0 64
		1 32
		2 96
		3 128
2 (R/W)	OSF	Operate on Second Frame. The <code>EMAC_DMA0_OPMODE.OSF</code> bit, when set, instructs the DMA to process a second frame of Transmit data even before status for first frame is obtained.
1 (R/W)	SR	Start/Stop Receive. The <code>EMAC_DMA0_OPMODE.SR</code> bit, when set, places the Receive process in the Running state. The DMA attempts to acquire the descriptor from the Receive list and processes incoming frames. Descriptor acquisition is attempted from the current position in the list, which is the address set by DMA Receive Descriptor List Address or the position retained when the Receive process was previously stopped. If no descriptor is owned by the DMA, reception is suspended, and the <code>EMAC_DMA0_STAT.RU</code> bit is set. The Start Receive command is effective only when reception has stopped. If the command was issued before setting <code>EMAC_DMA0_RXDSC_CUR</code> address register, DMA behavior is unpredictable. When this bit is cleared, Rx DMA operation is stopped after the transfer of the current frame. The next descriptor position in the Receive list is saved and becomes the current position after the Receive process is restarted. The Stop Receive command is effective only when the Receive process is in either the Running (waiting for receive packet) or in the Suspended state.

DMA Rx Buffer Current Register

The `EMAC_DMA0_RXBUF_CUR` register holds the pointer to the current receive DMA buffer.

Figure 24-35: EMAC_DMA0_RXBUF_CUR Register Diagram

Table 24-67: EMAC_DMA0_RXBUF_CUR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	ADDR	Host Receive Current Buffer Address. The <code>EMAC_DMA0_RXBUF_CUR.ADDR</code> bit field points to the current Receive Buffer address being read by the DMA. Pointer updated by DMA during operation. Cleared on Reset.

DMA Rx Descriptor List Address Register

The `EMAC_DMA0_RXDSC_ADDR` register holds the address for the DMA receive descriptor list. Writing to this Register is permitted only when reception is stopped. When stopped, this must be written to before the receive Start command is given. The processor can write to `EMAC_DMA0_RXDSC_ADDR` only when Rx DMA has stopped (`EMAC_DMA0_OPMODE.SR` bit =0). When stopped, it can be written with a new descriptor list address. When the processor sets the `EMAC_DMA0_OPMODE.SR` bit to 1, the DMA takes the newly programmed descriptor base address. If this register is not changed when the `EMAC_DMA0_OPMODE.SR` bit is cleared to 0, the DMA takes the descriptor address where it was stopped earlier.

Figure 24-36: `EMAC_DMA0_RXDSC_ADDR` Register Diagram

Table 24-68: `EMAC_DMA0_RXDSC_ADDR` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	Start of Receive List. The <code>EMAC_DMA0_RXDSC_ADDR.VALUE</code> bit field contains the base address of the First Descriptor in the Receive Descriptor list. The LSB bits [1:0] for the 32bit bus width are ignored and are taken as all-zero by the DMA internally. Therefore, these LSB bits are Read-Only (RO).

DMA Rx Descriptor Current Register

The `EMAC_DMA0_RXDSC_CUR` register contains the current DMA receive descriptor.

Figure 24-37: EMAC_DMA0_RXDSC_CUR Register Diagram

Table 24-69: EMAC_DMA0_RXDSC_CUR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	ADDR	Host Receive Current Descriptor Address. The <code>EMAC_DMA0_RXDSC_CUR.ADDR</code> bit field points to the start address of the current Receive Descriptor read by the DMA. Pointer updated by DMA during operation. Cleared on Reset.

DMA Rx Interrupt Watch Dog Register

The `EMAC_DMA0_RXIWDOG` register contains the timeout value for the EMAC DMA receive interrupt watch dog timer.

Figure 24-38: EMAC_DMA0_RXIWDOG Register Diagram

Table 24-70: EMAC_DMA0_RXIWDOG Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
7:0 (R/W)	RIWT	RI WatchDog Timer Count. The <code>EMAC_DMA0_RXIWDOG.RIWT</code> bit field indicates the number of system clock cycles multiplied by 256 for which the watchdog timer is set. The watchdog timer gets triggered with the programmed value after the Rx DMA completes the transfer of a frame for which the RI status bit is not set because of the setting in the corresponding descriptor <code>RDES1[31]</code> . When the watch-dog timer runs out, the RI bit is set and the timer is stopped. The watchdog timer is reset when <code>EMAC_DMA0_STAT.RI</code> bit is set high because of automatic setting of <code>EMAC_DMA0_STAT.RI</code> as per <code>RDES1[31]</code> of any received frame.

DMA Rx Poll Demand register

The `EMAC_DMA0_RXPOLL` register directs the EMAC to poll the receive descriptor list.

Figure 24-39: `EMAC_DMA0_RXPOLL` Register Diagram

Table 24-71: `EMAC_DMA0_RXPOLL` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	START	Receive Poll Demand. The <code>EMAC_DMA0_RXPOLL.START</code> bits, when written with any value, cause the DMA to read the current descriptor pointed to by the <code>EMAC_DMA0_RXDSC_CUR</code> register. If that descriptor is not available (owned by application), reception returns to the Suspended state, and the <code>EMAC_DMA0_STAT.RU</code> bit is asserted. If the descriptor is available, the Receive DMA returns to the active state.

DMA Status Register

The `EMAC_DMA0_STAT` register indicates EMAC DMA status.

Figure 24-40: EMAC_DMA0_STAT Register Diagram

Table 24-72: EMAC_DMA0_STAT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
30 (R/NW)	GLPII	GMAC LPI Interrupt. The <code>EMAC_DMA0_STAT.GLPII</code> bit indicates an interrupt event in the LPI logic of the MAC. To reset this bit to 1'b0, the software must read the corresponding registers in the <code>DWC_gmac</code> to get the exact cause of the interrupt and clear its source.

Table 24-72: EMAC_DMA0_STAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
29 (R/NW)	TTI	Time Stamp Trigger Interrupt. The EMAC_DMA0_STAT.TTI bit indicates an interrupt event in the MAC core's Time Stamp Generator block. The software must read the corresponding registers in the MAC core to get the exact cause of interrupt and clear its source to reset this bit to =0. When this bit is high, the interrupt signal from the MAC is high.
27 (R/NW)	MCI	MAC MMC Interrupt. The EMAC_DMA0_STAT.MCI bit reflects an interrupt event in the MMC module of the MAC core. The software must read the corresponding registers in the MAC core to get the exact cause of interrupt and clear the source of interrupt to make this bit as =0. The interrupt signal from the MAC is high when this bit is high.
26 (R/NW)	GLI	Line Interface Interrupt. The EMAC_DMA0_STAT.GLI bit When set, this bit reflects any of the following interrupt events in the DWC_gmac interfaces
25:23 (R/NW)	EB	Error Bits. The EMAC_DMA0_STAT.EB bits indicate the type of error that caused a Bus Error (for example, error response on the SCB interface). These bits are valid only when the EMAC_DMA0_STAT.FBI bit is set. This field does not generate an interrupt.
		0 Error during data buffer access, write transfer, Rx DMA
		1 Error during data buffer access, write transfer, Tx DMA
		2 Error during data buffer access, read transfer, Rx DMA
		3 Error during data buffer access, read transfer, Tx DMA
		4 Error during descriptor access, write transfer, Rx DMA
		5 Error during descriptor access, write transfer, Tx DMA
		6 Error during descriptor access, read transfer, Rx DMA
		7 Error during descriptor access, read transfer, Tx DMA
22:20 (R/NW)	TS	Tx Process State. The EMAC_DMA0_STAT.TS bits indicate the transmit DMA state. This field does not generate an interrupt.
		0 Stopped; Reset or Stop Tx Command Issued
		1 Running; Fetching Tx Transfer Descriptor
		2 Running; Waiting for Status
		3 Reading Data from Host Memory Buffer and Queuing It to Tx Buffer
		4 TIME_STAMP Write State

Table 24-72: EMAC_DMA0_STAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration	
		5	Reserved
		6	Suspended; Tx Descriptor Unavailable or Tx Buffer Underflow
		7	Closing Tx Descriptor
19:17 (R/NW)	RS	Rx Process State. The EMAC_DMA0_STAT.RS bits indicate the receive DMA state. This field does not generate an interrupt.	
		0	Stopped: Reset or Stop Rx Command Issued.
		1	Running: Fetching Rx Transfer Descriptor.
		2	Reserved
		3	Running: Waiting for Rx Packet
		4	Suspended: Rx Descriptor Unavailable
		5	Running: Closing Rx Descriptor
		6	TIME_STAMP Write State
		7	Running: Transferring Rx Packet Data from Rx Buffer to Host Memory
16 (R/W1C)	NIS	Normal Interrupt Summary. The value of the EMAC_DMA0_STAT.NIS bit field is the logical OR of the following when the corresponding interrupt bits are enabled in DMA Interrupt Enable Register: EMAC_DMA0_STAT.TI, EMAC_DMA0_STAT.TU, EMAC_DMA0_STAT.RI, and EMAC_DMA0_STAT.ERI. Only unmasked bits affect the Normal Interrupt Summary bit. This is a sticky bit and must be cleared (by writing a 1 to this bit) each time a corresponding bit that causes EMAC_DMA0_STAT.NIS to be set is cleared.	
15 (R/W1C)	AIS	Abnormal Interrupt Summary. The value of the EMAC_DMA0_STAT.AIS bit field is the logical OR of the following when the corresponding interrupt bits are enabled in DMA Interrupt Enable Register: EMAC_DMA0_IEN.TSE, EMAC_DMA0_IEN.TJE, EMAC_DMA0_IEN.OVE, EMAC_DMA0_IEN.UNE, EMAC_DMA0_IEN.RUE, EMAC_DMA0_IEN.RSE, EMAC_DMA0_IEN.RWE, EMAC_DMA0_IEN.ETE, and EMAC_DMA0_IEN.FBE. Only unmasked bits affect the Abnormal Interrupt Summary bit. This is a sticky bit and must be cleared each time a corresponding bit that causes EMAC_DMA0_STAT.AIS to be set is cleared.	
14 (R/W1C)	ERI	Early Receive Interrupt. The EMAC_DMA0_STAT.ERI bit indicates that the DMA had filled the first data buffer of the packet. The EMAC_DMA0_STAT.RI bit automatically clears this bit.	

Table 24-72: EMAC_DMA0_STAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
13 (R/W1C)	FBI	Fatal Bus Error Interrupt. The EMAC_DMA0_STAT.FBI bit indicates that a bus error occurred, as detailed in the EMAC_DMA0_STAT.EB field. When this bit is set, the corresponding DMA engine disables all its bus accesses.
10 (R/W1C)	ETI	Early Transmit Interrupt. The EMAC_DMA0_STAT.ETI bit indicates that the frame to be transmitted was fully transferred to the MFL Transmit FIFO.
9 (R/W1C)	RWT	Receive WatchDog Timeout. The EMAC_DMA0_STAT.RWT bit is asserted when a frame with a length greater than 2,048 bytes is received (10, 240 when Jumbo Frame mode is enabled).
8 (R/W1C)	RPS	Receive Process Stopped. The EMAC_DMA0_STAT.RPS bit is asserted when the Receive Process enters the Stopped state.
7 (R/W1C)	RU	Receive Buffer Unavailable. The EMAC_DMA0_STAT.RU bit indicates that the Next Descriptor in the Receive List is owned by the application and cannot be acquired by the DMA. Receive Process is suspended. To resume processing Receive descriptors, the application should change the ownership of the descriptor and issue a Receive Poll Demand command. If no Receive Poll Demand is issued, Receive Process resumes when the next recognized incoming frame is received. This bit is set only when the previous Receive Descriptor was owned by the DMA.
6 (R/W1C)	RI	Receive Interrupt. The EMAC_DMA0_STAT.RI bit indicates the completion of frame reception. Specific frame status information has been posted in the descriptor. Reception remains in the Running state.
5 (R/W1C)	UNF	Transmit Buffer Underflow. The EMAC_DMA0_STAT.UNF bit indicates that the Transmit Buffer had an Underflow during frame transmission. Transmission is suspended and an Underflow Error TDES0[1] is set.
4 (R/W1C)	OVF	Receive Buffer Overflow. The EMAC_DMA0_STAT.OVF bit indicates that the Receive Buffer had an Overflow during frame reception. If the partial frame is transferred to application, the overflow status is set in RDES0[11].
3 (R/W1C)	TJT	Transmit Jabber Timeout. The EMAC_DMA0_STAT.TJT bit indicates that the Transmit Jabber Timer expired, meaning that the transmitter had been excessively active. The transmission process is aborted and placed in the Stopped state. This causes the Transmit Jabber Timeout TDES0[14] flag to assert.

Table 24-72: EMAC_DMA0_STAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
2 (R/W1C)	TU	Transmit Buffer Unavailable. The EMAC_DMA0_STAT.TU bit indicates that the Next Descriptor in the Transmit List is owned by the application and cannot be acquired by the DMA. Transmission is suspended. The value in the EMAC_DMA0_STAT.TS bits explain the Transmit Process state transitions. To resume processing transmit descriptors, the application should change the ownership of the bit of the descriptor and then issue a Transmit Poll Demand command.
1 (R/W1C)	TPS	Transmit Process Stopped. The EMAC_DMA0_STAT.TPS bit is set when the transmission is stopped.
0 (R/W1C)	TI	Transmit Interrupt. The EMAC_DMA0_STAT.TI bit indicates that frame transmission is finished and TDES1[31] is set in the First Descriptor.

DMA Tx Buffer Current Register

The `EMAC_DMA0_TXBUF_CUR` register holds the pointer to the current transmit DMA buffer.

Figure 24-41: EMAC_DMA0_TXBUF_CUR Register Diagram

Table 24-73: EMAC_DMA0_TXBUF_CUR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	ADDR	Host Transmit Current Buffer Address. The <code>EMAC_DMA0_TXBUF_CUR.ADDR</code> bit field points to the current Transmit Buffer Address being read by the DMA. Pointer updated by DMA during operation. Cleared on Reset.

DMA Tx Descriptor List Address Register

The `EMAC_DMA0_TXDSC_ADDR` register holds the address for the DMA transmit descriptor list. The processor can write to this Register only when Tx DMA has stopped (`EMAC_DMA0_OPMODE.ST` bit =0). When stopped, this can be written with a new descriptor list address. When the processor sets the `EMAC_DMA0_OPMODE.ST` bit to 1, the DMA takes the newly programmed descriptor base address. If this register is not changed when the `EMAC_DMA0_OPMODE.ST` bit is cleared to 0, then the DMA takes the descriptor address where it was stopped earlier.

Figure 24-42: EMAC_DMA0_TXDSC_ADDR Register Diagram

Table 24-74: EMAC_DMA0_TXDSC_ADDR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	Start of Transmit List. The <code>EMAC_DMA0_TXDSC_ADDR.VALUE</code> bit field contains the base address of the First Descriptor in the Transmit Descriptor list. The LSB bits [1:0] for 32bit bus width are ignored and are taken as all-zero by the DMA internally. Therefore, these LSB bits are Read-Only (RO).

DMA Tx Descriptor Current Register

The `EMAC_DMA0_TXDSC_CUR` register contains the current DMA transmit descriptor.

Figure 24-43: `EMAC_DMA0_TXDSC_CUR` Register Diagram

Table 24-75: `EMAC_DMA0_TXDSC_CUR` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	ADDR	Host Transmit Descriptor Address. The <code>EMAC_DMA0_TXDSC_CUR.ADDR</code> bit field points to the start address of the current Transmit Descriptor read by the DMA. Pointer updated by DMA during operation. Cleared on Reset.

DMA Tx Poll Demand Register

The `EMAC_DMA0_TXPOLL` register directs the EMAC to poll the transmit descriptor list.

Figure 24-44: `EMAC_DMA0_TXPOLL` Register Diagram

Table 24-76: `EMAC_DMA0_TXPOLL` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	START	Transmit Poll Demand. The <code>EMAC_DMA0_TXPOLL.START</code> bits, when written with any value, cause the DMA to read the current descriptor pointed to by <code>EMAC_DMA0_TXDSC_CUR</code> register. If that descriptor is not available (owned by application), transmission returns to the Suspend state, and the <code>EMAC_DMA0_STAT.TU</code> bit is asserted. If the descriptor is available, transmission resumes.

DMA Bus Mode Register

The `EMAC_DMA1_BUSMODE` register selects the DMA bus operating modes for EMAC DMA.

Figure 24-45: EMAC_DMA1_BUSMODE Register Diagram

Table 24-77: EMAC_DMA1_BUSMODE Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
25 (R/W)	AAL	Address Aligned Bursts. The <code>EMAC_DMA1_BUSMODE.AAL</code> bit, when set high and the <code>FB</code> bit equals 1, directs the SCB interface to generate all bursts aligned to the start address LS bits. If the <code>FB</code> bit is equal to 0, the first burst (accessing the data buffers start address) is not aligned, but subsequent bursts are aligned to the address.
24 (R/W)	PBL8	PBL * 8. The <code>EMAC_DMA1_BUSMODE.PBL8</code> bit, when set high, multiplies the PBL value programmed (bits [22:17] and bits [13:8]) eight times. Therefore, the DMA transfers the data in 8, 16, and 32 beats depending on the PBL value.
23 (R/W)	USP	Use Separate PBL. The <code>EMAC_DMA1_BUSMODE.USP</code> bit, when set high, configures the Rx DMA to use the value configured in bits [22:17] as PBL while the PBL value in bits [13:8] is applicable to Tx DMA operations only.

Table 24-77: EMAC_DMA1_BUSMODE Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
22:17 (R/W)	RPBL	Receive Programmable Burst Length. The <code>EMAC_DMA1_BUSMODE.RPBL</code> bits indicate the maximum number of beats to be transferred in one Rx DMA transaction. This is the maximum value that is used in a single block Read/Write. The Rx DMA always attempts to burst as specified in RPBL every time it starts a Burst transfer on the host bus. RPBL can be programmed with permissible values of 1, 2, 4, 8, 16, and 32. Any other value results in undefined behavior. These bits are valid and applicable only when USP is set high.
16 (R/W)	FB	Fixed Burst. The <code>EMAC_DMA1_BUSMODE.FB</code> bit controls whether the SCB Master interface performs fixed burst transfers or not. See the <code>EMAC_DMA0_BMODE.UNDEF</code> bit description for more information.
13:8 (R/W)	PBL	Programmable Burst Length. The <code>EMAC_DMA1_BUSMODE.PBL</code> bits indicate the maximum number of beats to be transferred in one DMA transaction. This is the maximum value that is used in a single block Read/Write. The DMA always attempts to burst as specified in PBL each time it starts a Burst transfer on the host bus. Any other value results in undefined behavior. When USP is set high, this PBL value is applicable for Tx DMA transactions only. $PBL\text{-max limit} = (FIFO\ size / 2) / 4.$ $PBL\text{-max limit (transmit)} = 256\ bytes / 2 / 4 = 32.$ $PBL\text{-max limit (receive)} = 128\ bytes / 2 / 4 = 16.$ Note that this PBL is at the DMA end. If $PBL = 32$ and if <code>BLEN16</code> is enabled, the DMA automatically splits 32 bursts in to 2×16 bursts. If <code>EMAC_DMA1_BUSMODE.PBL = 8</code>, and if <code>EMAC_DMA0_BMODE.BLEN16</code> is enabled, the max burst is limited to <code>EMAC_DMA0_BMODE.BLEN8</code>. If <code>EMAC_DMA1_BUSMODE.PBL8</code> bit is set, the programmed PBL value is multiplied by 8 times internally. However, the result cannot be more than the above maximum limits specified above.
7 (R/W)	ATDS	Alternate Descriptor Size. The <code>EMAC_DMA1_BUSMODE.ATDS</code> bit, when set, increases the size of the alternate descriptor to 32 bytes (8 DWORDS). This is required when the Advanced Time Stamp feature or Full IPC Offload Engine is enabled in the receiver. When reset, the descriptor size reverts back to 4 DWORDS (16 bytes). The enhanced descriptor is not required if the Advanced Time Stamp and IPC Full Checksum Offload features are not enabled. In such case, you can use the 16 bytes descriptor to save 4 bytes of memory.

Table 24-77: EMAC_DMA1_BUSMODE Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
6:2 (R/W)	DSL	Descriptor Skip Length. The <code>EMAC_DMA1_BUSMODE.DSL</code> bit specifies the number of 32-bit words to skip between two unchained descriptors. The address skipping starts from the end of current descriptor to the start of next descriptor. When DSL value is equal to zero, then the descriptor table is taken as contiguous by the DMA, in Ring mode.

Channel 1 Credit Shaping Control Register

The `EMAC_DMA1_CHCBSCTL` register controls the credit-based shaper algorithm in the Traffic Manager for scheduling the frames for transmission. This register is present only when you select the Transmit Channel 1 in the AV mode.

Figure 24-46: EMAC_DMA1_CHCBSCTL Register Diagram

Table 24-78: EMAC_DMA1_CHCBSCTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
17 (R/W)	ABPSSIE	Average Bits Per Slot Interrupt Enable. When the <code>EMAC_DMA1_CHCBSCTL.ABPSSIE</code> bit is set, the MAC asserts an interrupt (<code>sbd_intr_o</code> or <code>mci_intr_o</code>) when the average bits per slot status is updated for Channel 1. When this bit is cleared, an interrupt is not asserted for such an event.
6:4 (R/W)	SLC	Slot Count. The <code>EMAC_DMA1_CHCBSCTL.SLC</code> bit field programs the number of slots (of duration 125 micro-sec) over which the average transmitted bits per slot (provided in the CBS Status register) are computed for Channel 1 when the credit-based shaper algorithm is enabled.
1 (R/W)	CC	Credit Control. The <code>EMAC_DMA1_CHCBSCTL.CC</code> bit, when reset, sets the accumulated credit parameter in the credit-based shaper algorithm logic to zero when there is positive credit and no frame to transmit in Channel 1.
0 (R/W)	CBSD	Credit based shaper disable. The <code>EMAC_DMA1_CHCBSCTL.CBSD</code> bit disables the credit-based shaper algorithm for Channel 1 traffic and makes the traffic management algorithm to strict priority for Channel 1 over Channel 0. When reset, the credit-based shaper algorithm schedules the traffic in Channel 1 for transmission.

Channel 1 Average Traffic Transmitted Register

The `EMAC_DMA1_CHCBSSTAT` register provides the average traffic transmitted in Channel 1. This register is present only when you select the Transmit Channel 1 in the AV mode.

Figure 24-47: EMAC_DMA1_CHCBSSTAT Register Diagram

Table 24-79: EMAC_DMA1_CHCBSSTAT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
17 (R/NW)	ABSU	ABS Updated. The <code>EMAC_DMA1_CHCBSSTAT.ABSU</code> bit indicates that the MAC has updated the ABS value. This bit is cleared when the application reads the ABS value.
16:0 (R/NW)	ABS	Average Bits Per Slot. The <code>EMAC_DMA1_CHCBSSTAT.ABS</code> bit field contains the average transmitted bits per slot. This field is computed over programmed number of slots (<code>EMAC_DMA1_CHCBSCTL.SLC</code> bit field) for Channel 1 traffic. The maximum value is 0x30D4 for 100 Mbps and 0x1E848 for 1000 Mbps.

Channel 1 High Credit Value Register

The `EMAC_DMA1_CHHIC` register provides the maximum value that can be accumulated for Channel 1 in the credit parameter of the credit-based shaper algorithm. This register is present only when you select the Transmit Channel 1 in the AV mode.

Figure 24-48: EMAC_DMA1_CHHIC Register Diagram

Table 24-80: EMAC_DMA1_CHHIC Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
28:0 (R/W)	HC	High Credit. The <code>EMAC_DMA1_CHHIC.HC</code> bit field contains the hiCredit value required for the credit-based shaper algorithm for Channel 1.

Channel 1 Idle Slope Credit Value Register

The `EMAC_DMA1_CHISC` register provides the bandwidth allocated for the AV traffic on Channel 1. This register is present only when you select the Transmit Channel 1 in the AV mode.

Figure 24-49: EMAC_DMA1_CHISC Register Diagram

Table 24-81: EMAC_DMA1_CHISC Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
13:0 (R/W)	ISC	Idle Slope Credit. The <code>EMAC_DMA1_CHISC.ISC</code> bit field contains the <code>idleSlopeCredit</code> value required for the credit-based shaper algorithm for Channel 1.

Channel 1 Low Credit Value Register

The `EMAC_DMA1_CHLOC` register provides the minimum value that can be accumulated for Channel 1 in the credit parameter of the credit-based shaper algorithm. This register is present only when you select Transmit Channel 1 in the AV mode.

Figure 24-50: EMAC_DMA1_CHLOC Register Diagram

Table 24-82: EMAC_DMA1_CHLOC Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
28:0 (R/W)	LC	Low Credit. The <code>EMAC_DMA1_CHLOC.LC</code> bit field contains the <code>loCredit</code> value required for the credit-based shaper algorithm for Channel 1.

Channel 1 Control Bits for Slot Function Register

The `EMAC_DMA1_CHSFCS` register controls the slot comparison feature that the Channel 1 transmit DMA uses to fetch the buffer data from system memory.

Figure 24-51: EMAC_DMA1_CHSFCS Register Diagram

Table 24-83: EMAC_DMA1_CHSFCS Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
19:16 (R/NW)	RSN	Reference Slot Number. The <code>EMAC_DMA1_CHSFCS</code> .RSN bits, gives the current value of the reference slot number in DMA used for comparison checking.
1 (R/W)	ASC	Advance Slot Check. When set, this bit enables the DMA to fetch the data from the buffer when the slot number (SLOTNUM) programmed in the transmit descriptor is ---equal to the reference slot number given in Bits [19:16] -or- ahead of the reference slot number by up to two slots. This bit is applicable only when Bit 0 (ESC) is set.
0 (R/W)	ESC	Enable Slot Comparison. The <code>EMAC_DMA1_CHSFCS</code> .ESC bits, When set, this bit enables the checking of the slot numbers, programmed in the transmit descriptor, with the current reference given in Bits [19:16]. The DMA fetches the data from the corresponding buffer only when the slot number is equal to the reference slot number or is ahead of the reference slot number by one slot. When reset, this bit disables the checking of the slot numbers. The DMA fetches the data immediately after the descriptor is processed.

Channel 1 Send Slope Credit Value Register

The `EMAC_DMA1_CHSSC` register provides the bandwidth that is available for the AV traffic on other channels. This register is present only when you select the Transmit Channel 1 in the AV mode.

Figure 24-52: EMAC_DMA1_CHSSC Register Diagram

Table 24-84: EMAC_DMA1_CHSSC Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
13:0 (R/W)	SSC	Send Slope Credit. The <code>EMAC_DMA1_CHSSC.SSC</code> bit field contains the <code>sendSlopeCredit</code> value required for credit-based shaper algorithm for Channel 1.

DMA Interrupt Enable Register

The `EMAC_DMA1_IEN` register enables (unmasks) EMAC DMA interrupts.

Figure 24-53: EMAC_DMA1_IEN Register Diagram

Table 24-85: EMAC_DMA1_IEN Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
16 (R/W)	NIE	Normal Interrupt Summary Enable. The <code>EMAC_DMA1_IEN.NIE</code> bit, when set, enables a normal interrupt. When this bit is reset, a normal interrupt is disabled. This bit enables the following bits: <code>EMAC_DMA1_STAT.TI</code> , <code>EMAC_DMA1_STAT.TU</code> , <code>EMAC_DMA1_STAT.RI</code> , and <code>EMAC_DMA1_STAT.ERI</code> .
15 (R/W)	AIE	Abnormal Interrupt Summary Enable. The <code>EMAC_DMA1_IEN.AIE</code> bit, when set, enables an abnormal interrupt. When this bit is reset, an Abnormal Interrupt is disabled. This bit enables the following bits: <code>EMAC_DMA1_STAT.TPS</code> , <code>EMAC_DMA1_STAT.TJT</code> , <code>EMAC_DMA1_STAT.OVF</code> , <code>EMAC_DMA1_STAT.RU</code> , <code>EMAC_DMA1_STAT.RPS</code> , <code>EMAC_DMA1_STAT.RWT</code> , <code>EMAC_DMA1_STAT.ETI</code> , and <code>EMAC_DMA1_STAT.FBI</code> .

Table 24-85: EMAC_DMA1_IEN Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
14 (R/W)	ERE	Early Receive Interrupt Enable. The EMAC_DMA1_IEN.ERE bit, when set (and with EMAC_DMA1_IEN.NIE =1), enables the Early Receive Interrupt. When this bit is reset, Early Receive Interrupt is disabled.
13 (R/W)	FBE	Fatal Bus Error Enable. The EMAC_DMA1_IEN.FBE bit, when set (and with EMAC_DMA1_IEN.AIE =1), enables the Fatal Bus Error Interrupt. When this bit is reset, Fatal Bus Error Enable Interrupt is disabled.
10 (R/W)	ETE	Early Transmit Interrupt Enable. The EMAC_DMA1_IEN.ETE bit, when this bit is set (and with EMAC_DMA1_IEN.AIE =1), enables the Early Transmit Interrupt. When this bit is reset, Early Transmit Interrupt is disabled.
9 (R/W)	RWE	Receive Watchdog Timeout Enable. The EMAC_DMA1_IEN.RWE bit, when set (and with EMAC_DMA1_IEN.AIE =1), enables the Receive Watchdog Timeout Interrupt. When this bit is reset, Receive Watchdog Timeout Interrupt is disabled.
8 (R/W)	RSE	Receive Stopped Enable. The EMAC_DMA1_IEN.RSE bit, when set (and with EMAC_DMA1_IEN.AIE =1), enables the Receive Stopped Interrupt is enabled. When this bit is reset, Receive Stopped Interrupt is disabled.
7 (R/W)	RUE	Receive Buffer Unavailable Enable. The EMAC_DMA1_IEN.RUE bit, when set (and with EMAC_DMA1_IEN.AIE =1), enables the Receive Buffer Unavailable Interrupt. When this bit is reset, the Receive Buffer Unavailable Interrupt is disabled.
6 (R/W)	RIE	Receive Interrupt Enable. The EMAC_DMA1_IEN.RIE bit, when set (and with EMAC_DMA1_IEN.NIE =1), enables the Receive Interrupt. When this bit is reset, Receive Interrupt is disabled.
5 (R/W)	UNE	Underflow Interrupt Enable. The EMAC_DMA1_IEN.UNE bit, when set (and with EMAC_DMA1_IEN.AIE =1), enables the Transmit Underflow Interrupt. When this bit is reset, Underflow Interrupt is disabled.
4 (R/W)	OVE	Overflow Interrupt Enable. The EMAC_DMA1_IEN.OVE bit, when set (and with EMAC_DMA1_IEN.AIE =1), enables the Receive Overflow Interrupt. When this bit is reset, Overflow Interrupt is disabled.

Table 24-85: EMAC_DMA1_IEN Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
3 (R/W)	TJE	Transmit Jabber Timeout Enable. The EMAC_DMA1_IEN.TJE bit, when set (and with EMAC_DMA1_IEN.AIE =1), enables the Transmit Jabber Timeout Interrupt. When this bit is reset, Transmit Jabber Timeout Interrupt is disabled.
2 (R/W)	TUE	Transmit Buffer Unavailable Enable. The EMAC_DMA1_IEN.TUE bit, when set (and with EMAC_DMA1_IEN.NIE =1), enables the Transmit Buffer Unavailable Interrupt. When this bit is reset, Transmit Buffer Unavailable Interrupt is disabled.
1 (R/W)	TSE	Transmit Stopped Enable. The EMAC_DMA1_IEN.TSE bit, when set (and with EMAC_DMA1_IEN.AIE =1), enables the Transmission Stopped Interrupt. When this bit is reset, Transmission Stopped Interrupt is disabled.
0 (R/W)	TIE	Transmit Interrupt Enable. The EMAC_DMA1_IEN.TIE bit, when set (and with EMAC_DMA1_IEN.NIE =1), enables the Transmit Interrupt. When this bit is reset, Transmit Interrupt is disabled.

DMA Missed Frame Register

The `EMAC_DMA1_MISS_FRM` register contains counters for EMAC DMA missed frames and buffer overflows.

Figure 24-54: `EMAC_DMA1_MISS_FRM` Register Diagram

Table 24-86: `EMAC_DMA1_MISS_FRM` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
28 (RC/NW)	OVFFIFO	Overflow bit for FIFO Overflow Counter. The <code>EMAC_DMA1_MISS_FRM.OVFFIFO</code> bit holds the overflow bit for FIFO Overflow Counter.
27:17 (RC/NW)	MISSFROV	Missed Frames Buffer Overflow. The <code>EMAC_DMA1_MISS_FRM.MISSFROV</code> bits indicate the number of frames missed by the application due to buffer overflow.
16 (RC/NW)	OVFMIS	Overflow bit for Missed Frame Counter. The <code>EMAC_DMA1_MISS_FRM.OVFMIS</code> bit holds the overflow bit for the Missed Frame Counter.
15:0 (RC/NW)	MISSFRUN	Missed Frames Unavailable Buffer. The <code>EMAC_DMA1_MISS_FRM.MISSFRUN</code> bits indicate the number of frames missed by the controller because of the Application Receive Buffer being unavailable.

DMA Operation Mode Register

The `EMAC_DMA1_OPMODE` register selects receive and transmit DMA operating modes.

Figure 24-55: `EMAC_DMA1_OPMODE` Register Diagram

Table 24-87: `EMAC_DMA1_OPMODE` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
26 (R/W)	DT	Disable Dropping TCP/IP Errors. The <code>EMAC_DMA1_OPMODE.DT</code> bit, when set, directs the core not to drop frames that only have errors detected by the Receive Checksum Offload engine. Such frames do not have any errors (including FCS error) in the Ethernet frame received by the MAC but have errors in the encapsulated payload only. When this bit is reset, all error frames are dropped if the <code>EMAC_DMA1_OPMODE.FEF</code> bit is reset.
25 (R/W)	RSF	Receive Store and Forward. The <code>EMAC_DMA1_OPMODE.RSF</code> bit, when set, directs the MFL only to read a frame from the Rx FIFO after the complete frame has been written to it, ignoring the <code>EMAC_DMA1_OPMODE.RTC</code> bits. When this bit is reset, the Rx FIFO operates in threshold mode, subject to the threshold specified by the <code>EMAC_DMA1_OPMODE.RTC</code> bits.
24 (R/W)	DFF	Disable Flushing of received Frames. The <code>EMAC_DMA1_OPMODE.DFF</code> bit, when set, directs the Rx DMA not to flush any frames because of the unavailability of receive descriptors/buffers as it does normally when this bit is reset.

Table 24-87: EMAC_DMA1_OPMODE Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration																
21 (R/W)	TSF	Transmit Store and Forward. The EMAC_DMA1_OPMODE . TSF bit, when set, starts transmission when a full frame resides in the MFL Transmit FIFO. When this bit is set, the TTC values specified in Register 6[16:14] are ignored. This bit should be changed only when transmission is stopped.																
20 (R/W1S)	FTF	Flush Transmit FIFO. The EMAC_DMA1_OPMODE . FTF bit, when set, directs the transmit FIFO controller logic to reset to its default values and thus all data in the Tx FIFO is lost/flushed. This bit is cleared internally when the flushing operation is completed fully. The Operation Mode register should not be written to until this bit is cleared. The data which is already accepted by the MAC transmitter is not flushed. It is scheduled for transmission and results in underflow and runt frame transmission. Note: The flush operation completes only after emptying the Tx FIFO of its contents and all the pending Transmit Status of the transmitted frames are accepted by the host. In order to complete this flush operation, the PHY transmit clock is required to be active. This field cleared to 1b0 by the core (Self Clear). The application cannot clear this type of field, and a register write of 1b0 to this bit has no effect on this field.																
16:14 (R/W)	TTC	Transmit Threshold Control. The EMAC_DMA1_OPMODE . TTC bits control the threshold level of the MFL Transmit FIFO. Transmission starts when the frame size within the MFL Transmit FIFO is larger than the threshold. In addition, full frames with a length less than the threshold are also transmitted. These bits are used only when the EMAC_DMA1_OPMODE . TSF bit is reset. The value =011 is not used. <table><tr><td>0</td><td>64</td></tr><tr><td>1</td><td>128</td></tr><tr><td>2</td><td>192</td></tr><tr><td>3</td><td>256</td></tr><tr><td>4</td><td>40</td></tr><tr><td>5</td><td>32</td></tr><tr><td>6</td><td>24</td></tr><tr><td>7</td><td>16</td></tr></table>	0	64	1	128	2	192	3	256	4	40	5	32	6	24	7	16

2	192																	
3	256																	
4	40																	
5	32																	
6	24																	
7	16																	

Table 24-87: EMAC_DMA1_OPMODE Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
13 (R/W)	ST	Start/Stop Transmission. The EMAC_DMA1_OPMODE.ST bit, when set, places transmission in the Running state, and the DMA checks the Transmit List at the current position for a frame to be transmitted. Descriptor acquisition is attempted either from the current position in the list, which is the Transmit List Base Address set by Transmit Descriptor List Address, or from the position retained when transmission was stopped previously. If the current descriptor is not owned by the DMA, transmission enters the Suspended state, and the EMAC_DMA1_STAT.TU bit is set. The Start Transmission command is effective only when transmission is stopped. If the command is issued before setting the EMAC_DMA1_TXDSC_CUR address register, then the DMA behavior is unpredictable. When this bit is reset, the transmission process is placed in the Stopped state after completing the transmission of the current frame. The Next Descriptor position in the Transmit List is saved, and becomes the current position when transmission is restarted. The stop transmission command is effective only when the transmission of the current frame is complete or the transmission is in the Suspended state.
7 (R/W)	FEF	Forward Error Frames. The EMAC_DMA1_OPMODE.FEF bit, when reset, directs the Rx FIFO to drop frames with error status (CRC error, collision error, giant frame, watchdog timeout, overflow). However, if the frames start byte (write) pointer is already transferred to the read controller side (in Threshold mode), then the frames are not dropped. When EMAC_DMA1_OPMODE.FEF bit is set, all frames except runt error frames are forwarded to the DMA. But when Rx FIFO overflows when a partial frame is written, then such frames are dropped even when EMAC_DMA1_OPMODE.FEF is set.
6 (R/W)	FUF	Forward Undersized Good Frames. The EMAC_DMA1_OPMODE.FUF bit, when set, directs the Rx FIFO to forward Undersized frames (frames with no Error and length less than 64 bytes) including pad-bytes and CRC). When reset, the Rx FIFO drops all frames of less than 64 bytes, unless it is already transferred because of lower value of Receive Threshold (for example, EMAC_DMA1_OPMODE.RTC = 01).
5 (R/W)	DGF	Drop Giant Frames. The EMAC_DMA1_OPMODE.DGF bit, when set, the MAC drops the received giant frames in the Rx FIFO, that is, frames that are larger than the computed giant frame limit. When reset, the MAC does not drop the giant frames in the Rx FIFO.

Table 24-87: EMAC_DMA1_OPMODE Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
4:3 (R/W)	RTC	Receive Threshold Control. The <code>EMAC_DMA1_OPMODE.RTC</code> bits control the threshold level of the MFL Receive FIFO. Transfer (request) to DMA starts when the frame size within the MFL Receive FIFO is larger than the threshold. In addition, full frames with a length less than the threshold are transferred automatically. These bits are valid only when the <code>EMAC_DMA1_OPMODE.RSF</code> bit is zero, and are ignored when the <code>EMAC_DMA1_OPMODE.RSF</code> bit is set to 1. The value =11 is not used.
		0 64
		1 32
		2 96
		3 128
2 (R/W)	OSF	Operate on Second Frame. The <code>EMAC_DMA1_OPMODE.OSF</code> bit, when set, instructs the DMA to process a second frame of Transmit data even before status for first frame is obtained.
1 (R/W)	SR	Start/Stop Receive. The <code>EMAC_DMA1_OPMODE.SR</code> bit, when set, places the Receive process in the Running state. The DMA attempts to acquire the descriptor from the Receive list and processes incoming frames. Descriptor acquisition is attempted from the current position in the list, which is the address set by DMA Receive Descriptor List Address or the position retained when the Receive process was previously stopped. If no descriptor is owned by the DMA, reception is suspended, and the <code>EMAC_DMA1_STAT.RU</code> bit is set. The Start Receive command is effective only when reception has stopped. If the command was issued before setting <code>EMAC_DMA1_RXDSC_CUR</code> address register, DMA behavior is unpredictable. When this bit is cleared, Rx DMA operation is stopped after the transfer of the current frame. The next descriptor position in the Receive list is saved and becomes the current position after the Receive process is restarted. The Stop Receive command is effective only when the Receive process is in either the Running (waiting for receive packet) or in the Suspended state.

DMA Rx Buffer Current Register

The `EMAC_DMA1_RXBUF_CUR` register holds the pointer to the current receive DMA buffer.

Figure 24-56: EMAC_DMA1_RXBUF_CUR Register Diagram

Table 24-88: EMAC_DMA1_RXBUF_CUR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	ADDR	Host Receive Current Buffer Address. The <code>EMAC_DMA1_RXBUF_CUR.ADDR</code> bit field points to the current Receive Buffer address being read by the DMA. Pointer updated by DMA during operation. Cleared on Reset.

DMA Rx Descriptor List Address Register

The `EMAC_DMA1_RXDSC_ADDR` register holds the address for the DMA receive descriptor list. Writing to this Register is permitted only when reception is stopped. When stopped, this must be written to before the receive Start command is given. The processor can write to `EMAC_DMA1_RXDSC_ADDR` only when Rx DMA has stopped (`EMAC_DMA1_OPMODE.SR` bit =0). When stopped, it can be written with a new descriptor list address. When the processor sets the `EMAC_DMA1_OPMODE.SR` bit to 1, the DMA takes the newly programmed descriptor base address. If this register is not changed when the `EMAC_DMA1_OPMODE.SR` bit is cleared to 0, the DMA takes the descriptor address where it was stopped earlier.

Figure 24-57: `EMAC_DMA1_RXDSC_ADDR` Register Diagram

Table 24-89: `EMAC_DMA1_RXDSC_ADDR` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	Start of Receive List. The <code>EMAC_DMA1_RXDSC_ADDR.VALUE</code> bit field contains the base address of the First Descriptor in the Receive Descriptor list. The LSB bits [1:0] for the 32bit bus width are ignored and are taken as all-zero by the DMA internally. Therefore, these LSB bits are Read-Only (RO).

DMA Rx Descriptor Current Register

The `EMAC_DMA1_RXDSC_CUR` register contains the current DMA receive descriptor.

Figure 24-58: `EMAC_DMA1_RXDSC_CUR` Register Diagram

Table 24-90: `EMAC_DMA1_RXDSC_CUR` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	ADDR	Host Receive Current Descriptor Address. The <code>EMAC_DMA1_RXDSC_CUR.ADDR</code> bit field points to the start address of the current Receive Descriptor read by the DMA. Pointer updated by DMA during operation. Cleared on Reset.

DMA Rx Interrupt Watch Dog Register

The `EMAC_DMA1_RXIWDOG` register contains the timeout value for the EMAC DMA receive interrupt watch dog timer.

Figure 24-59: EMAC_DMA1_RXIWDOG Register Diagram

Table 24-91: EMAC_DMA1_RXIWDOG Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
7:0 (R/W)	RIWT	RI Watch Dog Timer Count. The <code>EMAC_DMA1_RXIWDOG.RIWT</code> bit field indicates the number of system clock cycles multiplied by 256 for which the watchdog timer is set. The watchdog timer gets triggered with the programmed value after the Rx DMA completes the transfer of a frame for which the RI status bit is not set because of the setting in the corresponding descriptor <code>RDES1[31]</code> . When the watchdog timer runs out, the RI bit is set and the timer is stopped. The watchdog timer is reset when <code>EMAC_DMA1_STAT.RI</code> bit is set high because of automatic setting of <code>EMAC_DMA1_STAT.RI</code> as per <code>RDES1[31]</code> of any received frame.

DMA Rx Poll Demand Register

The `EMAC_DMA1_RXPOLL` register directs the EMAC to poll the receive descriptor list.

Figure 24-60: `EMAC_DMA1_RXPOLL` Register Diagram

Table 24-92: `EMAC_DMA1_RXPOLL` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	START	Receive Poll Demand. The <code>EMAC_DMA1_RXPOLL.START</code> bits, when written with any value, cause the DMA to read the current descriptor pointed to by the <code>EMAC_DMA1_RXDSC_CUR</code> register. If that descriptor is not available (owned by application), reception returns to the Suspended state, and the <code>EMAC_DMA1_STAT.RU</code> bit is asserted. If the descriptor is available, the Receive DMA returns to the active state.

DMA Status Register

The `EMAC_DMA1_STAT` register indicates EMAC DMA status.

Figure 24-61: EMAC_DMA1_STAT Register Diagram

Table 24-93: EMAC_DMA1_STAT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
30 (R/NW)	GTMSI	MAC TMS Interrupt. MAC TMS Interrupt: The <code>EMAC_DMA1_STAT.GTMSI</code> bit indicates an interrupt event in the traffic manager and scheduler logic. To reset this bit, the software must read the corresponding registers (Channel Status Register) to get the exact cause of the interrupt and clear its source.

Table 24-93: EMAC_DMA1_STAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
29 (R/NW)	TTI	Time Stamp Trigger Interrupt. The EMAC_DMA1_STAT.TTI bit indicates an interrupt event in the MAC core's Time Stamp Generator block. The software must read the corresponding registers in the MAC core to get the exact cause of interrupt and clear its source to reset this bit to =0. When this bit is high, the interrupt signal from the MAC is high.
27 (R/NW)	MCI	MAC MMC Interrupt. The EMAC_DMA1_STAT.MCI bit reflects an interrupt event in the MMC module of the MAC core. The software must read the corresponding registers in the MAC core to get the exact cause of interrupt and clear the source of interrupt to make this bit as =0. The interrupt signal from the MAC is high when this bit is high.
26 (R/NW)	GLI	Line Interface Interrupt. The EMAC_DMA1_STAT.GLI bit When set, this bit reflects any of the following interrupt events in the DWC_gmac interfaces
25:23 (R/NW)	EB	Error Bits. The EMAC_DMA1_STAT.EB bits indicate the type of error that caused a Bus Error (for example, error response on the SCB interface). These bits are valid only when the EMAC_DMA1_STAT.FBI bit is set. This field does not generate an interrupt.
		0 Error during data buffer access, write transfer, Rx DMA
		1 Error during data buffer access, write transfer, Tx DMA
		2 Error during data buffer access, read transfer, Rx DMA
		3 Error during data buffer access, read transfer, Tx DMA
		4 Error during descriptor access, write transfer, Rx DMA
		5 Error during descriptor access, write transfer, Tx DMA
		6 Error during descriptor access, read transfer, Rx DMA
		7 Error during descriptor access, read transfer, Tx DMA
22:20 (R/NW)	TS	Tx Process State. The EMAC_DMA1_STAT.TS bits indicate the transmit DMA state. This field does not generate an interrupt.
		0 Stopped; Reset or Stop Tx Command Issued
		1 Running; Fetching Tx Transfer Descriptor
		2 Running; Waiting for Status
		3 Reading Data from Host Memory Buffer and Queuing It to Tx Buffer
		4 TIME_STAMP Write State

Table 24-93: EMAC_DMA1_STAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration	
		5	Reserved
		6	Suspended; Tx Descriptor Unavailable or Tx Buffer Underflow
		7	Closing Tx Descriptor
19:17 (R/NW)	RS	Rx Process State. The EMAC_DMA1_STAT.RS bits indicate the receive DMA state. This field does not generate an interrupt.	
		0	Stopped: Reset or Stop Rx Command Issued.
		1	Running: Fetching Rx Transfer Descriptor.
		2	Reserved
		3	Running: Waiting for Rx Packet
		4	Suspended: Rx Descriptor Unavailable
		5	Running: Closing Rx Descriptor
		6	TIME_STAMP Write State
		7	Running: Transferring Rx Packet Data from Rx Buffer to Host Memory
16 (R/W1C)	NIS	Normal Interrupt Summary. The value of the EMAC_DMA1_STAT.NIS bit field is the logical OR of the following when the corresponding interrupt bits are enabled in DMA Interrupt Enable Register: EMAC_DMA1_STAT.TI, EMAC_DMA1_STAT.TU, EMAC_DMA1_STAT.RI, and EMAC_DMA1_STAT.ERI. Only unmasked bits affect the Normal Interrupt Summary bit. This is a sticky bit and must be cleared (by writing a 1 to this bit) each time a corresponding bit that causes EMAC_DMA1_STAT.NIS to be set is cleared.	
15 (R/W1C)	AIS	Abnormal Interrupt Summary. The value of the EMAC_DMA1_STAT.AIS bit field is the logical OR of the following when the corresponding interrupt bits are enabled in DMA Interrupt Enable Register: EMAC_DMA1_IEN.TSE, EMAC_DMA1_IEN.TJE, EMAC_DMA1_IEN.OVE, EMAC_DMA1_IEN.UNE, EMAC_DMA1_IEN.RUE, EMAC_DMA1_IEN.RSE, EMAC_DMA1_IEN.RWE, EMAC_DMA1_IEN.ETE, and EMAC_DMA1_IEN.FBE. Only unmasked bits affect the Abnormal Interrupt Summary bit. This is a sticky bit and must be cleared each time a corresponding bit that causes EMAC_DMA1_STAT.AIS to be set is cleared.	
14 (R/W1C)	ERI	Early Receive Interrupt. The EMAC_DMA1_STAT.ERI bit indicates that the DMA had filled the first data buffer of the packet. The EMAC_DMA1_STAT.RI bit automatically clears this bit.	

Table 24-93: EMAC_DMA1_STAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
13 (R/W1C)	FBI	Fatal Bus Error Interrupt. The EMAC_DMA1_STAT.FBI bit indicates that a bus error occurred, as detailed in the EMAC_DMA1_STAT.EB field. When this bit is set, the corresponding DMA engine disables all its bus accesses.
10 (R/W1C)	ETI	Early Transmit Interrupt. The EMAC_DMA1_STAT.ETI bit indicates that the frame to be transmitted was fully transferred to the MFL Transmit FIFO.
9 (R/W1C)	RWT	Receive WatchDog Timeout. The EMAC_DMA1_STAT.RWT bit is asserted when a frame with a length greater than 2,048 bytes is received (10, 240 when Jumbo Frame mode is enabled).
8 (R/W1C)	RPS	Receive Process Stopped. The EMAC_DMA1_STAT.RPS bit is asserted when the Receive Process enters the Stopped state.
7 (R/W1C)	RU	Receive Buffer Unavailable. The EMAC_DMA1_STAT.RU bit indicates that the Next Descriptor in the Receive List is owned by the application and cannot be acquired by the DMA. Receive Process is suspended. To resume processing Receive descriptors, the application should change the ownership of the descriptor and issue a Receive Poll Demand command. If no Receive Poll Demand is issued, Receive Process resumes when the next recognized incoming frame is received. This bit is set only when the previous Receive Descriptor was owned by the DMA.
6 (R/W1C)	RI	Receive Interrupt. The EMAC_DMA1_STAT.RI bit indicates the completion of frame reception. Specific frame status information has been posted in the descriptor. Reception remains in the Running state.
5 (R/W1C)	UNF	Transmit Buffer Underflow. The EMAC_DMA1_STAT.UNF bit indicates that the Transmit Buffer had an Underflow during frame transmission. Transmission is suspended and an Underflow Error TDES0[1] is set.
4 (R/W1C)	OVF	Receive Buffer Overflow. The EMAC_DMA1_STAT.OVF bit indicates that the Receive Buffer had an Overflow during frame reception. If the partial frame is transferred to application, the overflow status is set in RDES0[11].
3 (R/W1C)	TJT	Transmit Jabber Timeout. The EMAC_DMA1_STAT.TJT bit indicates that the Transmit Jabber Timer expired, meaning that the transmitter had been excessively active. The transmission process is aborted and placed in the Stopped state. This causes the Transmit Jabber Timeout TDES0[14] flag to assert.

Table 24-93: EMAC_DMA1_STAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
2 (R/W1C)	TU	Transmit Buffer Unavailable. The EMAC_DMA1_STAT.TU bit indicates that the Next Descriptor in the Transmit List is owned by the application and cannot be acquired by the DMA. Transmission is suspended. The value in the EMAC_DMA1_STAT.TS bits explain the Transmit Process state transitions. To resume processing transmit descriptors, the application should change the ownership of the bit of the descriptor and then issue a Transmit Poll Demand command.
1 (R/W1C)	TPS	Transmit Process Stopped. The EMAC_DMA1_STAT.TPS bit is set when the transmission is stopped.
0 (R/W1C)	TI	Transmit Interrupt. The EMAC_DMA1_STAT.TI bit indicates that frame transmission is finished and TDES1[31] is set in the First Descriptor.

DMA Tx Buffer Current Register

The `EMAC_DMA1_TXBUF_CUR` register holds the pointer to the current transmit DMA buffer.

Figure 24-62: EMAC_DMA1_TXBUF_CUR Register Diagram

Table 24-94: EMAC_DMA1_TXBUF_CUR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	ADDR	Host Transmit Current Buffer Address. The <code>EMAC_DMA1_TXBUF_CUR.ADDR</code> bit field points to the current Transmit Buffer Address being read by the DMA. Pointer updated by DMA during operation. Cleared on Reset.

DMA Tx Descriptor List Address Register

The `EMAC_DMA1_TXDSC_ADDR` register holds the address for the DMA transmit descriptor list. The processor can write to this Register only when Tx DMA has stopped (`EMAC_DMA1_OPMODE.ST` bit =0). When stopped, this can be written with a new descriptor list address. When the processor sets the `EMAC_DMA1_OPMODE.ST` bit to 1, the DMA takes the newly programmed descriptor base address. If this register is not changed when the `EMAC_DMA1_OPMODE.ST` bit is cleared to 0, then the DMA takes the descriptor address where it was stopped earlier.

Figure 24-63: EMAC_DMA1_TXDSC_ADDR Register Diagram

Table 24-95: EMAC_DMA1_TXDSC_ADDR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	Start of Transmit List. The <code>EMAC_DMA1_TXDSC_ADDR.VALUE</code> bit field contains the base address of the First Descriptor in the Transmit Descriptor list. The LSB bits [1:0] for 32bit bus width are ignored and are taken as all-zero by the DMA internally. Therefore, these LSB bits are Read-Only (RO).

DMA Tx Descriptor Current Register

The `EMAC_DMA1_TXDSC_CUR` register contains the current DMA transmit descriptor.

Figure 24-64: `EMAC_DMA1_TXDSC_CUR` Register Diagram

Table 24-96: `EMAC_DMA1_TXDSC_CUR` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	ADDR	Host Transmit Descriptor Address. The <code>EMAC_DMA1_TXDSC_CUR.ADDR</code> bit field points to the start address of the current Transmit Descriptor read by the DMA. Pointer updated by DMA during operation. Cleared on Reset.

DMA Tx Poll Demand Register

The `EMAC_DMA1_TXPOLL` register directs the EMAC to poll the transmit descriptor list.

Figure 24-65: `EMAC_DMA1_TXPOLL` Register Diagram

Table 24-97: `EMAC_DMA1_TXPOLL` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	START	Transmit Poll Demand. The <code>EMAC_DMA1_TXPOLL.START</code> bits, when written with any value, cause the DMA to read the current descriptor pointed to by <code>EMAC_DMA1_TXDSC_CUR</code> register. If that descriptor is not available (owned by application), transmission returns to the Suspend state, and the <code>EMAC_DMA1_STAT.TU</code> bit is asserted. If the descriptor is available, transmission resumes.

DMA Bus Mode Register

The `EMAC_DMA2_BUSMODE` register selects the DMA bus operating modes for EMAC DMA.

Figure 24-66: EMAC_DMA2_BUSMODE Register Diagram

Table 24-98: EMAC_DMA2_BUSMODE Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
25 (R/W)	AAL	Address Aligned Bursts. The <code>EMAC_DMA2_BUSMODE.AAL</code> bit, when set high and the <code>FB</code> bit equals 1, directs the SCB interface to generate all bursts aligned to the start address LS bits. If the <code>FB</code> bit is equal to 0, the first burst (accessing the data buffers start address) is not aligned, but subsequent bursts are aligned to the address.
24 (R/W)	PBL8	PBL * 8. The <code>EMAC_DMA2_BUSMODE.PBL8</code> bit, when set high, multiplies the PBL value programmed (bits [22:17] and bits [13:8]) eight times. Therefore, the DMA transfers the data in 8, 16, and 32 beats depending on the PBL value.
23 (R/W)	USP	Use Separate PBL. The <code>EMAC_DMA2_BUSMODE.USP</code> bit, when set high, configures the Rx DMA to use the value configured in bits [22:17] as PBL while the PBL value in bits [13:8] is applicable to Tx DMA operations only.

Table 24-98: EMAC_DMA2_BUSMODE Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
22:17 (R/W)	RPBL	Receive Programmable Burst Length. The <code>EMAC_DMA2_BUSMODE.RPBL</code> bits indicate the maximum number of beats to be transferred in one Rx DMA transaction. This is the maximum value that is used in a single block Read/Write. The Rx DMA always attempts to burst as specified in RPBL every time it starts a Burst transfer on the host bus. RPBL can be programmed with permissible values of 1, 2, 4, 8, 16, and 32. Any other value results in undefined behavior. These bits are valid and applicable only when USP is set high.
16 (R/W)	FB	Fixed Burst. The <code>EMAC_DMA2_BUSMODE.FB</code> bit controls whether the SCB Master interface performs fixed burst transfers or not. See the <code>EMAC_DMA0_BMODE.UNDEF</code> bit description for more information.
13:8 (R/W)	PBL	Programmable Burst Length. The <code>EMAC_DMA2_BUSMODE.PBL</code> bits indicate the maximum number of beats to be transferred in one DMA transaction. This is the maximum value that is used in a single block Read/Write. The DMA always attempts to burst as specified in PBL each time it starts a Burst transfer on the host bus. Any other value results in undefined behavior. When USP is set high, this PBL value is applicable for Tx DMA transactions only. $PBL\text{-max limit} = (FIFO\text{ size} / 2) / 4.$ $PBL\text{-max limit (transmit)} = 256\text{ bytes} / 2 / 4 = 32.$ $PBL\text{-max limit (receive)} = 128\text{ bytes} / 2 / 4 = 16.$ Note that this PBL is at the DMA end. If $PBL = 32$ and if <code>BLEN16</code> is enabled, the DMA automatically splits 32 bursts in to 2×16 bursts. If <code>EMAC_DMA2_BUSMODE.PBL = 8</code>, and if <code>EMAC_DMA0_BMODE.BLEN16</code> is enabled, the max burst is limited to <code>EMAC_DMA0_BMODE.BLEN8</code>. If <code>EMAC_DMA2_BUSMODE.PBL8</code> bit is set, the programmed PBL value is multiplied by 8 times internally. However, the result cannot be more than the above maximum limits specified above.
7 (R/W)	ATDS	Alternate Descriptor Size. The <code>EMAC_DMA2_BUSMODE.ATDS</code> bit, when set, increases the size of the alternate descriptor to 32 bytes (8 DWORDS). This is required when the Advanced Time Stamp feature or Full IPC Offload Engine is enabled in the receiver. When reset, the descriptor size reverts back to 4 DWORDS (16 bytes). The enhanced descriptor is not required if the Advanced Time Stamp and IPC Full Checksum Offload features are not enabled. In such case, you can use the 16 bytes descriptor to save 4 bytes of memory.

Table 24-98: EMAC_DMA2_BUSMODE Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
6:2 (R/W)	DSL	Descriptor Skip Length. The EMAC_DMA2_BUSMODE.DSL bit specifies the number of 32-bit words to skip between two unchained descriptors. The address skipping starts from the end of current descriptor to the start of next descriptor. When DSL value is equal to zero, then the descriptor table is taken as contiguous by the DMA, in Ring mode.
0 (R/W1S)	SWR	Software Reset. The EMAC_DMA2_BUSMODE.SWR bit, when set, directs the MAC DMA Controller to reset all MAC Subsystem internal registers and logic. It is cleared automatically after the reset operation has completed in all of the core clock domains. Read a 0 value in this bit before re-programming any register of the core. Note: The reset operation is completed only when all the resets in all the active clock domains are de-asserted. Therefore, it is essential that all the PHY inputs clocks (applicable for the selected PHY interface) are present for software reset completion. This field cleared to 1b0 by the core (Self Clear). The application cannot clear this type of field, and a register write of 1b0 to this bit has no effect on this field.

Channel 2 Credit Shaping Control Register

The `EMAC_DMA2_CHCBSCTL` register controls the credit-based shaper algorithm in the Traffic Manager for scheduling the frames for transmission. This register is present only when you select the Transmit Channel 1 in the AV mode.

Figure 24-67: EMAC_DMA2_CHCBSCTL Register Diagram

Table 24-99: EMAC_DMA2_CHCBSCTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
17 (R/W)	ABPSSIE	Average bits per slot Interrupt Enable. The <code>EMAC_DMA2_CHCBSCTL.ABPSSIE</code> bit asserts an interrupt (<code>sbd_intr_o</code> or <code>mci_intr_o</code>) when the average bits per slot status is updated for Channel 1. When this bit is cleared, interrupt is not asserted for such an event.
6:4 (R/W)	SLC	Slot Count. The <code>EMAC_DMA2_CHCBSCTL.SLC</code> bit field programs the number of slots (of duration 125 micro-sec) over which the average transmitted bits per slot (provided in the CBS Status register) need to be computed for Channel 1 when the credit-based shaper algorithm is enabled. The
1 (R/W)	CC	Credit Control. The <code>EMAC_DMA2_CHCBSCTL.CC</code> bit, when reset, sets the accumulated credit parameter in the credit-based shaper algorithm logic to zero when there is positive credit and no frame to transmit in Channel 1.
0 (R/W)	CBSD	Credit Based Shaper Disable. The <code>EMAC_DMA2_CHCBSCTL.CBSD</code> bit disables the credit-based shaper algorithm for Channel 1 traffic and makes the traffic management algorithm to strict priority for Channel 1 over Channel 0. When reset, the credit-based shaper algorithm schedules the traffic in Channel 1 for transmission.

Channel 2 Avg Traffic Transmitted Status Register

The `EMAC_DMA2_CHCBSSTAT` register provides the average traffic transmitted in Channel 1. This register is present only when you select the Transmit Channel 1 in the AV mode.

Figure 24-68: EMAC_DMA2_CHCBSSTAT Register Diagram

Table 24-100: EMAC_DMA2_CHCBSSTAT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
17 (R/NW)	ABSU	ABS Updated. The <code>EMAC_DMA2_CHCBSSTAT.ABSU</code> bits. When set, this bit indicates that the MAC has updated the ABS value. This bit is cleared when the application reads the ABS value.
16:0 (R/NW)	ABS	Average Bits per Slot. The <code>EMAC_DMA2_CHCBSSTAT.ABS</code> bit field contains the average transmitted bits per slot. This field is computed over programmed number of slots (<code>EMAC_DMA2_CHCBSCTL.SLC</code> bit field) for Channel 1 traffic. The maximum value is 0x30D4 for 100 Mbps and 0x1E848 for 1000 Mbps.

Channel 2 High Credit Value Register

The `EMAC_DMA2_CHHIC` register provides the maximum value that can be accumulated for Channel 1 in the credit parameter of the credit-based shaper algorithm. This register is present only when you select the Transmit Channel 1 in the AV mode.

Figure 24-69: EMAC_DMA2_CHHIC Register Diagram

Table 24-101: EMAC_DMA2_CHHIC Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
28:0 (R/W)	HC	High Credit. The <code>EMAC_DMA2_CHHIC.HC</code> bit field contains the hiCredit value required for the credit-based shaper algorithm for Channel 1.

Channel 2 Idle Slope Credit Value Register

The `EMAC_DMA2_CHISC` register provides the bandwidth allocated for the AV traffic on Channel 1. This register is present only when you select the Transmit Channel 1 in the AV mode.

Figure 24-70: EMAC_DMA2_CHISC Register Diagram

Table 24-102: EMAC_DMA2_CHISC Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
13:0 (R/W)	ISC	Idle Slope Credit. The <code>EMAC_DMA2_CHISC.ISC</code> bit field contains the <code>idleSlopeCredit</code> value required for the credit-based shaper algorithm for Channel 1.

Channel 2 Low Credit Value Register

The `EMAC_DMA2_CHLOC` register provides the minimum value that can be accumulated for Channel 1 in the credit parameter of the credit-based shaper algorithm. This register is present only when you select Transmit Channel 1 in the AV mode.

Figure 24-71: EMAC_DMA2_CHLOC Register Diagram

Table 24-103: EMAC_DMA2_CHLOC Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
28:0 (R/W)	LC	Low Credit. The <code>EMAC_DMA2_CHLOC.LC</code> bit field contains the <code>loCredit</code> value required for the credit-based shaper algorithm for Channel 1.

Channel 2 Control Bits for Slot Function Register

The `EMAC_DMA2_CHSFCS` register controls the slot comparison feature that the Channel 1 transmit DMA uses to fetch the buffer data from system memory.

Figure 24-72: EMAC_DMA2_CHSFCS Register Diagram

Table 24-104: EMAC_DMA2_CHSFCS Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
19:16 (R/NW)	RSN	Reference Slot number. The <code>EMAC_DMA2_CHSFCS</code> .RSN bits, gives the current value of the reference slot number in DMA used for comparison checking.
1 (R/W)	ASC	Advance Slot Check. The <code>EMAC_DMA2_CHSFCS</code> .ASC bits, When set, this bit enables the DMA to fetch the data from the buffer when the slot number (SLOTNUM) programmed in the transmit descriptor
0 (R/W)	ESC	Enable Slot Comparison. The <code>EMAC_DMA2_CHSFCS</code> .ESC bit enables the checking of the slot numbers, programmed in the transmit descriptor, with the current reference given in Bits [19:16]. The DMA fetches the data from the corresponding buffer only when the slot number is equal to the reference slot number or is ahead of the reference slot number by one slot. When reset, this bit disables the checking of the slot numbers. The DMA fetches the data immediately after the descriptor is processed.

Channel 2 Send Slope Credit Value Register

The `EMAC_DMA2_CHSSC` register provides the bandwidth that is available for the AV traffic on other channels. This register is present only when you select the Transmit Channel 1 in the AV mode.

Figure 24-73: EMAC_DMA2_CHSSC Register Diagram

Table 24-105: EMAC_DMA2_CHSSC Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
13:0 (R/W)	SSC	Send Slope Credit. The <code>EMAC_DMA2_CHSSC.SSC</code> bit field contains the <code>sendSlopeCredit</code> value required for credit-based shaper algorithm for Channel 1.

DMA Interrupt Enable Register

The `EMAC_DMA2_IEN` register enables (unmasks) EMAC DMA interrupts.

Figure 24-74: EMAC_DMA2_IEN Register Diagram

Table 24-106: EMAC_DMA2_IEN Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
16 (R/W)	NIE	Normal Interrupt Summary Enable. The <code>EMAC_DMA2_IEN.NIE</code> bit, when set, enables a normal interrupt. When this bit is reset, a normal interrupt is disabled. This bit enables the following bits: <code>EMAC_DMA2_STAT.TI</code> , <code>EMAC_DMA2_STAT.TU</code> , <code>EMAC_DMA2_STAT.RI</code> , and <code>EMAC_DMA2_STAT.ERI</code> .
15 (R/W)	AIE	Abnormal Interrupt Summary Enable. The <code>EMAC_DMA2_IEN.AIE</code> bit, when set, enables an abnormal interrupt. When this bit is reset, an Abnormal Interrupt is disabled. This bit enables the following bits: <code>EMAC_DMA2_STAT.TPS</code> , <code>EMAC_DMA2_STAT.TJT</code> , <code>EMAC_DMA2_STAT.OVF</code> , <code>EMAC_DMA2_STAT.RU</code> , <code>EMAC_DMA2_STAT.RPS</code> , <code>EMAC_DMA2_STAT.RWT</code> , <code>EMAC_DMA2_STAT.ETI</code> , and <code>EMAC_DMA2_STAT.FBI</code> .

Table 24-106: EMAC_DMA2_IEN Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
14 (R/W)	ERE	Early Receive Interrupt Enable. The EMAC_DMA2_IEN.ERE bit, when set (and with EMAC_DMA2_IEN.NIE =1), enables the Early Receive Interrupt. When this bit is reset, Early Receive Interrupt is disabled.
13 (R/W)	FBE	Fatal Bus Error Enable. The EMAC_DMA2_IEN.FBE bit, when set (and with EMAC_DMA2_IEN.AIE =1), enables the Fatal Bus Error Interrupt. When this bit is reset, Fatal Bus Error Enable Interrupt is disabled.
10 (R/W)	ETE	Early Transmit Interrupt Enable. The EMAC_DMA2_IEN.ETE bit, when this bit is set (and with EMAC_DMA2_IEN.AIE =1), enables the Early Transmit Interrupt. When this bit is reset, Early Transmit Interrupt is disabled.
9 (R/W)	RWE	Receive Watchdog Timeout Enable. The EMAC_DMA2_IEN.RWE bit, when set (and with EMAC_DMA2_IEN.AIE =1), enables the Receive Watchdog Timeout Interrupt. When this bit is reset, Receive Watchdog Timeout Interrupt is disabled.
8 (R/W)	RSE	Receive Stopped Enable. The EMAC_DMA2_IEN.RSE bit, when set (and with EMAC_DMA2_IEN.AIE =1), enables the Receive Stopped Interrupt is enabled. When this bit is reset, Receive Stopped Interrupt is disabled.
7 (R/W)	RUE	Receive Buffer Unavailable Enable. The EMAC_DMA2_IEN.RUE bit, when set (and with EMAC_DMA2_IEN.AIE =1), enables the Receive Buffer Unavailable Interrupt. When this bit is reset, the Receive Buffer Unavailable Interrupt is disabled.
6 (R/W)	RIE	Receive Interrupt Enable. The EMAC_DMA2_IEN.RIE bit, when set (and with EMAC_DMA2_IEN.NIE =1), enables the Receive Interrupt. When this bit is reset, Receive Interrupt is disabled.
5 (R/W)	UNE	Underflow Interrupt Enable. The EMAC_DMA2_IEN.UNE bit, when set (and with EMAC_DMA2_IEN.AIE =1), enables the Transmit Underflow Interrupt. When this bit is reset, Underflow Interrupt is disabled.
4 (R/W)	OVE	Overflow Interrupt Enable. The EMAC_DMA2_IEN.OVE bit, when set (and with EMAC_DMA2_IEN.AIE =1), enables the Receive Overflow Interrupt. When this bit is reset, Overflow Interrupt is disabled.

Table 24-106: EMAC_DMA2_IEN Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
3 (R/W)	TJE	Transmit Jabber Timeout Enable. The EMAC_DMA2_IEN.TJE bit, when set (and with EMAC_DMA2_IEN.AIE =1), enables the Transmit Jabber Timeout Interrupt. When this bit is reset, Transmit Jabber Timeout Interrupt is disabled.
2 (R/W)	TUE	Transmit Buffer Unavailable Enable. The EMAC_DMA2_IEN.TUE bit, when set (and with EMAC_DMA2_IEN.NIE =1), enables the Transmit Buffer Unavailable Interrupt. When this bit is reset, Transmit Buffer Unavailable Interrupt is disabled.
1 (R/W)	TSE	Transmit Stopped Enable. The EMAC_DMA2_IEN.TSE bit, when set (and with EMAC_DMA2_IEN.AIE =1), enables the Transmission Stopped Interrupt. When this bit is reset, Transmission Stopped Interrupt is disabled.
0 (R/W)	TIE	Transmit Interrupt Enable. The EMAC_DMA2_IEN.TIE bit, when set (and with EMAC_DMA2_IEN.NIE =1), enables the Transmit Interrupt. When this bit is reset, Transmit Interrupt is disabled.

DMA Missed Frame Register

The `EMAC_DMA2_MISS_FRM` register contains counters for EMAC DMA missed frames and buffer overflows.

Figure 24-75: `EMAC_DMA2_MISS_FRM` Register Diagram

Table 24-107: `EMAC_DMA2_MISS_FRM` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
28 (RC/NW)	OVFFIFO	Overflow bit for FIFO Overflow Counter. The <code>EMAC_DMA2_MISS_FRM.OVFFIFO</code> bit holds the overflow bit for FIFO Overflow Counter.
27:17 (RC/NW)	MISSFROV	Missed Frames Buffer Overflow. The <code>EMAC_DMA2_MISS_FRM.MISSFROV</code> bits indicate the number of frames missed by the application due to buffer overflow.
16 (RC/NW)	OVFMIS	Overflow bit for Missed Frame Counter. The <code>EMAC_DMA2_MISS_FRM.OVFMIS</code> bit holds the overflow bit for the Missed Frame Counter.
15:0 (RC/NW)	MISSFRUN	Missed Frames Unavailable Buffer. The <code>EMAC_DMA2_MISS_FRM.MISSFRUN</code> bits indicate the number of frames missed by the controller because of the Application Receive Buffer being unavailable.

DMA Operation Mode Register

The `EMAC_DMA2_OPMODE` register selects receive and transmit DMA operating modes.

Figure 24-76: `EMAC_DMA2_OPMODE` Register Diagram

Table 24-108: `EMAC_DMA2_OPMODE` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
26 (R/W)	DT	Disable Dropping TCP/IP Errors. The <code>EMAC_DMA2_OPMODE.DT</code> bit, when set, directs the core not to drop frames that only have errors detected by the Receive Checksum Offload engine. Such frames do not have any errors (including FCS error) in the Ethernet frame received by the MAC but have errors in the encapsulated payload only. When this bit is reset, all error frames are dropped if the <code>EMAC_DMA2_OPMODE.FEF</code> bit is reset.
25 (R/W)	RSF	Receive Store and Forward. The <code>EMAC_DMA2_OPMODE.RSF</code> bit, when set, directs the MFL only to read a frame from the Rx FIFO after the complete frame has been written to it, ignoring the <code>EMAC_DMA2_OPMODE.RTC</code> bits. When this bit is reset, the Rx FIFO operates in threshold mode, subject to the threshold specified by the <code>EMAC_DMA2_OPMODE.RTC</code> bits.
24 (R/W)	DFF	Disable Flushing of Received Frames. The <code>EMAC_DMA2_OPMODE.DFF</code> bit, when set, directs the Rx DMA not to flush any frames because of the unavailability of receive descriptors/buffers as it does normally when this bit is reset.

Table 24-108: EMAC_DMA2_OPMODE Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration																
21 (R/W)	TSF	Transmit Store and Forward. The EMAC_DMA2_OPMODE . TSF bit, when set, starts transmission when a full frame resides in the MFL Transmit FIFO. When this bit is set, the TTC values specified in Register 6[16:14] are ignored. This bit should be changed only when transmission is stopped.																
20 (R/W1S)	FTF	Flush Transmit FIFO. The EMAC_DMA2_OPMODE . FTF bit, when set, directs the transmit FIFO controller logic to reset to its default values and thus all data in the Tx FIFO is lost/flushed. This bit is cleared internally when the flushing operation is completed fully. The Operation Mode register should not be written to until this bit is cleared. The data which is already accepted by the MAC transmitter is not flushed. It is scheduled for transmission and results in underflow and runt frame transmission. Note: The flush operation completes only after emptying the Tx FIFO of its contents and all the pending Transmit Status of the transmitted frames are accepted by the host. In order to complete this flush operation, the PHY transmit clock is required to be active. This field cleared to 1b0 by the core (Self Clear). The application cannot clear this type of field, and a register write of 1b0 to this bit has no effect on this field.																
16:14 (R/W)	TTC	Transmit Threshold Control. The EMAC_DMA2_OPMODE . TTC bits control the threshold level of the MFL Transmit FIFO. Transmission starts when the frame size within the MFL Transmit FIFO is larger than the threshold. In addition, full frames with a length less than the threshold are also transmitted. These bits are used only when the EMAC_DMA2_OPMODE . TSF bit is reset. The value =011 is not used. <table><tr><td>0</td><td>64</td></tr><tr><td>1</td><td>128</td></tr><tr><td>2</td><td>192</td></tr><tr><td>3</td><td>256</td></tr><tr><td>4</td><td>40</td></tr><tr><td>5</td><td>32</td></tr><tr><td>6</td><td>24</td></tr><tr><td>7</td><td>16</td></tr></table>	0	64	1	128	2	192	3	256	4	40	5	32	6	24	7	16

Table 24-108: EMAC_DMA2_OPMODE Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
13 (R/W)	ST	Start/Stop Transmission. The EMAC_DMA2_OPMODE.ST bit, when set, places transmission in the Running state, and the DMA checks the Transmit List at the current position for a frame to be transmitted. Descriptor acquisition is attempted either from the current position in the list, which is the Transmit List Base Address set by Transmit Descriptor List Address, or from the position retained when transmission was stopped previously. If the current descriptor is not owned by the DMA, transmission enters the Suspended state, and the EMAC_DMA2_STAT.TU bit is set. The Start Transmission command is effective only when transmission is stopped. If the command is issued before setting the EMAC_DMA2_TXDSC_CUR address register, then the DMA behavior is unpredictable. When this bit is reset, the transmission process is placed in the Stopped state after completing the transmission of the current frame. The Next Descriptor position in the Transmit List is saved, and becomes the current position when transmission is restarted. The stop transmission command is effective only when the transmission of the current frame is complete or the transmission is in the Suspended state.
7 (R/W)	FEF	Forward Error Frames. The EMAC_DMA2_OPMODE.FEF bit, when reset, directs the Rx FIFO to drop frames with error status (CRC error, collision error, giant frame, watchdog timeout, overflow). However, if the frames start byte (write) pointer is already transferred to the read controller side (in Threshold mode), then the frames are not dropped. When EMAC_DMA2_OPMODE.FEF bit is set, all frames except runt error frames are forwarded to the DMA. But when Rx FIFO overflows when a partial frame is written, then such frames are dropped even when EMAC_DMA2_OPMODE.FEF is set.
6 (R/W)	FUF	Forward Undersized good Frames. The EMAC_DMA2_OPMODE.FUF bit, when set, directs the Rx FIFO to forward Undersized frames (frames with no Error and length less than 64 bytes) including pad-bytes and CRC). When reset, the Rx FIFO drops all frames of less than 64 bytes, unless it is already transferred because of lower value of Receive Threshold (for example, EMAC_DMA2_OPMODE.RTC = 01).
5 (R/W)	DGF	Drop Giant Frames. The EMAC_DMA2_OPMODE.DGF bit, when set, the MAC drops the received giant frames in the Rx FIFO, that is, frames that are larger than the computed giant frame limit. When reset, the MAC does not drop the giant frames in the Rx FIFO.

Table 24-108: EMAC_DMA2_OPMODE Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
4:3 (R/W)	RTC	Receive Threshold Control. The <code>EMAC_DMA2_OPMODE.RTC</code> bits control the threshold level of the MFL Receive FIFO. Transfer (request) to DMA starts when the frame size within the MFL Receive FIFO is larger than the threshold. In addition, full frames with a length less than the threshold are transferred automatically. These bits are valid only when the <code>EMAC_DMA2_OPMODE.RSF</code> bit is zero, and are ignored when the <code>EMAC_DMA2_OPMODE.RSF</code> bit is set to 1. The value =11 is not used.
		0 64
		1 32
		2 96
		3 128
2 (R/W)	OSF	Operate on Second Frame. The <code>EMAC_DMA2_OPMODE.OSF</code> bit, when set, instructs the DMA to process a second frame of Transmit data even before status for first frame is obtained.
1 (R/W)	SR	Start/Stop Receive. The <code>EMAC_DMA2_OPMODE.SR</code> bit, when set, places the Receive process in the Running state. The DMA attempts to acquire the descriptor from the Receive list and processes incoming frames. Descriptor acquisition is attempted from the current position in the list, which is the address set by DMA Receive Descriptor List Address or the position retained when the Receive process was previously stopped. If no descriptor is owned by the DMA, reception is suspended, and the <code>EMAC_DMA2_STAT.RU</code> bit is set. The Start Receive command is effective only when reception has stopped. If the command was issued before setting <code>EMAC_DMA2_RXDSC_CUR</code> address register, DMA behavior is unpredictable. When this bit is cleared, Rx DMA operation is stopped after the transfer of the current frame. The next descriptor position in the Receive list is saved and becomes the current position after the Receive process is restarted. The Stop Receive command is effective only when the Receive process is in either the Running (waiting for receive packet) or in the Suspended state.

DMA Rx Buffer Current Register

The `EMAC_DMA2_RXBUF_CUR` register holds the pointer to the current receive DMA buffer.

Figure 24-77: EMAC_DMA2_RXBUF_CUR Register Diagram

Table 24-109: EMAC_DMA2_RXBUF_CUR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	ADDR	Host Receive Current Buffer Address. The <code>EMAC_DMA2_RXBUF_CUR.ADDR</code> bit field points to the current Receive Buffer address being read by the DMA. Pointer updated by DMA during operation. Cleared on Reset.

DMA Rx Descriptor List Address Register

The `EMAC_DMA2_RXDSC_ADDR` register holds the address for the DMA receive descriptor list. Writing to this Register is permitted only when reception is stopped. When stopped, this must be written to before the receive Start command is given. The processor can write to `EMAC_DMA2_RXDSC_ADDR` only when Rx DMA has stopped (`EMAC_DMA2_OPMODE.SR` bit =0). When stopped, it can be written with a new descriptor list address. When the processor sets the `EMAC_DMA2_OPMODE.SR` bit to 1, the DMA takes the newly programmed descriptor base address. If this register is not changed when the `EMAC_DMA2_OPMODE.SR` bit is cleared to 0, the DMA takes the descriptor address where it was stopped earlier.

Figure 24-78: `EMAC_DMA2_RXDSC_ADDR` Register Diagram

Table 24-110: `EMAC_DMA2_RXDSC_ADDR` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	Start of Receive List. The <code>EMAC_DMA2_RXDSC_ADDR.VALUE</code> bit field contains the base address of the First Descriptor in the Receive Descriptor list. The LSB bits [1:0] for the 32bit bus width are ignored and are taken as all-zero by the DMA internally. Therefore, these LSB bits are Read-Only (RO).

DMA Rx Descriptor Current Register

The `EMAC_DMA2_RXDSC_CUR` register contains the current DMA receive descriptor.

Figure 24-79: EMAC_DMA2_RXDSC_CUR Register Diagram

Table 24-111: EMAC_DMA2_RXDSC_CUR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	ADDR	Host Receive Current Descriptor Address. The <code>EMAC_DMA2_RXDSC_CUR.ADDR</code> bit field points to the start address of the current Receive Descriptor read by the DMA. Pointer updated by DMA during operation. Cleared on Reset.

DMA Rx Interrupt Watch Dog Register

The `EMAC_DMA2_RXIWDOG` register contains the timeout value for the EMAC DMA receive interrupt watch dog timer.

Figure 24-80: EMAC_DMA2_RXIWDOG Register Diagram

Table 24-112: EMAC_DMA2_RXIWDOG Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
7:0 (R/W)	RIWT	RI WatchDog Timer Count. The <code>EMAC_DMA2_RXIWDOG.RIWT</code> bit field indicates the number of system clock cycles multiplied by 256 for which the watchdog timer is set. The watchdog timer gets triggered with the programmed value after the Rx DMA completes the transfer of a frame for which the RI status bit is not set because of the setting in the corresponding descriptor <code>RDES1[31]</code>. When the watch-dog timer runs out, the RI bit is set and the timer is stopped. The watchdog timer is reset when <code>EMAC_DMA2_STAT.RI</code> bit is set high because of automatic setting of <code>EMAC_DMA2_STAT.RI</code> as per <code>RDES1[31]</code> of any received frame.

DMA Rx Poll Demand register

The `EMAC_DMA2_RXPOLL` register directs the EMAC to poll the receive descriptor list.

Figure 24-81: EMAC_DMA2_RXPOLL Register Diagram

Table 24-113: EMAC_DMA2_RXPOLL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	START	Receive Poll Demand. The <code>EMAC_DMA2_RXPOLL.START</code> bits, when written with any value, cause the DMA to read the current descriptor pointed to by the <code>EMAC_DMA2_RXDSC_CUR</code> register. If that descriptor is not available (owned by application), reception returns to the Suspended state, and the <code>EMAC_DMA2_STAT.RU</code> bit is asserted. If the descriptor is available, the Receive DMA returns to the active state.

DMA Status Register

The `EMAC_DMA2_STAT` register indicates EMAC DMA status.

Figure 24-82: EMAC_DMA2_STAT Register Diagram

Table 24-114: EMAC_DMA2_STAT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
30 (R/NW)	GTMSI	MAC TMS Interrupt. The <code>EMAC_DMA2_STAT.GTMSI</code> bit indicates an interrupt event in the traffic manager and scheduler logic. To reset this bit, the software must read the corresponding registers (Channel Status Register) to get the exact cause of the interrupt and clear its source.

Table 24-114: EMAC_DMA2_STAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
29 (R/NW)	TTI	Time Stamp Trigger Interrupt. The EMAC_DMA2_STAT.TTI bit indicates an interrupt event in the MAC core's Time Stamp Generator block. The software must read the corresponding registers in the MAC core to get the exact cause of interrupt and clear its source to reset this bit to =0. When this bit is high, the interrupt signal from the MAC is high.
27 (R/NW)	MCI	MAC MMC Interrupt. The EMAC_DMA2_STAT.MCI bit reflects an interrupt event in the MMC module of the MAC core. The software must read the corresponding registers in the MAC core to get the exact cause of interrupt and clear the source of interrupt to make this bit as =0. The interrupt signal from the MAC is high when this bit is high.
26 (R/NW)	GLI	Line Interface Interrupt. The EMAC_DMA2_STAT.GLI bit When set, this bit reflects any of the following interrupt events in the DWC_gmac interfaces
25:23 (R/NW)	EB	Error Bits. The EMAC_DMA2_STAT.EB bits indicate the type of error that caused a Bus Error (for example, error response on the SCB interface). These bits are valid only when the EMAC_DMA2_STAT.FBI bit is set. This field does not generate an interrupt.
		0 Error during data buffer access, write transfer, Rx DMA
		1 Error during data buffer access, write transfer, Tx DMA
		2 Error during data buffer access, read transfer, Rx DMA
		3 Error during data buffer access, read transfer, Tx DMA
		4 Error during descriptor access, write transfer, Rx DMA
		5 Error during descriptor access, write transfer, Tx DMA
		6 Error during descriptor access, read transfer, Rx DMA
		7 Error during descriptor access, read transfer, Tx DMA
22:20 (R/NW)	TS	Tx Process State. The EMAC_DMA2_STAT.TS bits indicate the transmit DMA state. This field does not generate an interrupt.
		0 Stopped; Reset or Stop Tx Command Issued
		1 Running; Fetching Tx Transfer Descriptor
		2 Running; Waiting for Status
		3 Reading Data from Host Memory Buffer and Queuing It to Tx Buffer
		4 TIME_STAMP Write State

Table 24-114: EMAC_DMA2_STAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration	
		5	Reserved
		6	Suspended; Tx Descriptor Unavailable or Tx Buffer Underflow
		7	Closing Tx Descriptor
19:17 (R/NW)	RS	Rx Process State. The EMAC_DMA2_STAT.RS bits indicate the receive DMA state. This field does not generate an interrupt.	
		0	Stopped: Reset or Stop Rx Command Issued.
		1	Running: Fetching Rx Transfer Descriptor.
		2	Reserved
		3	Running: Waiting for Rx Packet
		4	Suspended: Rx Descriptor Unavailable
		5	Running: Closing Rx Descriptor
		6	TIME_STAMP Write State
		7	Running: Transferring Rx Packet Data from Rx Buffer to Host Memory
16 (R/W1C)	NIS	Normal Interrupt Summary. The value of the EMAC_DMA2_STAT.NIS bit field is the logical OR of the following when the corresponding interrupt bits are enabled in DMA Interrupt Enable Register: EMAC_DMA2_STAT.TI, EMAC_DMA2_STAT.TU, EMAC_DMA2_STAT.RI, and EMAC_DMA2_STAT.ERI. Only unmasked bits affect the Normal Interrupt Summary bit. This is a sticky bit and must be cleared (by writing a 1 to this bit) each time a corresponding bit that causes EMAC_DMA2_STAT.NIS to be set is cleared.	
15 (R/W1C)	AIS	Abnormal Interrupt Summary. The value of the EMAC_DMA2_STAT.AIS bit field is the logical OR of the following when the corresponding interrupt bits are enabled in DMA Interrupt Enable Register: EMAC_DMA2_IEN.TSE, EMAC_DMA2_IEN.TJE, EMAC_DMA2_IEN.OVE, EMAC_DMA2_IEN.UNE, EMAC_DMA2_IEN.RUE, EMAC_DMA2_IEN.RSE, EMAC_DMA2_IEN.RWE, EMAC_DMA2_IEN.ETE, and EMAC_DMA2_IEN.FBE. Only unmasked bits affect the Abnormal Interrupt Summary bit. This is a sticky bit and must be cleared each time a corresponding bit that causes EMAC_DMA2_STAT.AIS to be set is cleared.	
14 (R/W1C)	ERI	Early Receive Interrupt. The EMAC_DMA2_STAT.ERI bit indicates that the DMA had filled the first data buffer of the packet. The EMAC_DMA2_STAT.RI bit automatically clears this bit.	

Table 24-114: EMAC_DMA2_STAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
13 (R/W1C)	FBI	Fatal Bus Error Interrupt. The EMAC_DMA2_STAT.FBI bit indicates that a bus error occurred, as detailed in the EMAC_DMA2_STAT.EB field. When this bit is set, the corresponding DMA engine disables all its bus accesses.
10 (R/W1C)	ETI	Early Transmit Interrupt. The EMAC_DMA2_STAT.ETI bit indicates that the frame to be transmitted was fully transferred to the MFL Transmit FIFO.
9 (R/W1C)	RWT	Receive WatchDog Timeout. The EMAC_DMA2_STAT.RWT bit is asserted when a frame with a length greater than 2,048 bytes is received (10, 240 when Jumbo Frame mode is enabled).
8 (R/W1C)	RPS	Receive Process Stopped. The EMAC_DMA2_STAT.RPS bit is asserted when the Receive Process enters the Stopped state.
7 (R/W1C)	RU	Receive Buffer Unavailable. The EMAC_DMA2_STAT.RU bit indicates that the Next Descriptor in the Receive List is owned by the application and cannot be acquired by the DMA. Receive Process is suspended. To resume processing Receive descriptors, the application should change the ownership of the descriptor and issue a Receive Poll Demand command. If no Receive Poll Demand is issued, Receive Process resumes when the next recognized incoming frame is received. This bit is set only when the previous Receive Descriptor was owned by the DMA.
6 (R/W1C)	RI	Receive Interrupt. The EMAC_DMA2_STAT.RI bit indicates the completion of frame reception. Specific frame status information has been posted in the descriptor. Reception remains in the Running state.
5 (R/W1C)	UNF	Transmit Buffer Underflow. The EMAC_DMA2_STAT.UNF bit indicates that the Transmit Buffer had an Underflow during frame transmission. Transmission is suspended and an Underflow Error TDES0[1] is set.
4 (R/W1C)	OVF	Receive Buffer Overflow. The EMAC_DMA2_STAT.OVF bit indicates that the Receive Buffer had an Overflow during frame reception. If the partial frame is transferred to application, the overflow status is set in RDES0[11].
3 (R/W1C)	TJT	Transmit Jabber Timeout. The EMAC_DMA2_STAT.TJT bit indicates that the Transmit Jabber Timer expired, meaning that the transmitter had been excessively active. The transmission process is aborted and placed in the Stopped state. This causes the Transmit Jabber Timeout TDES0[14] flag to assert.

Table 24-114: EMAC_DMA2_STAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
2 (R/W1C)	TU	Transmit Buffer Unavailable. The EMAC_DMA2_STAT.TU bit indicates that the Next Descriptor in the Transmit List is owned by the application and cannot be acquired by the DMA. Transmission is suspended. The value in the EMAC_DMA2_STAT.TS bits explain the Transmit Process state transitions. To resume processing transmit descriptors, the application should change the ownership of the bit of the descriptor and then issue a Transmit Poll Demand command.
1 (R/W1C)	TPS	Transmit Process Stopped. The EMAC_DMA2_STAT.TPS bit is set when the transmission is stopped.
0 (R/W1C)	TI	Transmit Interrupt. The EMAC_DMA2_STAT.TI bit indicates that frame transmission is finished and TDES1[31] is set in the First Descriptor.

DMA Tx Buffer Current Register

The `EMAC_DMA2_TXBUF_CUR` register holds the pointer to the current transmit DMA buffer.

Figure 24-83: EMAC_DMA2_TXBUF_CUR Register Diagram

Table 24-115: EMAC_DMA2_TXBUF_CUR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	ADDR	Host Transmit Current Buffer Address. The <code>EMAC_DMA2_TXBUF_CUR.ADDR</code> bit field points to the current Transmit Buffer Address being read by the DMA. Pointer updated by DMA during operation. Cleared on Reset.

DMA Tx Descriptor List Address Register

The `EMAC_DMA2_TXDSC_ADDR` register holds the address for the DMA transmit descriptor list. The processor can write to this Register only when Tx DMA has stopped (`EMAC_DMA2_OPMODE.ST` bit =0). When stopped, this can be written with a new descriptor list address. When the processor sets the `EMAC_DMA2_OPMODE.ST` bit to 1, the DMA takes the newly programmed descriptor base address. If this register is not changed when the `EMAC_DMA2_OPMODE.ST` bit is cleared to 0, then the DMA takes the descriptor address where it was stopped earlier.

Figure 24-84: EMAC_DMA2_TXDSC_ADDR Register Diagram

Table 24-116: EMAC_DMA2_TXDSC_ADDR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	Start of Transmit List. The <code>EMAC_DMA2_TXDSC_ADDR.VALUE</code> bit field contains the base address of the First Descriptor in the Transmit Descriptor list. The LSB bits [1:0] for 32bit bus width are ignored and are taken as all-zero by the DMA internally. Therefore, these LSB bits are Read-Only (RO).

DMA Tx Descriptor Current Register

The `EMAC_DMA2_TXDSC_CUR` register contains the current DMA transmit descriptor.

Figure 24-85: `EMAC_DMA2_TXDSC_CUR` Register Diagram

Table 24-117: `EMAC_DMA2_TXDSC_CUR` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	ADDR	Host Transmit Descriptor Address. The <code>EMAC_DMA2_TXDSC_CUR.ADDR</code> bit field points to the start address of the current Transmit Descriptor read by the DMA. Pointer updated by DMA during operation. Cleared on Reset.

DMA Tx Poll Demand Register

The `EMAC_DMA2_TXPOLL` register directs the EMAC to poll the transmit descriptor list.

Figure 24-86: `EMAC_DMA2_TXPOLL` Register Diagram

Table 24-118: `EMAC_DMA2_TXPOLL` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	START	Transmit Poll Demand. The <code>EMAC_DMA2_TXPOLL.START</code> bits, when written with any value, cause the DMA to read the current descriptor pointed to by <code>EMAC_DMA2_TXDSC_CUR</code> register. If that descriptor is not available (owned by application), transmission returns to the Suspend state, and the <code>EMAC_DMA2_STAT.TU</code> bit is asserted. If the descriptor is available, transmission resumes.

Flow Control Register

The `EMAC_FLOWCTL` register controls EMAC flow control features.

Figure 24-87: EMAC_FLOWCTL Register Diagram

Table 24-119: EMAC_FLOWCTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:16 (R/W)	PT	Pause Time. The <code>EMAC_FLOWCTL.PT</code> bits hold the value to be used in the Pause Time field in the transmit control frame.
7 (R/W)	DZPQ	Disable Zero-Quanta Pause. The <code>EMAC_FLOWCTL.DZPQ</code> bit disables the automatic generation of the Zero-Quanta Pause frames on the de-assertion of the flow-control signal from the FIFO layer.
5:4 (R/W)	PLT	Pause Low Threshold. The <code>EMAC_FLOWCTL.PLT</code> bit configures the threshold of the Pause timer at which the input flow control signal <code>mti_flowctrl_i</code> (or <code>sbd_flowctrl_i</code>) is checked for automatic retransmission of the Pause frame.
3 (R/W)	UP	Unicast Pause Frame Detect. The <code>EMAC_FLOWCTL.UP</code> bit, when set, directs the MAC to detect the Pause frames with the station's unicast address specified in <code>EMAC_ADDR0_HI</code> and <code>EMAC_ADDR0_LO</code> address registers. This bit also directs the MAC to the detect Pause frames with the unique multicast address. When this bit is reset, the MAC will detect only a Pause frame with the unique multicast address specified in the 802.3x standard.

Table 24-119: EMAC_FLOWCTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
2 (R/W)	RFE	Receive Flow Control Enable. The <code>EMAC_FLOWCTL.RFE</code> bit, when set, directs the MAC to decode the received Pause frame and disable its transmitter for a specified (Pause Time) time. When this bit is reset, the decode function of the Pause frame is disabled.
1 (R/W)	TFE	Transmit Flow Control Enable. In Full-Duplex mode, when the <code>EMAC_FLOWCTL.TFE</code> bit is set, the MAC enables the flow control operation to transmit Pause frames. When this bit is reset, the flow control operation in the MAC is disabled, and the MAC does not transmit any Pause frames. In Half-Duplex mode, when this bit is set, the MAC enables the back pressure operation. When this bit is reset, the back pressure feature is disabled.
0 (R/W1S)	FCBBPA	Initiate Pause Control Frame. The <code>EMAC_FLOWCTL.FCBBPA</code> bit initiates a Pause Control frame in Full-Duplex mode and activates the back pressure function in Half-Duplex mode if TFE bit is set. In Full-Duplex mode, this bit should be read as =0 before writing to the <code>EMAC_FLOWCTL</code> register. To initiate a Pause control frame, the Application must set this bit to =1. During a transfer of the Control Frame, this bit continues to be set to signify that a frame transmission is in progress. After the completion of Pause control frame transmission, the MAC resets this bit to =0. The <code>EMAC_FLOWCTL</code> register should not be written to until this bit is cleared. In Half-Duplex mode, when this bit is set (and <code>EMAC_FLOWCTL.TFE</code> is set), the back pressure is asserted by the MAC Core. During back pressure, when the MAC receives a new frame, the transmitter starts sending a JAM pattern resulting in a collision. The <code>EMAC_FLOWCTL.FCBBPA</code> bit is logically OR'ed with the flow control input signal for the back pressure function. When the MAC is configured to Full-Duplex mode, the back pressure function is automatically disabled.

RGMI Control and Status Register

The `EMAC_GIGE_CTLSTAT` register indicates the status signals received from the PHY through the SGMII, RGMII, or SMII interface.

Figure 24-88: EMAC_GIGE_CTLSTAT Register Diagram

Table 24-120: EMAC_GIGE_CTLSTAT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
3 (R/NW)	LNKSTS	Link Status. The <code>EMAC_GIGE_CTLSTAT.LNKSTS</code> bit indicates that the link is up between the local PHY and the remote PHY. When cleared, this bit indicates that the link is down between the local PHY and the remote PHY.
2:1 (R/NW)	LNKSPED	Link Speed. The <code>EMAC_GIGE_CTLSTAT.LNKSPED</code> bit indicates the current speed of the link.
0 (R/NW)	LNKMOD	Link Mode. The <code>EMAC_GIGE_CTLSTAT.LNKMOD</code> bit indicates whether the current mode of link operation is half duplex or full duplex.

Hash Table High Register

The `EMAC_HASHTBL_HI` register contains the upper 32 bits of the hash table.

Figure 24-89: EMAC_HASHTBL_HI Register Diagram

Table 24-121: EMAC_HASHTBL_HI Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	Hash Table High. The <code>EMAC_HASHTBL_HI.VALUE</code> bits contain the upper 32 bits of Hash table.

Hash Table Low Register

The `EMAC_HASHTBL_LO` register contains the lower 32 bits of the hash table.

Figure 24-90: EMAC_HASHTBL_LO Register Diagram

Table 24-122: EMAC_HASHTBL_LO Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	VALUE	Hash Table Low. The <code>EMAC_HASHTBL_LO.VALUE</code> bits contain the lower 32 bits of Hash table.

Interrupt Mask Register

The `EMAC_IMSK` register enables (unmasks) EMAC interrupts.

Figure 24-91: EMAC_IMSK Register Diagram

Table 24-123: EMAC_IMSK Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
10 (R/W)	LPIIM	LPI Interrupt Mask. The <code>EMAC_IMSK.LPIIM</code> bit, When set, disables the assertion of the interrupt signal because of the setting of the LPI Interrupt Status bit in Interrupt Status Register.
9 (R/W)	TS	Time Stamp Interrupt Mask. The <code>EMAC_IMSK.TS</code> bit, when set, disables the assertion of the interrupt signal, which is generated when the <code>EMAC_ISTAT.TS</code> bit is set.
0 (R/W)	RGMIIIM	RGMII or SMII Interrupt Mask. The <code>EMAC_IMSK.RGMIIIM</code> bit, When set, disables the assertion of the interrupt signal because of the setting of the RGMII Interrupt Status bit in Interrupt Status Register.

MMC IPC Rx Interrupt Mask Register

The `EMAC_IPC_RXIMSK` register enables (unmasks) MMC IPC receive interrupts.

Figure 24-92: EMAC_IPC_RXIMSK Register Diagram

Table 24-124: EMAC_IPC_RXIMSK Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
29 (R/W)	ICMPERROCT	Rx ICMP Error Octets Count Half/Full Mask. The EMAC_IPC_RXIMSK.ICMPERROCT bit, when set, masks the interrupt when the EMAC_RXICMP_ERR_OCT counter reaches half the maximum value, and also when it reaches the maximum value.
28 (R/W)	ICMPGOCT	Rx ICMP (Good) Octets Count Half/Full Mask. The EMAC_IPC_RXIMSK.ICMPGOCT bit, when set, masks the interrupt when the EMAC_RXICMP_GD_OCT counter reaches half the maximum value, and also when it reaches the maximum value.
27 (R/W)	TCPPERROCT	Rx TCP Error Octets Count Half/Full Mask. The EMAC_IPC_RXIMSK.TCPPERROCT bit, when set, masks the interrupt when the EMAC_RXTCP_ERR_OCT counter reaches half the maximum value, and also when it reaches the maximum value.
26 (R/W)	TCPGOCT	Rx TCP (Good) Octets Count Half/Full Mask. The EMAC_IPC_RXIMSK.TCPGOCT bit, when set, masks the interrupt when the EMAC_RXTCP_GD_OCT counter reaches half the maximum value, and also when it reaches the maximum value.
25 (R/W)	UDPPERROCT	Rx UDP Error Octets Count Half/Full Mask. The EMAC_IPC_RXIMSK.UDPPERROCT bit, when set, masks the interrupt when the EMAC_RXUDP_ERR_OCT counter reaches half the maximum value, and also when it reaches the maximum value.
24 (R/W)	UDPGOCT	Rx UDP (Good) Octets Count Half/Full Mask. The EMAC_IPC_RXIMSK.UDPGOCT bit, when set, masks the interrupt when the EMAC_RXUDP_GD_OCT counter reaches half the maximum value, and also when it reaches the maximum value.
23 (R/W)	V6NOPAYOCT	Rx IPv6 No Payload Octets Count Half/Full Mask. The EMAC_IPC_RXIMSK.V6NOPAYOCT bit, when set, masks the interrupt when the EMAC_RXIPV6_NOPAY_OCT counter reaches half the maximum value, and also when it reaches the maximum value.
22 (R/W)	V6HDERROCT	Rx IPv6 Header Error Octets Count Half/Full Mask. The EMAC_IPC_RXIMSK.V6HDERROCT bit, when set, masks the interrupt when the EMAC_RXIPV6_HDR_ERR_OCT counter reaches half the maximum value, and also when it reaches the maximum value.
21 (R/W)	V6GOCT	Rx IPv6 (Good) Octets Count Half/Full Mask. The EMAC_IPC_RXIMSK.V6GOCT bit, when set, masks the interrupt when the EMAC_RXIPV6_GD_OCT counter reaches half the maximum value, and also when it reaches the maximum value.

Table 24-124: EMAC_IPC_RXIMSK Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
20 (R/W)	V4UDSBLOCT	Rx IPv4 UDS Disable Octets Count Half/Full Mask. The EMAC_IPC_RXIMSK.V4UDSBLOCT bit, when set, masks the interrupt when the EMAC_RXIPV4_UDSBL_OCT counter reaches half the maximum value, and also when it reaches the maximum value.
19 (R/W)	V4FRAGOCT	Rx IPv4 Fragmented Octets Count Half/Full Mask. The EMAC_IPC_RXIMSK.V4FRAGOCT bit, when set, masks the interrupt when the EMAC_RXIPV4_FRAG_OCT counter reaches half the maximum value, and also when it reaches the maximum value.
18 (R/W)	V4NOPAYOCT	Rx IPv4 No Payload Octets Count Half/Full Mask. The EMAC_IPC_RXIMSK.V4NOPAYOCT bit, when set, masks the interrupt when the EMAC_RXIPV4_NOPAY_OCT counter reaches half the maximum value, and also when it reaches the maximum value.
17 (R/W)	V4HDERROCT	Rx IPv4 Header Error Octets Count Half/Full Mask. The EMAC_IPC_RXIMSK.V4HDERROCT bit, when set, masks the interrupt when the EMAC_RXIPV4_HDR_ERR_OCT counter reaches half the maximum value, and also when it reaches the maximum value.
16 (R/W)	V4GOCT	Rx IPv4 (Good) Octets Count Half/Full Mask. The EMAC_IPC_RXIMSK.V4GOCT bit, when set, masks the interrupt when the EMAC_RXIPV4_GD_OCT counter reaches half the maximum value, and also when it reaches the maximum value.
13 (R/W)	ICMPERRFRM	Rx ICMP Error Frames Count Half/Full Mask. The EMAC_IPC_RXIMSK.ICMPERRFRM bit, when set, masks the interrupt when the EMAC_RXICMP_ERR_FRM counter reaches half the maximum value, and also when it reaches the maximum value.
12 (R/W)	ICMPGFRM	Rx ICMP (Good) Frames Count Half/Full Mask. The EMAC_IPC_RXIMSK.ICMPGFRM bit, when set, masks the interrupt when the EMAC_RXICMP_GD_FRM counter reaches half the maximum value, and also when it reaches the maximum value.
11 (R/W)	TCPERRFRM	Rx TCP Error Frames Count Half/Full Mask. The EMAC_IPC_RXIMSK.TCPERRFRM bit, when set, masks the interrupt when the EMAC_RXTCP_ERR_FRM counter reaches half the maximum value, and also when it reaches the maximum value.
10 (R/W)	TCPGFRM	Rx TCP (Good) Frames Count Half/Full Mask. The EMAC_IPC_RXIMSK.TCPGFRM bit, when set, masks the interrupt when the EMAC_RXTCP_GD_FRM counter reaches half the maximum value, and also when it reaches the maximum value.

Table 24-124: EMAC_IPC_RXIMSK Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
9 (R/W)	UDPERRFRM	Rx UDP Error Frames Count Half/Full Mask. The EMAC_IPC_RXIMSK.UDPERRFRM bit, when set, masks the interrupt when the EMAC_RXUDP_ERR_FRM counter reaches half the maximum value, and also when it reaches the maximum value.
8 (R/W)	UDPGFRM	Rx UDP (Good) Frames Count Half/Full Mask. The EMAC_IPC_RXIMSK.UDPGFRM bit, when set, masks the interrupt when the EMAC_RXUDP_GD_FRM counter reaches half the maximum value, and also when it reaches the maximum value.
7 (R/W)	V6NOPAYFRM	Rx IPv6 No Payload Frames Count Half/Full Mask. The EMAC_IPC_RXIMSK.V6NOPAYFRM bit, when set, masks the interrupt when the EMAC_RXIPV6_NOPAY_FRM counter reaches half the maximum value, and also when it reaches the maximum value.
6 (R/W)	V6HDERRFRM	Rx IPv6 Header Error Frames Count Half/Full Mask. The EMAC_IPC_RXIMSK.V6HDERRFRM bit, when set, masks the interrupt when the EMAC_RXIPV6_HDR_ERR_FRM counter reaches half the maximum value, and also when it reaches the maximum value.
5 (R/W)	V6GFRM	Rx IPv6 (Good) Frames Count Half/Full Mask. The EMAC_IPC_RXIMSK.V6GFRM bit, when set, masks the interrupt when the EMAC_RXIPV6_GD_FRM counter reaches half the maximum value, and also when it reaches the maximum value.
4 (R/W)	V4UDSBLFRM	Rx IPv4 UDS Disable Frames Count Half/Full Mask. The EMAC_IPC_RXIMSK.V4UDSBLFRM bit, when set, masks the interrupt when the EMAC_RXIPV4_UDSBL_FRM counter reaches half the maximum value, and also when it reaches the maximum value.
3 (R/W)	V4FRAGFRM	Rx IPv4 Fragmented Frames Count Half/Full Mask. The EMAC_IPC_RXIMSK.V4FRAGFRM bit, when set, masks the interrupt when the EMAC_RXIPV4_FRAG_FRM counter reaches half the maximum value, and also when it reaches the maximum value.
2 (R/W)	V4NOPAYFRM	Rx IPv4 No Payload Frame Count Half/Full Mask. The EMAC_IPC_RXIMSK.V4NOPAYFRM bit, when set, masks the interrupt when the EMAC_RXIPV4_NOPAY_FRM counter reaches half the maximum value, and also when it reaches the maximum value.
1 (R/W)	V4HDERRFRM	Rx IPv4 Header Error Frame Count Half/Full Mask. The EMAC_IPC_RXIMSK.V4HDERRFRM bit, when set, masks the interrupt when the EMAC_RXIPV4_HDR_ERR_FRM counter reaches half the maximum value, and also when it reaches the maximum value.

Table 24-124: EMAC_IPC_RXIMSK Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
0 (R/W)	V4GFRM	Rx IPv4 (Good) Frames Count Half/Full Mask. The EMAC_IPC_RXIMSK.V4GFRM bit, when set, masks the interrupt when the EMAC_RXIPV4_GD_FRM counter reaches half the maximum value, and also when it reaches the maximum value.

MMC IPC Rx Interrupt Register

The `EMAC_IPC_RXINT` register indicates status of MMC IPC receive interrupts.

Figure 24-93: EMAC_IPC_RXINT Register Diagram

Table 24-125: EMAC_IPC_RXINT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
29 (R/NW)	ICMPERROCT	Rx ICMP Error Octets Count Half/Full Interrupt. The EMAC_IPC_RXINT.ICMPERROCT bit is set when the EMAC_RXICMP_ERR_OCT counter reaches half the maximum value, and also when it reaches the maximum value.
28 (R/NW)	ICMPGOCT	Rx ICMP (Good) Octets Count Half/Full Interrupt. The EMAC_IPC_RXINT.ICMPGOCT bit is set when the EMAC_RXICMP_GD_OCT counter reaches half the maximum value, and also when it reaches the maximum value.
27 (R/NW)	TCPPERROCT	Rx TCP Error Octets Count Half/Full Interrupt. The EMAC_IPC_RXINT.TCPPERROCT bit is set when the EMAC_RXTCP_ERR_OCT counter reaches half the maximum value, and also when it reaches the maximum value.
26 (R/NW)	TCPGOCT	Rx TCP (Good) Octets Count Half/Full Interrupt. The EMAC_IPC_RXINT.TCPGOCT bit is set when the EMAC_RXTCP_GD_OCT counter reaches half the maximum value, and also when it reaches the maximum value.
25 (R/NW)	UDPPERROCT	Rx UDP Error Octets Count Half/Full Interrupt. The EMAC_IPC_RXINT.UDPPERROCT bit is set when the EMAC_RXUDP_ERR_OCT counter reaches half the maximum value, and also when it reaches the maximum value.
24 (R/NW)	UDPGOCT	Rx UDP (Good) Octets Count Half/Full Interrupt. The EMAC_IPC_RXINT.UDPGOCT bit is set when the EMAC_RXUDP_GD_OCT counter reaches half the maximum value, and also when it reaches the maximum value.
23 (R/NW)	V6NOPAYOCT	Rx IPv6 No Payload Octets Count Half/Full Interrupt. The EMAC_IPC_RXINT.V6NOPAYOCT bit is set when the EMAC_RXIPV6_NOPAY_OCT counter reaches half the maximum value, and also when it reaches the maximum value.
22 (R/NW)	V6HDERROCT	Rx IPv6 Header Error Octets Count Half/Full Interrupt. The EMAC_IPC_RXINT.V6HDERROCT bit is set when the EMAC_RXIPV6_HDR_ERR_OCT counter reaches half the maximum value, and also when it reaches the maximum value.
21 (R/NW)	V6GOCT	Rx IPv6 (Good) Octets Count Half/Full Interrupt. The EMAC_IPC_RXINT.V6GOCT bit is set when the EMAC_RXIPV6_GD_OCT counter reaches half the maximum value, and also when it reaches the maximum value.
20 (R/NW)	V4UDSBLOCT	Rx IPv4 UDS Disable Octets Count Half/Full Interrupt. The EMAC_IPC_RXINT.V4UDSBLOCT bit is set when the EMAC_RXIPV4_UDSBL_OCT counter reaches half the maximum value, and also when it reaches the maximum value.

Table 24-125: EMAC_IPC_RXINT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
19 (R/NW)	V4FRAGOCT	Rx IPv4 Fragmented Octets Count Half/Full Interrupt. The EMAC_IPC_RXINT.V4FRAGOCT bit is set when the EMAC_RXIPV4_FRAG_OCT counter reaches half the maximum value, and also when it reaches the maximum value.
18 (R/NW)	V4NOPAYOCT	Rx IPv4 No Payload Octets Count Half/Full Interrupt. The EMAC_IPC_RXINT.V4NOPAYOCT bit set when the EMAC_RXIPV4_NOPAY_OCT counter reaches half the maximum value, and also when it reaches the maximum value.
17 (R/NW)	V4HDERROCT	Rx IPv4 Header Error Octets Count Half/Full Interrupt. The EMAC_IPC_RXINT.V4HDERROCT bit is set when the EMAC_RXIPV4_HDR_ERR_OCT counter reaches half the maximum value, and also when it reaches the maximum value.
16 (R/NW)	V4GOCT	Rx IPv4 (Good) Octets Count Half/Full Interrupt. The EMAC_IPC_RXINT.V4GOCT bit is set when the EMAC_RXIPV4_GD_OCT counter reaches half the maximum value, and also when it reaches the maximum value.
13 (R/NW)	ICMPERRFRM	Rx ICMP Error Frames Count Half/Full Interrupt. The EMAC_IPC_RXINT.ICMPERRFRM bit is set when the EMAC_RXICMP_ERR_FRM counter reaches half the maximum value, and also when it reaches the maximum value.
12 (R/NW)	ICMPGFRM	Rx ICMP (Good) Frames Count Half/Full Interrupt. The EMAC_IPC_RXINT.ICMPGFRM bit is set when the EMAC_RXICMP_GD_FRM counter reaches half the maximum value, and also when it reaches the maximum value.
11 (R/NW)	TCPERRFRM	Rx TCP Error Frames Count Half/Full Interrupt. The EMAC_IPC_RXINT.TCPERRFRM bit is set when the EMAC_RXTCP_ERR_FRM counter reaches half the maximum value, and also when it reaches the maximum value.
10 (R/NW)	TCPGFRM	Rx TCP (Good) Frames Count Half/Full Interrupt. The EMAC_IPC_RXINT.TCPGFRM bit is set when the EMAC_RXTCP_GD_FRM counter reaches half the maximum value, and also when it reaches the maximum value.
9 (R/NW)	UDPERFRM	Rx IDP Error Frames Count Half/Full Interrupt. The EMAC_IPC_RXINT.UDPERFRM bit is set when the EMAC_RXUDP_ERR_FRM counter reaches half the maximum value, and also when it reaches the maximum value.
8 (R/NW)	UDPGFRM	Rx UDP (Good) Frames Count Half/Full Interrupt. The EMAC_IPC_RXINT.UDPGFRM bit is set when the EMAC_RXUDP_GD_FRM counter reaches half the maximum value, and also when it reaches the maximum value.

Table 24-125: EMAC_IPC_RXINT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
7 (R/NW)	V6NOPAYFRM	Rx IPv6 No Payload Frames Count Half/Full Interrupt. The EMAC_IPC_RXINT.V6NOPAYFRM bit is set when the EMAC_RXIPV6_NOPAY_FRM counter reaches half the maximum value, and also when it reaches the maximum value.
6 (R/NW)	V6HDERRFRM	Rx IPv6 Header Error Frames Count Half/Full Interrupt. The EMAC_IPC_RXINT.V6HDERRFRM bit is set when the EMAC_RXIPV6_HDR_ERR_FRM counter reaches half the maximum value, and also when it reaches the maximum value.
5 (R/NW)	V6GFRM	Rx IPv6 (Good) Frames Count Half/Full Interrupt. The EMAC_IPC_RXINT.V6GFRM bit is set when the EMAC_RXIPV6_GD_FRM counter reaches half the maximum value, and also when it reaches the maximum value.
4 (R/NW)	V4UDSBLFRM	Rx IPv4 UDS Disable Frames Count Half/Full Interrupt. The EMAC_IPC_RXINT.V4UDSBLFRM bit is set when the EMAC_RXIPV4_UDSBL_FRM counter reaches half the maximum value, and also when it reaches the maximum value.
3 (R/NW)	V4FRAGFRM	Rx IPv4 Fragmented Frames Count Half/Full Interrupt. The EMAC_IPC_RXINT.V4FRAGFRM bit is set when the EMAC_RXIPV4_FRAG_FRM counter reaches half the maximum value, and also when it reaches the maximum value.
2 (R/NW)	V4NOPAYFRM	Rx IPv4 No Payload Frames Count Half/Full Interrupt. The EMAC_IPC_RXINT.V4NOPAYFRM bit is set when the EMAC_RXIPV4_NOPAY_FRM counter reaches half the maximum value, and also when it reaches the maximum value.
1 (R/NW)	V4HDERRFRM	Rx IPv4 Header Error Frames Count Half/Full Interrupt. The EMAC_IPC_RXINT.V4HDERRFRM bit is set when the EMAC_RXIPV4_HDR_ERR_FRM counter reaches half the maximum value, and also when it reaches the maximum value.
0 (R/NW)	V4GFRM	Rx IPv4 (Good) Frames Count Half/Full Interrupt. The EMAC_IPC_RXINT.V4GFRM bit is set when the EMAC_RXIPV4_GD_FRM counter reaches half the maximum value, and also when it reaches the maximum value.

Interrupt Status Register

The `EMAC_ISTAT` register indicates EMAC interrupt status.

Figure 24-94: EMAC_ISTAT Register Diagram

Table 24-126: EMAC_ISTAT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
10 (R/NW)	LPIIS	LPI Interrupt Status. The <code>EMAC_ISTAT.LPIIS</code> bit is set for any LPI state entry or exit in the MAC Transmitter or Receiver.
9 (R/NW)	TS	Time Stamp Interrupt Status. The <code>EMAC_ISTAT.TS</code> bit is set when:
7 (R/NW)	MMCRC	MMC Receive Checksum Offload Interrupt Status. The <code>EMAC_ISTAT.MMCRC</code> bit is set high whenever an interrupt is generated in the <code>EMAC_IPC_RXINT</code> . This bit is cleared when all the bits in this interrupt register are cleared.
6 (R/NW)	MMCTX	MMC Transmit Interrupt Status. The <code>EMAC_ISTAT.MMCTX</code> bit is set high whenever an interrupt is generated in the <code>EMAC_MMC_TXINT</code> register. This bit is cleared when all the bits in this interrupt register are cleared.
5 (R/NW)	MMCRX	MMC Receive Interrupt Status. The <code>EMAC_ISTAT.MMCRX</code> bit is set high whenever an interrupt is generated in the <code>EMAC_MMC_RXINT</code> register. This bit is cleared when all the bits in this interrupt register are cleared.

Table 24-126: EMAC_ISTAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
4 (R/NW)	MMC	MMC Interrupt Status. The EMAC_ISTAT.MMC bit is set high whenever any of EMAC_ISTAT bits [7:5] is set (=1) and is cleared only when all of these bits are cleared (=0).
0 (R/NW)	RGMIIS	RGMII or SMII Interrupt Status. The EMAC_ISTAT.RGMIIS bit is set because of any change in value of the Link Status of RGMII interface.

Layer3 and Layer4 Control Register

The `EMAC_L3L4_CTL` register controls the operations of the filter 0 of Layer 3 and Layer 4. This register is reserved if the Layer 3 and Layer 4 Filtering feature is not selected during core configuration.

Figure 24-95: EMAC_L3L4_CTL Register Diagram

Table 24-127: EMAC_L3L4_CTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
21 (R/W)	L4DPIM	Layer 4 Destination Port Inverse Matching. The <code>EMAC_L3L4_CTL.L4DPIM</code> bit indicates that the Layer 4 Destination Port number field is enabled for inverse matching.
20 (R/W)	L4DPM	Layer 4 Destination Port Matching. The <code>EMAC_L3L4_CTL.L4DPM</code> bit indicates that the Layer 4 Destination Port number field is enabled for matching.
19 (R/W)	L4SPIM	Layer 4 Source Port Inverse Matching. The <code>EMAC_L3L4_CTL.L4SPIM</code> bit indicates that the Layer 4 Source Port number field is enabled for inverse matching.
18 (R/W)	L4SPM	Layer 4 Source Port Matching. The <code>EMAC_L3L4_CTL.L4SPM</code> bit indicates that the Layer 4 Source Port number field is enabled for matching.

Table 24-127: EMAC_L3L4_CTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
16 (R/W)	L4PEN	Layer 4 Filtering Enable. The EMAC_L3L4_CTL.L4PEN bit indicates that source and destination port number fields for UDP (TCP) frames are used for matching.
15:11 (R/W)	L3HDBM	Layer 3 Destination Address Bits Mask. The EMAC_L3L4_CTL.L3HDBM bits are the number of lower bits of IP destination Address that are masked for matching in the IPv4 frames.
10:6 (R/W)	L3HSBM	Layer 3 Source Address Bits Mask. The EMAC_L3L4_CTL.L3HSBM bit are the number of lower bits of IP source address that are masked for matching in the IPv4 frames.
5 (R/W)	L3DAIM	Layer 3 Destination Address Inverse Matching. The EMAC_L3L4_CTL.L3DAIM bit indicates that the Layer 3 IP destination address field is enabled for inverse matching.
4 (R/W)	L3DAM	Layer 3 Destination Address Matching. The EMAC_L3L4_CTL.L3DAM bit indicates that Layer 3 IP destination address field is enabled for matching.
3 (R/W)	L3SAIM	Layer 3 Source Address Inverse Matching. The EMAC_L3L4_CTL.L3SAIM bit indicates that the Layer 3 IP Source Address field is enabled for inverse matching.
2 (R/W)	L3SAM	Layer 3 Source Address Matching. The EMAC_L3L4_CTL.L3SAM bit indicates that the Layer 3 IP Source Address field is enabled for matching.
0 (R/W)	L3PEN	Layer 3 Enabled. The EMAC_L3L4_CTL.L3PEN bit indicates that layer 3 source or destination address matching is enabled for IPV6 (IPV4) frames.

Layer 3 Address0 Register

The `EMAC_L3_ADDR0` register tells For IPv4 frames, the Layer 3 Address 0 Register 0 contains the 32-bit IP Source Address field.

Figure 24-96: EMAC_L3_ADDR0 Register Diagram

Table 24-128: EMAC_L3_ADDR0 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	L3A0	Layer 3 Address 0 Field. When Bit 0 (L3PEN0) and Bit 2 (L3SAM0) are set in Register 256 (Layer 3 and Layer 4 Control Register 0), this field contains the value to be matched with Bits [31:0] of the IP Source Address field in the IPv6 frames. When Bit 0 (L3PEN0) and Bit 4 (L3DAM0) are set in Register 256 (Layer 3 and Layer 4 Control Register 0), this field contains the value to be matched with Bits [31:0] of the IP Destination Address field in the IPv6 frames. When Bit 0 (L3PEN0) is reset and Bit 2 (L3SAM0) is set in Register 256 (Layer 3 and Layer 4 Control Register 0), this field contains the value to be matched with the IP Source Address field in the IPv4 frames.

Layer 3 Address1 Register

The `EMAC_L3_ADDR1` register tells For IPv4 frames, the Layer 3 Address 1 Register 0 contains the 32-bit IP Source Address field.

Figure 24-97: EMAC_L3_ADDR1 Register Diagram

Table 24-129: EMAC_L3_ADDR1 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	L3A1	Layer 3 Address 1 Field. When Bit 0 (L3PEN0) and Bit 2 (L3SAM0) are set in Register 256 (Layer 3 and Layer 4 Control Register 0), this field contains the value to be matched with Bits [31:0] of the IP Source Address field in the IPv6 frames. When Bit 0 (L3PEN0) and Bit 4 (L3DAM0) are set in Register 256 (Layer 3 and Layer 4 Control Register 0), this field contains the value to be matched with Bits [31:0] of the IP Destination Address field in the IPv6 frames. When Bit 0 (L3PEN0) is reset and Bit 2 (L3SAM0) is set in Register 256 (Layer 3 and Layer 4 Control Register 0), this field contains the value to be matched with the IP Source Address field in the IPv4 frames.

Layer 3 Address2 Register

The `EMAC_L3_ADDR2` register tells For IPv4 frames, the Layer 3 Address 2 Register 0 contains the 32-bit IP Source Address field.

Figure 24-98: `EMAC_L3_ADDR2` Register Diagram

Table 24-130: `EMAC_L3_ADDR2` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	L3A2	Layer 3 Address 2 Field. When Bit 0 (L3PEN0) and Bit 2 (L3SAM0) are set in Register 256 (Layer 3 and Layer 4 Control Register 0), this field contains the value to be matched with Bits [31:0] of the IP Source Address field in the IPv6 frames. When Bit 0 (L3PEN0) and Bit 4 (L3DAM0) are set in Register 256 (Layer 3 and Layer 4 Control Register 0), this field contains the value to be matched with Bits [31:0] of the IP Destination Address field in the IPv6 frames. When Bit 0 (L3PEN0) is reset and Bit 2 (L3SAM0) is set in Register 256 (Layer 3 and Layer 4 Control Register 0), this field contains the value to be matched with the IP Source Address field in the IPv4 frames.

Layer 3 Address3 Register

The `EMAC_L3_ADDR3` register tells For IPv4 frames, the Layer 3 Address 3 Register 0 contains the 32-bit IP Source Address field.

Figure 24-99: EMAC_L3_ADDR3 Register Diagram

Table 24-131: EMAC_L3_ADDR3 Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/W)	L3A3	Layer 3 Address 3 Field. When Bit 0 (L3PEN0) and Bit 2 (L3SAM0) are set in Register 256 (Layer 3 and Layer 4 Control Register 0), this field contains the value to be matched with Bits [31:0] of the IP Source Address field in the IPv6 frames. When Bit 0 (L3PEN0) and Bit 4 (L3DAM0) are set in Register 256 (Layer 3 and Layer 4 Control Register 0), this field contains the value to be matched with Bits [31:0] of the IP Destination Address field in the IPv6 frames. When Bit 0 (L3PEN0) is reset and Bit 2 (L3SAM0) is set in Register 256 (Layer 3 and Layer 4 Control Register 0), this field contains the value to be matched with the IP Source Address field in the IPv4 frames.

Layer 4 Address Register

The `EMAC_L4_ADDR` register contains Layer 4 Port number field. It contains the 16-bit Source and Destination Port numbers of the TCP or UDP frame.

Figure 24-100: `EMAC_L4_ADDR` Register Diagram

Table 24-132: `EMAC_L4_ADDR` Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:16 (R/W)	L4DP	Layer 4 Destination Port. When <code>EMAC_L3L4_CTL.L4PEN</code> is reset and <code>EMAC_L3L4_CTL.L4DPM</code> is set, the <code>EMAC_L4_ADDR.L4DP</code> bit field contains the value to be matched with the TCP Destination Port Number field in the IPv4 or IPv6 frames. When <code>EMAC_L3L4_CTL.L4PEN</code> and <code>EMAC_L3L4_CTL.L4DPM</code> are set, the <code>EMAC_L4_ADDR.L4DP</code> bit field contains the value to be matched with the UDP Destination Port Number field in the IPv4 or IPv6 frames.
15:0 (R/W)	L4SP	Layer 4 Source Port. When <code>EMAC_L3L4_CTL.L4PEN</code> is reset and <code>EMAC_L3L4_CTL.L4DPM</code> is set, the <code>EMAC_L4_ADDR.L4SP</code> bit field contains the value to be matched with the TCP Source Port Number field in the IPv4 or IPv6 frames. When <code>EMAC_L3L4_CTL.L4PEN</code> and <code>EMAC_L3L4_CTL.L4DPM</code> are set, the <code>EMAC_L4_ADDR.L4SP</code> bit field contains the value to be matched with the UDP Source Port Number field in the IPv4 or IPv6 frames.

Low Power Idle Control and Status Register

The `EMAC_LPI_CTLSTAT` register controls the behavior of EMAC0 for LPI mode and reports status.

Figure 24-101: EMAC_LPI_CTLSTAT Register Diagram

Table 24-133: EMAC_LPI_CTLSTAT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
19 (R/W)	LPITXA	LPI Mode Transmit Behavior. The <code>EMAC_LPI_CTLSTAT.LPITXA</code> bit controls the behavior of the MAC when it is entering or exiting of the LPI mode on the transmit side.
18 (R/W)	PLSEN	LPI Link Status Enable. The <code>EMAC_LPI_CTLSTAT.PLS</code> bit enables the link status received on the RGMII receive paths to be used for activating the LPI LS timer.
17 (R/W)	PLS	PHY Link Status. The <code>EMAC_LPI_CTLSTAT.PLS</code> bit indicates the link status of the PHY
16 (R/W0C)	LPIEN	LPI Enable. The <code>EMAC_LPI_CTLSTAT.LPIEN</code> bit instructs the MAC Transmitter to enter the LPI state. When reset, this bit instructs the MAC to exit the LPI state and resume normal transmission.
9 (R/NW)	RLPIST	Receive LPI Status. The <code>EMAC_LPI_CTLSTAT.RLPIST</code> bit indicates that the MAC is receiving the LPI pattern on the GMII or MII interface.

Table 24-133: EMAC_LPI_CTLSTAT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
8 (R/NW)	TLPIST	Transmit LPI Status. The EMAC_LPI_CTLSTAT.TLPIST bit indicates that the MAC is transmitting the LPI pattern on the GMII or MII interface.
3 (RC/NW)	RLPIEX	Receiver LPI State Exit Status. The EMAC_LPI_CTLSTAT.RLPIEX bit indicates that the MAC Receiver has stopped receiving the LPI pattern on the GMII or MII interface, exited the LPI state, and resumed the normal reception. This bit is cleared by a read into this register.
2 (RC/NW)	RLPIEN	Receiver LPI State Enable Status. The EMAC_LPI_CTLSTAT.RLPIEN bit indicates that the MAC Receiver has received an LPI pattern and entered the LPI state. This bit is cleared by a read into this register.
1 (RC/NW)	TLPIEX	Transmitter LPI State Exit Status. The EMAC_LPI_CTLSTAT.TLPIEX bit indicates that the MAC transmitter has exited the LPI state after the program has cleared the EMAC_LPI_CTLSTAT.LPIEN bit and the LPI TW Timer has expired. This bit is cleared by a read into this register.
0 (RC/NW)	TLPIEN	Transmitter LPI State Enable Status. The EMAC_LPI_CTLSTAT.TLPIEN bit indicates that the MAC Transmitter has entered the LPI state due to the setting of the EMAC_LPI_CTLSTAT.LPIEN bit. This bit is cleared by a read into this register.

Low Power Idle Timeout Register

The `EMAC_LPI_TMRCTL` controls the timeout values in the LPI states. It specifies the time for which the MAC transmits the LPI pattern and also the time for which the MAC waits before resuming the normal transmission.

Figure 24-102: EMAC_LPI_TMRCTL Register Diagram

Table 24-134: EMAC_LPI_TMRCTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
25:16 (R/W)	LST	Link Status Timer. The <code>EMAC_LPI_TMRCTL.LST</code> bit, specifies the minimum time (in milliseconds) for which the link status from the PHY should be up (OKAY) before the LPI pattern can be transmitted to the PHY.
15:0 (R/W)	TWT	Timer Wait Time. The <code>EMAC_LPI_TMRCTL.TWT</code> bit, specifies the minimum time (in microseconds) for which the MAC waits after it stops transmitting the LPI pattern to the PHY and before it resumes the normal transmission.

MAC Configuration Register

The `EMAC_MACCFG` register configures MAC features.

Figure 24-103: EMAC_MACCFG Register Diagram

Table 24-135: EMAC_MACCFG Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
30:28 (R/W)	SARC	Source Address Insertion or Replacement Control. The <code>EMAC_MACCFG.SARC</code> bit, controls the source address insertion or replacement for all transmitted frames.

Table 24-135: EMAC_MACCFG Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
27 (R/W)	TWOKPE	Support for 2K packets. The EMAC_MACCFG.TWOKPE bit, IEEE 802.3as Support for 2K Packets When set, the MAC considers all frames, with up to 2,000 bytes length, as normal packets.
25 (R/W)	CST	CRC Stripping. The EMAC_MACCFG.CST bit, when set, directs the MAC to strip the last 4 bytes (FCS) of all frames of Ether type (Type field of frame greater than 0x0600) and drop these bytes before forwarding the frame to the application.
24 (R/W)	TC	Transmit Configuration in RGMII, SGMII or SMII. The EMAC_MACCFG.TC bit, enables the transmission of duplex mode, link speed, and link up or down information to the PHY in the RGMII port.
23 (R/W)	WD	Watch Dog Disable. The EMAC_MACCFG.WD bit, when set, disables the watchdog timer on the receiver, and can receive frames of up to 16,384 bytes. When this bit is reset, the MAC allows no more than 2,048 bytes (10,240 if EMAC_MACCFG.JE is set high) of the frame being received and cuts off any bytes received after that.
22 (R/W)	JB	Jabber Disable. The EMAC_MACCFG.JB bit, when set, disables the jabber timer on the transmitter, and can transfer frames of up to 16,384 bytes. When this bit is reset, the MAC cuts off the transmitter if the application sends out more than 2,048 bytes of data (10,240 if EMAC_MACCFG.JE is set high) during transmission.
21 (R/W)	BE	Frame Burst Enable. The EMAC_MACCFG.BE bit, allows frame bursting during transmission in the GMII half-duplex mode.
20 (R/W)	JE	Jumbo Frame Enable. The EMAC_MACCFG.JE bit, when set, directs the MAC to allow Jumbo frames of 9,018 bytes (9,022 bytes for VLAN tagged frames).
19:17 (R/W)	IFG	Inter-Frame Gap. The EMAC_MACCFG.IFG bits control the minimum inter-frame gap between frames during transmission. Note that in Half-Duplex mode, the minimum gap can be configured for 64 bit times (EMAC_MACCFG.IFG = 100) only. Lower values are not considered.
		0 96 bit times
		1 88 bit times
		2 80 bit times
		3 72 bit times
		4 64 bit times

Table 24-135: EMAC_MACCFG Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration	
		5	56 bit times
		6	48 bit times
		7	40 bit times
16 (R/W)	DCRS	Disable Carrier Sense. The EMAC_MACCFG.DCRS bit, when set, makes the MAC transmitter ignore the CRS signal during frame transmission in Half-Duplex mode. This request results in no errors generated due to Loss of Carrier or No Carrier during such transmission. When this bit is low, the MAC transmitter generates such errors due to Carrier Sense and will even abort the transmissions.	
15 (R/NW)	PS	Port Select. The EMAC_MACCFG.PS bit selects between GMII and MII as: 0=GMII (1000 Mbps) and 1=MII (10/100 Mbps). This bit is read-only with the appropriate value in the 10/100 Mbps-only (always 1) or 1000 Mbps-only (always 0) configurations, and R_W in the default 10/100/1000 Mbps configuration.	
14 (R/W)	FES	Speed of Operation. The EMAC_MACCFG.FES bit indicates the Ethernet speed as 10 Mbps (bit =0) or 100 Mbps (bit =1).	
13 (R/W)	DO	Disable Receive Own. The EMAC_MACCFG.DO bit, when set, disables MAC reception of frames when MAC is transmitting in Half-Duplex mode. When this bit is reset, the MAC receives all packets that are given by the PHY while transmitting. This bit is not applicable if the MAC is operating in Full-Duplex mode.	
12 (R/W)	LM	Loopback Mode. The EMAC_MACCFG.LM bit, when set, directs the MAC to operate in internal loop back mode. (The media independent interface pins are not driven or sampled.)	
11 (R/W)	DM	Duplex Mode. The EMAC_MACCFG.DM bit, when set, directs the MAC to operate in a Full-Duplex mode where it can transmit and receive simultaneously.	
10 (R/W)	IPC	IP Checksum. The EMAC_MACCFG.IPC bit, when set, directs the MAC to calculate the 16-bit one's complement of the one's complement sum of all received Ethernet frame payloads. It also checks whether the IPv4 Header checksum (assumed to be bytes 25-26 or 29-30 (VLAN-tagged) of the received Ethernet frame) is correct for the received frame and gives the status in the receive status word. The EMAC_MACCFG.IPC bit, when set, enables IPv4 checksum checking for received frame payloads' TCP/UDP/ICMP headers. When this bit is reset, the Checksum Offload Engine function in the receiver is disabled and the corresponding PCE and IP HCE status bits are always cleared.	

Table 24-135: EMAC_MACCFG Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
9 (R/W)	DR	Disable Retry. The EMAC_MACCFG.DR bit, when set, directs the MAC to attempt only 1 transmission. When a collision occurs on the media independent interface, the MAC ignores the current frame transmission and reports a Frame Abort with excessive collision error in the transmit frame status. When the EMAC_MACCFG.DR bit is reset, the MAC attempts retries based on the settings of BL. This bit is applicable only to Half-Duplex mode.
		0 Retry enabled
		1 Retry disabled
8 (R/W)	LUD	Link Up or Down. The EMAC_MACCFG.LUD bit, indicates whether the link is up or down during the transmission of configuration in the RGMII, SGMII, or SMII interface: 0 means Link down and 1 means Link Up
7 (R/W)	ACS	Automatic Pad/CRC Stripping. The EMAC_MACCFG.ACS bit, when set, directs the MAC to strip the Pad/FCS field on incoming frames only if the length fields value is less than or equal to 1,500 bytes. All received frames with length field greater than or equal to 1,501 bytes are passed to the application without stripping the Pad/FCS field. When the EMAC_MACCFG.ACS bit is reset, the MAC passes all incoming frames to the Host unmodified.
6:5 (R/W)	BL	Back Off Limit. The EMAC_MACCFG.BL bit selects the back-off limit, determining the random integer number (r) of slot time delays (512 bit times for 10/100 Mbps) the MAC waits before rescheduling a transmission attempt during retries after a collision. This bit is applicable only to Half-Duplex mode. The random integer r takes the value in the range: $0 \text{ less-than-equal-to } r \text{ less-than } 2^k$ Where k is the minimum of n (number of transmission attempts) or a limit value.
		0 $k = \min(n, 10)$
		1 $k = \min(n, 8)$
		2 $k = \min(n, 4)$
		3 $k = \min(n, 1)$

Table 24-135: EMAC_MACCFG Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
4 (R/W)	DC	Deferral Check. The EMAC_MACCFG.DC bit, when set, enables the deferral check function in the MAC. The MAC issues a Frame Abort status, along with the excessive deferral error bit set in the transmit frame status when the transmit state machine is deferred for more than 24,288 bit times in 10/100-Mbps mode. If the Jumbo frame mode is enabled in 10/100-Mbps mode, the threshold for deferral is 155,680 bits times. Deferral begins when the transmitter is ready to transmit, but is prevented because of an active CRS (carrier sense) signal. Defer time is not cumulative. If the transmitter defers for 10,000 bit times, then transmits, collides, backs off, and then has to defer again after completion of back-off, the deferral timer resets to 0 and restarts. When the EMAC_MACCFG.DC bit is reset, the deferral check function is disabled and the MAC defers until the CRS signal goes inactive. This bit is applicable only in Half-Duplex mode.
3 (R/W)	TE	Transmitter Enable. The EMAC_MACCFG.TE bit, when set, enables the transmit state machine of the MAC for transmission. When this bit is reset, the MAC transmit state machine is disabled after the completion of the transmission of the current frame, and will not transmit any further frames.
2 (R/W)	RE	Receiver Enable. The EMAC_MACCFG.RE bit, when set, enables the receiver state machine of the MAC for receiving frames. When this bit is reset, the MAC receive state machine is disabled after the completion of the reception of the current frame, and does not receive any further frames.
1:0 (R/W)	PRELEN	Preamble Length for Transmit Frames. The EMAC_MACCFG.PRELEN bit, control the number of preamble bytes that are added to the beginning of every Transmit frame.

MAC Rx Frame Filter Register

The `EMAC_MACFRMFILT` register controls receive frame filter features.

Figure 24-104: EMAC_MACFRMFILT Register Diagram

Table 24-136: EMAC_MACFRMFILT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31 (R/W)	RA	Receive All Frames. The <code>EMAC_MACFRMFILT.RA</code> bit, when set, directs the MAC Receiver module to pass to the Application all frames received irrespective of whether they pass the address filter. The result of the DA filtering is updated (pass or fail) in the corresponding bits in the Receive Status Word. When this bit is reset, the Receiver module passes to the Application only those frames that pass the DA address filter.
21 (R/W)	DNTU	Drop non-TCP/UDP over IP Frames. The <code>EMAC_MACFRMFILT.DNTU</code> bit, enables the MAC to drop the non-TCP or UDP over IP frames. The MAC forward only those frames that are processed by the Layer 4 filter. When reset, this bit enables the MAC to forward all non-TCP or UDP over IP frames.
20 (R/W)	IPFE	Layer 3 and Layer 4 Filter Enable. The <code>EMAC_MACFRMFILT.IPFE</code> bit, enables the MAC to drop frames that do not match the enabled Layer 3 and Layer 4 filters. If Layer 3 or Layer 4 filters are not enabled for matching, this bit does not have any effect.

Table 24-136: EMAC_MACFRMFILT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
16 (R/W)	VTFE	VAN Tag Filter Enable. The EMAC_MACFRMFILT.VTFE bit, enables the MAC to drop VLAN tagged frames that do not match the VLAN Tag comparison.
10 (R/W)	HPF	Hash or Perfect Filter. The EMAC_MACFRMFILT.HPF bit, when set, configures the address filter to pass a frame if it matches either the perfect filtering or the hash filtering as set by EMAC_MACFRMFILT.HMC or EMAC_MACFRMFILT.HUC bits. When EMAC_MACFRMFILT.HPF is low and either the EMAC_MACFRMFILT.HUC bit or EMAC_MACFRMFILT.HMC bit is set, the frame is passed only if it matches the Hash filter.
9 (R/W)	SAF	Source Address Filter Enable. When the EMAC_MACFRMFILT.SAF bit, is set, the MAC compares the SA field of the received frames with the values programmed in the enabled SA registers. If the comparison fails, the MAC drops the frame.
8 (R/W)	SAIF	Source Address Inverse Filtering. When the EMAC_MACFRMFILT.SAIF bit is set, the Address Check block operates in inverse filtering mode for the SA address comparison. The frames whose SA matches the SA registers are marked as failing the SA Address filter.
7:6 (R/W)	PCF	Pass Control Frames. The EMAC_MACFRMFILT.PCF bits control the forwarding of all control frames (including unicast and multicast PAUSE frames). Note that the processing of PAUSE control frames depends only on the value of the EMAC_FLOWCTL.RFE bit.
		0 Pass no control frames All control frames are filtered from reaching the application.
		1 Pass no PAUSE frames All control frames are passed to the application (even if they fail the address filter), except for PAUSE frames.
		2 Pass all control frames All control frames are passed to the application (even if they fail the address filter).
		3 Pass address filtered control frames All control frames that pass the address filter are passed to the application.
5 (R/W)	DBF	Disable Broadcast Frames. The EMAC_MACFRMFILT.DBF bit, when set, directs the AFM module to filter all incoming broadcast frames. When this bit is reset, the AFM module passes all received broadcast frames.
		0 AFM module passes all received broadcast frames
		1 AFM module filters all incoming broadcast frames

Table 24-136: EMAC_MACFRMFILT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
4 (R/W)	PM	Pass All Multicast Frames. The EMAC_MACFRMFILT . PM bit, when set, indicates that all received frames with a multicast destination address (first bit in the destination address field is =1) are passed. When this bit is reset, filtering of multicast frame depends on EMAC_MACFRMFILT . HMC bit.
3 (R/W)	DAIF	Destination Address Inverse Filtering. The EMAC_MACFRMFILT . DAIF bit, when set, directs the Address Check block to operate in inverse filtering mode for the DA address comparison for both unicast and multicast frames. When this bit is reset, normal filtering of frames is performed.
2 (R/W)	HMC	Hash Multicast. The EMAC_MACFRMFILT . HMC bit, when set, directs the EMAC to perform destination address filtering of received multicast frames according to the hash table. When this bit is reset, the MAC performs a perfect destination address filtering for multicast frames, that is, the MAC compares the DA field with the values programmed in the EMAC_ADDR0_HI and EMAC_ADDR0_LO address registers.
1 (R/W)	HUC	Hash Unicast. The EMAC_MACFRMFILT . HUC bit, when set, directs the EMAC to perform destination address filtering of unicast frames according to the hash table. When this bit is reset, the MAC performs a perfect destination address filtering for unicast frames, that is, it compares the DA field with the values programmed in the EMAC_ADDR0_HI and EMAC_ADDR0_LO address registers.
0 (R/W)	PR	Promiscuous Mode. The EMAC_MACFRMFILT . PR bit, when set, directs the Address Filter module to pass all incoming frames regardless of its destination or source address. The DA Filter Fails status bits of the Receive Status Word is always cleared when EMAC_MACFRMFILT . PR is set.

AV MAC Control Register

The `EMAC_MAC_AVCTL` register controls the AV traffic by identifying the AV traffic and queuing it to appropriate channel. This register is present only when you select the AV feature during core configuration.

Figure 24-105: EMAC_MAC_AVCTL Register Diagram

Table 24-137: EMAC_MAC_AVCTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
25:24 (R/W)	PTPCH	Channel for Queuing the PTP Packets. The <code>EMAC_MAC_AVCTL.PTPCH</code> bit, specifies the channel on which the untagged PTP packets, sent over the Ethernet payload and not over IPv4 or IPv6, are queued.
22:21 (R/W)	AVCH	Channel for Queuing AV Control Packets. The <code>EMAC_MAC_AVCTL.AVCH</code> bit, specifies the channel on which the received untagged AV control packets are queued.
20 (R/W)	AVCD	AV Channel Disable. The <code>EMAC_MAC_AVCTL.AVCD</code> bit, When this bit is set, the MAC forwards all packets to the default Channel 0 and the values programmed in the AVP, AVCH, and PTPCH fields are ignored. This bit is reserved and read-only if Channel 1 or Channel 2 receive paths are not selected during core configuration.
19 (R/W)	VQE	VLAN Tagged non-AV packets queuing enable. The <code>EMAC_MAC_AVCTL.VQE</code> bit, When this bit is set, the MAC also queues non-AV VLAN tagged packets into the available channels according to the value of the AVP bits. This bit is reserved and read-only if Channel 1 and Channel 2 Receive paths are not selected during core configuration.

Table 24-137: EMAC_MAC_AVCTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
18:16 (R/W)	AVP	AV Priority for Queuing. The EMAC_MAC_AVCTL.AVP bit, The value programmed in these bits control the receive channel (0, 1, or 2) to which an AV packet with a given priority must be queued.
15:0 (R/W)	AVT	AV Ether Type Value. The EMAC_MAC_AVCTL.AVT bit, contains the value that is compared with the EtherType field of the incoming (tagged or untagged) Ethernet frame to detect an AV packet.

MMC Control Register

The `EMAC_MMC_CTL` register selects the MMC operating mode.

Figure 24-106: EMAC_MMC_CTL Register Diagram

Table 24-138: EMAC_MMC_CTL Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
5 (R/W)	FULLPSET	Full Preset. The <code>EMAC_MMC_CTL.FULLPSET</code> bit, when =0 (and <code>EMAC_MMC_CTL.CNTRPSET</code> =1), presets all MMC counters to almost-half value. All octet counters get preset to 0x7FFF_F800 (half - 2KBytes) and all frame-counters gets preset to 0x7FFF_FFF0 (half - 16). When <code>EMAC_MMC_CTL.FULLPSET</code> =1 (and <code>EMAC_MMC_CTL.CNTRPSET</code> =1), all MMC counters get preset to almost-full value. All octet counters get preset to 0xFFFF_F800 (full - 2KBytes) and all frame-counters gets preset to 0xFFFF_FFF0 (full - 16). For 16-bit counters, the almost-half preset values are 0x7800 and 0x7FF0 for the respective octet and frame counters. Similarly, the almost-full preset values for the 16-bit counters are 0xF800 and 0xFFFF0.
4 (R/W)	CNTRPSET	Counter Reset/Preset. The <code>EMAC_MMC_CTL.CNTRPSET</code> bit, when set, initializes all counters or presets counters to almost full or almost half as per <code>EMAC_MMC_CTL.FULLPSET</code> . The <code>EMAC_MMC_CTL.CNTRPSET</code> bit is cleared automatically after 1 clock cycle. This bit along with bit5 is useful for debugging and testing the assertion of interrupts because of MMC counter becoming half-full or full.
3 (R/W)	CNTRFRZ	Counter Freeze. The <code>EMAC_MMC_CTL.CNTRFRZ</code> bit, when set, freezes all the MMC counters to their current value. None of the MMC counters are updated due to any transmitted or received frame, until this bit is reset to 0. If any MMC counter is read with the <code>EMAC_MMC_CTL.RDRST</code> bit set, then that counter is also cleared in this mode.

Table 24-138: EMAC_MMC_CTL Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
2 (R/W)	RDRST	Read Reset. The EMAC_MMC_CTL.RDRST bit, when set, resets the MMC counters to zero after Read (self-clearing after reset). The counters are cleared when the least significant byte lane (bits[7:0]) is read.
1 (R/W)	NOROLL	No Rollover. The EMAC_MMC_CTL.NOROLL bit, when set, prevents counter rolls over to 0 after reaching max.
0 (R/W)	RST	Reset. The EMAC_MMC_CTL.RST bit, when set, resets all counters. This bit is cleared automatically after 1 clock cycle.

MMC Rx Interrupt Mask Register

The `EMAC_MMC_RXIMSK` register enables (unmasks) MMC receive interrupts.

Figure 24-107: EMAC_MMC_RXIMSK Register Diagram

Table 24-139: EMAC_MMC_RXIMSK Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
25 (R/W)	CTLFIM	Rx Control Frame Counter Interrupt Mask. The EMAC_MMC_RXIMSK.CTLFIM bit, masks the interrupt when the rxctrlframes_g counter reaches half of the maximum value or the maximum value.
24 (R/W)	RCVERRFIM	Rx Error Frame Counter Interrupt Mask. The EMAC_MMC_RXIMSK.RCVERRFIM bit, masks the interrupt when the rxrcverror counter reaches half of the maximum value or the maximum value.
23 (R/W)	WATCHERR	Rx Watch Dog Error Count Half/Full Mask. The EMAC_MMC_RXIMSK.WATCHERR bit, when set, masks the interrupt when EMAC_RXWDOG_ERR counter reaches full or half.
22 (R/W)	VLANFRGB	Rx VLAN Frames (Good/Bad) Count Half/Full Mask. The EMAC_MMC_RXIMSK.VLANFRGB bit, when set, masks the interrupt when EMAC_RXVLANFRM_GB counter reaches full or half.
21 (R/W)	FIFOOV	Rx FIFO Overflow Count Half/Full Mask. The EMAC_MMC_RXIMSK.FIFOOV bit, when set, masks the interrupt when EMAC_RXFIFO_OVF counter reaches full or half.
20 (R/W)	PAUSEFRM	Rx Pause Frames Count Half/Full Mask. The EMAC_MMC_RXIMSK.PAUSEFRM bit, when set, masks the interrupt when EMAC_RXPAUSEFRM counter reaches full or half.
19 (R/W)	OUTRANGE	Rx Out Of Range Type Count Half/Full Mask. The EMAC_MMC_RXIMSK.OUTRANGE bit, when set, masks the interrupt when EMAC_RXOORTYPE counter reaches full or half.
18 (R/W)	LENERR	Rx Length Error Count Half/Full Mask. The EMAC_MMC_RXIMSK.LENERR bit, when set, masks the interrupt when EMAC_RXLEN_ERR counter reaches full or half.
17 (R/W)	UCASTG	Rx Unicast Frames (Good) Count Half/Full Mask. The EMAC_MMC_RXIMSK.UCASTG bit, when set, masks the interrupt when EMAC_RXUCASTFRM_G counter reaches full or half.
16 (R/W)	R1024TOMAX	Rx 1024-to-max Octets (Good/Bad) Count Half/Full Mask. The EMAC_MMC_RXIMSK.R1024TOMAX bit, when set, masks the interrupt when EMAC_RX1024TOMAX_GB counter reaches full or half.
15 (R/W)	R512TO1023	Rx 512-to-1023 Octets (Good/Bad) Count Half/Full Mask. The EMAC_MMC_RXIMSK.R512TO1023 bit, when set, masks the interrupt when EMAC_RX512TO1023_GB counter reaches full or half.
14 (R/W)	R256TO511	Rx 255-to-511 Octets (Good/Bad) Count Half/Full Mask. The EMAC_MMC_RXIMSK.R256TO511 bit, when set, masks the interrupt when EMAC_RX256TO511_GB counter reaches full or half.

Table 24-139: EMAC_MMC_RXIMSK Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
13 (R/W)	R128TO255	Rx 128-to-255 Octets (Good/Bad) Count Half/Full Mask. The EMAC_MMC_RXIMSK.R128TO255 bit, when set, masks the interrupt when EMAC_RX128TO255_GB counter reaches full or half.
12 (R/W)	R65TO127	Rx 65-to-127 Octets (Good/Bad) Count Half/Full Mask. The EMAC_MMC_RXIMSK.R65TO127 bit, when set, masks the interrupt when EMAC_RX65TO127_GB counter reaches full or half.
11 (R/W)	R64	Rx 64 Octets (Good/Bad) Count Half/Full Mask. The EMAC_MMC_RXIMSK.R64 bit, when set, masks the interrupt when EMAC_RX64_GB counter reaches full or half.
10 (R/W)	OSIZEG	Rx Oversize (Good) Count Half/Full Mask. The EMAC_MMC_RXIMSK.OSIZEG bit, when set, masks the interrupt when EMAC_RXOSIZE_G counter reaches full or half.
9 (R/W)	USIZEG	Rx Undersize (Good) Count Half/Full Mask. The EMAC_MMC_RXIMSK.USIZEG bit, when set, masks the interrupt when EMAC_RXUSIZE_G counter reaches full or half.
8 (R/W)	JABERR	Rx Jabber Error Count Half/Full Mask. The EMAC_MMC_RXIMSK.JABERR bit, when set, masks the interrupt when EMAC_RXJAB_ERR counter reaches full or half.
7 (R/W)	RUNTERR	Rx Runt Error Count Half/Full Mask. The EMAC_MMC_RXIMSK.RUNTERR bit, when set, masks the interrupt when EMAC_RXRUNT_ERR counter reaches full or half.
6 (R/W)	ALIGNERR	Rx Alignment Error Count Half/Full Mask. The EMAC_MMC_RXIMSK.ALIGNERR bit, when set, masks the interrupt when EMAC_RXALIGN_ERR counter reaches full or half.
5 (R/W)	CRCERR	Rx CRC Error Count Half/Full Mask. The EMAC_MMC_RXIMSK.CRCERR bit, when set, masks the interrupt when EMAC_RXCRC_ERR counter reaches full or half.
4 (R/W)	MCASTG	Rx Multicast Frames (Good) Count Half/Full Mask. The EMAC_MMC_RXIMSK.MCASTG bit, when set, masks the interrupt when EMAC_RXMCASTFRM_G counter reaches full or half.
3 (R/W)	BCASTG	Rx Broadcast Frames (Good) Count Half/Full Mask. The EMAC_MMC_RXIMSK.BCASTG bit, when set, masks the interrupt when EMAC_RXBCASTFRM_G counter reaches full or half.

Table 24-139: EMAC_MMC_RXIMSK Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
2 (R/W)	OCTCNTG	Rx Octet Count (Good) Count Half/Full Mask. The EMAC_MMC_RXIMSK.OCTCNTG bit, when set, masks the interrupt when EMAC_RXOCTCNT_G counter reaches full or half.
1 (R/W)	OCTCNTGB	Rx Octet Count (Good/Bad) Count Half/Full Mask. The EMAC_MMC_RXIMSK.OCTCNTGB bit, when set, masks the interrupt when EMAC_RXOCTCNT_GB counter reaches half or full.
0 (R/W)	FRCNTGB	Rx Frame Count (Good/Bad) Count Half/Full Mask. The EMAC_MMC_RXIMSK.FRCNTGB bit, when set, masks the interrupt when EMAC_RXFRMCNT_GB counter reaches half or full.

MMC Rx Interrupt Register

The `EMAC_MMC_RXINT` register indicates status of MMC receive interrupts.

Figure 24-108: EMAC_MMC_RXINT Register Diagram

Table 24-140: EMAC_MMC_RXINT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
25 (RC/NW)	RXCTLFIS	Rx Control Frame Counter Interrupt Status. The EMAC_MMC_RXINT.RXCTLFIS bit is set when the rxctrlframes_g counter reaches half of the maximum value or the maximum value.
24 (RC/NW)	RXRCVERRFIS	Rx Error Frame Counter Interrupt Status. The EMAC_MMC_RXINT.RXRCVERRFIS bit is set when the rxrcverror counter reaches half of the maximum value or the maximum value.
23 (R/NW)	WDOGERR	Rx Watch Dog Error Count Half/Full. The EMAC_MMC_RXINT.WDOGERR bit is set when the EMAC_RXWDG_ERR counter reaches full or half.
22 (R/NW)	VLANFRGB	Rx VLAN Frames (Good/Bad) Count Half/Full. The EMAC_MMC_RXINT.VLANFRGB bit is set when EMAC_RXVLANFRM_GB counter reaches full or half.
21 (R/NW)	FIFOOVF	Rx FIFO Overflow Count Half/Full. The EMAC_MMC_RXINT.FIFOOVF bit is set when EMAC_RXFIFO_OVF counter reaches full or half.
20 (R/NW)	PAUSEFR	Rx Pause Frames Count Half/Full. The EMAC_MMC_RXINT.PAUSEFR bit is set when EMAC_RXPAUSEFRM counter reaches full or half.
19 (R/NW)	OUTRANGE	Rx Out Of Range Type Count Half/Full. The EMAC_MMC_RXINT.OUTRANGE bit is set when EMAC_RXOORTYPE counter reaches full or half.
18 (R/NW)	LENERR	Rx Length Error Count Half/Full. The EMAC_MMC_RXINT.LENERR bit is set when EMAC_RXLEN_ERR counter reaches full or half.
17 (R/NW)	UCASTG	Rx Unicast Frames (Good) Count Half/Full. The EMAC_MMC_RXINT.UCASTG bit is set when EMAC_RXUCASTFRM_G counter reaches full or half.
16 (R/NW)	R1024TOMAX	Rx 1024-to-max Octets (Good/Bad) Count Half/Full. The EMAC_MMC_RXINT.R1024TOMAX bit is set when EMAC_RX1024TOMAX_GB counter reaches full or half.
15 (R/NW)	R512TO1023	Rx 512-to-1023 Octets (Good/Bad) Count Half/Full. The EMAC_MMC_RXINT.R512TO1023 bit is set when EMAC_RX512TO1023_GB counter reaches full or half.
14 (R/NW)	R256TO511	Rx 255-to-511 Octets (Good/Bad) Count Half/Full. The EMAC_MMC_RXINT.R256TO511 bit is set when EMAC_RX256TO511_GB counter reaches full or half.

Table 24-140: EMAC_MMC_RXINT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
13 (R/NW)	R128TO255	Rx 128-to-255 Octets (Good/Bad) Count Half/Full. The EMAC_MMC_RXINT.R128TO255 bit is set when EMAC_RX128TO255_GB counter reaches full or half.
12 (R/NW)	R65TO127	Rx 65-to-127 Octets (Good/Bad) Count Half/Full. The EMAC_MMC_RXINT.R65TO127 bit is set when EMAC_RX65TO127_GB counter reaches full or half.
11 (R/NW)	R64	Rx 64 Octets (Good/Bad) Count Half/Full. The EMAC_MMC_RXINT.R64 bit is set when EMAC_RX64_GB counter reaches full or half.
10 (R/NW)	OSIZEG	Rx Oversize (Good) Count Half/Full. The EMAC_MMC_RXINT.OSIZEG bit is set when EMAC_RXOSIZE_G counter reaches full or half.
9 (R/NW)	USIZEG	Rx Undersize (Good) Count Half/Full. The EMAC_MMC_RXINT.USIZEG bit is set when EMAC_RXUSIZE_G counter reaches full or half.
8 (R/NW)	JABERR	Rx Jabber Error Count Half/Full. The EMAC_MMC_RXINT.JABERR bit is set when EMAC_RXJAB_ERR counter reaches full or half.
7 (R/NW)	RUNTERR	Rx Runt Error Count Half/Full. The EMAC_MMC_RXINT.RUNTERR bit is set when EMAC_RXRUNT_ERR counter reaches full or half.
6 (R/NW)	ALIGNERR	Rx Alignment Error Count Half/Full. The EMAC_MMC_RXINT.ALIGNERR bit is set when EMAC_RXALIGN_ERR counter reaches full or half.
5 (R/NW)	CRCERR	Rx CRC Error Counter Half/Full. The EMAC_MMC_RXINT.CRCERR bit is set when EMAC_RXCRC_ERR counter reaches full or half.
4 (R/NW)	MCASTG	Rx Multicast Count (Good) Half/Full. The EMAC_MMC_RXINT.MCASTG bit is set when EMAC_RXMCASTFRM_G counter reaches full or half.
3 (R/NW)	BCASTG	Rx Broadcast Count (Good) Half/Full. The EMAC_MMC_RXINT.BCASTG bit is set when EMAC_RXBCASTFRM_G counter reaches full or half.

Table 24-140: EMAC_MMC_RXINT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
2 (R/NW)	OCTCNTG	Octet Count (Good) Half/Full. The EMAC_MMC_RXINT.OCTCNTG bit is set when EMAC_RXOCTCNT_G counter reaches full or half.
1 (R/NW)	OCTCNTGB	Octet Count (Good/Bad) Half/Full. The EMAC_MMC_RXINT.OCTCNTGB bit is set when EMAC_RXOCTCNT_GB counter reaches half or full.
0 (R/NW)	FRCNTGB	Frame Count (Good/Bad) Half/Full. The EMAC_MMC_RXINT.FRCNTGB bit is set when EMAC_RXFRMCNT_GB counter reaches half or full.

MMC TX Interrupt Mask Register

The `EMAC_MMC_TXIMSK` register enables (unmasks) MMC transmit interrupts.

Figure 24-109: EMAC_MMC_TXIMSK Register Diagram

Table 24-141: EMAC_MMC_TXIMSK Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
25 (R/W)	OSZGFIM	Tx Oversize Good Frame Count Interrupt Mask. The EMAC_MMC_TXIMSK.OSZGFIM bit masks the interrupt when the txoversize_g counter reaches half of the maximum value or the maximum value.
24 (R/W)	VLANFRG	Tx VLAN Frames (Good) Count Half/Full Mask. The EMAC_MMC_TXIMSK.VLANFRG bit, when set, masks the interrupt when EMAC_TXVLANFRM_G counter reaches full or half.
23 (R/W)	PAUSEFRM	Tx Pause Frames Count Half/Full Mask. The EMAC_MMC_TXIMSK.PAUSEFRM bit, when set, masks the interrupt when EMAC_TXPAUSEFRM counter reaches full or half.
22 (R/W)	EXCESSDEF	Tx Excess Deferred Count Half/Full Mask. The EMAC_MMC_TXIMSK.EXCESSDEF bit, when set, masks the interrupt when EMAC_TXEXCESSDEF counter reaches full or half.
21 (R/W)	FRCNTG	Tx Frame Count (Good) Count Half/Full Mask. The EMAC_MMC_TXIMSK.FRCNTG bit, when set, masks the interrupt when EMAC_TXFRMCNT_G counter reaches full or half.
20 (R/W)	OCTCNTG	Tx Octet Count (Good) Count Half/Full Mask. The EMAC_MMC_TXIMSK.OCTCNTG bit, when set, masks the interrupt when EMAC_TXOCTCNT_G counter reaches full or half.
19 (R/W)	CARRERR	Tx Carrier Error Count Half/Full Mask. The EMAC_MMC_TXIMSK.CARRERR bit, when set, masks the interrupt when EMAC_TXCARR_ERR counter reaches full or half.
18 (R/W)	EXCESSCOL	Tx Excess collision Count Half/Full Mask. The EMAC_MMC_TXIMSK.EXCESSCOL bit, when set, masks the interrupt when EMAC_TXEXCESSCOL counter reaches full or half.
17 (R/W)	LATECOL	Tx Late Collision Count Half/Full Mask. The EMAC_MMC_TXIMSK.LATECOL bit, when set, masks the interrupt when EMAC_TXLATECOL counter reaches full or half.
16 (R/W)	DEFERRED	Tx Deferred Count Half/Full Mask. The EMAC_MMC_TXIMSK.DEFERRED bit, when set, masks the interrupt when EMAC_TXDEFERRED counter reaches full or half.
15 (R/W)	MULTCOLG	Tx Multiple Collisions (Good) Count Mask. The EMAC_MMC_TXIMSK.MULTCOLG bit, when set, masks the interrupt when EMAC_TXMULTCOL_G counter reaches full or half.
14 (R/W)	SNGCOLG	Tx Single Collision (Good) Count Half/Full Mask. The EMAC_MMC_TXIMSK.SNGCOLG bit, when set, masks the interrupt when EMAC_TXSNGCOL_G counter reaches full or half.

Table 24-141: EMAC_MMC_TXIMSK Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
13 (R/W)	UNDERR	Tx Underflow Error Count Half/Full Mask. The EMAC_MMC_TXIMSK.UNDERR bit, when set, masks the interrupt when EMAC_TXUNDR_ERR counter reaches full or half.
12 (R/W)	BCASTGB	Tx Broadcast Frames (Good/Bad) Count Half/Full Mask. The EMAC_MMC_TXIMSK.BCASTGB bit, when set, masks the interrupt when EMAC_TXBCASTFRM_GB counter reaches full or half.
11 (R/W)	MCASTGB	Tx Multicast Frames (Good/Bad) Count Half/Full Mask. The EMAC_MMC_TXIMSK.MCASTGB bit, when set, masks the interrupt when EMAC_TXMCASTFRM_GB counter reaches full or half.
10 (R/W)	UCASTGB	Tx Unicast Frames (Good/Bad) Count Half/Full Mask. The EMAC_MMC_TXIMSK.UCASTGB bit, when set, masks the interrupt when EMAC_TXUCASTFRM_GB counter reaches full or half.
9 (R/W)	T1024TOMAX	Tx 1024-to-max Octets (Good/Bad) Count Half/Full Mask. The EMAC_MMC_TXIMSK.T1024TOMAX bit, when set, masks the interrupt when EMAC_TX1024TOMAX_GB counter reaches full or half.
8 (R/W)	T512TO1023	Tx 512-to-1023 Octets (Good/Bad) Count Half/Full Mask. The EMAC_MMC_TXIMSK.T512TO1023 bit, when set, masks the interrupt when EMAC_TX512TO1023_GB counter reaches full or half.
7 (R/W)	T256TO511	Tx 256-to-511 Octets (Good/Bad) Count Half/Full Mask. The EMAC_MMC_TXIMSK.T256TO511 bit, when set, masks the interrupt when EMAC_TX256TO511_GB counter reaches full or half.
6 (R/W)	T128TO255	Tx 128-to-255 Octets (Good/Bad) Count Half/Full Mask. The EMAC_MMC_TXIMSK.T128TO255 bit, when set, masks the interrupt when EMAC_TX128TO255_GB counter reaches full or half.
5 (R/W)	T65TO127	Tx 65-to-127 Octets (Good/Bad) Count Half/Full Mask. The EMAC_MMC_TXIMSK.T65TO127 bit, when set, masks the interrupt when EMAC_TX65TO127_GB counter reaches full or half.
4 (R/W)	T64	Tx 64 Octets (Good/Bad) Count Half/Full Mask. The EMAC_MMC_TXIMSK.T64 bit, when set, masks the interrupt when EMAC_TX64_GB counter reaches full or half.
3 (R/W)	MCASTG	Tx Multicast Frames (Good) Count Half/Full Mask. The EMAC_MMC_TXIMSK.MCASTG bit, when set, masks the interrupt when EMAC_TXMCASTFRM_G counter reaches full or half.

Table 24-141: EMAC_MMC_TXIMSK Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
2 (R/W)	BCASTG	Tx Broadcast Frames (Good) Count Half/Full Mask. The EMAC_MMC_TXIMSK.BCASTG bit, when set, masks the interrupt when EMAC_TXBCASTFRM_G counter reaches full or half.
1 (R/W)	FRCNTGB	Tx Frame Count (Good/Bad) Count Half/Full Mask. The EMAC_MMC_TXIMSK.FRCNTGB bit, when set, masks the interrupt when EMAC_TXFRMCNT_GB counter reaches full or half.
0 (R/W)	OCTCNTGB	Tx Octet Count (Good/Bad) Count Half/Full Mask. The EMAC_MMC_TXIMSK.OCTCNTGB bit, when set, masks the interrupt when EMAC_TXOCTCNT_GB counter reaches full or half.

MMC Tx Interrupt Register

The `EMAC_MMC_TXINT` register indicates status of MMC transmit interrupts.

Figure 24-110: EMAC_MMC_TXINT Register Diagram

Table 24-142: EMAC_MMC_TXINT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
25 (RC/NW)	TXOSIZEGFIS	Tx Oversize Good Frame Count Interrupt Status. The EMAC_MMC_TXINT.TXOSIZEGFIS bit is set when the txoversize_g counter reaches half of the maximum value or the maximum value.
24 (R/NW)	VLANFRGB	Tx VLAN Frames (Good) Count Half/Full. The EMAC_MMC_TXINT.VLANFRGB bit is set when EMAC_TXVLANFRM_G counter reaches full or half.
23 (R/NW)	PAUSEFRM	Tx Pause Frames Count Half/Full. The EMAC_MMC_TXINT.PAUSEFRM bit is set when EMAC_TXPAUSEFRM counter reaches full or half.
22 (R/NW)	EXCESSDEF	Tx Excess Deferred Count Half/Full. The EMAC_MMC_TXINT.EXCESSDEF bit is set when EMAC_TXEXCESSDEF counter reaches full or half.
21 (R/NW)	FRCNTG	Tx Frame Count (Good) Count Half/Full. The EMAC_MMC_TXINT.FRCNTG bit is set when EMAC_TXFRMCNT_G counter reaches full or half.
20 (R/NW)	OCTCNTG	Tx Octet Count (Good) Count Half/Full. The EMAC_MMC_TXINT.OCTCNTG bit is set when EMAC_TXOCTCNT_G counter reaches full or half.
19 (R/NW)	CARRERR	Tx Carrier Error Count Half/Full. The EMAC_MMC_TXINT.CARRERR bit is set when EMAC_TXCARR_ERR counter reaches full or half.
18 (R/NW)	EXCESSCOL	Tx Excess Collision Count Half/Full. The EMAC_MMC_TXINT.EXCESSCOL bit is set when EMAC_TXEXCESSCOL counter reaches full or half.
17 (R/NW)	LATECOL	Tx Late Collision Count Half/Full. The EMAC_MMC_TXINT.LATECOL bit is set when EMAC_TXLATECOL counter reaches full or half.
16 (R/NW)	DEFERRED	Tx Deferred Count Half/Full. The EMAC_MMC_TXINT.DEFERRED bit is set when EMAC_TXDEFERRED counter reaches full or half.
15 (R/NW)	MULTCOLG	Tx Multiple collision (Good) Count Half/Full. The EMAC_MMC_TXINT.MULTCOLG bit is set when EMAC_TXMULTCOL_G counter reaches full or half.
14 (R/NW)	SNGCOLG	Tx Single Collision (Good) Count Half/Full. The EMAC_MMC_TXINT.SNGCOLG bit is set when EMAC_TXSNGCOL_G counter reaches full or half.

Table 24-142: EMAC_MMC_TXINT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
13 (R/NW)	UNDERR	Tx Underflow Error Count Half/Full. The EMAC_MMC_TXINT.UNDERR bit is set when EMAC_TXUNDR_ERR counter reaches full or half.
12 (R/NW)	BCASTGB	Tx Broadcast Frames (Good/Bad) Count Half/Full. The EMAC_MMC_TXINT.BCASTGB bit is set when EMAC_TXBCASTFRM_GB counter reaches full or half.
11 (R/NW)	MCASTGB	Tx Multicast Frames (Good/Bad) Count Half/Full. The EMAC_MMC_TXINT.MCASTGB bit is set when EMAC_TXMCASTFRM_GB counter reaches full or half.
10 (R/NW)	UCASTGB	Tx Unicast Frames (Good/Bad) Count Half/Full. The EMAC_MMC_TXINT.UCASTGB bit is set when EMAC_TXUCASTFRM_GB counter reaches full or half.
9 (R/NW)	T1024TOMAX	Tx 1024-to-max Octets (Good/Bad) Count Half/Full. The EMAC_MMC_TXINT.T1024TOMAX bit is set when EMAC_TX1024TOMAX_GB counter reaches full or half.
8 (R/NW)	T512TO1023	Tx 512-to-1023 Octets (Good/Bad) Count Half/Full. The EMAC_MMC_TXINT.T512TO1023 bit is set when EMAC_TX512TO1023_GB counter reaches full or half.
7 (R/NW)	T256TO511	Tx 256-to-511 Octets (Good/Bad) Count Half/Full. The EMAC_MMC_TXINT.T256TO511 bit is set when EMAC_TX256TO511_GB counter reaches full or half.
6 (R/NW)	T128TO255	Tx 128-to-255 Octets (Good/Bad) Count Half/Full. The EMAC_MMC_TXINT.T128TO255 bit is set when EMAC_TX128TO255_GB counter reaches full or half.
5 (R/NW)	T65TO127	Tx 65-to-127 Octets (Good/Bad) Count Half/Full. The EMAC_MMC_TXINT.T65TO127 bit is set when EMAC_TX65TO127_GB counter reaches full or half.
4 (R/NW)	T64	Tx 64 Octets (Good/Bad) Count Half/Full. The EMAC_MMC_TXINT.T64 bit is set when EMAC_TX64_GB counter reaches full or half.
3 (R/NW)	MCASTG	Tx Multicast Frames (Good) Count Half/Full. The EMAC_MMC_TXINT.MCASTG bit is set when EMAC_TXMCASTFRM_G counter reaches full or half.

Table 24-142: EMAC_MMC_TXINT Register Fields (Continued)

Bit No. (Access)	Bit Name	Description/Enumeration
2 (R/NW)	BCASTG	Tx Broadcast Frames (Good) Count Half/Full. The EMAC_MMC_TXINT.BCASTG bit is set when EMAC_TXBCASTFRM_G counter reaches full or half.
1 (R/NW)	FRCNTGB	Tx Frame Count (Good/Bad) Count Half/Full. The EMAC_MMC_TXINT.FRCNTGB bit is set when EMAC_TXFRMCNT_GB counter reaches full or half.
0 (R/NW)	OCTCNTGB	Tx Octet Count (Good/Bad) Count Half/Full. The EMAC_MMC_TXINT.OCTCNTGB bit is set when EMAC_TXOCTCNT_GB counter reaches full or half.

Rx 1024- to Max-Byte Frames (Good/Bad) Register

The `EMAC_RX1024TOMAX_GB` register contains a count of the number of good and bad frames received with length between 1024 and maxsize (inclusive) bytes, exclusive of preamble.

Figure 24-111: EMAC_RX1024TOMAX_GB Register Diagram

Table 24-143: EMAC_RX1024TOMAX_GB Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	CNT	Count Value.

Rx 128- to 255-Byte Frames (Good/Bad) Register

The `EMAC_RX128TO255_GB` register contains a count of the number of good and bad frames received with length between 128 and 255 (inclusive) bytes, exclusive of preamble.

Figure 24-112: EMAC_RX128TO255_GB Register Diagram

Table 24-144: EMAC_RX128TO255_GB Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	CNT	Count Value.

Rx 256- to 511-Byte Frames (Good/Bad) Register

The `EMAC_RX256TO511_GB` register contains a count of the number of good and bad frames received with length between 256 and 511 (inclusive) bytes, exclusive of preamble.

Figure 24-113: EMAC_RX256TO511_GB Register Diagram

Table 24-145: EMAC_RX256TO511_GB Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	CNT	Count Value.

Rx 512- to 1023-Byte Frames (Good/Bad) Register

The `EMAC_RX512TO1023_GB` register contains a count of the number of good and bad frames received with length between 512 and 1023 (inclusive) bytes, exclusive of preamble.

Figure 24-114: EMAC_RX512TO1023_GB Register Diagram

Table 24-146: EMAC_RX512TO1023_GB Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	CNT	Count Value.

Rx 64-Byte Frames (Good/Bad) Register

The `EMAC_RX64_GB` register contains a count of the number of good and bad frames received with length 64 bytes, exclusive of preamble.

Figure 24-115: EMAC_RX64_GB Register Diagram

Table 24-147: EMAC_RX64_GB Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	CNT	Count Value.

Rx 65- to 127-Byte Frames (Good/Bad) Register

The `EMAC_RX65TO127_GB` register contains a count of the number of good and bad frames received with length between 65 and 127 (inclusive) bytes, exclusive of preamble.

Figure 24-116: EMAC_RX65TO127_GB Register Diagram

Table 24-148: EMAC_RX65TO127_GB Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	CNT	Count Value.

Rx alignment Error Register

The `EMAC_RXALIGN_ERR` register contains a count of the number of frames received with alignment (dribble) error. Valid only in 10/100 mode.

Figure 24-117: EMAC_RXALIGN_ERR Register Diagram

Table 24-149: EMAC_RXALIGN_ERR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	CNT	Count Value.

Rx Broadcast Frames (Good) Register

The `EMAC_RXBCASTFRM_G` register contains a count of the number of good broadcast frames received.

Figure 24-118: EMAC_RXBCASTFRM_G Register Diagram

Table 24-150: EMAC_RXBCASTFRM_G Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	CNT	Count Value.

Rx CRC Error Register

The `EMAC_RXCRC_ERR` register contains a count of the number of frames received with CRC error.

Figure 24-119: EMAC_RXCRC_ERR Register Diagram

Table 24-151: EMAC_RXCRC_ERR Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	CNT	Count Value.

Rx Good Control Frames Register

The `EMAC_RXCTLFRM_G` register contains a count of the number of good control frames received

Figure 24-120: EMAC_RXCTLFRM_G Register Diagram

Table 24-152: EMAC_RXCTLFRM_G Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	CNT	Count Value.

Rx FIFO Overflow Register

The `EMAC_RXFIFO_OVF` register contains a count of the number of missed received frames due to FIFO overflow.

Figure 24-121: EMAC_RXFIFO_OVF Register Diagram

Table 24-153: EMAC_RXFIFO_OVF Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	CNT	Count Value.

Rx Frame Count (Good/Bad) Register

The `EMAC_RXFRMCNT_GB` register contains a count of the number of good and bad frames received.

Figure 24-122: EMAC_RXFRMCNT_GB Register Diagram

Table 24-154: EMAC_RXFRMCNT_GB Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	CNT	Count Value.

Rx ICMP Error Frames Register

The `EMAC_RXICMP_ERR_FRM` register contains a count of the number of good IP datagrams whose ICMP payload has a checksum error.

Figure 24-123: EMAC_RXICMP_ERR_FRM Register Diagram

Table 24-155: EMAC_RXICMP_ERR_FRM Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	CNT	Count Value.

Rx ICMP Error Octets Register

The `EMAC_RXICMP_ERR_OCT` register contains a count of the number of bytes received in an ICMP segment with checksum errors.

Figure 24-124: EMAC_RXICMP_ERR_OCT Register Diagram

Table 24-156: EMAC_RXICMP_ERR_OCT Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	CNT	Count Value.

Rx ICMP Good Frames Register

The `EMAC_RXICMP_GD_FRM` register contains a count of the number of good IP datagrams with a good ICMP payload.

Figure 24-125: EMAC_RXICMP_GD_FRM Register Diagram

Table 24-157: EMAC_RXICMP_GD_FRM Register Fields

Bit No. (Access)	Bit Name	Description/Enumeration
31:0 (R/NW)	CNT	Count Value.

Rx ICMP Good Octets Register

The `EMAC_RXICMP_GD_OCT` register contains a count of the Number of bytes received in a good ICMP segment.

Figure 24-126: EMAC_RXICMP_GD_OCT Register Diagram

Table 24-158: EMAC_RXICMP_GD_OCT Register Fields
